Revision History

Revision	Revision Date	Description
1.1	Sept 2006	Added a note to section 1.0 "Introduction and Scope" that relates to auto-switching. Added a block of 10/100 code to section 4.0 "Design Considerations" that explains how to turn on/off auto MDI-X.
1.0	August 2004	Initial release

1.0 Introduction and Scope

This application note describes the 82551QM/ER/IT Fast Ethernet PCI Controller’s Management Data Interface MDI\MDI-X feature.

The MDI/MDI-X feature provides the ability to automatically detect the required cable connection type and configure the controller-side MAU to the cable type. This feature effectively allows all properly wired Ethernet cables, usable with any Ethernet device, to be connected to the 82551QM/ER/IT without any additional external logic.

This advanced feature enables auto-correction of incorrect cabling with respect to cross-over versus straight-through cables. The 82551QM/ER/IT can identify the cable connection type and adjust its MDI port to the cable by switching between the TD and RD pairs.

Note: The auto-switching function is not supported when forcing speed and duplex modes. While in forced link mode, auto MDI-X cannot properly resolve auto-switching. Refer to Section 4.0 for the code that can be used to turn on/off auto MDI-X.

In a standard straight-through RJ-45 port configuration, the transmit pair is on contacts 1 and 2, and the receive pair on contacts 3 and 6. These are defined by Clause 23.7.1 of the IEEE 802.3u standard.

Table 1 lists the connections for both straight-through and cross-over RJ-45 ports for comparison.

Table 1. RJ-45 Connections

RJ-45 Contact	Straight-Through MDI Signal ^a	Cross-Over MDIX Signal ^b
1	TD+	RD+
2	TD-	RD-
3	RD+	TD+
4	Not Used	Not Used
5	Not Used	Not Used
6	RD-	TD-
7	Not Used	Not Used
8	Not Used	Not Used

- a. Straight-through connections used on DTE applications.
- b. Cross-over connections used on Hub and Switch applications.

2.0 Connection Types

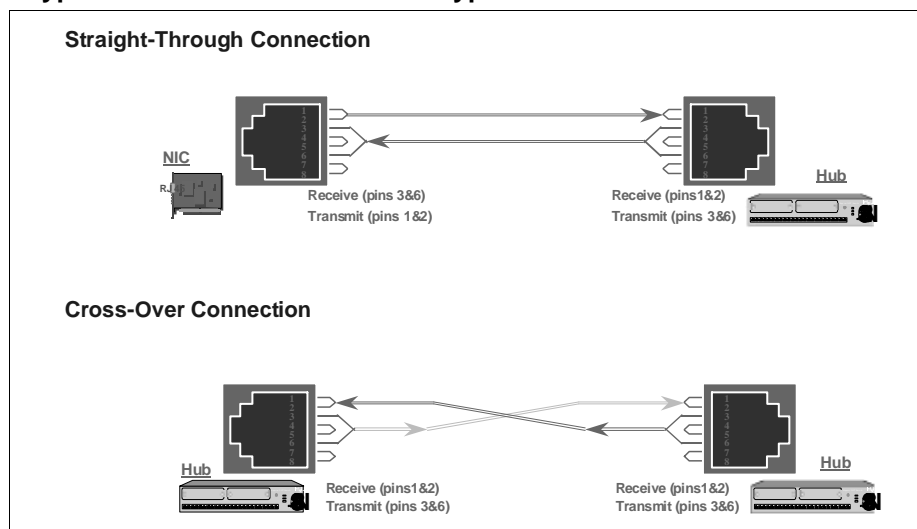

There are typically two cable types used to connect Ethernet devices together: straight-through and cross-over cables (see Figure 1). The networking equipment used determines the required cable type. In a networking environment, the need to manage two different types of cable connections consumes maintenance time and money. Implementing networking systems with manual or automatic correction of cross-over/straight-through cables usually adds to the system cost, as it requires dedicated hardware. The 82551QM/ER/IT Fast Ethernet PCI Controller offers a software-controlled solution for this problem. As a result, a lower system solution cost and simplified maintenance can be achieved.

In a typical Data Terminal Equipment (DTE)-to-repeater/switch connection, the cross-over is implemented in the repeater/switch Medium Attachment Unit (MAU). In this case a straight-through cable is required.

However, in connections between two MAUs of the same type (i.e. hub-to-switch, or switch-to-switch uplink connections), an external cross-over cable is required. If the cable type does not match the MAU configuration on both ends, the cable must be replaced. If the cable that must be replaced is located in a wiring closet then typically the installation or replacement of a “patch panel” is required.

In a typical medium-sized business there are perhaps 100’s of Ethernet ports that connect to a central switch or hub. If the hub or switch had the ability to sense and switch the wire pairs internally on a port basis, overall savings would be realized both in maintenance time and money.

Figure 1. Typical RJ-45 Cable Connection Types

3.0 MDI/MDI-X Auto-Switching Activation

The 82551QM/ER/IT provides an EEPROM bit for software to enable or disable the MDI-X auto-switching feature on a per port basis. This setting (Compatibility Word 03h, bit 7) is accessed via the MII Management Interface (refer to Table 2).

Table 2. Compatibility Word (03h)

Bit	Name	Description	Type ^a
7	Auto Switch Enable	Enables the MDI/MDI-X auto-switching feature. 1 = Enabled. 0 = Disabled (default).	R/W

a. R/W = Read/Write

When auto-switching is enabled, the PHY attempts to detect link activity in a given configuration (MDI or MDI-X) for duration of 80 - 105ms. If no link activity is detected during this slot time, the PHY waits a random amount of time (greater than 80ms) and then switches the MDI pairs to the other configuration (refer to Table 3).

Table 3. MDI/MDI-X Control Register Bit Definitions (Register 28, 1Ch)

Bit(s)	Name	Definition	Type ^a
15:8	Reserved	Reserved for future use. Set these bits to 0.	R/W
7	Auto Switch Enable	Enables the MDI/MDI-X feature (writing to this bit overwrites the default value). 1 = Enabled. 0 = Disabled (default).	R/W
6	Switch	Manual switch (valid only if bit 7 is set to 0). 1 = Forces the port to be MDI-X (cross-over). 0 = Forces the port to be MDI (straight-through); (default).	R/W
5	Status	Indicates the state of the MDI pair. 1 = MDI-X (cross-over). 0 = MDI (straight-through); (default).	RO
4	Auto Switch Complete	Indicates when the correct configuration is achieved. 1 = Resolution algorithm has completed (default). 0 = Resolution algorithm has not completed.	RO
3:0	Resolution Timer	Defines the minimum slot time the algorithm uses in order to switch between one configuration or another. 0000 = 80ms (default). 1111 = 105ms.	R/W

a. R/W = Read/Write
RO = Read Only

4.0 Design Considerations

To fully implement the MDI-X feature, the following hardware layout changes need to be considered:

- The transmit and receive termination resistors should have the same value. 110 ohms is recommended.
- Do not place a capacitor on the transformer center taps for either channel.
- Follow a symmetrical style when selecting magnetics. The transmit and receive channels should have the same construction and electrical specifications. For discrete modules, the Pulse H1338 is suggested.
- Use the following code to turn on/off the auto MDI-X function:

```
#define NCONFIG_AUTO_SWITCH0x0080
#define MII_NCONFIG 0x01C

    if (!(nic->eeprom[eeprom_cnfg_mdix] & eeprom_mdix_enabled) &&
        (Force_Speed_And_Duplex == TRUE))
        e100_write_phy_reg(MII_NCONFIG, 0);
    else
        e100_write_phy_reg(MII_NCONFIG, NCONFIG_AUTO_SWITCH);
```

Refer to the *82562EZ/82551ER/82551IT/82541ER Combined Footprint LOM Design Guide (AP-456)* or the *82551QM/82540EM Interchangeable LOM Design Guide (AP-432)* for additional hardware design considerations.
