GPP_E5_SATA_DEVSLP1	OD	**Serial ATA Port [1] Device Sleep:** This is an open-drain pin on the PCH side. PCH will tri-state this pin to signal to the SATA device that it may enter a lower power state (pin will go high due to pull-up that is internal to the SATA device, per DEVSLP specification). PCH will drive pin low to signal an exit from DEVSLP state. Design Constraint: As per the PDG, no external pull-up or pull-down termination required when used as DEVSLP. ***Note:*** This pin can be mapped to SATA Port 1.
GPP_E6_SATA_DEVSLP2	OD	**Serial ATA Port [2] Device Sleep:** This is an open-drain pin on the PCH side. PCH will tri-state this pin to signal to the SATA device that it may enter a lower power state (pin will go high due to pull-up that is internal to the SATA device, per DEVSLP specification). PCH will drive pin low to signal an exit from DEVSLP state. Design Constraint: As per the PDG, no external pull-up or pull-down termination required when used as DEVSLP. ***Note:*** This pin can be mapped to SATA Port 2.
GPP_F5_SATA_DEVSLP3	OD	**Serial ATA Port [3] Device Sleep**: This is an open-drain pin on the PCH side. PCH will tri-state this pin to signal to the SATA device that it may enter a lower power state (pin will go high due to pull-up that is internal to the SATA device, per DEVSLP specification). PCH will drive pin low to signal an exit from DEVSLP state. Design Constraint: As per the PDG, no external pull-up or pull-down termination required when used as DEVSLP. ***Note:*** This pin can be mapped to SATA Port 3.
GPP_F6_SATA_DEVSLP4	OD	**Serial ATA Port [4] Device Sleep**: This is an open-drain pin on the PCH side. PCH will tri-state this pin to signal to the SATA device that it may enter a lower power state (pin will go high due to pull-up that is internal to the SATA device, per DEVSLP specification). PCH will drive pin low to signal an exit from DEVSLP state. Design Constraint: As per the PDG, no external pull-up or pull-down termination required when used as DEVSLP. ***Note:*** This pin can be mapped to SATA Port 4.
GPP_F7_SATA_DEVSLP5	OD	**Serial ATA Port [5] Device Sleep**: This is an open-drain pin on the PCH side. PCH will tri-state this pin to signal to the SATA device that it may enter a lower power state (pin will go high due to pull-up that is internal to the SATA device, per DEVSLP specification). PCH will drive pin low to signal an exit from DEVSLP state. Design Constraint: As per the PDG, no external pull-up or pull-down termination required when used as DEVSLP. ***Note:*** This pin can be mapped to SATA Port 5.
GPP_F8_SATA_DEVSLP6	OD	**Serial ATA Port [6] Device Sleep**: This is an open-drain pin on the PCH side. PCH will tri-state this pin to signal to the SATA device that it may enter a lower power state (pin will go high due to pull-up that is internal to the SATA device, per DEVSLP specification). PCH will drive pin low to signal an exit from DEVSLP state. Design Constraint: As per the PDG, no external pull-up or pull-down termination required when used as DEVSLP. ***Note:*** This pin can be mapped to SATA Port 6.
GPP_F9_SATA_DEVSLP7	OD	**Serial ATA Port [7] Device Sleep**: This is an open-drain pin on the PCH side. PCH will tri-state this pin to signal to the SATA device that it may enter a lower power state (pin will go high due to pull-up that is internal to the SATA device, per DEVSLP specification). PCH will drive pin low to signal an exit from DEVSLP state. Design Constraint: As per the PDG, no external pull-up or pull-down termination required when used as DEVSLP. ***Note:*** This pin can be mapped to SATA Port 7.

Name	Type	Description
PCIE_12_UP_0_SATA0_TXP PCIE_12_UP_0_SATA0_TXN	O	**Serial ATA Differential Transmit Pair 0:** These outbound SATA Port 0 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 12 and PCIe Uplink Port 0. ***Note:*** Use FITC to allow selection of PCIe versus SATA based on strapping of SATA/PCIe Select GPIO polarity for SATA Port 0 with SATAXPCIE0.
PCIE_12_UP_0_SATA0_RXP PCIE_12_UP_0_SATA0_RXN	I	**Serial ATA Differential Receive Pair 0:** These inbound SATA Port 0 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 12 and PCIe Uplink Port 0. ***Note:*** Use FITC to allow selection of PCIe versus SATA based on strapping of SATA/PCIe Select GPIO polarity for SATA Port 0 with SATAXPCIE0.
PCIE_13_UP_1_SATA1_TXP PCIE_13_UP_1_SATA1_TXN	O	**Serial ATA Differential Transmit Pair 1:** These outbound SATA Port 1 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 13 and PCIe Uplink Port 1. ***Note:*** Use FITC to allow selection of PCIe versus SATA based on strapping of SATA/PCIe Select GPIO polarity for SATA Port 1 with SATAXPCIE1.
PCIE_13_UP_1_SATA1_RXP PCIE_13_UP_1_SATA1_RXN	I	**Serial ATA Differential Receive Pair 1 [First Instance]:** These inbound SATA Port 1 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 13 and PCIe Uplink Port 1. ***Note:*** Use FITC to allow selection of PCIe versus SATA based on strapping of SATA/PCIe Select GPIO polarity for SATA Port 1 with SATAXPCIE1.
PCIE_14_UP_2_SATA2_TXP PCIE_14_UP_2_SATA2_TXN	O	**Serial ATA Differential Transmit Pair 2:** These outbound SATA Port 2 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 14 and PCIe Uplink Port 2. ***Note:*** Use FITC to allow selection of PCIe versus SATA based on strapping of SATA/PCIe Select GPIO polarity for SATA Port 2 with SATAXPCIE2.
PCIE_14_UP_2_SATA2_RXP PCIE_14_UP_2_SATA2_RXN	I	**Serial ATA Differential Receive Pair 2:** These inbound SATA Port 2 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 14 and PCIe Uplink Port 2. ***Note:*** Use FITC to allow selection of PCIe versus SATA based on strapping of SATA/PCIe Select GPIO polarity for SATA Port 2 with SATAXPCIE2.
PCIE_15_UP_3_SATA3_TXP PCIE_15_UP_3_SATA3_TXN	O	**Serial ATA Differential Transmit Pair 3:** These outbound SATA Port 3 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 15 and PCIe Uplink Port 3. ***Note:*** Use FITC to allow selection of PCIe versus SATA based on strapping of SATA/PCIe Select GPIO polarity for SATA Port 3 with SATAXPCIE3.
PCIE_15_UP_3_SATA3_RXP PCIE_15_UP_3_SATA3_RXN	I	**Serial ATA Differential Receive Pair 3:** These inbound SATA Port 3 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 15 and PCIe Uplink Port 3. ***Note:*** Use FITC to allow selection of PCIe versus SATA based on strapping of SATA/PCIe Select GPIO polarity for SATA Port 3 with SATAXPCIE3.
PCIE_16_UP_4_SATA4_TXP PCIE_16_UP_4_SATA4_TXN	O	**Serial ATA Differential Transmit Pair 4:** These outbound SATA Port 4 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 16 and PCIe Uplink Port 4. ***Note:*** Use FITC to allow selection of PCIe versus SATA based on strapping of SATA/PCIe Select GPIO polarity for SATA Port 4 with SATAXPCIE4.
PCIE_16_UP_4_SATA4_RXP PCIE_16_UP_4_SATA4_RXN	I	**Serial ATA Differential Receive Pair 4:** These inbound SATA Port 4 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 16 and PCIe Uplink Port 4. ***Note:*** Use FITC to allow selection of PCIe versus SATA based on strapping of SATA/PCIe Select GPIO polarity for SATA Port 4 with SATAXPCIE4.

Name	Type	Description
PCIE_17_UP_5_SATA5_TXP PCIE_17_UP_5_SATA5_TXN	O	**Serial ATA Differential Transmit Pair 5:** These outbound SATA Port 5 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 17 and PCIe Uplink Port 5. ***Note:*** Use FITC to allow selection of PCIe versus SATA based on strapping of SATA/PCIe Select GPIO polarity for SATA Port 5 with SATAXPCIE5.
PCIE_17_UP_5_SATA5_RXP PCIE_17_UP_5_SATA5_RXN	I	**Serial ATA Differential Receive Pair 5:** These inbound SATA Port 5 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 17 and PCIe Uplink Port 5. ***Note:*** Use FITC to allow selection of PCIe versus SATA based on strapping of SATA/PCIe Select GPIO polarity for SATA Port 5 with SATAXPCIE5.
PCIE_18_UP_6_SATA6_TXP PCIE_18_UP_6_SATA6_TXN	O	**Serial ATA Differential Transmit Pair 6:** These outbound SATA Port 6 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 18 and PCIe Uplink Port 6. ***Note:*** Use FITC to allow selection of PCIe versus SATA based on strapping of SATA/PCIe Select GPIO polarity for SATA Port 6 with SATAXPCIE6.
PCIE_18_UP_6_SATA6_RXP PCIE_18_UP_6_SATA6_RXN	I	**Serial ATA Differential Receive Pair 6:** These inbound SATA Port 6 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 18 and PCIe Uplink Port 6. ***Note:*** Use FITC to allow selection of PCIe versus SATA based on strapping of SATA/PCIe Select GPIO polarity for SATA Port 6 with SATAXPCIE6.
PCIE_19_UP_7_SATA7_TXP PCIE_19_UP_7_SATA7_TXN	O	**Serial ATA Differential Transmit Pair 7:** These outbound SATA Port 7 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 19 and PCIe Uplink Port 7. ***Note:*** Use FITC to allow selection of PCIe versus SATA based on strapping of SATA/PCIe Select GPIO polarity for SATA Port 7 with SATAXPCIE7.
PCIE_19_UP_7_SATA7_RXP PCIE_19_UP_7_SATA7_RXN	I	**Serial ATA Differential Receive Pair 7:** These inbound SATA Port 7 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 19 and PCIe Uplink Port 7. ***Note:*** Use FITC to allow selection of PCIe versus SATA based on strapping of SATA/PCIe Select GPIO polarity for SATA Port 7 with / SATAXPCIE7.
GPP_E0_SATAXPCIE0_SATAGP0	I	**Serial ATA Port [0] General Purpose Inputs:** When configured as SATAGP_0, this is an input pin that is used as an interlock switch status indicator for SATA Port 0. Drive the pin to '0' to indicate that the switch is closed and to '1' to indicate that the switch is open.
GPP_E0_SATAXPCIE0_SATAGP0	I	S**ATA/PCIe selection**: When configured as SATAXPCIE0, this pin will configure the PCIE_12_UP_0_SATA0[TX/RX] pins to be either PCIe signals or SATAPort0 signals. The pin must be stable at the time PCH_PWROK goes high and remain in that state.
GPP_E1_SATAXPCIE1_SATAGP1	I	**Serial ATA Port [1] General Purpose Inputs:** When configured as SATAGP_1, this is an input pin that is used as an interlock switch status indicator for SATA Port 1. Drive the pin to '0' to indicate that the switch is closed and to '1' to indicate that the switch is open.
GPP_E1_SATAXPCIE1_SATAGP1	I	S**ATA/PCIe selection**: When configured as SATAXPCIE1, this pin will configure the PCIE_13_UP_1_SATA1[TX/RX] pins to be either PCIe signals or SATAPort1 signals. The pin must be stable at the time PCH_PWROK goes high and remain in that state.
GPP_E2_SATAXPCIE2_SATAGP2	I	**Serial ATA Port [2] General Purpose Inputs:** When configured as SATAGP_2, this is an input pin that is used as an interlock switch status indicator for SATA Port 2. Drive the pin to '0' to indicate that the switch is closed and to '1' to indicate that the switch is open.
GPP_E2_SATAXPCIE2_SATAGP2	I	S**ATA/PCIe selection**: When configured as SATAXPCIE2, this pin will configure the PCIE_14_UP_2_SATA2[TX/RX] pins to be either PCIe signals or SATAPort2 signals. The pin must be stable at the time PCH_PWROK goes high and remain in that state.
GPP_F0_SATAXCPIE3_SATAGP3	I	**Serial ATA Port [3] General Purpose Inputs:** When configured as SATAGP_3, this is an input pin that is used as an interlock switch status indicator for SATA Port 3. Drive the pin to '0' to indicate that the switch is closed and to '1' to indicate that the switch is open.

Name	Type	Description
GPP_F0_SATAXCPIE3_SATAGP3	I	S**ATA/PCIe selection**: When configured as SATAXPCIE3, this pin will configure the PCIE_15_UP_3_SATA3[TX/RX] pins to be either PCIe signals or SATAPort3 signals. The pin must be stable at the time PCH_PWROK goes high and remain in that state.
GPP_F1_SATAXPCIE4_SATAGP4	I	**Serial ATA Port [4] General Purpose Inputs:** When configured as SATAGP_4, this is an input pin that is used as an interlock switch status indicator for SATA Port 4. Drive the pin to '0' to indicate that the switch is closed and to '1' to indicate that the switch is open.
PP_F1_SATAXPCIE4_SATAGP4	I	S**ATA/PCIe selection**: When configured as SATAXPCIE4, this pin will configure the PCIE_16_UP_4_SATA4[TX/RX] pins to be either PCIe signals or SATAPort4 signals. The pin must be stable at the time PCH_PWROK goes high and remain in that state.
GPP_F2_SATAXPCIE5_SATAGP5	I	**Serial ATA Port [5] General Purpose Inputs:** When configured as SATAGP_5, this is an input pin that is used as an interlock switch status indicator for SATA Port 5. Drive the pin to '0' to indicate that the switch is closed and to '1' to indicate that the switch is open.
GPP_F2_SATAXPCIE5_SATAGP5	I	S**ATA/PCIe selection**: When configured as SATAXPCIE5, this pin will configure the PCIE_17_UP_5_SATA5[TX/RX] pins to be either PCIe signals or SATAPort5 signals. The pin must be stable at the time PCH_PWROK goes high and remain in that state.
GPP_F3_SATAXPCIE6_SATAGP6	I	**Serial ATA Port [6] General Purpose Inputs:** When configured as SATAGP_6, this is an input pin that is used as an interlock switch status indicator for SATA Port 6. Drive the pin to '0' to indicate that the switch is closed and to '1' to indicate that the switch is open.
GPP_F3_SATAXPCIE6_SATAGP6	I	S**ATA/PCIe selection**: When configured as SATAXPCIE6, this pin will configure the PCIE_18_UP_6_SATA6[TX/RX] pins to be either PCIe signals or SATAPort6 signals. The pin must be stable at the time PCH_PWROK goes high and remain in that state.
GPP_F4_SATAXPCIE7_SATAGP7	I	**Serial ATA Port [7] General Purpose Inputs:** When configured as SATAGP_7, this is an input pin that is used as an interlock switch status indicator for SATA Port 7. Drive the pin to '0' to indicate that the switch is closed and to '1' to indicate that the switch is open.
GPP_F3_SATAXPCIE6_SATAGP6	I	S**ATA/PCIe selection**: When configured as SATAXPCIE7, this pin will configure the PCIE_19_UP_7_SATA7[TX/RX] pins to be either PCIe signals or SATAPort7 signals. The pin must be stable at the time PCH_PWROK goes high and remain in that state.
GPP_E8_SATA_LED#	OD O	**Serial ATA LED:** This signal is an open-drain output pin driven during SATA command activity. It is to be connected to external circuitry that can provide the current to drive a platform LED. When active, the LED is on. When tri-stated, the LED is off. ***Note:*** An external pull-up resistor to VCC3_3 is required.
GPP_F10_SATA_SCLOCK	OD	**SGPIO Reference Clock:** The SATA controller uses rising edges of this clock to transmit serial data, and the target uses the falling edge of this clock to latch data. The SClock frequency supported is 32 kHz. If SGPIO interface is not used, this signal can be used as GPP_F10.
GPP_F11_SATA_SLOAD	OD	**SGPIO Load:** The controller drives a '1' at the rising edge of SCLOCK to indicate either the start or end of a bit stream. A 4-bit vendor specific pattern will be transmitted right after the signal assertion. If SGPIO interface is not used, this signal can be used as GPP_F11.
GPP_F13_SATA_SDATAOUT0	OD	**SGPIO Dataout0:** Driven by the controller to indicate the drive status in the following sequence: drive 0, 1,2, 3, 4, 5, 6, 7, 0, 1, 2... If SGPIO interface is not used, the signals can be used as GPP_F13.
GPP_F12_SATA_SDATAOUT1	OD	**SGPIO Dataout1:** Driven by the controller to indicate the drive status in the following sequence: drive 0, 1,2, 3, 4, 5, 6, 7, 0, 1, 2... If SGPIO interface is not used, the signals can be used as GPP_F12.

Name	Type	Description
GPP_G20_SSATA_DEVSLP0	OD	**SSATA Port [0] Device Sleep**: This is an open-drain pin on the PCH side. PCH will tri-state this pin to signal to the SATA device that it may enter a lower power state (pin will go high due to pull-up that is internal to the SATA device, per DEVSLP specification). PCH will drive pin low to signal an exit from DEVSLP state. Design Constraint: As per PDG, no external pull-up or pull-down termination required when used as DEVSLP. This pin can be mapped to SSATA Port 0.
GPP_G21_SSATA_DEVSLP1	OD	**SSATA Port [1] Device Sleep**: This is an open-drain pin on the PCH side. PCH will tri-state this pin to signal to the SATA device that it may enter a lower power state (pin will go high due to pull-up that is internal to the SATA device, per DEVSLP specification). PCH will drive pin low to signal an exit from DEVSLP state. Design Constraint: As per PDG, no external pull-up or pull-down termination required when used as DEVSLP. This pin can be mapped to SSATA Port 1.
GPP_G22_SSATA_DEVSLP2	OD	**SSATA Port [2] Device Sleep**: This is an open-drain pin on the PCH side. PCH will tri-state this pin to signal to the SATA device that it may enter a lower power state (pin will go high due to pull-up that is internal to the SATA device, per DEVSLP specification). PCH will drive pin low to signal an exit from DEVSLP state. Design Constraint: As per PDG, no external pull-up or pull-down termination required when used as DEVSLP. This pin can be mapped to SSATA Port 2.
GPP_D9_SSATA_DEVSLP3	OD	**SSATA Port [3] Device Sleep**: This is an open-drain pin on the PCH side. PCH will tri-state this pin to signal to the SATA device that it may enter a lower power state (pin will go high due to pull-up that is internal to the SATA device, per DEVSLP specification). PCH will drive pin low to signal an exit from DEVSLP state. Design Constraint: As per PDG, no external pull-up or pull-down termination required when used as DEVSLP. This pin can be mapped to SSATA Port 3.
GPP_D10_SSATA_DEVSLP4	OD	**SSATA Port [4] Device Sleep**: This is an open-drain pin on the PCH side. PCH will tri-state this pin to signal to the SATA device that it may enter a lower power state (pin will go high due to pull-up that is internal to the SATA device, per DEVSLP specification). PCH will drive pin low to signal an exit from DEVSLP state. Design Constraint: As per PDG, no external pull-up or pull-down termination required when used as DEVSLP. This pin can be mapped to SSATA Port 4.
GPP_D11_SSATA_DEVSLP5	OD	**SSATA Port [5] Device Sleep**: This is an open-drain pin on the PCH side. PCH will tri-state this pin to signal to the SATA device that it may enter a lower power state (pin will go high due to pull-up that is internal to the SATA device, per DEVSLP specification). PCH will drive pin low to signal an exit from DEVSLP state. Design Constraint: As per PDG, no external pull-up or pull-down termination required when used as DEVSLP. This pin can be mapped to SSATA Port 5.
PCIE_6_SSATA0_TXP PCIE_6_SSATA0_TXN	O	**SSATA Differential Transmit Pair 0:** These outbound SATA Port 0 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 6. ***Note:*** Use FITC to allow selection of PCIe versus SSATA based on strapping of SATA/PCIe Select GPIO polarity for SSATA Port 0 with SSATAXPCIE0.
PCIE_6_SSATA0_RXP PCIE_6_SSATA0_RXN	I	**SSATA Differential Receive Pair 0:** These outbound SATA Port 0 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 6. ***Note:*** Use FITC to allow selection of PCIe versus SSATA based on strapping of SATA/PCIe Select GPIO polarity for SSATA Port 0 with SSATAXPCIE0.

Name	Type	Description
PCIE_7_SSATA1_TXP PCIE_7_SSATA1_TXN	O	**SSATA Differential Transmit Pair 1:** These outbound SATA Port 0 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 7. ***Note:*** Use FITC to allow selection of PCIe versus SSATA based on strapping of SATA/PCIe Select GPIO polarity for SSATA Port 1 with SSATAXPCIE1.
PCIE_7_SSATA1_RXP PCIE_7_SSATA1_RXN	I	**SSATA Differential Receive Pair 1:** These outbound SATA Port 0 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 7. ***Note:*** Use FITC to allow selection of PCIe versus SSATA based on strapping of SATA/PCIe Select GPIO polarity for SSATA Port 1 with SSATAXPCIE1.
PCIE_8_SSATA2_GBE_TXP PCIE_8_SSATA2_GBE_TXN	O	**SSATA Differential Transmit Pair 2:** These outbound SATA Port 0 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 8 and the 1GbE MAC ***Note:*** Use FITC to allow selection of PCIe versus SSATA based on strapping of SATA/PCIe Select GPIO polarity for SSATA Port 2 with SSATAXPCIE2.
PCIE_8_SSATA2_GBE_RXP PCIE_8_SSATA2_GBE_RXN	I	**SSATA Differential Receive Pair 2:** These outbound SATA Port 0 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 8 and the 1GbE MAC. ***Note:*** Use FITC to allow selection of PCIe versus SSATA based on strapping of SATA/PCIe Select GPIO polarity for SSATA Port 2 with SSATAXPCIE2
PCIE_9_SSATA3_TXP PCIE_9_SSATA3_TXN	O	**SSATA Differential Transmit Pair 3:** These outbound SATA Port 0 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 9. ***Note:*** Use FITC to allow selection of PCIe versus SSATA based on strapping of SATA/PCIe Select GPIO polarity for SSATA Port 3 with SSATAXPCIE3.
PCIE_9_SSATA3_RXP PCIE_9_SSATA3_RXN	I	**SSATA Differential Receive Pair 3:** These outbound SATA Port 0 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 9. ***Note:*** Use FITC to allow selection of PCIe versus SSATA based on strapping of SATA/PCIe Select GPIO polarity for SSATA Port 3 with SSATAXPCIE3.
PCIE_10_SSATA4_TXP PCIE_10_SSATA4_TXN	O	**SSATA Differential Transmit Pair 4:**These outbound SATA Port 0 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 10 ***Note:*** Use FITC to allow selection of PCIe versus SSATA based on strapping of SATA/PCIe Select GPIO polarity for SSATA Port 4 with SSATAXPCIE4.
PCIE_10_SSATA4_RXP PCIE_10_SSATA4_RXN	I	**SSATA Differential Receive Pair 4:** These outbound SATA Port 0 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 10. ***Note:*** Use FITC to allow selection of PCIe versus SSATA based on strapping of SATA/PCIe Select GPIO polarity for SSATA Port 4 with SSATAXPCIE4.
PCIE_11_SSATA5_TXP PCIE_11_SSATA5_TXN	O	**SSATA Differential Transmit Pair 5:**These outbound SATA Port 0 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 11 ***Note:*** Use FITC to allow selection of PCIe versus SSATA based on strapping of SATA/PCIe Select GPIO polarity for SSATA Port 5 with SSATAXPCIE5.
PCIE_11_SSATA5_RXP PCIE_11_SSATA5_RXN	I	**SSATA Differential Receive Pair 5:** These outbound SATA Port 0 high-speed differential signals support 1.5 Gb/s, 3 Gb/s and 6 Gb/s. The signals are multiplexed with PCIe Root Port 11. ***Note:*** Use FITC to allow selection of PCIe versus SSATA based on strapping of SATA/PCIe Select GPIO polarity for SSATA Port 5 with SSATAXPCIE5.
GPP_G23_SSATAXPCIE0_SSATAGP0/	I	**SSATA Port [0] General Purpose Inputs:** When configured as SSATAGP_0, this is an input pin that is used as an interlock switch status indicator for SSATA Port 0. Drive the pin to '0' to indicate that the switch is closed and to '1' to indicate that the switch is open.

Name	Type	Description
GPP_G23_SSATAXPCIE0_SSATAGP0	I	**SSATA/PCIe selection**: When configured as SSATAXPCIE0, this pin will configure the PCIE_6_SSATA0[TX/RX] pins to be either PCIe signals or SSATAPort0 signals. The pin must be stable at the time PCH_PWROK goes high and remain in that state.
GPP_H19_SSATAXPCIE1_SSATAGP1/	I	**SSATA Port [1] General Purpose Inputs:** When configured as SSATAGP_1, this is an input pin that is used as an interlock switch status indicator for SSATA Port 1. Drive the pin to '0' to indicate that the switch is closed and to '1' to indicate that the switch is open.
GPP_H19_SSATAXPCIE1_SSATAGP1/	I	**SSATA/PCIe selection**: When configured as SSATAXPCIE1, this pin will configure the PCIE_7_SSATA1[TX/RX] pins to be either PCIe signals or SSATAPort1 signals.
GPP_H20_SSATAXPCIE2_SSATAGP2/	I	**SSATA Port [2] General Purpose Inputs:** When configured as SSATAGP_2, this is an input pin that is used as an interlock switch status indicator for SSATA Port 2. Drive the pin to '0' to indicate that the switch is closed and to '1' to indicate that the switch is open.
GPP_H20_SSATAXPCIE2_SSATAGP2	I	**SSATA/PCIe selection**: When configured as SSATAXPCIE2, this pin will configure the PCIE_8_SSATA2[TX/RX] pins to be either PCIe signals or SSATAPort2 signals. The pin must be stable at the time PCH_PWROK goes high and remain in that state.
GPP_H21_SSATAXPCIE3_SSATAGP3/	I	**SSATA Port [3] General Purpose Inputs:** When configured as SSATAGP_3, this is an input pin that is used as an interlock switch status indicator for SSATA Port 3. Drive the pin to '0' to indicate that the switch is closed and to '1' to indicate that the switch is open.
GPP_H21_SSATAXPCIE3_SSATAGP3/	I	**SSATA/PCIe selection**: When configured as SSATAXPCIE3, this pin will configure the PCIE_9_SSATA3[TX/RX] pins to be either PCIe signals or SSATAPort3 signals. The pin must be stable at the time PCH_PWROK goes high and remain in that state.
GPP_H22_SSATAXPCIE4_SSATAGP4/	I	**SSATA Port [4] General Purpose Inputs:** When configured as SSATAGP_4, this is an input pin that is used as an interlock switch status indicator for SSATA Port 4. Drive the pin to '0' to indicate that the switch is closed and to '1' to indicate that the switch is open.
GPP_H22_SSATAXPCIE4_SSATAGP4/	I	**SSATA/PCIe selection**: When configured as SSATAXPCIE4, this pin will configure the PCIE_10_SSATA4[TX/RX] pins to be either PCIe signals or SSATAPort4 signals. The pin must be stable at the time PCH_PWROK goes high and remain in that state.
GPP_H23_SSATAXPCIE4_SSATAGP4/	I	**SSATA Port [5] General Purpose Inputs:** When configured as SSATAGP_5, this is an input pin that is used as an interlock switch status indicator for SSATA Port 5. Drive the pin to '0' to indicate that the switch is closed and to '1' to indicate that the switch is open.
GPP_H23_SSATAXPCIE4_SSATAGP4	I	**SSATA/PCIe selection**: When configured as SSATAXPCIE5, this pin will configure the PCIE_11_SSATA5[TX/RX] pins to be either PCIe signals or SSATAPort5 signals. The pin must be stable at the time PCH_PWROK goes high and remain in that state.
GPP_F22_SSATA_SCLOCK/	OD	**SGPIO Reference Clock:** The SSATA controller uses rising edges of this clock to transmit serial data, and the target uses the falling edge of this clock to latch data. The SClock frequency supported is 32 kHz. If SGPIO interface is not used, this signal can be used as GPP_F22.
GPP_F23_SSATA_SLOAD/	OD	**SGPIO Load:** The controller drives a '1' at the rising edge of SCLOCK to indicate either the start or end of a bit stream. A 4-bit vendor specific pattern will be transmitted right after the signal assertion. If SGPIO interface is not used, this signal can be used as GPP_F22.
GPP_D15_SSATA_SDATAOUT0	OD	**SGPIO Dataout0:** Driven by the SSATA controller to indicate the drive status in the following sequence: drive 0, 1,2, 3, 4, 5, 6, 7, 0, 1, 2... If SGPIO interface is not used, the signals can be used as GPP_D15.
GPP_D12_SSATA_SDATAOUT1	OD	**SGPIO Dataout1:** Driven by the SSATA controller to indicate the drive status in the following sequence: drive 0, 1,2, 3, 4, 5, 6, 7, 0, 1, 2... If SGPIO interface is not used, the signals can be used as GPP_D12.

24.5 Integrated Pull-Ups and Pull-Downs

Signal	Resistor Type	Nominal Value	Notes
SATAXPCIE[2:0]	Pull-up	20 KΩ	1, 2
SATAXPCIE[7:3]	Pull-up	20 KΩ	1, 2

Note:
1. SATAGP[2:0]/SATAXPCIE[2:0]/GPP_E[2:0] and SATAGP[7:3]/SATAXPCIE[7:3]/GPP_F[4:0] has two native functions – the first native function (SATAXPCIEx) is selected if the Flex I/O soft strap SATA_PCIE_Select_for_Port_x = 11b. Setting SATA_PCIE_Select_for_Port_x = 11b also enables an internal pull-up resistor in this pin to allow Flexible I/O selection of SATA Port x or PCIe Port x to be assigned based on the type of card installed and based on the SATAXPCIEx mux selector with the polarity for SATA or PCIe (When SPSGPx = 0, PCIe will be selected if the sampled value is "0" and SATA will be selected if the sampled value is "1"; When SPSGPx = 1, SATA will be selected if the sampled value is "0" and PCIe* will be selected if the sampled value is "1"). SATA/PCIe Select GPIO polarity for SATA Port x (SPSGPx) and Soft straps are handled through FITC and described in the Intel® C620 Series Chipset PCH SPI Flash Programming Guide (RDC document number 559021).
2. Simulation data shows that these resistor values can range from 14 kΩ – 26 kΩ.
3. Integrated pull-ups and pull-downs will not be valid until all the voltages have reached a valid level.

24.6 I/O Signal Planes and States

Signal Name	Power Plane	During Reset	Immediately After Reset	S3/S4/S5	Deep Sx
SATA[7:0]_TXP/N, **SATA[7:0]_RXP/N**[3]	Primary	Internal Pull-down	Internal Pull-down	Internal Pull-down	Off
SSATA[5:0]_TXP/N, **SSATA[5:0]_RXP/N**[3]	Primary	Internal Pull-down	Internal Pull-down	Internal Pull-down	Off
SATALED#/GPP_E8[1]	Primary	Undriven	Undriven	Undriven	Off
GPP_F14_SSATA_LED#	Primary	Undriven	Undriven	Undriven	Off
DEVSLP[2:0]/GPP_E[6:4][1]	Primary	Undriven	Undriven	Undriven	Off
DEVSLP[7:3]/GPP_F[9:5][1, 3]	Primary	Undriven	Undriven	Undriven	Off
SSATA_DEVSLP[2:0]	Primary	Undriven	Undriven	Undriven	Off
SSATA_DEVSLP[5:3]	Primary	Undriven	Undriven	Undriven	Off
SATAGP[2:0]/GPP_E[2:0][2, 3]	Primary	Undriven	Undriven	Undriven	Off
SATAGP[7:3]/GPP_F[4:0][2]	Primary	Undriven	Undriven	Undriven	Off
SSATAGP[5:0]	Primary	Undriven	Undriven	Undriven	Off
SATAXPCIE[7:0] [3]	Primary	Internal Pull-up	Internal Pull-u	Undriven	Off
SSATAXPCIE[5:0]	Primary	Internal Pull-up	Internal Pull-u	Undriven	Off
SATA_SCLOCK/GPP_F10[1]	Primary	Undriven	Undriven	Undriven	Off
SATA_SLOAD/GPP_F11[1]	Primary	Undriven	Undriven	Undriven	Off
SATA_SDATAOUT[1:0]	Primary	Undriven	Undriven	Undriven	Off
SSATA_CLOCK[1]	Primary	Undriven	Undriven	Undriven	Off
SSATA_SLOAD	Primary	Undriven	Undriven	Undriven	Off
SSATA_SDATA[1:0]	Primary	Undriven	Undriven	Undriven	Off

Note:
1. Pin defaults to GPIO mode. The pin state during and immediately after reset follows default GPIO mode pin state. The pin state for S0 to Deep Sx reflects assumption that GPIO Use Select register was programmed to native mode functionality. If GPIO Use Select register is programmed to GPIO mode, refer to Multiplexed GPIO (Defaults to GPIO Mode) section for the respective pin states in S0 to Deep Sx.
2. Pin defaults to Native mode as SATAXPCIEx depends on soft-strap.

24.7 Functional Description

This chapter describes the SATA functions of both the SATA and SSATA controllers. For the rest of the chapter, when "SATA" is used, it'll be referring to both SATA and SSATA, unless explicitly calling out them individually.

24.7.1 SATA Host Controller (D23:F0) SSATA Host Controller (D17:F5)

The SATA function supports AHCI or RAID mode.

The SATA controllers do not support legacy IDE mode or combination mode.

The SATA controller features14 ports split across the SATA (8) and SSATA (6) controllers that can be independently enabled or disabled (they cannot be tri-stated or driven low). Each interface is supported by an independent DMA controller.

The PCH SATA controller interacts with an attached mass storage device through a register interface that is compatible with an SATA AHCI/RAID host adapter. The host software follows existing standards and conventions when accessing the register interface and follows standard command protocol conventions.

24.7.2 SATA 6 Gb/s Support

The PCH SATA controller is SATA 6 Gb/s capable and supports 6 Gb/s transfers with all capable SATA devices. The PCH SATA controller also supports SATA 3 Gb/s and 1.5 Gb/s transfer capabilities.

24.7.3 SATA Feature Support

The PCH SATA controller is capable of supporting all AHCI 1.3 and AHCI 1.3.1 expanded capabilities for DEVSLP.

Also, refer to the Intel web site on Advanced Host Controller Interface Specification for current specification status: http://www.intel.com/content/www/us/en/io/serial-ata/ahci.html.

For capability details, refer to D23:F0:Offset 00h CAP, and AHCI BAR PxCMD Offset 18h for the SATA controller, and D17:F5:00fset 00h CAP and AHCI BAR PxCMD off18h for the SSATA controller.

The PCH SATA controller does not support:

- Port Multiplier
- FIS Based Switching
- Command Based Switching
- IDE mode or combination mode
- Cold Presence Detect
- Function Level Reset (FLR)

24.7.4 Hot-Plug Operation

The PCH SATA controller supports Hot-Plug Surprise removal and Insertion Notification. An internal SATA port with a Mechanical Presence Switch can support PARTIAL and SLUMBER with Hot-Plug Enabled. Software can take advantage of power savings in the low power states while enabling Hot-Plug operation. Refer to Chapter 7 of the *AHCI Specification* for details.

24.7.5 Power Management Operation

Power management of the PCH SATA controller and ports will cover operations of the host controller and the SATA link.

24.7.5.1 Power State Mappings

The D0 PCI Power Management (PM) state for device is supported by the PCH SATA controller.

SATA devices may also have multiple power states. SATA adopted three main power states from parallel ATA. The three device states are supported through ACPI. They are:

- **D0** – Device is working and instantly available.
- **D1** – Device enters when it receives a STANDBY IMMEDIATE command. Exit latency from this state is in seconds
- **D3** – From the SATA device's perspective, no different than a D1 state, in that it is entered using the STANDBY IMMEDIATE command. However, an ACPI method is also called which will reset the device and then cut its power.

Each of these device states are subsets of the host controller's D0 state.

Finally, the SATA specification defines three PHY layer power states, which have no equivalent mappings to parallel ATA. They are:

- **PHY READY** – PHY logic and PLL are both on and in active state
- **Partial** – PHY logic is powered up, and in a reduced power state. The link PM exit latency to active state maximum is 10 ns.
- **Slumber** – PHY logic is powered up, and in a reduced power state. The link PM exit latency to active state maximum is 10 ms.
- **Devslp** – PHY logic is powered down. The link PM exit latency from this state to active state maximum is 20 ms, unless otherwise specified by DETO in Identify Device Data Log page 08h (see 13.7.9.4 of the *SATA Rev3.2 Gold Specification*).

Since these states have much lower exit latency than the ACPI D1 and D3 states, the SATA controller specification defines these states as sub-states of the device D0 state.

24.7.5.2 Power State Transitions

24.7.5.2.1 Partial and Slumber State Entry/Exit

The partial and slumber states save interface power when the interface is idle. It would be most analogous to CLKRUN# (in power savings, not in mechanism), where the interface can have power saved while no commands are pending. The SATA controller defines PHY layer power management (as performed using primitives) as a driver

operation from the host side, and a device proprietary mechanism on the device side. The SATA controller accepts device transition types, but does not issue any transitions as a host. All received requests from a SATA device will be ACKed.

When an operation is performed to the SATA controller such that it needs to use the SATA cable, the controller must check whether the link is in the Partial or Slumber states, and if so, must issue a COMWAKE to bring the link back online. Similarly, the SATA device must perform the same COMWAKE action.

24.7.5.2.2 Devslp State Entry/Exit

Device Sleep (DEVSLP) is a host-controlled SATA interface power state. To support a hardware autonomous approach that is software agnostic Intel is recommending that BIOS configure the AHCI controller and the device to enable Device Sleep. This allows the AHCI controller and associated device to automatically enter and exit Device Sleep without the involvement of OS software.

To enter Device Sleep the link must first be in Slumber. By enabling HIPM (with Slumber) or DIPM on a Slumber capable device, the device/host link may enter the DevSleep Interface Power state.

The device must be DevSleep capable. Device Sleep is only entered when the link is in slumber, therefore when exiting the Device Sleep state, the device must resume with the COMWAKE out-of-band signal (and not the COMINIT out-of-band signal). Assuming Device Sleep was asserted when the link was in slumber, the device is expected to exit DEVSLP to the DR_Slumber state. Devices that do not support this feature will not be able to take advantage of the hardware automated entry to Device Sleep that is part of the AHCI 1.3.1 specification and supported by Intel platforms.

24.7.5.2.3 Device D1 and D3 States

These states are entered after some period of time when software has determined that no commands will be sent to this device for some time. The mechanism for putting a device in these states does not involve any work on the host controller, other then sending commands over the interface to the device. The command most likely to be used in ATA/ATAPI is the “STANDBY IMMEDIATE” command.

24.7.5.2.4 Host Controller $D3_{HOT}$ State

After the interface and device have been put into a low power state, the SATA host controller may be put into a low power state. This is performed using the PCI power management registers in configuration space. There are two very important aspects to Note when using PCI power management.

1. When the power state is D3, only accesses to configuration space are allowed. Any attempt to access the memory or I/O spaces will result in master abort.
2. When the power state is D3, no interrupts may be generated, even if they are enabled. If an interrupt status bit is pending when the controller transitions to D0, an interrupt may be generated.

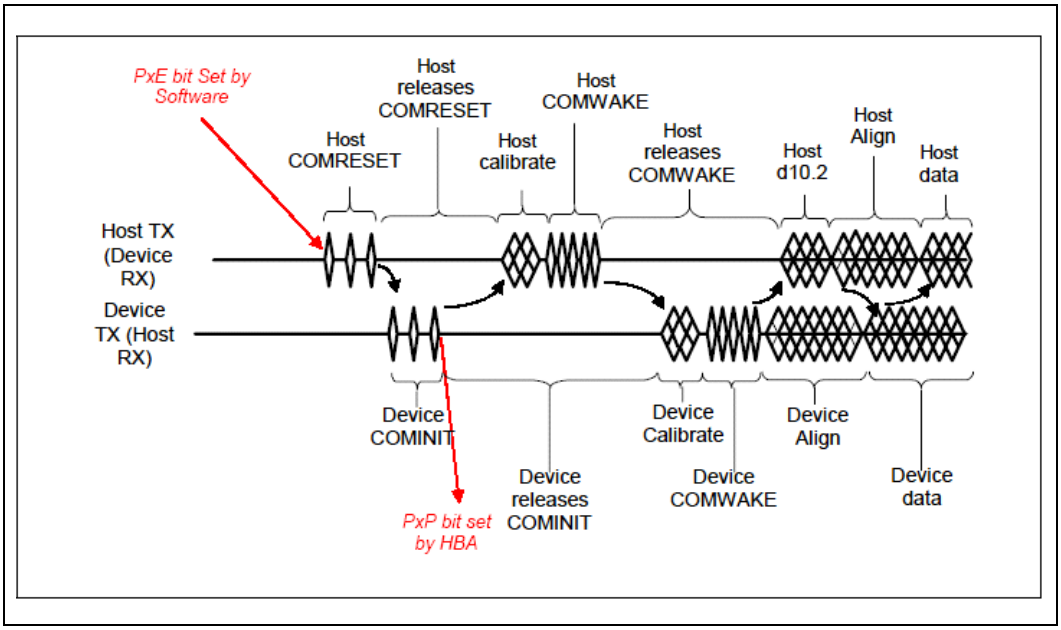
When the controller is put into D3, it is assumed that software has properly shut down the device and disabled the ports. Therefore, there is no need to sustain any values on the port wires. The interface will be treated as if no device is present on the cable, and power will be minimized.

When returning from a D3 state, an internal reset will not be performed.

24.7.6 SATA Device Presence

The flow used to indicate SATA device presence is shown in Figure 24-1. The 'PxE' bit refers to PCS.P[3:0]E bits, depending on the port being checked and the 'PxP' bits refer to the PCS.P[3:0]P bits, depending on the port being checked. If the PCS/PxP bit is set a device is present, if the bit is cleared a device is not present. If a port is disabled, software can check to see if a new device is connected by periodically re-enabling the port and observing if a device is present, if a device is not present it can disable the port and check again later. If a port remains enabled, software can periodically poll PCS.PxP to see if a new device is connected.

Figure 24-1. Flow for Port Enable/Device Present Bits



24.7.7 SATA LED

The SATALED# output is driven whenever the BSY bit is set in any SATA port. The SATALED# is an active-low open-drain output. When SATALED# is low, the LED should be active. When SATALED# is high, the LED should be inactive.

24.7.8 Advanced Host Controller Interface (AHCI) Operation

The PCH SATA controller provides hardware support for Advanced Host Controller Interface (AHCI), a standardized programming interface for SATA host controllers developed through a joint industry effort. Platforms supporting AHCI may take advantage of performance features such as port independent DMA Engines—each device is treated as a master—and hardware-assisted native command queuing.

AHCI defines transactions between the SATA controller and software and enables advanced performance and usability with SATA. Platforms supporting AHCI may take advantage of performance features such as no master/slave designation for SATA devices—each device is treated as a master—and hardware assisted native command queuing. AHCI also provides usability enhancements such as hot-plug and advanced power management. AHCI requires appropriate software support (such as, an AHCI

driver) and for some features, hardware support in the SATA device or additional platform hardware. Visit the Intel web site for current information on the AHCI specification.

The PCH SATA controller supports all of the mandatory features of the *Serial ATA Advanced Host Controller Interface Specification*, Revision 1.3 and many optional features, such as hardware assisted native command queuing, aggressive power management, LED indicator support, and hot-plug through the use of interlock switch support (additional platform hardware and software may be required depending upon the implementation).

Note: For reliable device removal notification while in AHCI operation without the use of interlock switches (surprise removal), interface power management should be disabled for the associated port. See Section 7.3.1 of the *AHCI Specification* for more information.

24.7.9 External SATA

The PCH SATA controller supports external SATA. External SATA utilizes the SATA interface outside of the system box. The usage model for this feature must comply with the *Serial ATA II (SATA Gen2, 3 Gb/s) Cables and Connectors Volume 2 Gold Specification* at: www.sata-io.org. Intel validates one configuration: the back-panel solution involves running a trace to the I/O back panel and connecting a device using an external SATA connector on the board.

24.7.10 Enclosure Management (SGPIO Signals)

Enclosure management is a mechanism by which the storage driver can monitor and control auxiliary service in a drive enclosure. This feature is only valid in AHCI/RAID mode.

The SGPIO signals are used in the enclosure management protocol (refer to the *SFF-8485 Specification*) and supports multiple-activity LEDs to shows the per drive status information.

The enclosure management HW is assuming that these signals will only be used if a device is either connected to a port or could be connected to a port without the system being reset, meaning hot plug is enabled. If hot plug is disabled and there are no devices attached to the SATA/SSATA ports, then the SGPIO pins will not function correctly if any commands are sent to the controller to be drive on the SGPIO pins. As there are two SGPIO controllers, one for SATA and one for SSATA, the rules apply to both. If you have a device attached to SATA, but SSATA has no devices or hot plug enabled, then the SGPIO signals will not function on the SSATA SGPIO pins, but will work on the SATA SGPIO pins.

Note: These signals are not related to SATALED#.

The SGPIO group interfaces with an external controller chip that fetches and serializes the data for driving across the SGPIO bus. The output signals then control the LEDs within the enclosure. The PCH SATA controller only supports LED messages transmission and has three SGPIO protocol signals implemented, that is SCLOCK, SDATAOUT and SLOAD.

Note: Intel does not validate all possible usage cases of this feature. Customers should validate their specific design implementation on their own platforms.

24.7.10.1 Mechanism

The enclosure management for SATA Controller involves sending messages that control LEDs in the enclosure. The messages for this function are stored after the normal registers in the AHCI BAR, at Offset 580h bytes for the PCH from the beginning of the AHCI BAR as specified by the EM_LOC global register.

Software creates messages for transmission in the enclosure management message buffer. The data in the message buffer should not be changed if CTL.TM bit is set by software to transmit an update message. Software should only update the message buffer when CTL.TM bit is cleared by hardware otherwise the message transmitted will be indeterminate. Software then writes a register to cause hardware to transmit the message or take appropriate action based on the message content. The software should only create message types supported by the controller, which is LED messages for the PCH. If the software creates other non LED message types (such as, SAF-TE, SES-2), the SGPIO interface may hang and the result is indeterminate.

During reset, all SGPIO pins will be in the tri-state state. The interface will continue staying in the tri-state state after reset until the first transmission occurs, when software programs the message buffer and sets the transmit bit CTL.TM. The SATA host controller will initiate the transmission by driving SCLOCK and at the same time driving the SLOAD to "0" prior to the actual bit stream transmission. The Host will drive SLOAD low for at least 5 SCLOCK then only start the bit stream by driving the SLOAD to high. SLOAD will be driven high for 1 SCLOCK, followed by vendor-specific pattern that is default to "0000" if software is yet to program the value. A total of 24-bit streams from 8 ports (Port 0, Port 1, Port 2, Port 3, Port 4, Port 5, Port 6, Port 7) of 3-bit per port LED message will be transmitted on SDATAOUT0 pin after the SLOAD is driven high for 1 SCLOCK. For 8 SATA port configuration, only 4 ports (port 4, port 5, port 6 and port 7) of 12 bit total LED message follow by 12 bits of tri-state value will be transmitted out on SDATAOUT1 pin. For 6 SATA port configuration, only 2 ports (port 4 and port 5) of 6 bit total LED message follow by 18 bits of tri-state value will be transmitted out on SDATAOUT1 pin. For 4 SATA port configuration, SDATAOUT1 pin is not required hence can be tri-state always.

All the default LED message values will be high prior to software setting them, except the Activity LED message that is configured to be hardware driven that will be generated based on the activity from the respective port. All the LED message values will be driven to '1' for the port that is unimplemented as indicated in the Port Implemented register regardless of the software programmed value through the message buffer.

There are 2 different ways of resetting the PCH's SGPIO interface, asynchronous reset and synchronous reset. Asynchronous reset is caused by platform reset to cause the SGPIO interface to be tri-state asynchronously. Synchronous reset is caused by setting the CTL.RESET bit, or HBA reset, where Host Controller will complete the existing full bit stream transmission then only tri-state all the SGPIO pins. After the reset, both synchronous reset and asynchronous reset, the SGPIO pins will stay tri-stated.

Note: The PCH Host Controller does not ensure that it will cause the target SGPIO device or controller to be reset. Software is responsible to keep the PCH SGPIO interface in tri-state for 2 second to cause a reset on the target of the SGPIO interface.

24.7.10.2 Message Format

Messages shall be constructed with a one DWord header that describes the message to be sent followed by the actual message contents. The first DWord shall be constructed as shown in Enclosure Management Message Format (EM_MF) register.

The SAF-TE, SES-2, and SGPIO message formats are defined in the corresponding specifications, respectively. The LED message type is defined in the Enclosure Management LED (EM_LED) register. It is the responsibility of software to ensure the content of the message format is correct. If the message type is not programmed as 'LED' for this controller, the controller shall not take any action to update its LEDs. For LED message type, the message size always consists of 4 bytes.

24.7.10.3 LED Message Type

The LED message type specifies the status of up to three LEDs. Typically, the usage for these LEDs is activity, fault, and locate. Not all implementations necessarily contain all LEDs (for example, some implementations may not have a locate LED). The message identifies the HBA port number and the Port Multiplier port number that the slot status applies to. If a Port Multiplier is not in use with a particular device, the Port Multiplier port number shall be ‘0’. The format of the LED message type is defined in the Enclosure Management LED (EM_LED) register The LEDs shall retain their values until there is a following update for that particular slot.

24.8.1.1 Identifiers (ID)—Offset 0h

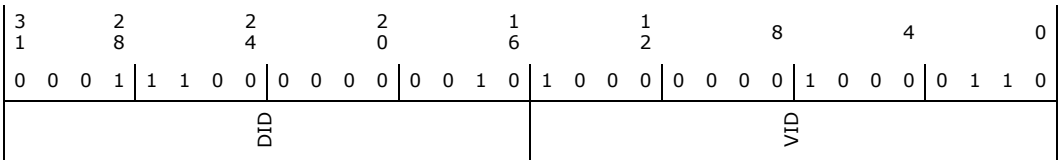
Identifiers

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 1C028086h



Bit Range	Default and Access	Field Name (ID): Description
31:16	1C02h RO	**Device ID (DID):** Indicates the Device ID of the SATA controller.
15:0	8086h RO	**Vendor ID (VID):** 16-bit field which indicates the company vendor as Intel.

24.8.1.2 Command (CMD)—Offset 4h

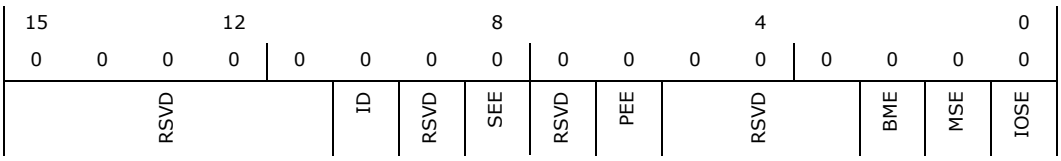
Command

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:11	0h RO	Reserved.
10	0h RW	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts. This bit has no effect on MSI operation. When set, internal INTx# will not be generated. When cleared, internal INTx# are generated if there is an interrupt and MSI is not enabled.
9	0h RO	Reserved.
8	0h RW	**SERR# Enable (SEE):** When set to 1, the HBA is allowed to generate SERR# on DPD or SATAGC.URD event that is enabled for SERR# generation. When cleared to 0, it is not.
7	0h RO	Reserved.
6	0h RW	**Parity Error Response Enable (PEE):** When set, the SATA Controller will corrupt the outbound DATA FIS CRC if a forwarded data parity error is indicated.
5:3	0h RO	Reserved.
2	0h RW	**Bus Master Enable (BME):** Controls the SATA Controller's ability to act as a master for data transfers. This bit does not impact the generation of completions for split transaction commands.
1	0h RW	**Memory Space Enable (MSE):** Controls access to the SATA Controller's target memory space (for AHCI).
0	0h RW	**I/O Space Enable (IOSE):** Controls access to the SATA Controller's target I/O space.

24.8.1.3 Device Status (STS)—Offset 6h

DPE	SSE	RMA	RTA	STA	DEVT		DPD	RSVD			CL	IS	RSVD		

Bit Range	Default and Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE):** Set when the SATA Controller detects a parity error on its interface.
14	0h RW/1C	**Signaled System Error (SSE):** Set when SATA Controller generates an SERR#.
13	0h RW/1C	**Received Master-Abort Status (RMA):** Set when the SATA Controller receives a master abort to a cycle it generated.
12	0h RW/1C	**Received Target-Abort Status (RTA):** Set when the SATA Controller receives a target abort to a cycle it generated.

Bit Range	Default and Access	Field Name (ID): Description
11	0h RW/1C	**Signaled Target-Abort Status (STA):** This bit must be set by a target device whenever it terminates a transaction with Target-Abort. Devices that will never signal Target-Abort do not need to implement this bit.
10:9	1h RO	**DEVSEL# Timing Status (DEVT):** Controls the device select time for the SATA Controller's PCI interface.
8	0h RW/1C	**Master Data Parity Error Detected (DPD):** Set when the SATA Controller, as a master, either detects a parity error or sees the parity error line asserted, and the parity error response bit (bit 6 of the command register) is set. This bit can only be set on read completions received from the backbone where there is a parity error.
7:5	0h RO	Reserved.
4	1h RO	**Capabilities List (CL):** Indicates the presence of a capabilities list. The minimum requirement for the capabilities list must be PCI power management for the SATA Controller.
3	0h RO	**Interrupt Status (IS):** Reflects the state of INTx# messages, IRQ14 or IRQ15. This bit is set when the interrupt is to be asserted. This bit is a 0 after the interrupt is cleared
2:0	0h RO	Reserved.

24.8.1.4 Revision ID (RID)—Offset 8h

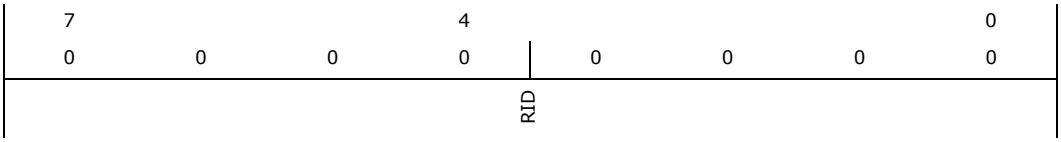
Revision ID

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Revision ID (RID):** Indicates stepping of the host controller hardware.

24.8.1.5 Programming Interface (PI)—Offset 9h

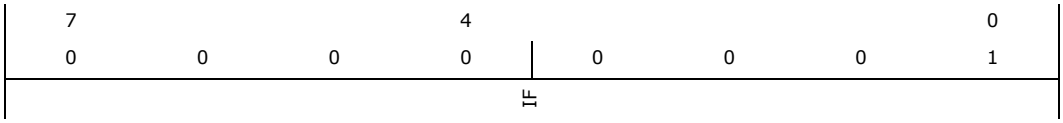
Programming Interface

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 23
Function: 0

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
7:0	1h RO	**Interface (IF):** If CC.SCC=06h(AHCI mode), it indicates that this is an AHCI HBA that has a major revision of 1 (as specified in the AHCI Version register). If CC.SCC=04h(RAID mode), it indicates that there is no programming interface(IF=00h). Internally, under this condition, the SATA controller is in native mode and its I/O spaces are only accessible through the I/O BARs.

24.8.1.6 Class Code (CC)—Offset Ah

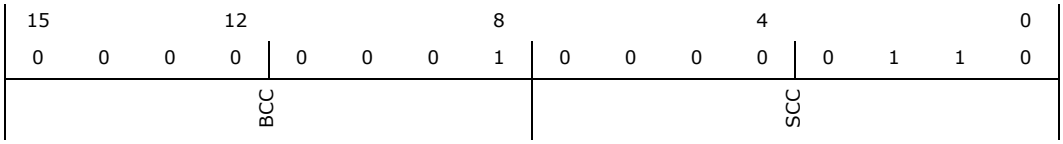
Class Code

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 23
Function: 0

Default: 106h



Bit Range	Default and Access	Field Name (ID): Description
15:8	1h RO	**Base Class Code (BCC):** Indicates that this is a mass storage device.
7:0	6h RO	**Sub Class Code (SCC):** Indicates the sub class code.

24.8.1.7 Cache Line Size (CLS)—Offset Ch

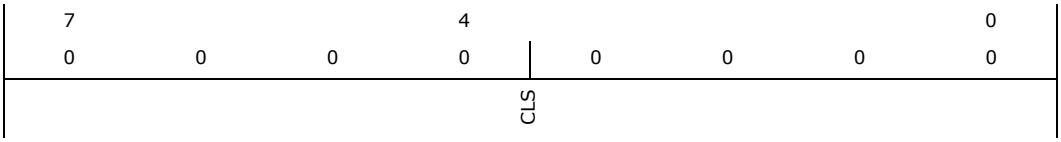
Cache Line Size

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Cache Line Size (CLS):** This register has no meaning for the SATA controller.

24.8.1.8 Master Latency Timer (MLT)—Offset Dh

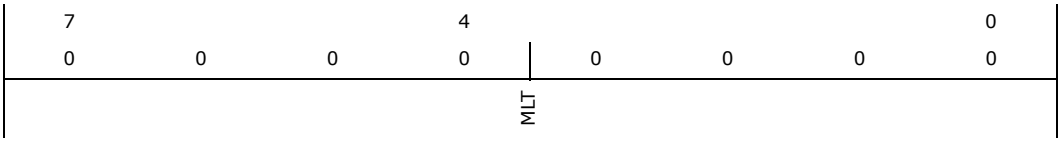
Master Latency Timer

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Master Latency Timer (MLT):** This register has no meaning for the SATA controller.

24.8.1.9 Header Type (HTYPE)—Offset Eh

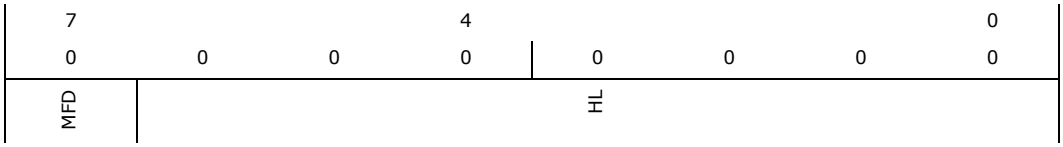
Header Type

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7	0h RO	**Multi-function Device (MFD):** Indicates this controller is not part of a multi-function device.
6:0	0h RO	**Header Layout (HL):** Indicates that the controller uses a target device layout.

24.8.1.10 MSI-X Table Base Address (MXTBA)—Offset 10h

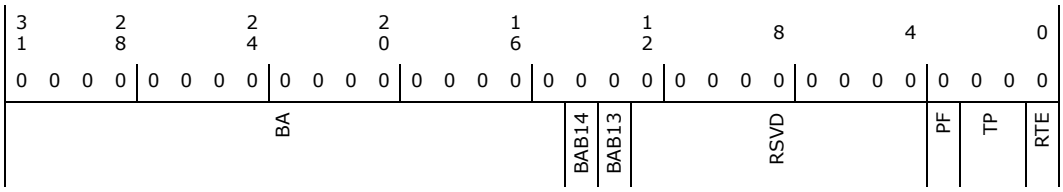
MSI-X Table Base Address. This BAR is used to allocate 32K, 16K or 8K Memory space for the MSI-X Table. The Memory space size is determined by the BIOS by making bit-14 and bit-13 Read-Only '1' or Read-Write '0' based on SATAGC.MSS[1:0].

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:15	0h RW	**Base Address (BA):** Base address of memory space.
14	0h RW	**Base Address Bit 14 (BAB14):** When SATAGC.MSS[1:0]=00, this bit is Read Only '0' else it's Read Write '0'.
13	0h RW	**Base Address Bit 13 (BAB13):** When SATAGC.MSS[1:0]=00 or 01, this bit is Read Only '0' else it's Read Write '0'.

Bit Range	Default and Access	Field Name (ID): Description
12:4	0h RO	Reserved.
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable.
2:1	0h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 32-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for Memory space.

24.8.1.11 MXP Base Address (MXPBA)—Offset 14h

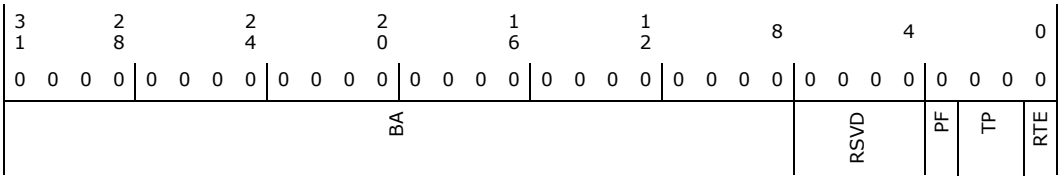
This BAR is used to allocate 256-byte Memory space for the MSI-X PBA.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RW	**Base Address (BA):** Base address of memory space (aligned to 256B).
7:4	0h RO	Reserved.
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable.
2:1	0h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 32-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for Memory space.

24.8.1.12 AHCI Index Data Pair Base Address (AIDPBA)—Offset 20h

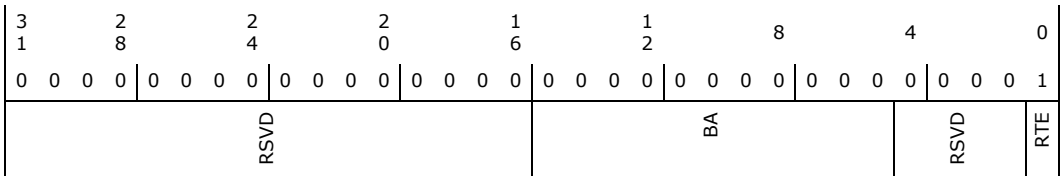
AHCI Index Data Pair Base Address. This BAR is used to allocate I/O space for the AHCI index/data pair mechanism. Note that hardware does not clear the BA bits (including BA4) when switching from IDE mode to non-IDE mode or vice versa. The BIOS is responsible for clearing those bits to 0 since the number of writable bits changes after mode switching.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:5	0h RW	**Base Address (BA):** Base address of the I/O space.
4:1	0h RO	Reserved.
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for I/O space.

24.8.1.13 AHCI Base Address (ABAR)—Offset 24h

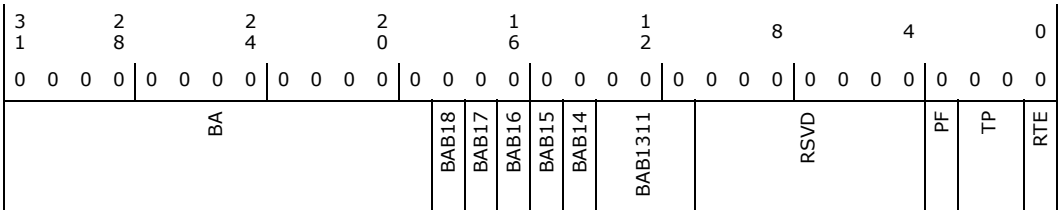
ABAR - AHCI Base Address. This register represents a memory BAR allocating space for the AHCI memory registers. Note that bit [31:16] of this register must be programmed to a value greater than 0 to ensure the memory is mapped to an address of 1 MB and greater (i.e., ABAR must be 00010000h or greater). Otherwise, memory cycle targeting the ABAR range may not be accepted. The Memory space size is determined by BIOS by making bit 15:11 Read-Only '1' or Read-Write '0' based on SATAGC.ASSEL[1:0].

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:19	0h RW	**Base Address (BA):** Base address of register memory space.
18	0h RW	**Base Address Bit 18 (BAB18):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 256K, this bit is Read Only '0' else it's Read Write '0'.
17	0h RW	**Base Address Bit 17 (BAB17):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 128K, this bit is Read Only '0' else it's Read Write '0'.
16	0h RW	**Base Address Bit 16 (BAB16):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 64K, this bit is Read Only '0' else it's Read Write '0'.
15	0h RW	**Base Address Bit 15 (BAB15):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 32K, this bit is Read Only '0' else it's Read Write '0'.
14	0h RW	**Base Address Bit 14 (BAB14):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 16K, this bit is Read Only '0' else it's Read Write '0'.
13:11	0h RW	**Base Address Bit 13-11 (BAB1311):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 2K, this bit is Read Only '0' else it's Read Write '0'.
10:4	0h RO	Reserved.
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable.
2:1	0h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 32-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

24.8.1.14 Sub System Identifiers (SS)—Offset 2Ch

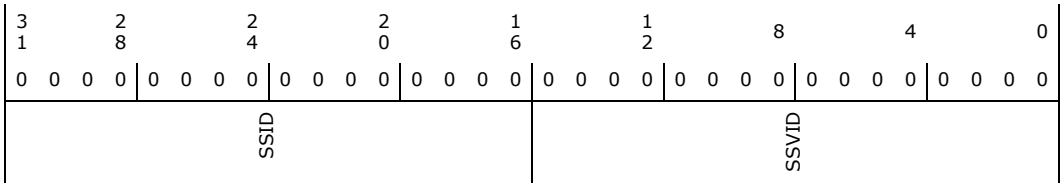
Sub System Identifiers. This register is initialized to logic 0 by the assertion of PLTRST#. This register can be written only once after PLTRST# de-assertion. This register is not reset by FLR.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** This is written by BIOS. No hardware action taken on this value.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** This is written by BIOS. No hardware action taken on this value.

24.8.1.15 Capabilities Pointer (CAP)—Offset 34h

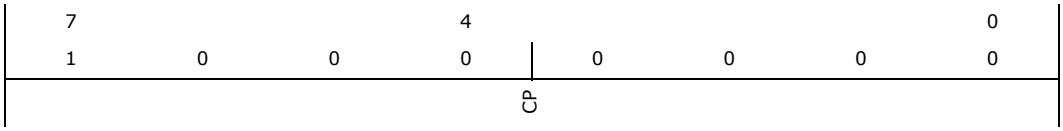
Capabilities Pointer

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 23
Function: 0

Default: 80h



Bit Range	Default and Access	Field Name (ID): Description
7:0	80h RW/L	**Capability Pointer (CP):** Indicates that the first capability pointer offset is offset 80h (the Message Signaled Interrupt capability). The following capability structures are linked by default: CAP.CP -> 80h (MSI) -> D0h (MSI-X)-> 70h (PCI Power) -> A8h (SATA) -> 00h end. BIOS may alter the capability structure list above (by programming a leading capability structure's Next Pointer field) if BIOS wants to bypass any specific capability. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.

24.8.1.16 Interrupt Information (INTR)—Offset 3Ch

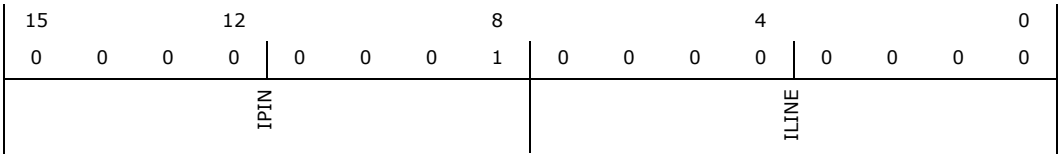
Interrupt Information

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 23
Function: 0

Default: 100h



Bit Range	Default and Access	Field Name (ID): Description
15:8	1h RW/O	**Interrupt Pin (IPIN):** This register tells which interrupt pin the device function uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#. This register is not reset by FLR.
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register. Interrupt Line register is not reset by FLR.

24.8.1.17 PCI Power Management Capability ID (PID)—Offset 70h

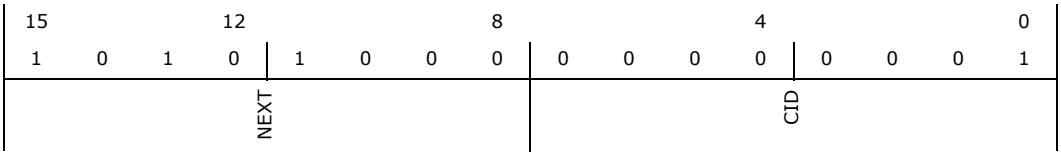
PCI Power Management Capability ID

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 23
Function: 0

Default: A801h



Bit Range	Default and Access	Field Name (ID): Description
15:8	A8h RW/L	**Next Capability (NEXT):** A8h is location of the Serial ATA Capability structure. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.
7:0	1h RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management capability.

24.8.1.18 PCI Power Management Capabilities (PC)—Offset 72h

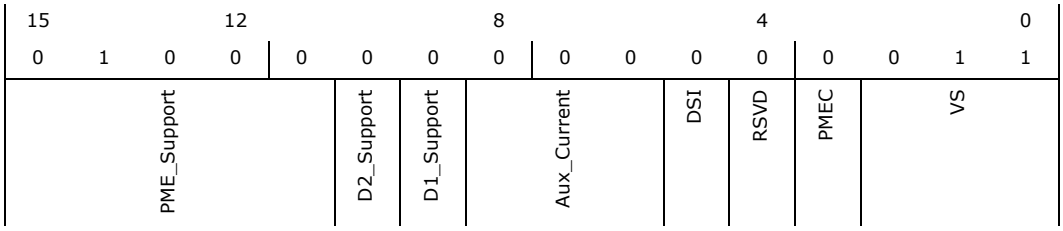
PCI Power Management Capabilities

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 23
Function: 0

Default: 4003h



Bit Range	Default and Access	Field Name (ID): Description
15:11	8h RO	**PME_Support (PME_Support):** The default value is 01000 which indicates PME# can be generated from the $D3_{HOT}$ state in the SATA controller.
10	0h RO	**D2_Support (D2_Support):** The D2 state is not supported.
9	0h RO	**D1_Support (D1_Support):** The D1 state is not supported.
8:6	0h RO	**Aux_Current (Aux_Current):** PME# from $D3_{COLD}$ state is not supported, therefore this field is 000b.
5	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
4	0h RO	Reserved.
3	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

24.8.1.19 PCI Power Management Control and Status (PMCS)—Offset 74h

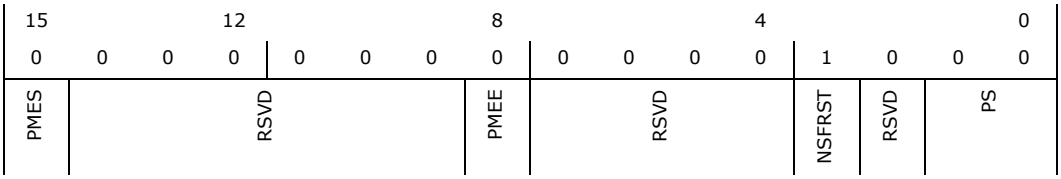
PCI Power Management Control and Status

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 23
Function: 0

Default: 8h



Bit Range	Default and Access	Field Name (ID): Description
15	0h RW/1C	**PME Status (PMES):** This bit is set when a PME event is to be requested, and if this bit is set and PMEE is set, a PME# will be generated. This register field is not reset by FLR.
14:9	0h RO	Reserved.
8	0h RW	**PME Enable (PMEE):** When set, the SATA controller generates PME# from $D3_{HOT}$ on a wake event. ***Note:*** Software is advised to clear PMEE together with PMES prior to changing CC.SCC through SATAGC.SMS. This register field is not reset by FLR.
7:4	0h RO	Reserved.
3	1h RO	**No Soft Reset (NSFRST):** A 1 indicates that devices transitioning from $D3_{HOT}$ to D0 because of PowerState commands do not perform an internal reset. Configuration context is preserved. Upon transition from the $D3_{HOT}$ to the D0 state initialized state, no additional operating system intervention is required to preserve configuration context beyond writing to the PowerState bits. Regardless of this bit, the controller transition from $D3_{HOT}$ to the D0 by a system or bus segment reset will return to the state D0 uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	Reserved.
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the SATA Controller and to set a new power state. The values are: 00 = D0 state; 11 = $D3_{HOT}$ state. When in the $D3_{HOT}$ state, the controller's configuration space is available, but the I/O and memory spaces are not. Additionally, interrupts are blocked. If software attempts to write a 10 or 01 to these bits, the write will be ignored. Refer to *PCI PM Specification* Section 8.2.2. on software requirements in ensuring I/O space, memory space and Bus Master are disabled prior to entering D3 state.

24.8.1.20 Message Signaled Interrupt Identifier (MID)—Offset 80h

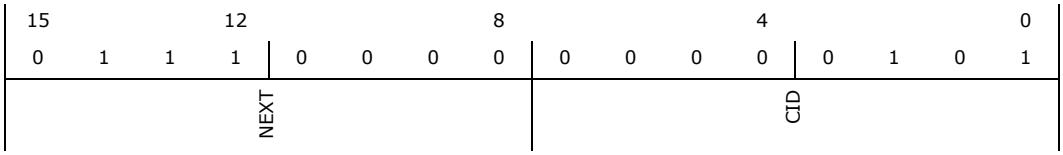
Message Signaled Interrupt Identifier

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 23
Function: 0

Default: 7005h



Bit Range	Default and Access	Field Name (ID): Description
15:8	70h RW/L	**Next Pointer (NEXT):** Indicates the next item in the list is the PCI power management pointer. This is the recommended value. BIOS may program this field to A8h indicating that the next item is Serial ATA Capability structure. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.
7:0	5h RO	**Capability ID (CID):** Capabilities ID indicates MSI.

24.8.1.21 Message Signaled Interrupt Message Control (MC)—Offset 82h

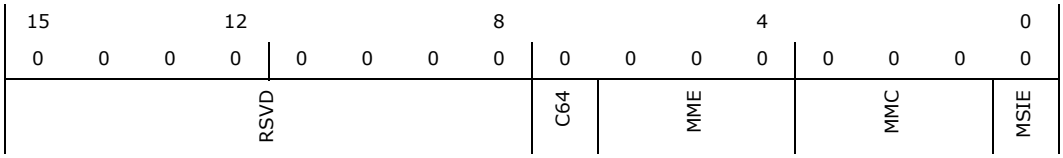
Message Signaled Interrupt Message Control

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7	0h RO	**64 Bit Address Capable (C64):** Capable of generating a 32-bit message only.
6:4	0h RO	**Multiple Message Enable (MME):** When this field is cleared to 000 (and MSIE is set), only a single MSI message will be generated for all SATA ports, and bits [15:0] of the message vector will be driven from MD[15:0].

Bit Range	Default and Access	Field Name (ID): Description
3:1	0h RO	**Multiple Message Capable (MMC):** Not supported.
0	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. Note that CMD.ID bit has not effect on MSI. Software must clear this bit to 0 to disable MSI first before changing the number of messages allocated in the MMC field.

24.8.1.22 Message Signaled Interrupt Message Address (MA)—Offset 84h

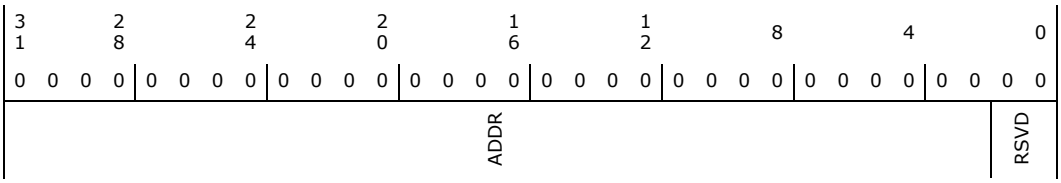
Message Signaled Interrupt Message Address

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**Address (ADDR):** Lower 32 bits of the system specified message address, always DWORD aligned.
1:0	0h RO	Reserved.

24.8.1.23 Message Signaled Interrupt Message Data (MD)—Offset 88h

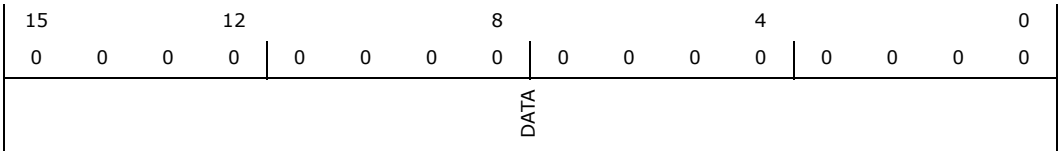
Message Signaled Interrupt Message Data

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:0	0h RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word of the data bus of the MSI memory write transaction.

24.8.1.24 Port Mapping Register (MAP)—Offset 90h

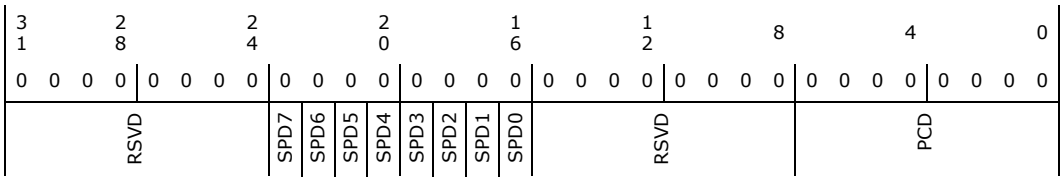
Port Mapping Register

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23	0h RW/O	**SATA Port 7 Disable (SPD7):** Similar to SPD0 but for port 7. This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero. PCIe/SATA muxing for port 7 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 7 physically.
22	0h RW/O	**SATA Port 6 Disable (SPD6):** Similar to SPD0 but for port 6. This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero. PCIe/SATA muxing for port 6 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 6 physically.
21	0h RW/O	**SATA Port 5 Disable (SPD5):** Similar to SPD0 but for port 5. This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero. PCIe/SATA muxing for port 5 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 5 physically.
20	0h RW/O	**SATA Port 4 Disable (SPD4):** Similar to SPD0 but for port 4. This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero. PCIe/SATA muxing for port 4 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 4 physically.
19	0h RW/O	**SATA Port 3 Disable (SPD3):** Similar to SPD0 but for port 3. This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero. 1.Fuse FFSATA7 (disable port 2 and 3). 2.Fuse FFSATA8 (disable port 1 and 3). 3. PCIe/SATA muxing for port 3 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 3 physically.
18	0h RW/O	**SATA Port 2 Disable (SPD2):** Similar to SPD0 but for port 2. This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero. 1.Fuse FFSATA7 (disable port 2 and 3). 2.PCIe/SATA muxing for port 3 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 3 physically.
17	0h RW/O	**SATA Port 1 Disable (SPD1):** Similar to SPD0 but for port 1. This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero. 1.Fuse FFSATA8 (disable port 1 and 3). 2.PCIe/SATA muxing for port 3 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 1 physically.

Bit Range	Default and Access	Field Name (ID): Description
16	0h RW/O	**SATA Port 0 Disable (SPD0):** A 1 prevents the SATA port from being enabled via config PCS.PxE. Write of 1 to PCS.PxE has no effect when the corresponding SPD[x] bit is 1.In preventing a port(s) from being enabled, BIOS shall first configure MAP.SPDx. And only then BIOS configures the PCS.PxE. This field is not reset by FLR. This bit is only applicable to project(s): that has port 0 physically.
15:8	0h RO	Reserved.
7:0	0h RW	**Port Clock Disable (PCD):** When any of these bits is set to 1, the backbone clock driven to the associated port logic is gated and will not toggle. When this bit is cleared to 0, all clocks to the associated port logic will operate normally. Assignment of the bits is: Bit 7: Port 7, this bit is only applicable to project(s): that has port 7 physically; Bit 6: Port 6, this bit is only applicable to project(s): that has port 6 physically; Bit 5: Port 5, this bit is only applicable to project(s): that has port 5 physically; Bit 4: Port 4, this bit is only applicable to project(s): that has port 4 physically; Bit 3: Port 3, this bit is only applicable to project(s): that has port 3 physically; Bit 2: Port 2, this bit is only applicable to project(s): that has port 2 physically; Bit 1: Port 1, this bit is only applicable to project(s): that has port 1 physically; Bit 0: Port 0, this bit is only applicable to project(s): That has port 0 physically. If a particular port is not available, software shall set the corresponding bit to 1. Software can also set the corresponding bit(s) to 1 after disabling particular port(s). Software cannot set the PCD[port x]=1 if the corresponding config PCS.PxE=1 or AHCI MMIO GHC.PI[x]=1.

24.8.1.25 Port Control and Status (PCS)—Offset 94h

Port Control and Status. By default, the SATA ports are set (by hardware) to the disabled state (e.g., bits [5:0] == '0') as a result of an initial power on reset. When enabled by software, the ports can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. This register is not reset by FLR.

AHCI specific notes:

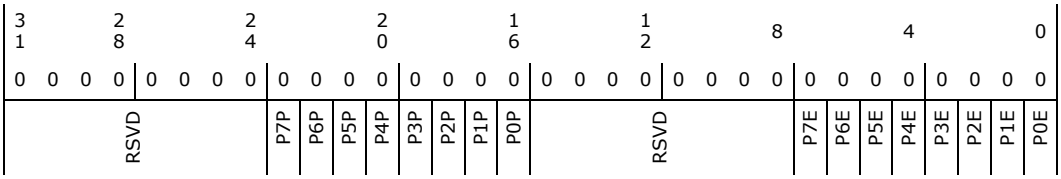
If an AHCI-aware or RAID enabled operating system is being booted then system BIOS shall insure that all supported SATA ports are enabled prior to passing control to the OS. Once the AHCI aware OS is booted it becomes the enabling/disabling policy owner for the individual SATA ports. This is accomplished by manipulating a port's PxSCTL.DET and PxCMD.SUD fields. Because an AHCI or RAID aware OS will typically not have knowledge of the PxE bits and because the PxE bits act as master on/off switches for the ports, pre-boot software must insure that these bits are set to '1' prior to booting the OS, regardless as to whether or not a device is currently on the port.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23	0h RO	**Port 7 Present (P7P):** Same as P0P, except for port 7. This bit is only applicable to project(s): That has port 7 physically.
22	0h RO	**Port 6 Present (P6P):** Same as P0P, except for port 6. This bit is only applicable to project(s): That has port 6 physically.
21	0h RO	**Port 5 Present (P5P):** Same as P0P, except for port 5. This bit is only applicable to project(s): That has port 5 physically.
20	0h RO	**Port 4 Present (P4P):** Same as P0P, except for port 4. This bit is only applicable to project(s): That has port 4 physically.
19	0h RO	**Port 3 Present (P3P):** Same as P0P, except for port 3. This bit is only applicable to project(s): That has port 3 physically.
18	0h RO	**Port 2 Present (P2P):** Same as P0P, except for port 2. This bit is only applicable to project(s): That has port 2 physically.
17	0h RO	**Port 1 Present (P1P):** Same as P0P, except for port 1. This bit is only applicable to project(s): That has port 1 physically.
16	0h RO	**Port 0 Present (P0P):** When set, the SATA controller has detected the presence of a device on port 0. It may change at any time. Clearing P0E bit leads to clearing of this bit after implementation delay. ***Note:*** For system software that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again in two consecutive write cycles, software shall poll on this bit being 0 before setting P0E bit to 1. This bit is only applicable to project(s): That has port 0 physically.
15:8	0h RO	Reserved.
7	0h RW	**Port 7 Enabled (P7E):** When MAP.SPD[7] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this field is RW and the definition of this bit is the same as P0E, except for port 7. This bit takes precedence over P7CMD.SUD. This bit is only applicable to project(s): That has port 7 physically.
6	0h RW	**Port 6 Enabled (P6E):** When MAP.SPD[6] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this field is RW and the definition of this bit is the same as P0E, except for port 6. This bit takes precedence over P6CMD.SUD. This bit is only applicable to project(s): That has port 6 physically.
5	0h RW	**Port 5 Enabled (P5E):** When MAP.SPD[5] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this field is RW and the definition of this bit is the same as P0E, except for port 5. This bit takes precedence over P5CMD.SUD. This bit is only applicable to project(s): That has port 5 physically.
4	0h RW	**Port 4 Enabled (P4E):** When MAP.SPD[4] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 4 and takes precedence over P4CMD.SUD. This bit is only applicable to project(s): That has port 4 physically.
3	0h RW	**Port 3 Enabled (P3E):** When MAP.SPD[3] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 3 and takes precedence over P3CMD.SUD. This bit is only applicable to project(s): That has port 3 physically.
2	0h RW	**Port 2 Enabled (P2E):** When MAP.SPD[2] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 2 and takes precedence over P2CMD.SUD. This bit is only applicable to project(s): That has port 2 physically.
1	0h RW	**Port 1 Enabled (P1E):** When MAP.SPD[1] is 1, this bit is reserved and read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 1 and takes precedence over P1CMD.SUD. This bit is only applicable to project(s): That has port 1 physically.

Bit Range	Default and Access	Field Name (ID): Description
0	0h RW	**Port 0 Enabled (P0E):** When MAP.SPD[0] is 1, this bit is reserved and read-only 0. When set, the port is enabled. When cleared, the port is disabled. When enabled, the port can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. This bit takes precedence over P0CMD.SUD. ***Note:*** The recommendation for software code that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again immediately shall refer to the polling requirement as described in P0P register bit. At any time that BIOS or software is clearing PCS.PxE from 1 to 0, due to time needed for port staggering hardware process (up to 6 ports) to complete, BIOS and software shall delay the write to set the MAP.PCD register by 1.4us. This bit is only applicable to project(s): That has port 0 physically.

24.8.1.26 SATA General Configuration (SATAGC)—Offset 9Ch

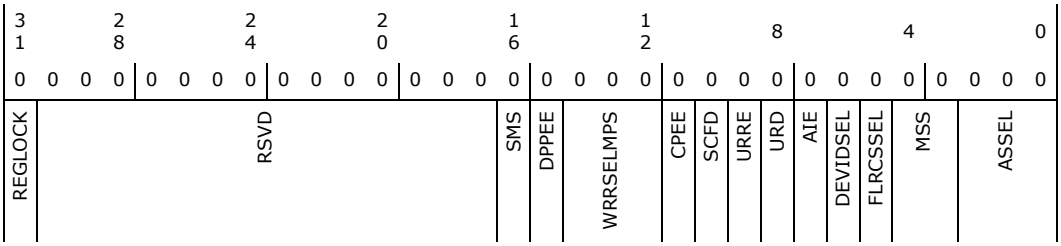
SATA General Configuration

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/O	**Register Lock (REGLOCK):** BIOS can set this bit to 1 to lock the following registers with RW/L attribute: CAP,CP, MID.NEXT, PIE.NEXT, SATACR0.NEXT. Once locked the register attribute of above list changes from RW/L to RO holding the existing value. BIOS is required to program this field to 1 prior to handle off to OS. If BIOS needs the SATA host controller to change operation a few times (i.e., changing CC.SCC mode) and need different capability structures for each specific operation mode, BIOS need not activate the lock until BIOS is ready to hand off to OS. BIOS may need to separate write access to this byte offset (x9Fh) from write to the lower 3-byte of the dword (x9C-9Eh) if there is a need to program the lower 3-byte dword location early during boot process. This field is not reset by FLR.
30:17	0h RO	Reserved.
16	0h RW	**SATA Mode Select (SMS):** Software (SW) programs these bits to control the mode in which the SATA HBA should operate: 0b = AHCI mode 1b = RAID mode ***Notes:*** SW shall not manipulate SATAGC.SMS during runtime operation i.e., the OS will not do this. The BIOS may choose to switch from one mode to another during POST; AHCI mode may be selected when RAID feature is enabled by fuse; RAID mode may only be selected when FFSATA5 and FFSATA3 (concatenated value not indicating No RAID); This register field is not reset by FLR.
15	0h RW	**Data Phase Parity Error Enable (DPPEE):** When 1, IOSF data phase parity error handling is enabled. When 0, the data phase parity error handling is disabled.

Bit Range	Default and Access	Field Name (ID): Description
14:12	0h RW	**Write Request_Size Select/Max_Payload_Size (WRRSELMPS):** These two bits select the max write request size that SATA host controller will initiate for DMA write to memory. SATA host controller will internally break up larger write request based on these bits. The request is address-aligned to the selected size. Defined encodings for this field are: 000b = 128 address aligned bytes max payload size; 111b = 64 address aligned bytes max payload size. All other values are reserved for SATA host controller. This field is not reset by FLR.
11	0h RW	**Command Parity Error Enable (CPEE):** When 1, command parity error handing is enable. When 0 the command parity error handling is disable.
10	0h RW	**SATA Controller Function Disable (SCFD):** BIOS program this bit to 1 to disable the SATA Controller function. When 0, SATA Controller function is enabled. When disable, SATA Host Controller will not claimed the register access targeting its Configuration Space. In IOSF primary Fabric Decode scheme, it's expected BIOS also program the corresponding bit used by the Fabric Decoder accordingly hence both SATA SIP and Fabric Decoder are in sync, and BIOS need to program this bit before programming the one in Fabric Decoder. Once this bit is set, BIOS is not able to revert it back to Function Enable until next round of platform reset.
9	0h RW	**Unsupported Request Reporting Enable (URRE):** If set to 1 by software, it allows reporting of an Unsupported Request as a system error. If both URRE and PCI configuration SERR# Enable registers are set to a 1, then the agent must set the Signaled System Error bit in the PCI Status register and send a DO_SERR message in IOSF-SB interface.
8	0h RW/1C	**Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unsupported Request on IOSF Primary interface that is not considered Advisory Non-Fatal. Cleared to 0 by SW.
7	0h RW/O	**Alternate ID Enable (AIE):** When programmed to 0, HW will report the following device id's: 2822h for desktop or 282Ah for mobile. When programmed to a 1, HW will not report these device IDs. ***Note:*** Programming this bit to a 1 will prevent the Windows in-box version of the Intel AHCI driver from loading on the platform - will require that the user perform an 'F6' install of the Intel driver that is appropriate for the reported DID. This field is applicable when the AHCI is configured for RAID mode of operation. It has no impact for AHCI and IDE modes of operation. ***Note:*** The BIOS is recommended to program this bit prior to programming the MAP.SMS field to reflect RAID. This field is reset by PLTRST# and BIOS is required to reprogram the value (either 0 or 1) after resuming from S3, S4 or S5.
6	0h RW/O	**AIE0 DevID Selection (DEVIDSEL):** This register allows BIOS to select Device ID when AIE=0 and Server Feature (SATA AIE DEVIDSEL) Disable Fuse =0. This bit only has effect in Desktop SKU. In Mobile SKU this bit has no effect at all. Refer to config register offset 09h PI for usage. ***Note:*** WBG BIOS is required to program this field to 1 together with the write to the AIE bit in a single configuration write cycle. LPT BIOS is required to program this bit to 0 together with the write to the AIE bit in a single configuration write cycle. When Server Feature (SATA AIE DEVIDSEL) Disable Fuse is programmed to 1, this disables the writeability of this DEVIDSEL register bit, and becomes RO with a value of 0, which only allows a choice of 2822h. This field is not reset by FLR.
5	0h RW/O	**FLR Capability Selection (FLRCSSEL):** This allows the FLR Capability to be bypassed. Refer to config offset B0h. BIOS is required to program this bit to 1 and config offset A8h SATACR0.NEXT to 00h. This field is not reset by FLR.
4:3	0h RW/O	**MXTBA Size Select (MSS):** These 2 bits select the size of the Memory space for the MSI-X Table defined in BAR 0 (Configuration space offset 10h). MSI-X Table Memory space size is 32k when MSS[1:0]=00, 16k when MSS[1:0]=01, 8k when MSS[1:0]=10. This field is not reset by FLR.
2:0	0h RW/O	**ABAR Size Select (ASSEL):** These 3 bits select the size of the Memory space for the ABAR in BAR 5 (Configuration space offset 24h). ABAR Memory space size is 2k when ASSEL[2:0]=000, 16k when ASSEL[2:0]=001, 32k when ASSEL[2:0]=010, 64k when ASSEL[2:0]=011, 128k when ASSEL[2:0]=100, 256k when ASSEL[2:0]=101, 512k when ASSEL[2:0]=110. This field is not reset by FLR.

24.8.1.27 SATA Initialization Register Index (SIRI)—Offset A0h

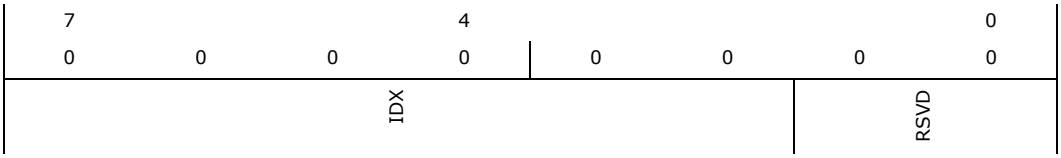
SATA Initialization Register Index

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:2	0h RW	**Index (IDX):** 6-bit index pointer into the 256-byte space. Data is written into the SIRD register and read from the SIRD register. This point to a DWord register. The byte enables on the SIRD register affect what will be written. Refer to SATA Initialization Register section for detail of the register space.
1:0	0h RO	Reserved.

24.8.1.28 SATA Initialization Register Data (SIRD)—Offset A4h

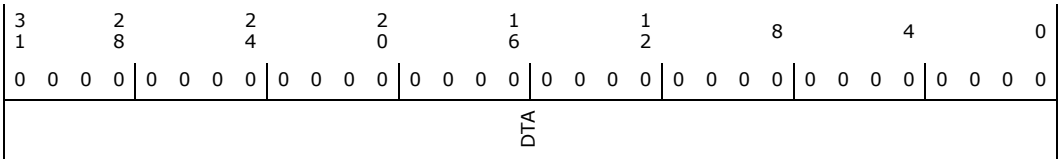
SATA Initialization Register Data

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Data (DTA):** 32-bit data value that is written to the register pointed to by SIRI, or read from the register pointed to by SIRI.

24.8.1.29 Serial ATA Capability Register 0 (SATACR0)—Offset A8h

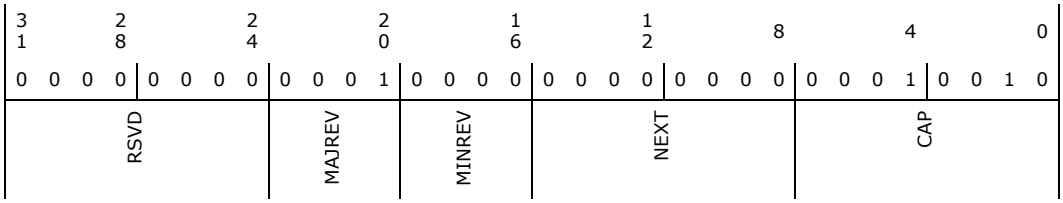
Note that the SATACR0.NEXT is not changed from RO to become RWO because there is an existing method (SATAGC.FLRCSSEL bit) to bypass the FLR Capability structure. And FLR Capability ID.NEXT is already indicating end of capability structure, it does not need change to be RWO.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 100012h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	1h RO	**Major Revision (MAJREV):** Major revision number of the SATA Capability Pointer implemented.
19:16	0h RO	**Minor Revision (MINREV):** Minor revision number of the SATA Capability Pointer implemented.
15:8	0h RW/L	**Next Capability Pointer (NEXT):** 00h indicating the final item in the Capability List. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.
7:0	12h RO	**Capability ID (CAP):** The value of 12h has been assigned by the PCI SIG to designate the SATA Capability pointer.

24.8.1.30 Serial ATA Capability Register 1 (SATACR1)—Offset ACh

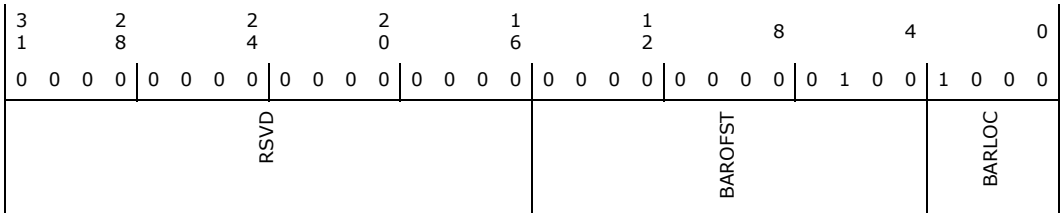
Serial ATA Capability Register 1

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 48h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:4	4h RO	**BAR Offset (BAROFST):** Indicates the offset into the BAR where the AHCI Index/Data pair are located (in Dword granularity). The Index and Data I/O registers are located at offset 10h within the I/O space defined by LBAR (BAR4). A value of 004h indicates offset 10h. 000h = 0h offset; 001h = 4h offset; 002h = 8h offset; 003h = Ch offset; 004h = 10h offset;...; FFFh = 3FFFh offset (max 16 KB)
3:0	8h RO	**BAR Location (BARLOC):** Indicates the absolute PCI Configuration Register address of the BAR containing the Index/Data pair (in Dword granularity). The Index and Data I/O registers reside within the space defined by LBAR (BAR4) in the SATA controller. A value of 8h indicates offset 20h, which is LBAR (BAR4). 0000 - 0011b = reserved; 0100b = 10h => BAR0; 0101b = 14h => BAR1; 0110b = 18h => BAR2; 0111b = 1Ch => BAR3; 1000b = 20h => AIDPBA; 1001b = 24h => BAR5; 1010 - 1110b = reserved; 1111b = Index/Data pair in PCI Configuration space which is not supported.

24.8.1.31 Scratch Pad (SP)—Offset C0h

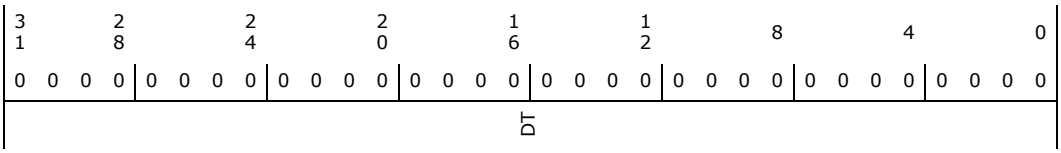
Scratch Pad

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Data (DT):** This is a read/write register that is available for software to use. No hardware action is taken on this register.

24.8.1.32 MSI-X Identifiers (MXID)—Offset D0h

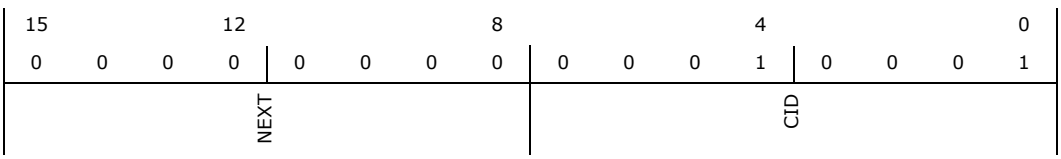
MSI-X Identifiers

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 23
Function: 0

Default: 11h



Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RW/L	**Next Pointer (NEXT):** Indicates the next item in the list. This may be other capability pointers or it may be the last item in the list.The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.
7:0	11h RO	**Capability ID (CID):** Capabilities ID indicates this is an MSI-X capability.

24.8.1.33 MSI-X Message Control (MXC)—Offset D2h

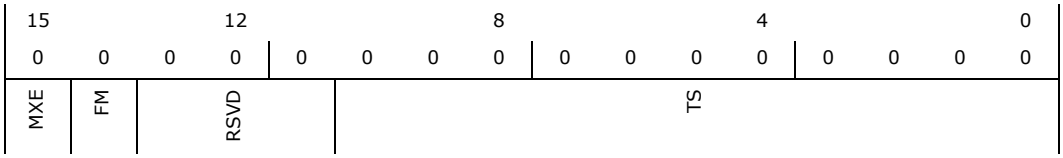
MSI-X Message Control

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15	0h RW	**MSI-X Enable (MXE):** If set to '1' and the MSI Enable bit in the MSI Message Control register is cleared to '0', the function is permitted to use MSI-X to request service and is prohibited from using its INTx# pin (if implemented). If cleared to '0', the function is prohibited from using MSI-X to request service.
14	0h RW	**Function Mask (FM):** If set to '1', all of the vectors associated with the function are masked, regardless of their per vector Mask bit states. If cleared to '0', each vector's Mask bit determines whether the vector is masked or not. Setting or clearing the MSI-X Function Mask bit has no effect on the state of the per vector Mask bits.
13:11	0h RO	Reserved.
10:0	0h RO	**Table Size (TS):** This value indicates the size of the MSI-X Table as the value n, which is encoded as n - 1. For example, a returned value of 3h corresponds to a table size of 4.

24.8.1.34 MSI-X Table Offset/Table BIR (MXT)—Offset D4h

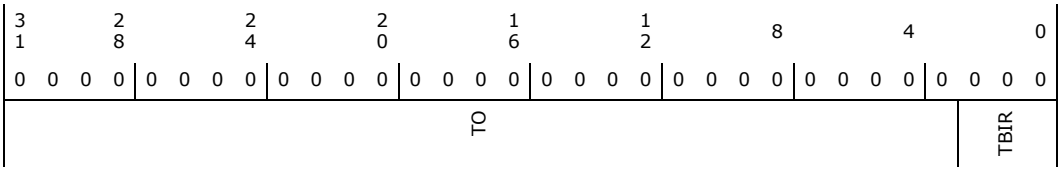
MSI-X Table Offset/Table BIR

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:3	0h RO	**Table Offset (TO):** Used as an offset from the address contained by one of the function's Base Address registers to point to the base of the MSI-X Table. The lower three Table BIR bits are masked off (cleared to 000b) by system software to form a 32-bit Qword-aligned offset.
2:0	0h RO	**Table BIR (TBIR):** This field indicates which one of a function's Base Address registers, located beginning at 10h in Configuration Space, is used to map the function's MSI-X Table into system memory. A read-only value of '0' means 10h.

24.8.1.35 MSI-X PBA Offset / PBA BIR (MXP)—Offset D8h

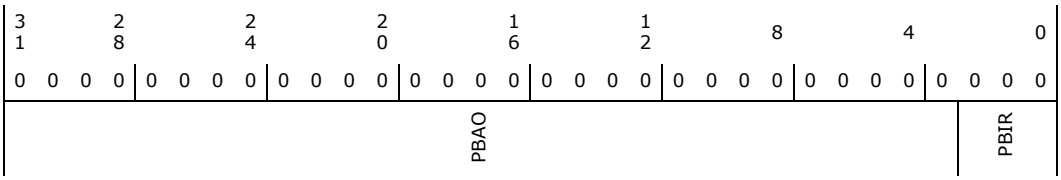
MSI-X PBA Offset / PBA BIR

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:3	0h RO	**PBA Offset (PBAO):** Used as an offset from the address contained by one of the function's Base Address registers to point to the base of the MSI-X PBA. The lower three PBA BIR bits are masked off (cleared to 000b) by software to form a 32-bit Qword-aligned offset.
2:0	0h RO	**PBA BIR (PBIR):** This field indicates which one of a function's Base Address registers, located beginning at 10h in Configuration Space, is used to map the function's MSI-X PBA into system memory. A read-only value of '1' means 14h.

24.8.1.36 BIST FIS Control/Status (BFCS)—Offset E0h

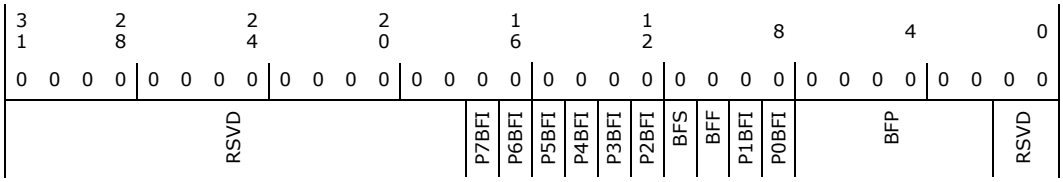
BIST FIS Control/Status

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RW	**Port 7 BIST FIS Initiate (P7BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 7, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable the PCS.P7E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 7 physically.
16	0h RW	**Port 6 BIST FIS Initiate (P6BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 6, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable the PCS.P6E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 6 physically.
15	0h RW	**Port 5 BIST FIS Initiate (P5BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 5, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable the PCS.P5E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 5 physically.
14	0h RW	**Port 4 BIST FIS Initiate (P4BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 4, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P4E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 4 physically.
13	0h RW	**Port 3 BIST FIS Initiate (P3BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 3, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable the PCS.P3E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 3 physically.

Bit Range	Default and Access	Field Name (ID): Description
12	0h RW	**Port 2 BIST FIS Initiate (P2BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 2, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P2E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 2 physically.
11	0h RW/1C	**BIST FIS Successful (BFS):** This bit is set any time a BIST FIS transmitted by the SATA controller receives an R_OK completion status from the device.
10	0h RW/1C	**BIST FIS Failed (BFF):** This bit is set any time that a BIST FIS transmitted by the SATA controller receives an R_ERR completion status from the device.
9	0h RW	**Port 1 BIST FIS Initiate (P1BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 1, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P1E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 1 physically.
8	0h RW	**Port 0 BIST FIS Initiate (P0BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 0, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P0E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 0 physically.
7:2	0h RW	**BIST FIS Parameters (BFP):** These bits form the contents of the upper 6 bits of the BIST FIS Pattern Definition in the BIST FIS transmitted by the SATA controller. This field is not port specific - its contents will be used for any BIST FIS initiated on the SATA controller. The specific bit definitions are: Bit 7 (T) Far End Transmit mode; bit 6 (A) Align Bypass mode; bit 5 (S) Bypass Scrambling; bit 4 (L) Far End Retimed Loopback; bit 3 (F) Far End Analog Loopback; bit 2 (P) Primitive bit for use with Transmit mode.
1:0	0h RO	Reserved.

24.8.1.37 BIST FIS Transmit Data 1 (BFTD1)—Offset E4h

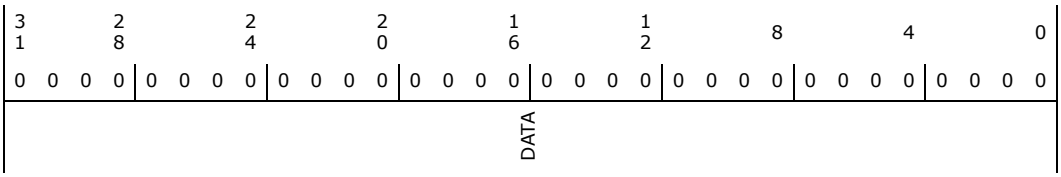
BIST FIS Transmit Data 1

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Data (DATA):** The data programmed into this register will form the contents of the second DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 2nd DW regardless of whether or not the T bit is indicated in the BFCS register.

24.8.1.38 BIST FIS Transmit Data 2 (BFTD2)—Offset E8h

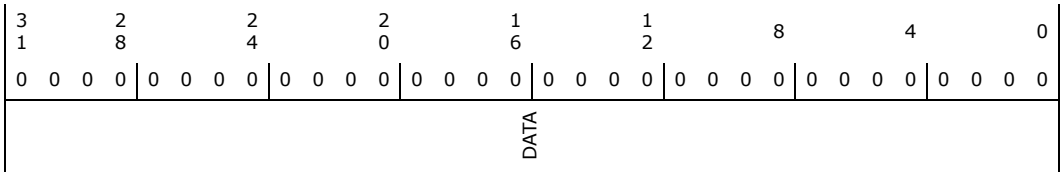
BIST FIS Transmit Data 2

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Data (DATA):** The data programmed into this register will form the contents of the third DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 3rd DW regardless of whether or not the T bit is set in the BFCS register.

24.8.2 SATA ABAR Registers Summary

Table 24-2. Summary of SATA ABAR Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	HBA Capabilities (GHC_CAP)—Offset 0h	FF36FF07h
4h	7h	Global HBA Control (GHC)—Offset 4h	80000000h
8h	Bh	Interrupt Status Register (IS)—Offset 8h	0h
Ch	Fh	Ports Implemented (GHC_PI)—Offset Ch	0h
10h	13h	AHCI Version (VS)—Offset 10h	10300h
1Ch	1Fh	Enclosure Management Location (EM_LOC)—Offset 1Ch	1600002h
20h	23h	Enclosure Management Control (EM_CTL)—Offset 20h	7010000h
24h	27h	HBA Capabilities Extended (GHC_CAP2)—Offset 24h	3Ch
A0h	A3h	Vendor Specific (VSP)—Offset A0h	48h
A4h	A7h	Vendor Specific Capabilities Register (VS_CAP)—Offset A4h	1002DEh
C0h	C3h	RAID Platform ID (RPID)—Offset C0h	311C02h

Table 24-2. Summary of SATA ABAR Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
C4h	C5h	Premium Feature Block (PFB)—Offset C4h	0h
C8h	C9h	SW Feature Mask (SFM)—Offset C8h	3Fh
100h	103h	Port 0 Command List Base Address (P0CLB)—Offset 100h	0h
104h	107h	Port 0 Command List Base Address Upper 32-bits (P0CLBU)—Offset 104h	0h
108h	10Bh	Port 0 FIS Base Address (P0FB)—Offset 108h	0h
10Ch	10Fh	Port 0 FIS Base Address Upper 32-Bits (P0FBU)—Offset 10Ch	0h
110h	113h	Port 0 Interrupt Status (P0IS)—Offset 110h	0h
114h	117h	Port 0 Interrupt Enable (P0IE)—Offset 114h	0h
118h	11Bh	Port 0 Command (P0CMD)—Offset 118h	4h
120h	123h	Port 0 Task File Data (P0TFD)—Offset 120h	9h
124h	127h	Port 0 Signature (P0SIG)—Offset 124h	FFFFFFFFh
128h	12Bh	Port 0 Serial ATA Status (P0SSTS)—Offset 128h	0h
12Ch	12Fh	Port 0 Serial ATA Control (P0SCTL)—Offset 12Ch	0h
130h	133h	Port 0 Serial ATA Error (P0SERR)—Offset 130h	0h
134h	137h	Port 0 Serial ATA Active (P0SACT)—Offset 134h	0h
138h	13Bh	Port 0 Command Issue (P0CI)—Offset 138h	0h
13Ch	13Fh	Port 0 SNotification (P0SNTF)—Offset 13Ch	0h

24.8.2.1 HBA Capabilities (GHC_CAP)—Offset 0h

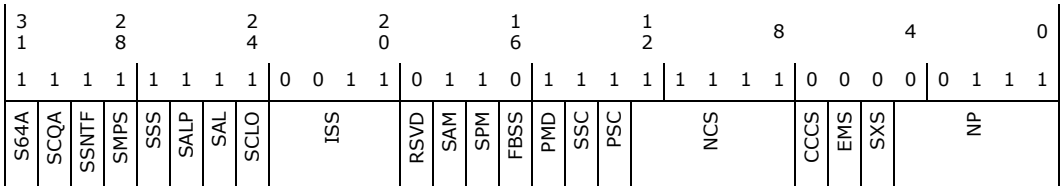
HBA Capabilities. This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon PLTRST#. This register is not reset by FLR.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: FF36FF07h



Bit Range	Default and Access	Field Name (ID): Description
31	1h RW/O	**Supports 64-bit Addressing (S64A):** Indicates the S-ATA controller can access 64-bit data structures. The 32-bit upper bits of the port DMA Descriptor, the PRD Base, and each PRD entry are read/write.
30	1h RW/O	**Supports Native Command Queuing Acceleration (SCQA):** Indicates the SATA controller supports Serial-ATA Native Command Queueing. The HBA will handle DMA Setup FISes in hardware, including support for auto-activate optimization through the FIS.
29	1h RW/O	**Supports SNotification Register (SSNTF):** When set to 1, indicates that the HBA supports the PxSNTF (SNotification) register and its associated functionality. When cleared to 0., the HBA does not support the PxSNTF (SNotification) register and its associated functionality.
28	1h RW/O	**Supports Mechanical Presence Switch (SMPS):** When set to 1, the HBA supports mechanical presence switches on its ports for use in hot plug operations. When cleared to 0, this function is not supported. This value is loaded by the BIOS prior to OS initialization.
27	1h RW/O	**Supports Staggered Spin-up (SSS):** Indicates whether the S-ATA controller supports staggered spin-up on its ports, for use in balancing power spikes. This value is loaded by platform BIOS prior to OS initialization.

Bit Range	Default and Access	Field Name (ID): Description
26	1h RW/O	**Supports Aggressive Link Power Management (SALP):** Indicates the S-ATA controller supports auto-generating link requests to the partial or slumber states when there are no commands to process. When cleared to 0, software shall treat the PxCMD.ALPE and PxCMD.ASP bits as reserved.
25	1h RW/O	**Supports Activity LED (SAL):** Indicates the S-ATA controller supports a single output pin (SATALED#) which indicates activity.
24	1h RW/O	**Supports Command List Override (SCLO):** When set to 1, indicates that the HBA supports the PxCMD.CLO bit and it's associated function. When cleared to 0., The HBA is not capable of clearing the BSY and DRQ bits in the Status register in order to issue a software reset if these bits are still set from a previous operation.
23:20	3h RW/O	**Interface Speed Support (ISS):** Indicates the maximum speed the S-ATA controller can support on its ports. These encodings match the system software programmable PxSCTL.DET.SPD field. 0000 = Reserved 0001 = Gen 1 (1.5 Gbps) 0010 = Gen 2 (3 Gbps) 0011 = Gen 3 (6 Gbps) 0100 - 1111 = Reserved. ***Note:*** If (FFSATA0p0, FFSATA0p1, FFSATA0p2, FFSATA0p3, FFSATA0p4 and FFSATA0p5) is 1, this field is RWO defaulting to 0010 and ignores software write value of 0011. If either FFSATA0p0, FFSATA0p1, FFSATA0p2, FFSATA0p3, FFSATA0p4 or FFSATA0p5 is 0, this field is RWO defaulting to 0011.
19	0h RO	Reserved.
18	1h RO	**Supports AHCI mode only (SAM):** The SATA controller may optionally support AHCI access mechanism only. A value of 0 indicates that in addition to the native AHCI mechanism (via ABAR), the SATA controller implements a legacy, task-file based register interface such as SFF-8038i. A value of 1 indicates that the SATA controller does not implement a legacy, task-file based register interface.
17	1h RO	**Supports Port Multiplier (SPM):** The SATA controller may optionally support command-based switching Port Multipliers. BIOS must clear this bit if Port Multipliers are not supported.
16	0h RO	**FIS-based Switching Supported (FBSS):** Not supported.
15	1h RO	**PIO Multiple DRQ Block (PMD):** If set to 1, the HBA supports multiple DRQ block data transfers for the PIO command protocol.
14	1h RW/O	**Slumber State Capable (SSC):** The SATA controller supports the slumber state.
13	1h RW/O	**Partial State Capable (PSC):** The SATA controller supports the partial state.
12:8	1Fh RO	**Number of Command Slots (NCS):** 1Fh indicating support for 32 slots.
7	0h RO	**Command Completion Coalescing Supported (CCCS):** When set to 1, indicates that the HBA supports command completion coalescing. When command completion coalescing is supported, the HBA has implemented the CCC_CTL and the CCC_PORTS global HBA registers. When cleared to 0, indicates that the HBA does not support command completion coalescing and the CCC_CTL and CCC_PORTS global HBA registers are not implemented.

Bit Range	Default and Access	Field Name (ID): Description
6	0h RO	**Enclosure Management Supported (EMS):** When set to 1, indicates that the HBA supports enclosure management. When enclosure management is supported, the HBA has implemented the EM_LOC and EM_CTL global HBA registers. When cleared to 0, indicates that the HBA does not support enclosure management and the EM_LOC and EM_CTL global HBA registers are not implemented.
5	0h RW/O	**Supports External SATA (SXS):** When set to 1, indicates that the HBA has one or more Serial ATA ports that has a signal only connector that is externally accessible. If this bit is set, software may refer to the PxCMD.ESP bit to determine whether a specific port has its signal connector externally accessible as a signal only connector (i.e., power is not part of that connector). When the bit is cleared to 0, indicates that the HBA has no Serial ATA ports that have a signal only connector externally accessible.
4:0	7h RO	**Number of Ports (NP):** 0's based value indicating the maximum number of ports supported. Note that the number of ports indicated in this field may be more than the number of ports indicated in the PI register. Number of ports shall be dependent on MAP.SC, fuses (FFSATA7, FFSATA8) and PCIe/SATA muxing configuration where if ANY of these parameter disable a particular port then that port is disabled and not counted. The maximum number of ports supported by SIP is 8 and the least is 0 (i.e., Function Disable). In the case of 0 port configuration, the value of NP is a don't care (while implementation has it fixed as 07h). Any combination in between is supported by SATA host controller. Indicates the number of supported ports.

24.8.2.2 Global HBA Control (GHC)—Offset 4h

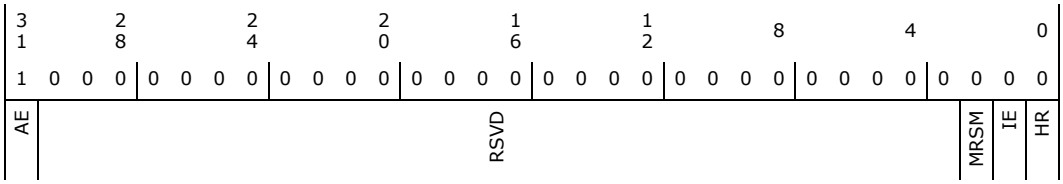
Global HBA Control. This register controls various global actions of the HBA.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 80000000h



Bit Range	Default and Access	Field Name (ID): Description
31	1h RO	**AHCI Enable (AE):** When set, indicates that an AHCI driver is loaded and communication to the HBA shall be via AHCI mechanisms. This can be used by an HBA that supports both legacy mechanisms (such as SFF-8038i) and AHCI to know when the HBA is running under an AHCI driver. When set, software shall only talk to the HBA using AHCI. The HBA will not have to allow command processing via both AHCI and legacy mechanisms. When cleared, software will only communicate with the HBA using legacy mechanisms. Software shall set this bit to 1 before accessing other AHCI registers. ***Note:*** The implementation of this bit is dependent upon the value of the CAP.SAM bit. If CAP.SAM is 0, then GHC.AE should be RW and shall have a reset value of 0. If CAP.SAM is 1, then AE shall be read only and shall have a reset value of 1.
30:3	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
2	0h RO	**MSI Revert to Single Message (MRSM):** When set to 1 by hardware, indicates that the HBA requested more than one MSI vector but has reverted to using the first vector only. When this bit is cleared to 0, the HBA has not reverted to single MSI mode (i.e., hardware is already in single MSI mode, software has allocated the number of messages requested, or hardware is sharing interrupt vectors if MC.MME < MC.MMC). The HBA may revert to single MSI mode when the number of vectors allocated by the host is less than the number requested. This bit shall only be set to 1 when the following conditions hold: MC.MSIE = 1 (MSI is enabled); MC.MMC > 0 (multiple messages requested); MC.MME > 0 (more than one message allocated); MC.MME != MC.MMC (messages allocated not equal to number requested). When this bit is set to 1, single MSI mode operation is in use and software is responsible for clearing bits in the IS register to clear interrupts. This bit shall be cleared to 0 by hardware when any of the four conditions stated is false. This bit is also cleared to 0 when MC.MSIE = 1 and MC.MME = 0h. In this case, the hardware has been programmed to use single MSI mode, and is not reverting to that mode. The HBA shall always revert to single MSI mode when the number of vectors allocated by the host is less than the number requested. Value of MRSM is a don't care when GHC.HR=1.
1	0h RW	**Interrupt Enable (IE):** This global bit enables interrupts from the HBA. When cleared (reset default), all interrupt sources from all ports are disabled. When set, interrupts are enabled.
0	0h RW/1S	**HBA Reset (HR):** When set by SW, this bit causes an internal reset of the HBA. All state machines that relate to data transfers and native command queuing will return to an idle condition, and all ports will be re-initialized via COMRESET. When the HBA has performed the reset action, it will reset this bit to 0. A software write of 0 will have no effect. For a description on which bits are reset when this bit is set, see the *AHCI Specification*, Section 10.3.3.

24.8.2.3 Interrupt Status Register (IS)—Offset 8h

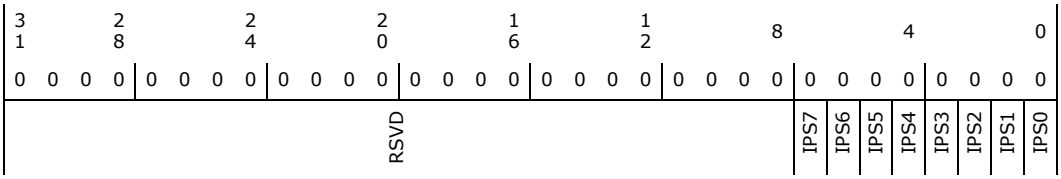
Interrupt Status Register. This register indicates which of the ports within the controller have an interrupt pending and require service.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7	0h RW/1C	**Interrupt Pending Status Port 7 (IPS7):** If set, indicates that port 7 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 7 physically.
6	0h RW/1C	**Interrupt Pending Status Port 6 (IPS6):** If set, indicates that port 6 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 6 physically.

Bit Range	Default and Access	Field Name (ID): Description
5	0h RW/1C	**Interrupt Pending Status Port 5 (IPS5):** If set, indicates that port 5 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 5 physically.
4	0h RW/1C	**Interrupt Pending Status Port 4 (IPS4):** If set, indicates that port 4 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 4 physically.
3	0h RW/1C	**Interrupt Pending Status Port 3 (IPS3):** If set, indicates that port 3 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 3 physically.
2	0h RW/1C	**Interrupt Pending Status Port 2 (IPS2):** If set, indicates that port 2 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 2 physically.
1	0h RW/1C	**Interrupt Pending Status Port 1 (IPS1):** If set, indicates that port 1 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 1 physically.
0	0h RW/1C	**Interrupt Pending Status Port 0 (IPS0):** If set, indicates that port 0 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 0 physically.

24.8.2.4 Ports Implemented (GHC_PI)—Offset Ch

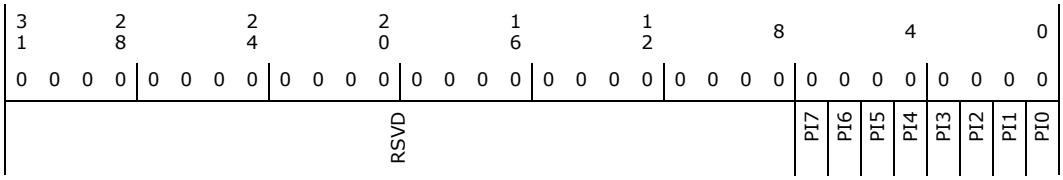
Ports Implemented. This register indicates which ports are exposed to the HBA. It is loaded by platform BIOS. It indicates which ports that the device supports are available for software to use. Any available port may not be implemented. This register is not reset by FLR.

Access Method

Type: MEM Register (Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7	0h RW/O	**Port 7 Implemented (PI7):** If set, then port 7 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 7 is not available.
6	0h RW/O	**Port 6 Implemented (PI6):** If set, then port 6 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 6 is not available.

Bit Range	Default and Access	Field Name (ID): Description
5	0h RW/O	**Port 5 Implemented (PI5):** If set, then port 5 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 5 is not available.
4	0h RW/O	**Port 4 Implemented (PI4):** If set, then port 4 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 4 is not available.
3	0h RW/O	**Port 3 Implemented (PI3):** If set, then port 3 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 3 is not available.
2	0h RW/O	**Port 2 Implemented (PI2):** If set, then port 2 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 2 is not available.
1	0h RW/O	**Port 1 Implemented (PI1):** If set, then port 1 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 1 is not available.
0	0h RW/O	**Port 0 Implemented (PI0):** If set, then port 0 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 0 is not available.

24.8.2.5 AHCI Version (VS)—Offset 10h

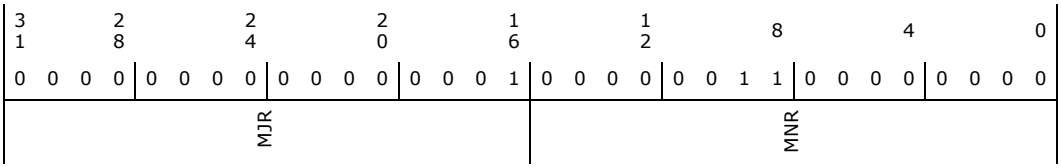
AHCI Version. This register indicates the major and minor version of the AHCI specification. It is BCD encoded. The upper two bytes represent the major version number, and the lower two bytes represent the minor version number. Example: Version 3.12 would be represented as 00030102h.

Access Method

Type: MEM Register (Size: 32 bits)

Device: 23
Function: 0

Default: 10300h



Bit Range	Default and Access	Field Name (ID): Description
31:16	1h RO	**Major Version Number (MJR):** Indicates the major version is 1
15:0	300h RO	**Minor Version Number (MNR):** Indicates the minor version is 30

24.8.2.6 Enclosure Management Location (EM_LOC)—Offset 1Ch

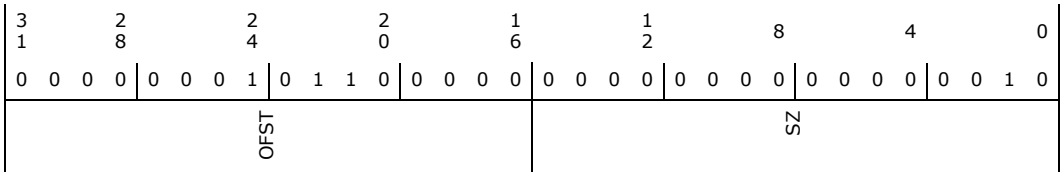
Enclosure Management Location. The enclosure management location register identifies the location and size of the enclosure management message buffer. This register is not implemented if enclosure management is not supported (i.e., CAP.EMS = 0).

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 1600002h



Bit Range	Default and Access	Field Name (ID): Description
31:16	160h RO	**Offset (OFST):** The offset of the message buffer in Dwords from the beginning of the ABAR.
15:0	2h RO	**Buffer Size (SZ):** Specifies the size of the transmit message buffer area in Dwords. If both transmit and receive buffers are supported, then the transmit buffer begins at ABAR[EM_LOC.OFST*4] and the receive buffer directly follows it. If both transmit and receive buffers are supported, both buffers are of the size indicated in the Buffer Size field. A value of 0 is invalid. Note that SATA controller only supports transmit buffer.

24.8.2.7 Enclosure Management Control (EM_CTL)—Offset 20h

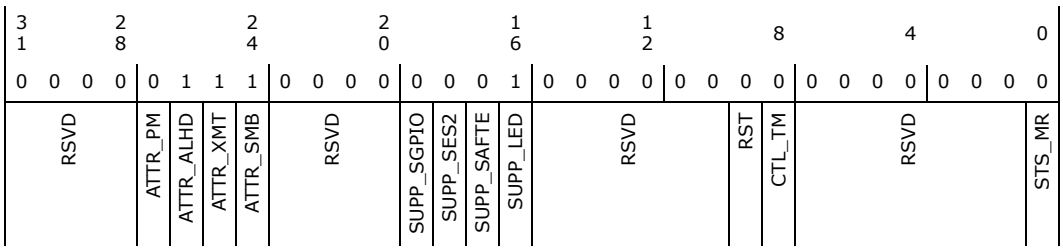
Enclosure Management Control. This register is used to control and obtain status for the enclosure management interface. The register includes information on the attributes of the implementation, enclosure management messages supported, the status of the interface, whether any messages are pending, and is used to initiate sending messages. This register is not implemented if enclosure management is not supported (i.e., CAP.EMS = 0).

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 7010000h



Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27	0h RO	**Port Multiplier Support (ATTR_PM):** The HBA does not support enclosure management messages for devices attached via a Port Multiplier. Software should use the Serial ATA enclosure management bridge that is built into many Port Multipliers for enclosure services with these devices. For more information on Serial ATA enclosure management bridges, refer to the Serial ATA II: Extensions to Serial ATA 1.0a revision 1.2 specification.
26	1h RW/O	**Activity LED Hardware Driven (ATTR_ALHD):** If set to 1, the HBA drives the activity LED for the LED message type in hardware and does not utilize software settings for this LED. The HBA does not begin transmitting the hardware based activity signal until after software has written CTL.TM=1 after a reset condition.
25	1h RO	**Transmit Only (ATTR_XMT):** If set to 1, the HBA only supports transmitting messages and does not support receiving messages. If cleared to 0, the HBA supports transmitting and receiving messages.
24	1h RO	**Single Message Buffer (ATTR_SMB):** If set to 1, the HBA has one message buffer that is shared for messages to transmit and messages received. In this case, unsolicited receive messages are not supported and it is software's responsibility to manage access to this buffer. If cleared to 0, there are separate receive and transmit buffers such that unsolicited messages could be supported.
23:20	0h RO	Reserved.
19	0h RO	**SGPIO Enclosure Management Messages (SUPP_SGPIO):** If set to 1, the HBA supports the SGPIO register interface message type.
18	0h RO	**SES-2 Enclosure Management Messages (SUPP_SES2):** If set to 1, the HBA supports the SES-2 message type.
17	0h RO	**SAF-TE Enclosure Management Messages (SUPP_SAFTE):** If set to 1, the HBA supports the SAF-TE message type.
16	1h RO	**LED Message Types (SUPP_LED):** If set to 1, the HBA supports the LED message type defined in LED Message Type.
15:10	0h RO	Reserved.
9	0h RW/1S	**Reset (RST):** When set to 1 by software, the HBA shall reset all enclosure management message logic and take all appropriate reset actions to ensure messages can be transmitted/received after the reset. After the HBA completes the reset operation, the HBA shall set the value to 0. A write of 0 by software to this field shall have no effect.
8	0h RW/1S	**Transmit Message (CTL_TM):** When set to 1 by software, the HBA shall transmit the message contained in the message buffer. When the message is completely sent, the HBA shall clear this bit to 0. A write of 0 to this bit by software shall have no effect. Software shall not change the contents of the message buffer while CTL.TM is set to 1.
7:1	0h RO	Reserved.
0	0h RO	**Message Received (STS_MR):** Message received is not supported.

24.8.2.8 HBA Capabilities Extended (GHC_CAP2)—Offset 24h

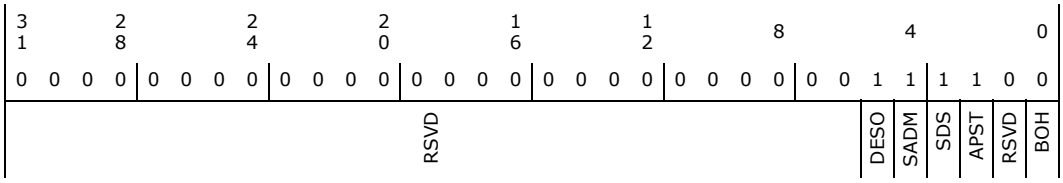
HBA Capabilities Extended. This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon PLTRST#. This register is not reset by FLR.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 3Ch



Bit Range	Default and Access	Field Name (ID): Description
31:6	0h RO	Reserved.
5	1h RW/O	**DEVSLP Entrance from Slumber Only (DESO):** This field specifies that the HBA shall only assert DEVSLP if the interface is in Slumber. When this bit is set to 1, the HBA shall ignore software directed entrance to DEVSLP via PxCMD.ICC unless PxSSTS.IPM = 6h. When this bit is cleared to 0, the HBA may enter DEVSLP from any link state (active, Partial, or Slumber). BIOS is required to program this field to 1.
4	1h RW/O	**Supports Aggressive DEVSLP Management (SADM):** When set to 1, the HBA supports hardware assertion of the DEVSLP signal after the idle timeout expires. When cleared to 0, this function is not supported and software shall treat the PxDEVSLP.ADSE field as reserved. ***Note:*** If PHY I/O PM Disable Fuse is 1, this register will read 0. Else this register will read 1 with RWO attribute.
3	1h RW/O	**Supports DEVSLP (SDS):** When set to 1, the HBA supports the DEVSLP feature. When cleared to 0, DEVSLP is not supported. ***Note:*** If PHY I/O PM Disable Fuse is 1, this register will read 0. Else this register will read 1 with RWO attribute.
2	1h RW/O	**Automatic Partial to Slumber Transitions (APST):** When set to 1, the HBA supports Automatic Partial to Slumber Transitions. When cleared to 0, Automatic Partial to Slumber Transition is not supported. ***Note:*** If SATA PHY PM Disable Fuse is 1, this register will read only 0. Else this register will read 1 with RWO attribute.
1	0h RO	Reserved.
0	0h RO	**BIOS/OS Handoff (BOH):** Not supported.

24.8.2.9 Vendor Specific (VSP)—Offset A0h

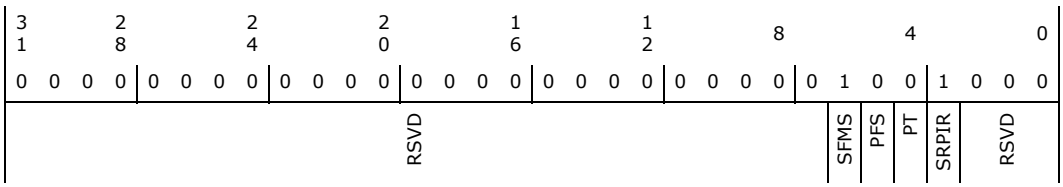
Vendor Specific

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 48h



Bit Range	Default and Access	Field Name (ID): Description
31:7	0h RO	Reserved.
6	1h RO	**Software Feature Mask Supported (SFMS):** Set to 1 if the platform is enabled for premium storage features mask (SFM) as described in VS MMIO space at offset ABAR[RPID.(OFST*4)+4].
5	0h RO	**Premium Features Supported (PFS):** Set to 1 if the platform is enabled for premium storage features (PFB) as described in VS MMIO space at offset ABAR[RPID.OFST*4]. Set to 0 if the platform is not enabled for premium storage features.
4	0h RO	**Platform Type (PT):** Set to 1 if mobile platform. Clear (0) if desktop.
3	1h RO	**Supports RAID Platform ID Reporting (SRPIR):** If set to 1, then indicates that the RAID Platform ID is reported via ABAR + C0h. Set to 0 if this ID is not reported via MMIO space.
2:0	0h RO	Reserved.

24.8.2.10 Vendor Specific Capabilities Register (VS_CAP)—Offset A4h

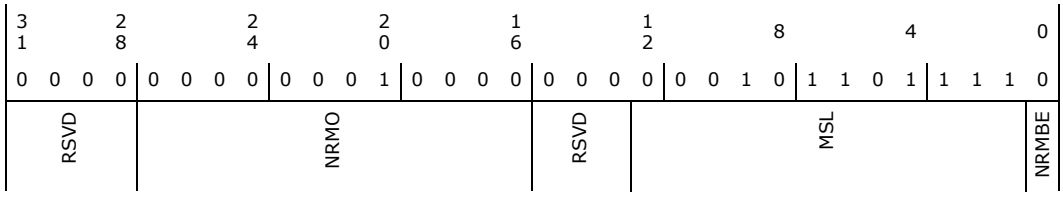
Vendor Specific Capabilities Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 1002DEh



Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:16	10h RW/O	**NVM Remapped Register Offset (NRMO):** Specifies the offset (in 128B unit) within ABAR as to where the PCIe NAND memory BAR register space is remapped. For example, NRMO=1 means ABAR + 128B. This allows the remapped offset to shift between ABAR + 0B, and ABAR + 512KK - 128B, with 128B step. The remapped offset into the AHCI memory space must not overlap with the memory space used for SATA. The remapped offset into the AHCI memory space and the remapped size must not exceed the allocated AHCI memory space of the integrated AHCI controller. Only valid when NRMBE = 1. The reset default of this field is 10h, this places the start of the PCIe NAND memory BAR register space at ABAR + 2K. This field is not reset by FLR.

Bit Range	Default and Access	Field Name (ID): Description
15:13	0h RO	Reserved.
12:1	16Fh RW/O	**Memory Space Limit. (MSL):** This field specifies the size (in 128B unit) of the remapped memory space for the PCIe NAND device. It is a 0-based field. For example, MSL=1 means 256B. This allows the remapped size to shift between 128B and 512K with the step of 128B.Memory BAR offset from 0 to MSL of the PCIe NAND device are remapped under the integrated AHCI controller memory space.The remapped offset into the AHCI memory space and the value programmed in this field must not exceed the allocated AHCI memory space of the integrated AHCI controller. Only valid when NRMBE = 1. The reset default of this field is 16Fh which specifies the size of the remapped memory space as 34k.This field is not reset by FLR.
0	0h RW/O	**PCIe NAND Memory BAR Remapped Enable (NRMBE):** Set to 1 if a PCIe NAND device is present and remapping of its memory BAR register space is enabled. Cleared to 0 if there is no PCIe NAND device present or the remapping of its memory BAR register space is disabled. This bit is not reset by FLR.

24.8.2.11 RAID Platform ID (RPID)—Offset C0h

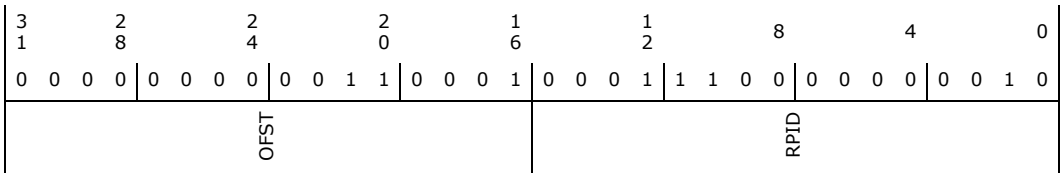
RAID Platform ID. This register is used by the Intel Matrix Storage Manager OROM to match the features supported by the OROM with the platform on which the OROM is executing. This prevents the use of an OROM designed for newer chipsets from being use on older chipsets as this could reduce up-sell potential.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: A206h



Bit Range	Default and Access	Field Name (ID): Description
31:16	31h RO	**Offset (OFST):** The offset of the Premium Feature Block (PFB) in DWords from the beginning of the ABAR. SFM follows directly after PFB.
15:0	1C02h RO	**RAID Platform ID (RPID):** Specifies the DID value that has been assigned to the platform. This is the same DID that is reported by the SATA controller when SATAGC.AIE is set to 1 except that the DID is always reported through this register, regardless if the programming of SATAGC.AIE.

24.8.2.12 Premium Feature Block (PFB)—Offset C4h

Premium Feature Block.

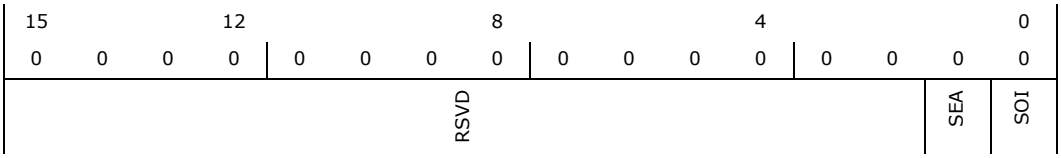
Note: Bits 4-0 are not bit-mapped to individual fuses and/or soft SKU settings; rather a single fuse FFSATA5 and FFSATA 3 /soft sku is used to indicate support for all of these features (refer to VSP.PFS). These registers indicate to the Intel Rapid Storage Technology AHCI driver that those premium RAID features that can be supported on the platform.

Access Method

Type: MEM Register
(Size: 16 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:2	0h RO	Reserved.
1	0h RO	**Supports Email Alert (SEA):** Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.
0	0h RO	**Supports OEM IOCTL (SOI):** Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.

24.8.2.13 SW Feature Mask (SFM)—Offset C8h

SW Feature Mask. The following will be programmed by the BIOS when VS_CAP.SFMS == 1. The feature mask is used by SW to determine which non-premium features shall be supported by SW. These register bits are not reset by FLR since they are programmed by BIOS.

Access Method

Type: MEM Register
(Size: 16 bits)

Device: 23
Function: 0

Default: 3Fh

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1
RSVD				OROM_UI_Normal_Delay		Smart_Response_Technology	IRRT_Only_on_ESATA	LED_Locate	HDDUNLOCK	OROM_UI_and_BANNER	IRRT	R5	R10	R1	R0

Bit Range	Default and Access	Field Name (ID): Description
15:12	0h RO	Reserved.
11:10	0h RW/O	**OROM UI Normal Delay. (OROM_UI_Normal_Delay):** Values of these bits specify the delay of the OROM UI Splash Screen in a normal status. 00 = 2 secs (default and previous value); 01 = 4 secs; 10 = 6 secs; 11 = 8 secs. If bit 5 == 0, then these values are disregarded.
9	0h RW/O	**Smart Response Technology. (Smart_Response_Technology):** If set to '1', then Smart Response Technology is enabled. If cleared to '0', the feature is disabled.
8	0h RW/O	**RRT Only on ESATA (IRRT_Only_on_ESATA):** If set to 1, then only RRT volumes can span internal and external SATA ports (e.g., eSATA). If cleared to 0, then any RAID volume can span internal and external SATA ports (e.g., eSATA).
7	0h RW/O	**LED Locate (LED_Locate):** If set to 1, then LED/SGPIO hardware is attached and the ping to locate feature is enabled in the OS.
6	0h RW/O	**HDDUNLOCK (HDDUNLOCK):** If set to 1, then HDD password unlock is enabled in the OS.
5	1h RW/O	**OROM UI and BANNER (OROM_UI_and_BANNER):** If set to 1, then the OROM UI is displayed. When cleared to 0, the OROM UI and BANNER are not displayed if all disks and volumes have a normal status.
4	1h RW/O	**RRT (IRRT):** If set to 1, then Rapid Recovery Technology is enabled.
3	1h RW/O	**R5 (R5):** If set to 1, then RAID5 is enabled.
2	1h RW/O	**R10 (R10):** If set to 1, then RAID10 is enabled.
1	1h RW/O	**R1 (R1):** If set to 1, then RAID1 is enabled.
0	1h RW/O	**R0 (R0):** If set to 1, then RAID0 is enabled.

24.8.2.14 Port 0 Command List Base Address (P0CLB)—Offset 100h

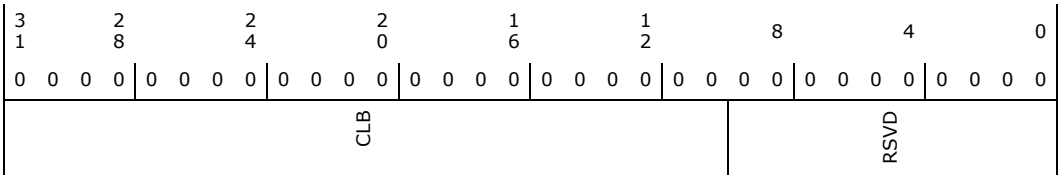
Port 0 Command List Base Address

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:10	0h RW	**Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute. This address must be 1K aligned as indicated by bits 31:10 being read/write. Note that these bits are not reset on a HBA reset.
9:0	0h RO	Reserved.

24.8.2.15 Port 0 Command List Base Address Upper 32-bits (P0CLBU)—Offset 104h

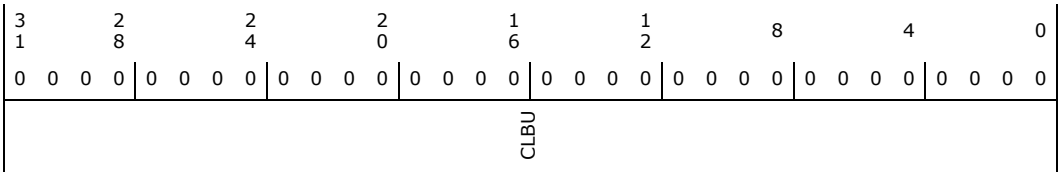
Port 0 Command List Base Address Upper 32-bits

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. Note that these bits are not reset on a HBA reset.

24.8.2.16 Port 0 FIS Base Address (P0FB)—Offset 108h

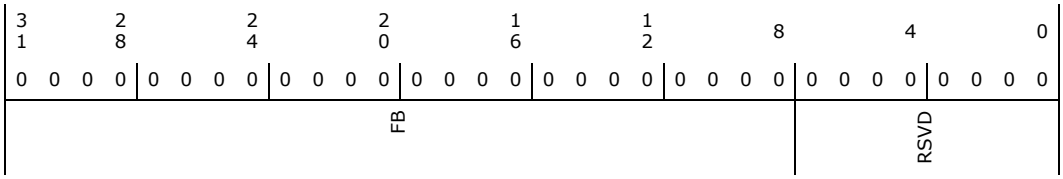
Port 0 FIS Base Address

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RW	**FIS Base Address (FB):** Indicates the 32-bit base for received FISes. This address must be 256-byte aligned as indicated by bits 31:08 being read/write. When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned. Note that these bits are not reset on a HBA reset.
7:0	0h RO	Reserved.

24.8.2.17 Port 0 FIS Base Address Upper 32-Bits (P0FBU)—Offset 10Ch

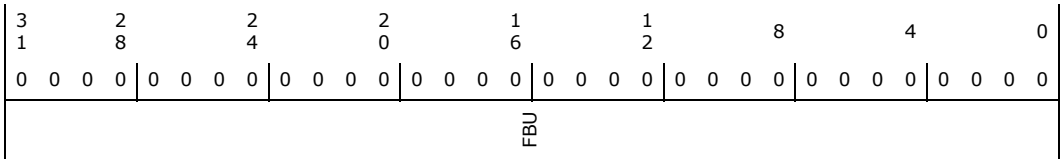
Port 0 FIS Base Address Upper 32-bits

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port. Note that these bits are not reset on a HBA reset.

24.8.2.18 Port 0 Interrupt Status (P0IS)—Offset 110h

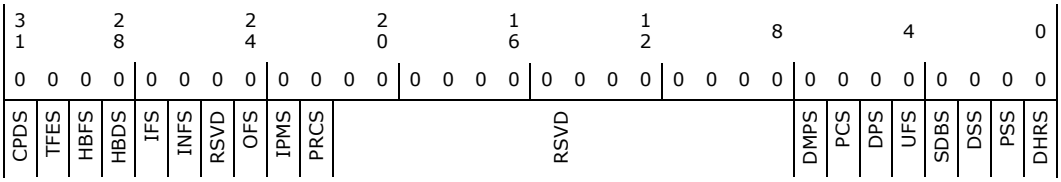
Port 0 Interrupt Status

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	**Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW/1C	**Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0h RW/1C	**Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0h RW/1C	**Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0h RW/1C	**Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0h RW/1C	**Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0h RO	Reserved.
24	0h RW/1C	**Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0h RW/1C	**Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected. The IPMS bit may be set during emuneration process. It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier.
22	0h RO	**PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0h RO	Reserved.
7	0h RW/1C	**Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0h RO	**Port Connect Change Status (PCS):** 1=Change in Current Connect Status. 0=No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0h RW/1C	**Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data.

Bit Range	Default and Access	Field Name (ID): Description
4	0h RO	**Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.
3	0h RW/1C	**Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0h RW/1C	**DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0h RW/1C	**PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0h RW/1C	**Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

24.8.2.19 Port 0 Interrupt Enable (P0IE)—Offset 114h

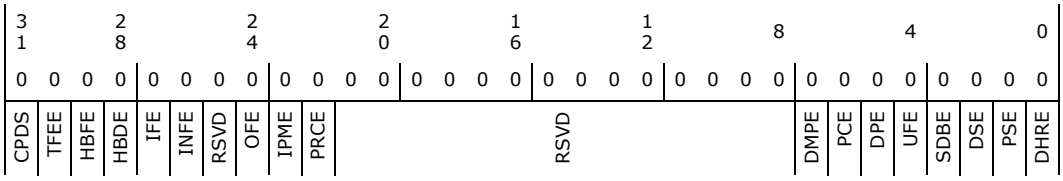
Port 0 Interrupt Enable

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	**Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW	**Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.
29	0h RW	**Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0h RW	**Host Bus Data Error Enable (HBDE):** When set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0h RW	**Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0h RW	**Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
24	0h RW	**Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0h RW	**Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt. BIOS is required to program this field to '0'. The same applies to AHCI driver.
22	0h RW	**PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0h RO	Reserved.
7	0h RW	**Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.
6	0h RW	**Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0h RW	**Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0h RW	**Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0h RW	**Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0h RW	**DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0h RW	**PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0h RW	**Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

24.8.2.20 Port 0 Command (P0CMD)—Offset 118h

Port 0 Command

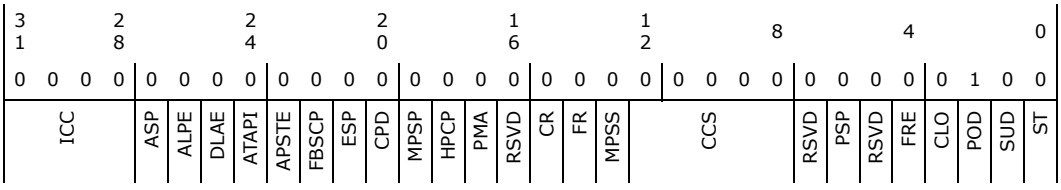
Access Method

Type: MEM Register (Size: 32 bits)

Device: 23

Function: 0

Default: 4h



Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RW	**Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect.

Bit Range	Default and Access	Field Name (ID): Description
27	0h RW	**Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. If CAP.SALP is cleared to 0., software shall treat this bit as reserved.
26	0h RW	**Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit. Software shall only set this bit to 1 if CAP.SALP is set to 1. If CAP.SALP is cleared to 0, software shall treat this bit as reserved. BIOS is recommended to program this field to 1.
25	0h RW	**Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0. This bit is set by software
24	0h RW	**Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0h RW	**Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved.
22	0h RO	**FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching.
21	0h RW/O	**External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to '1', then the port may experience hot plug events.
20	0h RO	**Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect.
19	0h RW/O	**Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0h RW/O	**Hot Plug Capable Port (HPCP):** This indicates whether the this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0h RO	**Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port. When cleared, a Port Multiplier is not attached to the HBA for this port. This bit is a read only 0. when CAP.PMS = 0., and read/write when CAP.PMS = 1. Note that this bit is set by software; hardware does not auto-detect that a Port Multiplier is attached.
16	0h RO	Reserved.
15	0h RO	**Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running.
14	0h RO	**FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running. Note to software: When FR bit stays set, read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any
13	0h RO	**Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.

Bit Range	Default and Access	Field Name (ID): Description
12:8	0h RO	**Current Command Slot (CCS):** Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7	0h RO	Reserved.
6	0h RO	**PHYSLP Present (PSP):** If set to '1', the platform supports PHYSLP on this port. If cleared to '0', the platform does not support PHYSLP on this port. This bit may only be set to '1' if CAP2.SPS is set to '1'.
5	0h RO	Reserved.
4	0h RW	**FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0h RW/1S	**Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.
2	1h RO	**Power On Device (POD):** The SATA controller does not support cold presence detect.
1	0h RW	**Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1. for HBAs that do not support staggered spin-up. On an edge detect from 0. to 1, the HBA shall start a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0h RW	**Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

24.8.2.21 Port 0 Task File Data (P0TFD)—Offset 120h

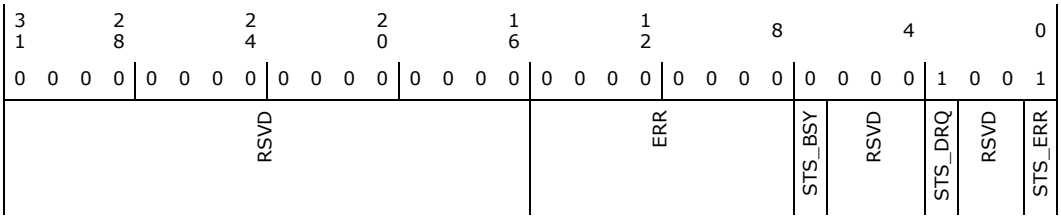
Port 0 Task File Data

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 9h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:8	0h RO	**Error (ERR):** Contains the latest copy of the task file error register.
7	0h RO	**Status Busy (STS_BSY):** Status - Indicates the interface is busy.
6:4	0h RO	Reserved.
3	1h RO	**Status Drq (STS_DRQ):** Status - Indicates a data transfer is requested.
2:1	0h RO	Reserved.
0	1h RO	**Status Err (STS_ERR):** Status - Indicates an error during the transfer.

24.8.2.22 Port 0 Signature (P0SIG)—Offset 124h

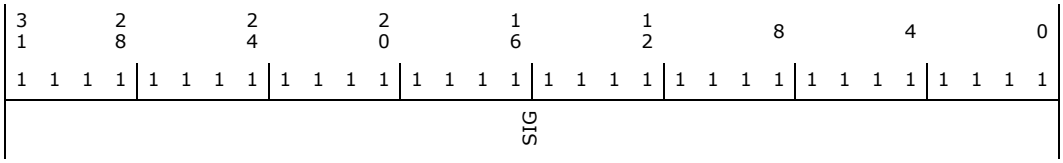
Port 0 Signature

Access Method

Type: MEM Register (Size: 32 bits)

Device: 23
Function: 0

Default: FFFFFFFFh



Bit Range	Default and Access	Field Name (ID): Description
31:0	FFFFFFFFh RO	**Signature (SIG):** Contains the signature received from a device on the first D2H Register FIS.

24.8.2.23 Port 0 Serial ATA Status (P0SSTS)—Offset 128h

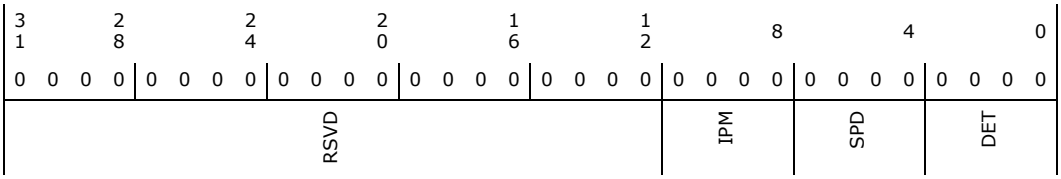
Port 0 Serial ATA Status

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:12	0h RO	Reserved.
11:8	0h RO	**Interface Power Management (IPM):** Indicates the current interface state
7:4	0h RO	**Current Interface Speed (SPD):** Indicates the negotiated interface communication speed.
3:0	0h RO	**Device Detection (DET):** Indicates the interface device detection and PHY state.

24.8.2.24 Port 0 Serial ATA Control (P0SCTL)—Offset 12Ch

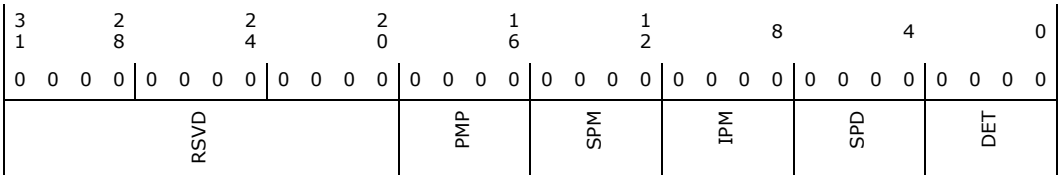
Port 0 Serial ATA Control

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:20	0h RO	Reserved.
19:16	0h RW	**Port Multiplier Port (PMP):** This field is not used by AHCI.
15:12	0h RW	**Select Power Management (SPM):** This field is not used by AHCI.
11:8	0h RW	**Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state.
7:4	0h RW	**Speed Allowed (SPD):** Indicates the highest allowable speed of the interface.
3:0	0h RW	**Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization.

24.8.2.25 Port 0 Serial ATA Error (P0SERR)—Offset 130h

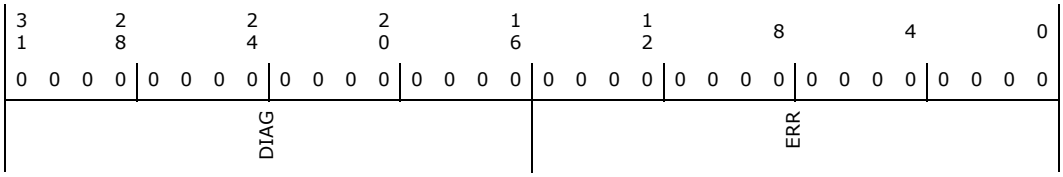
Port 0 Serial ATA Error

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW/1C	**Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes.
15:0	0h RW/1C	**Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer.

24.8.2.26 Port 0 Serial ATA Active (P0SACT)—Offset 134h

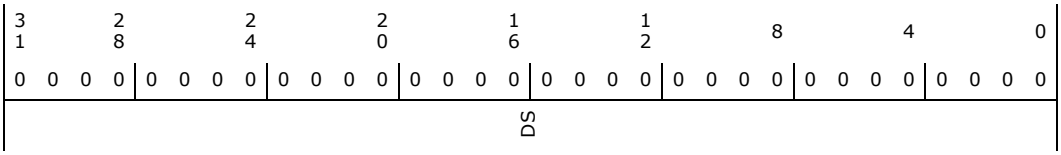
Port 0 Serial ATA Active

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/1S	**Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry. This field is cleared via the Set Device Bits FIS.

24.8.2.27 Port 0 Command Issue (P0CI)—Offset 138h

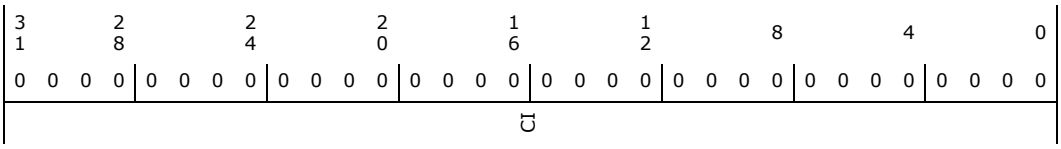
Port 0 Commands Issued

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1.

24.8.2.28 Port 0 SNotification (P0SNTF)—Offset 13Ch

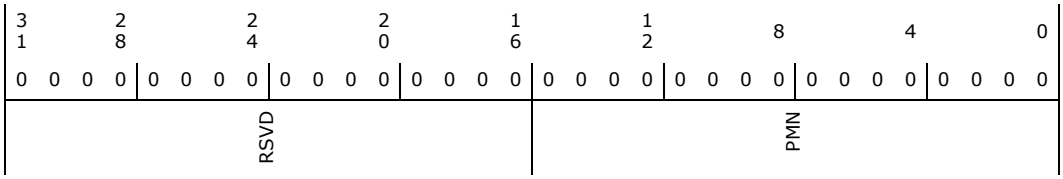
Port 0 SNotification

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW/1C	**PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set. PM Port 0h sets bit 0. PM Port Fh sets bit 15. Individual bits are cleared by software writing 1's to the corresponding bit positions. Note that, while this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST

24.8.2.29 Port 0 Device Sleep (P0DEVSLP)—Offset 144h

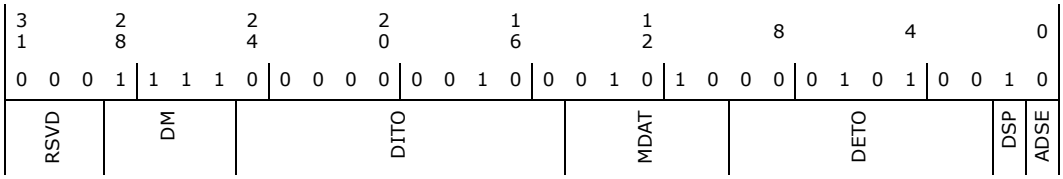
Port 0 Device Sleep

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 1E022852h



Bit Range	Default and Access	Field Name (ID): Description
31:29	0h RO	Reserved.
28:25	Fh RW/O	**DITO Multiplier (DM):** 0's based value that specifies the DITO multiplier that the HBA applies to the specified DITO value, effectively extending the range of DITO from 1ms to 16368ms. A value of 0h indicates a multiplier of 1. A maximum multiplier of 16 may be applied. The HBA computes the total idle timeout as a product of DM and DITO (i.e., DITO actual = DITO * DM).

Bit Range	Default and Access	Field Name (ID): Description
24:15	4h RW	**DEVSLP Idle Timeout (DITO):** This field specifies the amount of the time (in approximate 1ms granularity) that the HBA shall wait before driving the DEVSLP signal.Hardware reloads its port specific DEVSLP timer with this value each time the port transitions out of DEVSLP state. For example: from DEVSLP to active or PxDEVSLP.ADSE transitions from 0 to a 1. If CAP2.SDS or CAP2.SADM or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0 and PxDEVSLP.ADSE is cleared to 0.
14:10	Ah RW	**DEVSLP Minimum Assertion Time (MDAT):** This field specifies the minimum amount of time (in 1ms granularity) that the HBA must assert the DEVSLP signal before it may be de-asserted. The nominal value is 10ms and the minimum is 1ms depending on device identification information. If CAP2.SDS is cleared to 0 or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0, PxDEVSLP.ADSE is cleared to 0, and prior to setting PxCMD.ICC to 8h.
9:2	14h RW	**DEVSLP Exit Timeout (DETO):** This field specifies the maximum duration (in approximate 1ms granularity) from DEVSLP de-assertion until the device is ready to accept OOB. The nominal value is 20ms while the max value is 255ms depending on device identification information. If CAP2.SDS is cleared to 0 or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0, PxDEVSLP.ADSE is cleared to 0, and prior to setting PxCMD.ICC to 8h.
1	1h RW/O	**DEVSLP Present (DSP):** If set to '1', the platform supports DEVSLP on this port. If cleared to '0', the platform does not support DEVSLP on this port. This bit may only be set to '1' if CAP2.SDS is set to '1'.DSP is mutually exclusive with the PxCMD.HPCP bit and PxCMD.ESP bit. Note that these bits are not reset on a HBA reset.
0	0h RW	**Aggressive DEVSLP Enable (ADSE):** This bit is read/write for HBAs that support aggressive DEVSLP management (CAP2. SADM = ?1?). When this bit is set to ?1?, the HBA shall assert the DEVSLP signal after the port has been idle (PxCI = 0h and PxSACT = 0h) for the amount of time specified by the PxDEVSLP.DITO register and the interface is in Slumber (PxSSTS.IPM = 6h). When this bit is cleared to ?0?, the HBA does not enter DEVSLP unless software directed via PxCMD.ICC. This bit shall only be set to ?1? if PxDEVSLP.DSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the DEVSLP signal if asserted. Note that these bits are not reset on a HBA reset. BIOS is recommended to program this field to 1 if the platform support the DEVSLP feature. If CAP2.SDS is cleared to 0 or CAP2.SADM is cleared to 0, or if PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved.

24.8.2.30 Port 1 Command List Base Address (P1CLB)—Offset 180h

Same bit definition as P0CLB.

24.8.2.31 Port 1 Command List Base Address Upper 32-bits (P1CLBU)—Offset 184h

Same bit definition as P0CLBU.

24.8.2.32 Port 1 FIS Base Address (P1FB)—Offset 188h

Same bit definition as P0FB.

24.8.2.33 Port 1 FIS Base Address Upper 32-bits (P1FBU)—Offset 18Ch

Same bit definition as P0FBU.

24.8.2.34 Port 1 Interrupt Status (P1IS)—Offset 190h

Same bit definition as P0IS.

24.8.3 Port 1 Interrupt Enable (P1IE)—Offset 194h

Same bit definition as P0IE.

24.8.3.1 Port 1 Command (P1CMD)—Offset 198h

Same bit definition as P0CMD.

24.8.3.2 Port 1 Task File Data (P1TFD)—Offset 1A0h

Same bit definition as P0TFD.

24.8.3.3 Port 1 Signature (P1SIG)—Offset 1A4h

Same bit definition as P0SIG.

24.8.3.4 Port 1 Serial ATA Status (P1SSTS)—Offset 1A8h

Same bit definition as P0SSTS.

24.8.3.5 Port 1 Serial ATA Control (P1SCTL)—Offset 1ACh

Same bit definition as P0SCTL.

24.8.3.6 Port 1 Serial ATA Error (P1SERR)—Offset 1B0h

Same bit definition as P0SERR.

24.8.3.7 Port 1 Serial ATA Active (P1SACT)—Offset 1B4h

Same bit definition as P0SACT.

24.8.3.8 Port 1 Command Issue (P1CI)—Offset 1B8h

Same bit definition as P0CI.

24.8.3.9 Port 1 SNotification (P1SNTF)—Offset 1BCh

Same bit definition as P0SNTF.

24.8.3.10 Port 1 Device Sleep (P1DEVSLP)—Offset 1C4h

Same bit definition as P0DEVSLP.

24.8.3.11 Port 2 Command List Base Address (P2CLB)—Offset 200h

Same bit definition as P0CLB.

24.8.3.12 Port 2 Command List Base Address Upper 32-bits (P2CLBU)—Offset 204h

Same bit definition as P0CLBU.

24.8.3.13 Port 2 FIS Base Address (P2FB)—Offset 208h

Same bit definition as P0FB.

24.8.3.14 Port 2 FIS Base Address Upper 32-bits (P2FBU)—Offset 20Ch

Same bit definition as P0FBU.

24.8.3.15 Port 2 Interrupt Status (P2IS)—Offset 210h

Same bit definition as P0IS.

24.8.3.16 Port 2 Interrupt Enable (P2IE)—Offset 214h

Same bit definition as P0IE.

24.8.3.17 Port 2 Command (P2CMD)—Offset 218h

Same bit definition as P0CMD.

24.8.3.18 Port 2 Task File Data (P2TFD)—Offset 220h

Same bit definition as P0TFD.

24.8.3.19 Port 2 Signature (P2SIG)—Offset 224h

Same bit definition as P0SIG.

24.8.3.20 Port 2 Serial ATA Status (P2SSTS)—Offset 228h

Same bit definition as P0SSTS.

24.8.3.21 Port 2 Serial ATA Control (P2SCTL)—Offset 22Ch

Same bit definition as P0SCTL.

24.8.3.22 Port 2 Serial ATA Error (P2SERR)—Offset 230h

Same bit definition as P0SERR.

24.8.3.23 Port 2 Serial ATA Active (P2SACT)—Offset 234h

Same bit definition as P0SACT.

24.8.3.24 Port 2 Command Issue (P2CI)—Offset 238h

Same bit definition as P0CI.

24.8.3.25 Port 2 SNotification (P2SNTF)—Offset 23Ch

Same bit definition as P0SNTF.

24.8.3.26 Port 2 Device Sleep (P2DEVSLP)—Offset 244h

Same bit definition as P0DEVSLP.

24.8.3.27 Port 3 Command List Base Address (P3CLB)—Offset 280h

Same bit definition as P0CLB.

24.8.3.28 Port 3 Command List Base Address Upper 32-bits (P3CLBU)—Offset 284h

Same bit definition as P0CLBU.

24.8.3.29 Port 3 FIS Base Address (P3FB)—Offset 288h

Same bit definition as P0FB.

24.8.3.30 Port 3 FIS Base Address Upper 32-bits (P3FBU)—Offset 28Ch

Same bit definition as P0FBU.

24.8.3.31 Port 3 Interrupt Status (P3IS)—Offset 290h

Same bit definition as P0IS.

24.8.3.32 Port 3 Interrupt Enable (P3IE)—Offset 294h

Same bit definition as P0IE.

24.8.3.33 Port 3 Command (P3CMD)—Offset 298h

Same bit definition as P0CMD.

24.8.3.34 Port 3 Task File Data (P3TFD)—Offset 2A0h

Same bit definition as P0TFD.

24.8.3.35 Port 3 Signature (P3SIG)—Offset 2A4h

Same bit definition as P0SIG.

24.8.3.36 Port 3 Serial ATA Status (P3SSTS)—Offset 2A8h

Same bit definition as P0SSTS.

24.8.3.37 Port 3 Serial ATA Control (P3SCTL)—Offset 2ACh

Same bit definition as P0SCTL.

24.8.3.38 Port 3 Serial ATA Error (P3SERR)—Offset 2B0h

Same bit definition as P0SERR.

24.8.3.39 Port 3 Serial ATA Active (P3SACT)—Offset 2B4h

Same bit definition as P0SACT.

24.8.3.40 Port 3 Commands Issued (P3CI)—Offset 2B8h

Same bit definition as P0CI.

24.8.3.41 Port 3 SNotification (P3SNTF)—Offset 2BCh

Same bit definition as P0SNTF.

24.8.3.42 Port 3 Device Sleep (P3DEVSLP)—Offset 2C4h

Same bit definition as P0DEVSLP.

24.8.3.43 Port 4 Command List Base Address (P4CLB)—Offset 300h

Same bit definition as P0CLB.

24.8.3.44 Port 4 Command List Base Address Upper 32-bits (P4CLBU)—Offset 304h

Same bit definition as P0CLBU.

24.8.3.45 Port 4 FIS Base Address (P4FB)—Offset 308h

Same bit definition as P0FB.

24.8.3.46 Port 4 FIS Base Address Upper 32-bits (P4FBU)—Offset 30Ch

Same bit definition as P0FBU.

24.8.3.47 Port 4 Interrupt Status (P4IS)—Offset 310h

Same bit definition as P0IS.

24.8.3.48 Port 4 Interrupt Enable (P4IE)—Offset 314h

Same bit definition as P0IE.

24.8.3.49 Port 4 Command (P4CMD)—Offset 318h

Same bit definition as P0CMD.

24.8.3.50 Port 4 Task File Data (P4TFD)—Offset 320h

Same bit description as P0TFD.

24.8.3.51 Port 4 Signature (P4SIG)—Offset 324h

Same bit description as P0SIG.

24.8.3.52 Port 4 Serial ATA Status (P4SSTS)—Offset 328h

Same bit description as P0SSTS.

24.8.3.53 Port 4 Serial ATA Control (P4SCTL)—Offset 32Ch

Same bit description as P0SCTL.

24.8.3.54 Port 4 Serial ATA Error (P4SERR)—Offset 330h

Same bit description as P0SERR.

24.8.3.55 Port 4 Serial ATA Active (P4SACT)—Offset 334h

Same bit description as P0SACT.

24.8.3.56 Port 4 Commands Issued (P4CI)—Offset 338h

Same bit description as P0CI.

24.8.3.57 Port 4 SNotification (P4SNTF)—Offset 33Ch

Same bit description as P0SNTF.

24.8.3.58 Port 4 Device Sleep (P4DEVSLP)—Offset 344h

Same bit description as P0DEVSLP.

24.8.3.59 Port 5 Command List Base Address (P5CLB)—Offset 380h

Same bit description as P0CLB.

24.8.3.60 Port 5 Command List Base Address Upper 32-bits (P5CLBU)—Offset 384h

Same bit definition as P0CLBU.

24.8.3.61 Port 5 FIS Base Address (P5FB)—Offset 388h

Same bit definition as P0FB.

24.8.3.62 Port 5 FIS Base Address Upper 32-bits (P5FBU)—Offset 38Ch

Same bit definition as P0FBU.

24.8.3.63 Port 5 Interrupt Status (P5IS)—Offset 390h

Same bit definition as P0IS.

24.8.3.64 Port 5 Interrupt Enable (P5IE)—Offset 394h

Same bit definition as P0IE.

24.8.3.65 Port 5 Command (P5CMD)—Offset 398h

Same bit definition as P0CMD.

24.8.3.66 Port 5 Task File Data (P5TFD)—Offset 3A0h

Same bit definition as P0TFD.

24.8.3.67 Port 5 Signature (P5SIG)—Offset 3A4h

Same bit definition as P0SIG.

24.8.3.68 Port 5 Serial ATA Status (P5SSTS)—Offset 3A8h

Same bit definition as P0SSTS.

24.8.3.69 Port 5 Serial ATA Control (P5SCTL)—Offset 3ACh

Same bit definition as P0SCTL.

24.8.3.70 Port 5 Serial ATA Error (P5SERR)—Offset 3B0h

Same bit definition as P0SERR.

24.8.3.71 Port 5 Serial ATA Active (P5SACT)—Offset 3B4h

Same bit definition as P0SACT.

24.8.3.72 Port 5 Commands Issued (P5CI)—Offset 3B8h

Same bit definition as P0CI.

24.8.3.73 Port 5 SNotification (P5SNTF)—Offset 3BCh

Same bit definition as P0SNTF.

24.8.3.74 Port 5 Device Sleep (P5DEVSLP)—Offset 3C4h

Same bit definition as P0DEVSLP.

24.8.3.75 Port 6 Command List Base Address (P6CLB)—Offset 400h

Same bit definition as P0CLB.

24.8.3.76 Port 6 Command List Base Address Upper 32-bits (P6CLBU)—Offset 404h

Same bit definition as P0CLBU.

24.8.3.77 Port 6 FIS Base Address (P6FB)—Offset 408h

Same bit definition as P0FB.

24.8.3.78 Port 6 FIS Base Address Upper 32-bits (P6FBU)—Offset 40Ch

Same bit definition as P0FBU.

24.8.3.79 Port 6 Interrupt Status (P6IS)—Offset 410h

Same bit definition as P0IS.

24.8.3.80 Port 6 Interrupt Enable (P6IE)—Offset 414h

Same bit definition as P0IE.

24.8.3.81 Port 6 Command (P6CMD)—Offset 418h

Same bit definition as P0CMD.

24.8.3.82 Port 6 Task File Data (P6TFD)—Offset 420h

Same bit definition as P0TFD.

24.8.3.83 Port 6 Signature (P6SIG)—Offset 424h

Same bit definition as P0SIG.

24.8.3.84 Port 6 Serial ATA Status (P6SSTS)—Offset 428h

Same bit definition as P0SSTS.

24.8.3.85 Port 6 Serial ATA Control (P6SCTL)—Offset 42Ch

Same bit definition as P0SCTL.

24.8.3.86 Port 6 Serial ATA Error (P6SERR)—Offset 430h

Same bit definition as P0SERR.

24.8.3.87 Port 6 Serial ATA Active (P6SACT)—Offset 434h

Same bit definition as P0SACT.

24.8.3.88 Port 6 Commands Issued (P6CI)—Offset 438h

Same bit definition as P0CI.

24.8.3.89 Port 6 SNotification (P6SNTF)—Offset 43Ch

Same bit definition as P0SNTF.

24.8.3.90 Port 6 Device Sleep (P6DEVSLP)—Offset 444h

Same bit definition as P0DEVSLP.

24.8.3.91 Port 7 Command List Base Address (P7CLB)—Offset 480h

Same bit definition as P0CLB.

24.8.3.92 Port 7 Command List Base Address Upper 32-bits (P7CLBU)—Offset 484h

Same bit definition as P0CLBU.

24.8.3.93 Port 7 FIS Base Address (P7FB)—Offset 488h

Same bit definition as P0FB.

24.8.3.94 Port 7 FIS Base Address Upper 32-bits (P7FBU)—Offset 48Ch

Same bit definition as P0FBU.

24.8.3.95 Port 7 Interrupt Status (P7IS)—Offset 490h

Same bit definition as P0IS.

24.8.3.96 Port 7 Interrupt Enable (P7IE)—Offset 494h

Same bit definition as P0IE.

24.8.3.97 Port 7 Command (P7CMD)—Offset 498h

Same bit definition as P0CMD.

24.8.3.98 Port 7 Task File Data (P7TFD)—Offset 4A0h

Same bit definition as P0TFD.

24.8.3.99 Port 7 Signature (P7SIG)—Offset 4A4h

Same bit definition as P0SIG.

24.8.3.100 Port 7 Serial ATA Status (P7SSTS)—Offset 4A8h

Same bit definition as P0SSTS.

24.8.3.101 Port 7 Serial ATA Control (P7SCTL)—Offset 4ACh

Same bit definition as P0SCTL.

24.8.3.102 Port 7 Serial ATA Error (P7SERR)—Offset 4B0h

Same bit definition as P0SERR.

24.8.3.103 Port 7 Serial ATA Active (P7SACT)—Offset 4B4h

Same bit definition as P0SACT.

24.8.3.104 Port 7 Commands Issued (P7CI)—Offset 4B8h

Same bit definition as P0CI.

24.8.3.105 Port 7 SNotification (P7SNTF)—Offset 4BCh

Same bit definition as P0SNTF.

24.8.3.106 Port 7 Device Sleep (P7DEVSLP)—Offset 4C4h

Same bit definition as P0DEVSLP.

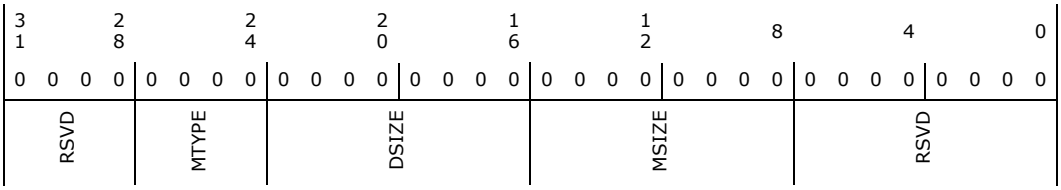
24.8.3.107 Enclosure Management Message Format (EM_MF)—Offset 580h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:24	0h RW	**Message Type (MTYPE):** Specifies the type of the message. The message types are: 0h = LED; 1h = SAF-TE; 2h = SES-2; 3h = SGPIO (register based interface); All other values reserved.

Bit Range	Default and Access	Field Name (ID): Description
23:16	0h RW	**Data Size (DSIZE):** Specifies the data size in bytes. If the message (enclosure services command) has a data buffer that is associated with it that is transferred, the size of that data buffer is specified in this field. If there is no separate data buffer, this field shall have a value of '0'. The data directly follows the message in the message buffer. This value should always be '0'.
15:8	0h RW	**Message Size (MSIZE):** Specifies the size of the message in bytes. The message size does not include the one Dword header. A value of '0'. is invalid. The message size is always 4 bytes.
7:0	0h RO	Reserved.

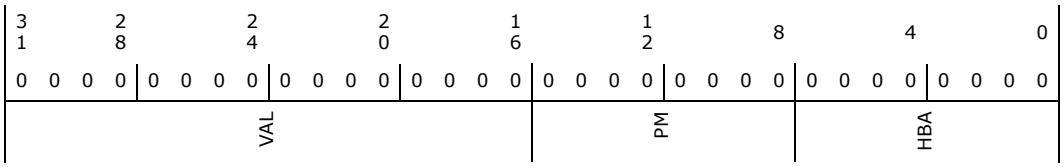
24.8.3.108 Enclosure Management LED (EM_LED)—Offset 584h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW	**Value (VAL):** This field describes the state of each LED for a particular location. There are three LEDs that may be supported by the HBA. Each LED has 3 bits of control. LED values are: 000b - LED must be off 001b - LED must be solid on as perceived by human eye; All other values reserved. The LED bit locations are: Bits 2:0 - Activity LED (may be driven by hardware) Bits 5:3 - Vendor Specific LED (e.g., locate) Bits 8:6 - Vendor Specific LED (e.g., fault) Bits 15:9 - Reserved. Vendor specific message is: Bit 3:0 - Vendor Specific Pattern Bit 15:4 - Reserved. ***Note:*** If Activity LED Hardware Driven (ATTR.ALHD) bit is set, host will output the hardware LED value sampled internally and will ignore software written activity value on bit [2:0]. Since Enclosure Management does not support port multiplier based LED message, the LED message will be generated independently based on respective port's operation activity. Vendor specific LED values Locate (Bits 5:3) and Fault (Bits 8:6) always are driven by software.
15:8	0h RW	**Port Multiplier Information (PM):** Specifies slot specific information related to Port Multiplier. Bits 3:0 specify the Port Multiplier port number for the slot that requires the status update. If a Port Multiplier is not attached to the device in the affected slot, the Port Multiplier port number shall be '0'. Bits 7:4 are reserved. SATA does not support LED messages for devices behind a Port Multiplier. This byte should be 0.
7:0	0h RW	**HBA Information (HBA):** Specifies slot specific information related to the HBA. Bits 4:0 - HBA port number for the slot that requires the status update. Bit 5 - If set to '1', Value is a vendor specific message that applies to the entire enclosure. If cleared to '0', Value applies to the port specified in bits 4:0. Bits 7:6 - Reserved.

24.8.4 SATA AIDP Registers Summary

Table 24-3. Summary of SATA AIDP Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
10h	13h	AHCI Index Register (INDEX)—Offset 10h	0h
14h	17h	AHCI Data Register (DATA)—Offset 14h	0h

24.8.4.1 AHCI Index Register (INDEX)—Offset 10h

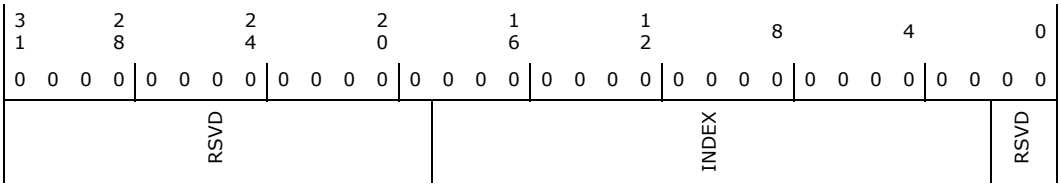
AHCI Index Register. This registers are only available if CC.SCC is not 01h to index into all memory registers defined in Memory Registers and the message buffer used for enclosure management. If CC.SCC is 01h, these AHCI Index Data Pair registers are not accessible and SINDEX/SDATA register pair shall be used to index into a subset of the memory registers defined in (See Memory Registers for more information on which registers could be indexed).

Access Method

Type: I/O Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:19	0h RO	Reserved.
18:2	0h RW	**Index (INDEX):** This Index register is used to select the Dword offset of the Memory Mapped AHCI register to be accessed. A Dword, Word or Byte access is specified by the active byte enables of the I/O access to the Data register.
1:0	0h RO	Reserved.

24.8.4.2 AHCI Data Register (DATA)—Offset 14h

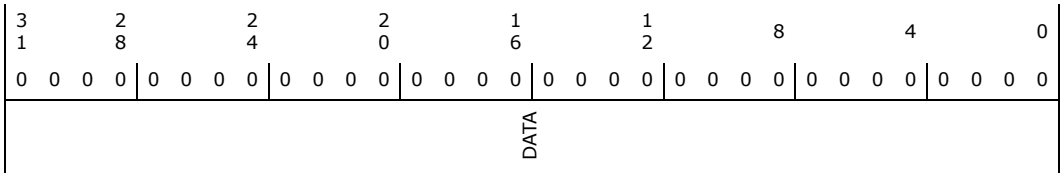
AHCI Data Register. This registers are index into all memory registers defined in Memory Registers and the message buffer used for enclosure management.

Access Method

Type: I/O Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Data (DATA):** This Data register is a window through which data is read or written to the memory mapped register pointed to by the Index register. Note that a physical register is not actually implemented as the data is actually stored in the memory mapped registers. Since this is not a physical register, the default value is the same as the default value of the register pointed to by Index.

24.8.5 SATA MXTBA Registers Summary

Table 24-4. Summary of SATA MXTBA Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	MSI-X Table Entries 0 Message Lower Address (MXTE0MLA)—Offset 0h	0h
4h	7h	MSI-X Table Entries 0 Message Upper Address (MXTE0MUA)—Offset 4h	0h
8h	Bh	MSI-X Table Entries 0 Message Data (MXTE0MD)—Offset 8h	0h
Ch	Fh	MSI-X Table Entries 0 Vector Control (MXTE0VC)—Offset Ch	1h

24.8.5.1 MSI-X Table Entries 0 Message Lower Address (MXTE0MLA)—Offset 0h

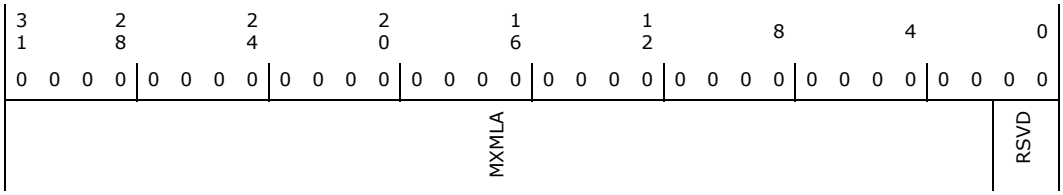
MSI-X Table Entries 0 Message Lower Address

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**MSI-X message lower address (MXMLA):** Specifies the lower 32-bit of the DWORD-aligned address (Addr[31:02]) of the MSI-X Message.
1:0	0h RO	Reserved.

24.8.5.2 MSI-X Table Entries 0 Message Upper Address (MXTE0MUA)—Offset 4h

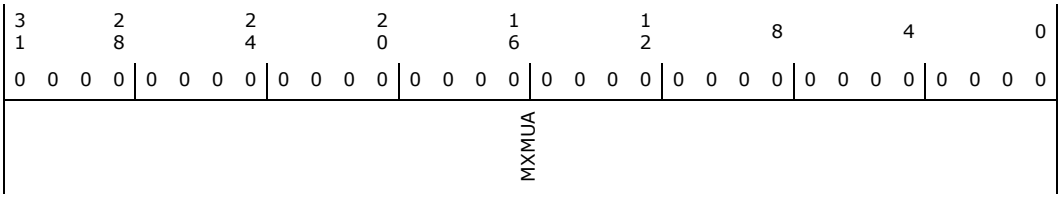
MSI-X Table Entries 0 Message Upper Address

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI-X message upper 32-bit address (MXMUA):** Specifies the lower 32-bit of the DWORD-aligned address (Addr[31:02]) of the MSI-X Message.

24.8.5.3 MSI-X Table Entries 0 Message Data (MXTE0MD)—Offset 8h

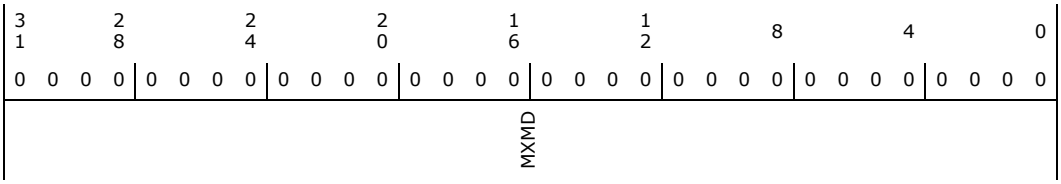
MSI-X Table Entries 0 Message Data

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI-X message Data (MXMD):** Specifies the 32-bit Data of the MSI-X Message.

24.8.5.4 MSI-X Table Entries 0 Vector Control (MXTE0VC)—Offset Ch

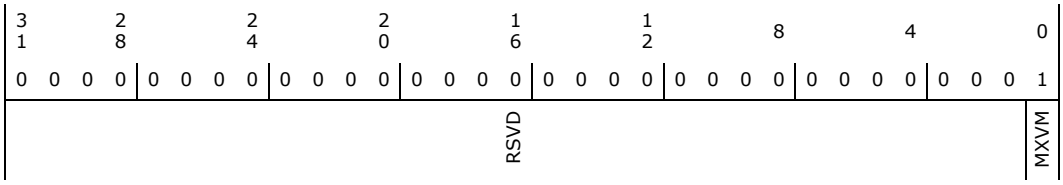
MSI-X Table Entries 0 Vector Control

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	1h RW	**MSI-X vector Mask (MXVM):** When this bit is set, the function is prohibited from sending a message using this MSI-X Table entry. However, any other MSI-X Table entries programmed with the same vector will still be capable of sending an equivalent message unless they are also masked. This bit's state after reset is 1 (entry is masked).

24.8.6 SATA MXPBA Registers Summary

Table 24-5. Summary of SATA MXPBA Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	MSI-X Pending Bit Array QW 0 (MXPQW0_DW0)—Offset 0h	0h

24.8.6.1 MSI-X Pending Bit Array QW 0 (MXPQW0_DW0)—Offset 0h

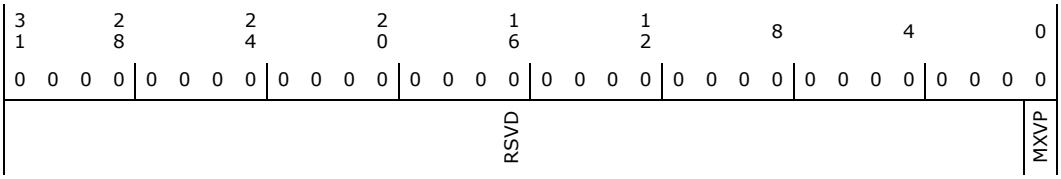
MSI-X Pending Bit Array QW 0

Access Method

Type: MEM Register (Size: 32 bits)

Device: 23
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO	**MSI-X vector Pending (MXVP):** For each Pending Bit that is set, the function has a pending message for the associated MSI-X Table entry. Pending bits that have no associated MSI-X Table entry are reserved. After reset, the state of reserved Pending bits must be 0. Software should never write, and should only read Pending Bits. If software writes to Pending Bits, the result is undefined. Each Pending Bit's state after reset is 0 (no message pending).

24.9 SSATA Port Registers

24.9.1 SSATA Configuration Registers Summary

Table 24-6. Summary of SATA Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Identifiers (ID)—Offset 0h	1C028086h
4h	5h	Command (CMD)—Offset 4h	0h
6h	7h	Device Status (STS)—Offset 6h	210h
8h	8h	Revision ID (RID)—Offset 8h	0h
9h	9h	Programming Interface (PI)—Offset 9h	1h
Ah	Bh	Class Code (CC)—Offset Ah	106h

D4h	D7h	MSI-X Table Offset/Table BIR (MXT)—Offset D4h	0h
D8h	DBh	MSI-X PBA Offset / PBA BIR (MXP)—Offset D8h	0h
E0h	E3h	BIST FIS Control/Status (BFCS)—Offset E0h	0h
E4h	E7h	BIST FIS Transmit Data 1 (BFTD1)—Offset E4h	0h
E8h	EBh	BIST FIS Transmit Data 2 (BFTD2)—Offset E8h	0h

24.9.1.1 Identifiers (ID)—Offset 0h

Identifiers

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 1C028086h

31			28				24				20				16				12				8				4				0
1	0	1	0	0	0	2	0	0	1	0	1	0	0	1	0	1	0	0	0	0	0	0	0	1	0	0	0	0	1	1	0
DID																VID															

Bit Range	Default and Access	Field Name (ID): Description
31:16	A1D2/ A252h RO	**Device ID (DID):** Indicates the Device ID of the SSATA controller. For Super SKUs this will be A252. For Production SKUs it will be A1D2.
15:0	8086h RO	**Vendor ID (VID):** 16-bit field which indicates the company vendor as Intel.

24.9.1.2 Command (CMD)—Offset 4h

Command

Access Method

Type: CFG Register (Size: 16 bits)

Device: 17
Function: 5

Default: 0h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD					ID	RSVD	SEE	RSVD	PEE	RSVD			BME	MSE	IOSE

Bit Range	Default and Access	Field Name (ID): Description
15:11	0h RO	Reserved.
10	0h RW	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts. This bit has no effect on MSI operation. When set, internal INTx# will not be generated. When cleared, internal INTx# are generated if there is an interrupt and MSI is not enabled.
9	0h RO	Reserved.
8	0h RW	**SERR# Enable (SEE):** When set to 1, the HBA is allowed to generate SERR# on DPD or SATAGC.URD event that is enabled for SERR# generation. When cleared to 0, it is not.
7	0h RO	Reserved.
6	0h RW	**Parity Error Response Enable (PEE):** When set, the SATA Controller will corrupt the outbound DATA FIS CRC if a forwarded data parity error is indicated.
5:3	0h RO	Reserved.
2	0h RW	**Bus Master Enable (BME):** Controls the SATA Controller's ability to act as a master for data transfers. This bit does not impact the generation of completions for split transaction commands.
1	0h RW	**Memory Space Enable (MSE):** Controls access to the SATA Controller's target memory space (for AHCI).
0	0h RW	**I/O Space Enable (IOSE):** Controls access to the SATA Controller's target I/O space.

24.9.1.3 Device Status (STS)—Offset 6h

Device Status

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 5

Default: 210h

15			12				8				4				0
0	0	0	0	0	0	1	0	0	0	0	1	0	0	0	0
DPE	SSE	RMA	RTA	STA	DEVT		DPD	RSVD			CL	IS	RSVD		

Bit Range	Default and Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE):** Set when the SATA Controller detects a parity error on its interface.
14	0h RW/1C	**Signaled System Error (SSE):** Set when SATA Controller generates an SERR#.
13	0h RW/1C	**Received Master-Abort Status (RMA):** Set when the SATA Controller receives a master abort to a cycle it generated.
12	0h RW/1C	**Received Target-Abort Status (RTA):** Set when the SATA Controller receives a target abort to a cycle it generated.
11	0h RW/1C	**Signaled Target-Abort Status (STA):** This bit must be set by a target device whenever it terminates a transaction with Target-Abort. Devices that will never signal Target-Abort do not need to implement this bit.
10:9	1h RO	**DEVSEL# Timing Status (DEVT):** Controls the device select time for the SATA Controller's PCI interface.
8	0h RW/1C	**Master Data Parity Error Detected (DPD):** Set when the SATA Controller, as a master, either detects a parity error or sees the parity error line asserted, and the parity error response bit (bit 6 of the command register) is set. This bit can only be set on read completions received from the backbone where there is a parity error.
7:5	0h RO	Reserved.
4	1h RO	**Capabilities List (CL):** Indicates the presence of a capabilities list. The minimum requirement for the capabilities list must be PCI power management for the SATA Controller.
3	0h RO	**Interrupt Status (IS):** Reflects the state of INTx# messages, IRQ14 or IRQ15. This bit is set when the interrupt is to be asserted. This bit is a 0 after the interrupt is cleared.
2:0	0h RO	Reserved.

24.9.1.4 Revision ID (RID)—Offset 8h

Revision ID

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 5

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
RID							

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Revision ID (RID):** Indicates stepping of the host controller hardware.

24.9.1.5 Programming Interface (PI)—Offset 9h

Programming Interface

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 5

Default: 01h

7			4				0
0	0	0	0	0	0	0	1
IF							

Bit Range	Default and Access	Field Name (ID): Description
7:0	1h RO	**Interface (IF):** If CC.SCC=06h(AHCI mode), it indicates that this is an AHCI HBA that has a major revision of 1 (as specified in the AHCI Version register). If CC.SCC=04h(RAID mode), it indicates that there is no programming interface(IF=00h). Internally, under this condition, the SATA controller is in native mode and its I/O spaces are only accessible through the I/O BARs.

24.9.1.6 Class Code (CC)—Offset Ah

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 5

Default: 0106h

15			12				8				4				0
0	0	0	0	0	0	0	1	0	0	0	0	0	1	1	0
BCC								SCC							

Bit Range	Default and Access	Field Name (ID): Description
15:8	1h RO	**Base Class Code (BCC):** Indicates that this is a mass storage device.
7:0	6h RO	**Sub Class Code (SCC):** Indicates the sub class code.

24.9.1.7 Cache Line Size (CLS)—Offset Ch

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 5

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
CLS							

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Cache Line Size (CLS):** This register has no meaning for the SATA controller.

24.9.1.8 Master Latency Timer (MLT)—Offset Dh

Master Latency Timer

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 5

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
MLT							

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Master Latency Timer (MLT):** This register has no meaning for the SATA controller.

24.9.1.9 Header Type (HTYPE)—Offset Eh

Header Type

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 5

Default: 80h

7			4				0
1	0	0	0	0	0	0	0
MFD	HL						

Bit Range	Default and Access	Field Name (ID): Description
7	1b RO	**Multi-function Device (MFD):** Indicates this controller is part of a multi-function device.
6:0	0h RO	**Header Layout (HL):** Indicates that the controller uses a target device layout.

24.9.1.10 MSI-X Table Base Address (MXTBA)—Offset 10h

MSI-X Table Base Address. This BAR is used to allocate 32K, 16K or 8K Memory space for the MSI-X Table. The Memory space size is determined by BIOS by making bit-14 and bit-13 Read-Only '1' or Read-Write '0' based on SATAGC.MSS[1:0].

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
BA																		BAB14	BAB13	RSVD									PF	TP		RTE

Bit Range	Default and Access	Field Name (ID): Description
31:15	0h RW	**Base Address (BA):** Base address of memory space.
14	0h RW	**Base Address Bit 14 (BAB14):** When SATAGC.MSS[1:0]=00, this bit is Read Only '0' else it's Read Write '0'.
13	0h RW	**Base Address Bit 13 (BAB13):** When SATAGC.MSS[1:0]=00 or 01, this bit is Read Only '0' else it's Read Write '0'.
12:4	0h RO	Reserved.
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable.
2:1	0h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 32-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for Memory space.

24.9.1.11 MXP Base Address (MXPBA)—Offset 14h

This BAR is used to allocate 256-byte Memory space for the MSI-X PBA.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
BA																							RSVD					PF	TP		RTE

Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RW	**Base Address (BA):** Base address of memory space (aligned to 256B).
7:4	0h RO	Reserved.
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable.
2:1	0h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 32-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for Memory space.

24.9.1.12 AHCI Index Data Pair Base Address (AIDPBA)—Offset 20h

AHCI Index Data Pair Base Address. This BAR is used to allocate I/O space for the AHCI index/data pair mechanism. Note that hardware does not clear the BA bits (including BA4) when switching from IDE mode to non-IDE mode or vice versa. The BIOS is responsible for clearing those bits to 0 since the number of writable bits changes after mode switching.

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 00000001h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
RSVD																BA												RSVD				RTE

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:5	0h RW	**Base Address (BA):** Base address of the I/O space.
4:1	0h RO	Reserved.
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for I/O space.

24.9.1.13 AHCI Base Address (ABAR)—Offset 24h

ABAR - AHCI Base Address. This register represents a memory BAR allocating space for the AHCI memory registers. Note that bit [31:16] of this register must be programmed to a value greater than 0 to ensure the memory is mapped to an address of 1 MBytes and greater (i.e., ABAR must be 00010000h or greater). Otherwise, memory cycle targeting the ABAR range may not be accepted. The Memory space size is determined by BIOS by making bit 15:11 Read-Only '1' or Read-Write '0' based on SATAGC.ASSEL[1:0].

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
BA													BAB18	BAB17	BAB16	BAB15	BAB14	BAB1311			RSVD							PF	TP		RTE	

Bit Range	Default and Access	Field Name (ID): Description
31:19	0h RW	**Base Address (BA):** Base address of register memory space.
18	0h RW	**Base Address Bit 18 (BAB18):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 256K, this bit is Read Only '0' else it's Read Write '0'.
17	0h RW	**Base Address Bit 17 (BAB17):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 128K, this bit is Read Only '0' else it's Read Write '0'.
16	0h RW	**Base Address Bit 16 (BAB16):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 64K, this bit is Read Only '0' else it's Read Write '0'.
15	0h RW	**Base Address Bit 15 (BAB15):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 32K, this bit is Read Only '0' else it's Read Write '0'.
14	0h RW	**Base Address Bit 14 (BAB14):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 16K, this bit is Read Only '0' else it's Read Write '0'.
13:11	0h RW	**Base Address Bit 13-11 (BAB1311):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 2K, this bit is Read Only '0' else it's Read Write '0'.
10:4	0h RO	Reserved.
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable
2:1	0h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 32-bit address space
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

24.9.1.14 Sub System Identifiers (SS)—Offset 2Ch

Sub System Identifiers. This register is initialized to logic 0 by the assertion of PLTRST#. This register can be written only once after PLTRST# de-assertion. This register is not reset by FLR.

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
SSID																SSVID																

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** This is written by BIOS. No hardware action taken on this value.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** This is written by BIOS. No hardware action taken on this value.

24.9.1.15 Capabilities Pointer (CAP)—Offset 34h

Capabilities Pointer

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 0

Default: 80h

7			4				0
1	0	0	0	0	0	0	0
CP							

Bit Range	Default and Access	Field Name (ID): Description
7:0	80h RW/L	**Capability Pointer (CP):** Indicates that the first capability pointer offset is offset 80h (the Message Signaled Interrupt capability). The following capability structures are linked by default: CAP.CP -> 80h (MSI) -> D0h (MSI-X)-> 70h (PCI Power) -> A8h (SATA) -> 00h end. BIOS may alter the capability structure list above (by programming a leading capability structure's Next Pointer field) if BIOS wants to bypass any specific capability. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.

24.9.1.16 Interrupt Information (INTR)—Offset 3Ch

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 5

Default: 0100h

15			12				8				4				0
0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
IPIN								ILINE							

Bit Range	Default and Access	Field Name (ID): Description
15:8	1h RW/O	**Interrupt Pin (IPIN):** This register tells which interrupt pin the device function uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#. This register is not reset by FLR.
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register. Interrupt Line register is not reset by FLR.

24.9.1.17 PCI Power Management Capability ID (PID)—Offset 70h

PCI Power Management Capability ID

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 5

Default: A801h

15			12				8				4				0
1	0	1	0	1	0	0	0	0	0	0	0	0	0	0	1
NEXT								CID							

Bit Range	Default and Access	Field Name (ID): Description
15:8	A8h RW/L	**Next Capability (NEXT):** A8h is location of the Serial ATA Capability structure. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.
7:0	1h RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management capability.

24.9.1.18 PCI Power Management Capabilities (PC)—Offset 72h

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 5

Default: 4003h

15			12				8				4				0
0	1	0	0	0	0	0	0	0	0	0	0	0	0	1	1
PME_Support					D2_Support	D1_Support	Aux_Current			DSI	RSVD	PMEC	VS		

Bit Range	Default and Access	Field Name (ID): Description
15:11	8h RO	**PME_Support (PME_Support):** The default value is 01000 which indicates PME# can be generated from the $D3_{HOT}$ state in the SATA controller.
10	0h RO	**D2_Support (D2_Support):** The D2 state is not supported.
9	0h RO	**D1_Support (D1_Support):** The D1 state is not supported.
8:6	0h RO	**Aux_Current (Aux_Current):** PME# from $D3_{COLD}$ state is not supported, therefore this field is 000b.
5	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
4	0h RO	**Reserved.**
3	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

24.9.1.19 PCI Power Management Control and Status (PMCS)—Offset 74h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 5

Default: 8h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
PMES	RSVD						PMEE	RSVD				NSFRST	RSVD	PS	

Bit Range	Default and Access	Field Name (ID): Description
15	0h RW/1C	**PME Status (PMES):** This bit is set when a PME event is to be requested, and if this bit is set and PMEE is set, a PME# will be generated. This register field is not reset by FLR.
14:9	0h RO	Reserved.
8	0h RW	**PME Enable (PMEE):** When set, the SATA controller generates PME# from $D3_{HOT}$ on a wake event. ***Note:*** Software is advised to clear PMEE together with PMES prior to changing CC.SCC through SATAGC.SMS. This register field is not reset by FLR.
7:4	0h RO	Reserved.
3	1h RO	**No Soft Reset (NSFRST):** A 1 indicates that devices transitioning from $D3_{HOT}$ to D0 because of PowerState commands do not perform an internal reset. Configuration context is preserved. Upon transition from the $D3_{HOT}$ to the D0 state initialized state, no additional operating system intervention is required to preserve configuration context beyond writing to the PowerState bits. Regardless of this bit, the controller transition from $D3_{HOT}$ to the D0 by a system or bus segment reset will return to the state D0 uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	Reserved.
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the SATA Controller and to set a new power state. The values are: 00 = D0 state; 11 = $D3_{HOT}$ state. When in the $D3_{HOT}$ state, the controller's configuration space is available, but the I/O and memory spaces are not. Additionally, interrupts are blocked. If software attempts to write a 10 or 01 to these bits, the write will be ignored. Refer to *PCI PM Specification* Section 8.2.2. on software requirements in ensuring I/O space, memory space and Bus Master are disabled prior to entering D3 state.

24.9.1.20 Message Signaled Interrupt Identifier (MID)—Offset 80h

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 5

Default: 7005h

15			12				8				4				0
0	1	1	1	0	0	0	0	0	0	0	0	0	1	0	1
NEXT								CID							

Bit Range	Default and Access	Field Name (ID): Description
15:8	70h RW/L	**Next Pointer (NEXT):** Indicates the next item in the list is the PCI power management pointer. This is the recommended value. BIOS may program this field to A8h indicating that the next item is Serial ATA Capability structure. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.
7:0	5h RO	**Capability ID (CID):** Capabilities ID indicates MSI.

24.9.1.21 Message Signaled Interrupt Message Control (MC)—Offset 82h

Message Signaled Interrupt Message Control

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 5

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD								C64	MME			MMC			MSIE

Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7	0h RO	**64 Bit Address Capable (C64):** Capable of generating a 32-bit message only.
6:4	0h RO	**Multiple Message Enable (MME):** When this field is cleared to 000 (and MSIE is set), only a single MSI message will be generated for all SATA ports, and bits [15:0] of the message vector will be driven from MD[15:0].
3:1	0h RO	**Multiple Message Capable (MMC):** Not supported.
0	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. Note that CMD.ID bit has not effect on MSI. Software must clear this bit to 0 to disable MSI first before changing the number of messages allocated in the MMC field.

24.9.1.22 Message Signaled Interrupt Message Address (MA)—Offset 84h

Message Signaled Interrupt Message Address

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
ADDR																														RSVD	

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**Address (ADDR):** Lower 32 bits of the system specified message address, always DWORD aligned.
1:0	0h RO	Reserved.

24.9.1.23 Message Signaled Interrupt Message Data (MD)—Offset 88h

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 5

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DATA															

Bit Range	Default and Access	Field Name (ID): Description
15:0	0h RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word of the data bus of the MSI memory write transaction.

24.9.1.24 Port Mapping Register (MAP)—Offset 90h

Port Mapping Register

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD										SPD5	SPD4	SPD3	SPD2	SPD1	SPD0	RSVD													PCD			

Bit Range	Default and Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21	0h RW/O	**SATA Port 5 Disable (SPD5):** Similar to SPD0 but for port 5. This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero. PCIe/ SATA muxing for port 5 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 5 physically.

Bit Range	Default and Access	Field Name (ID): Description
20	0h RW/O	**SATA Port 4 Disable (SPD4):** Similar to SPD0 but for port 4. This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero. PCIe/ SATA muxing for port 4 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 4 physically.
19	0h RW/O	**SATA Port 3 Disable (SPD3):** Similar to SPD0 but for port 3. This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero. 1.Fuse FFSATA7 (disable port 2 and 3). 2.Fuse FFSATA8 (disable port 1 and 3). 3. PCIe/SATA muxing for port 3 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 3 physically.
18	0h RW/O	**SATA Port 2 Disable (SPD2):** Similar to SPD0 but for port 2. This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero. 1.Fuse FFSATA7 (disable port 2 and 3). 2.PCIe/SATA muxing for port 3 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 3 physically.
17	0h RW/O	**SATA Port 1 Disable (SPD1):** Similar to SPD0 but for port 1. This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero. 1.Fuse FFSATA8 (disable port 1 and 3). 2.PCIe/SATA muxing for port 3 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 1 physically.
16	0h RW/O	**SATA Port 0 Disable (SPD0):** A 1 prevents the SATA port from being enabled via config PCS.PxE. Write of 1 to PCS.PxE has no effect when the corresponding SPD[x] bit is 1.In preventing a port(s) from being enabled, BIOS shall first configure MAP.SPDx. And only then BIOS configures the PCS.PxE. This field is not reset by FLR. This bit is only applicable to project(s): that has port 0 physically.
15:6	0h RO	Reserved.
5:0	0h RW	**Port Clock Disable (PCD):** When any of these bits is set to 1, the backbone clock driven to the associated port logic is gated and will not toggle. When this bit is cleared to 0, all clocks to the associated port logic will operate normally. Assignment of the bits is: Bit 5: Port 5, this bit is only applicable to project(s): that has port 5 physically; Bit 4: Port 4, this bit is only applicable to project(s): that has port 4 physically; Bit 3: Port 3, this bit is only applicable to project(s): that has port 3 physically; Bit 2: Port 2, this bit is only applicable to project(s): that has port 2 physically; Bit 1: Port 1, this bit is only applicable to project(s): that has port 1 physically; Bit 0: Port 0, this bit is only applicable to project(s): That has port 0 physically. If a particular port is not available, software shall set the corresponding bit to 1. Software can also set the corresponding bit(s) to 1 after disabling particular port(s). Software cannot set the PCD[port x]=1 if the corresponding config PCS.PxE=1 or AHCI MMIO GHC.PI[x]=1.

24.9.1.25 Port Control and Status (PCS)—Offset 94h

Port Control and Status. By default, the SATA ports are set (by hardware) to the disabled state (e.g., bits[5:0] == '0') as a result of an initial power on reset. When enabled by software, the ports can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. This register is not reset by FLR.

Note: AHCI specific notes: If an AHCI-aware or RAID enabled operating system is being booted then system BIOS shall insure that all supported SATA ports are enabled prior to passing control to the OS. Once the AHCI aware OS is booted it becomes the enabling/ disabling policy owner for the individual SATA ports. This is accomplished by manipulating a port's PxSCTL.DET and PxCMD.SUD fields. Because an AHCI or RAID aware OS will typically not have knowledge of the PxE bits and because the PxE bits act as master on/off switches for the ports, pre-boot software must insure that these bits are set to '1' prior to booting the OS, regardless as to whether or not a device is currently on the port.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD										P5P	P4P	P3P	P2P	P1P	P0P	RSVD										P5E	P4E	P3E	P2E	P1E	P0E

Bit Range	Default and Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21	0h RO	**Port 5 Present (P5P):** Same as P0P, except for port 5. This bit is only applicable to project(s): That has port 5 physically.
20	0h RO	**Port 4 Present (P4P):** Same as P0P, except for port 4. This bit is only applicable to project(s): That has port 4 physically.
19	0h RO	**Port 3 Present (P3P):** Same as P0P, except for port 3. This bit is only applicable to project(s): That has port 3 physically.
18	0h RO	**Port 2 Present (P2P):** Same as P0P, except for port 2. This bit is only applicable to project(s): That has port 2 physically.
17	0h RO	**Port 1 Present (P1P):** Same as P0P, except for port 1. This bit is only applicable to project(s): That has port 1 physically.
16	0h RO	**Port 0 Present (P0P):** When set, the SATA controller has detected the presence of a device on port 0. It may change at any time. Clearing P0E bit leads to clearing of this bit after implementation delay. ***Note:*** For system software that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again in two consecutive write cycles, software shall poll on this bit being 0 before setting P0E bit to 1. This bit is only applicable to project(s): That has port 0 physically.
15:6	0h RO	Reserved.
5	0h RW	**Port 5 Enabled (P5E):** When MAP.SPD[5] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this field is RW and the definition of this bit is the same as P0E, except for port 5. This bit takes precedence over P5CMD.SUD. This bit is only applicable to project(s): That has port 5 physically.
4	0h RW	**Port 4 Enabled (P4E):** When MAP.SPD[4] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 4 and takes precedence over P4CMD.SUD. This bit is only applicable to project(s): That has port 4 physically.
3	0h RW	**Port 3 Enabled (P3E):** When MAP.SPD[3] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 3 and takes precedence over P3CMD.SUD. This bit is only applicable to project(s): That has port 3 physically.

Bit Range	Default and Access	Field Name (ID): Description
2	0h RW	**Port 2 Enabled (P2E):** When MAP.SPD[2] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 2 and takes precedence over P2CMD.SUD. This bit is only applicable to project(s): That has port 2 physically.
1	0h RW	**Port 1 Enabled (P1E):** When MAP.SPD[1] is 1, this bit is reserved and read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 1 and takes precedence over P1CMD.SUD. This bit is only applicable to project(s): That has port 1 physically.
0	0h RW	**Port 0 Enabled (P0E):** When MAP.SPD[0] is 1, this bit is reserved and read-only 0. When set, the port is enabled. When cleared, the port is disabled. When enabled, the port can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. This bit takes precedence over P0CMD.SUD. ***Note:*** The recommendation for software code that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again immediately shall refer to the polling requirement as described in P0P register bit. At any time that BIOS or software is clearing PCS.PxE from 1 to 0, due to time needed for port staggering hardware process (up to 6 ports) to complete, BIOS and software shall delay the write to set the MAP.PCD register by 1.4us. This bit is only applicable to project(s): That has port 0 physically. This bit is only applicable to project(s): That has port 0 physically.

24.9.1.26 SATA General Configuration (SATAGC)—Offset 9Ch

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 0h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
REGLOCK	RSVD															SMS	DPPEE	WRRSELMPS			CPEE	SCFD	URRE	URD	AIE	DEVIDSEL	FLRCSSEL	MSS		ASSEL		

Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/O	**Register Lock (REGLOCK):** BIOS can set this bit to 1 to lock the following registers with RW/L attribute: CAP,CP, MID.NEXT, PIE.NEXT, SATACR0.NEXT. Once locked the register attribute of above list changes from RW/L to RO holding the existing value. BIOS is required to program this field to 1 prior to handle off to OS. If BIOS needs the SATA host controller to change operation a few times (i.e., changing CC.SCC mode) and need different capability structures for each specific operation mode, BIOS need not activate the lock until BIOS is ready to hand off to OS. BIOS may need to separate write access to this byte offset (x9Fh) from write to the lower 3-byte of the dword (x9C-9Eh) if there is a need to program the lower 3-byte dword location early during boot process. This field is not reset by FLR.
30:17	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
16	0h RW	**SATA Mode Select (SMS):** Software (SW) programs these bits to control the mode in which the SATA HBA should operate: 0b = AHCI mode 1b = RAID mode ***Notes:*** SW shall not manipulate SATAGC.SMS during runtime operation; i.e., the OS will not do this. The BIOS may choose to switch from one mode to another during POST; AHCI mode may be selected when RAID feature is enabled by fuse; RAID mode may only be selected when FFSATA5 and FFSATA3 (concatenated value not indicating No RAID); This register field is not reset by FLR.
15	0h RW	**Data Phase Parity Error Eenable (DPPEE):** When 1, IOSF data phase parity error handling is enabled. When 0, the data phase parity error handling is disabled
14:12	0h RW	**Write Request_Size Select/Max_Payload_Size (WRRSELMPS):** These two bits select the max write request size that SATA host controller will initiate for DMA write to memory. SATA host controller will internally break up larger write request based on these bits. The request is address-aligned to the selected size. Defined encodings for this field are: 000b = 128 address aligned bytes max payload size; 111b = 64 address aligned bytes max payload size. All other values are reserved for SATA host controller. This field is not reset by FLR.
11	0h RW	**Command Parity Error Enable (CPEE):** When 1, command parity error handing is enable. When 0 the command parity error handling is disable
10	0h RW	**SATA Controller Function Disable (SCFD):** BIOS program this bit to 1 to disable the SATA Controller function. When 0, SATA Controller function is enabled. When disable, SATA Host Controller will not claimed the register access targeting its Configuration Space. In IOSF primary Fabric Decode scheme, it's expected BIOS also program the corresponding bit used by the Fabric Decoder accordingly hence both SATA SIP and Fabric Decoder are in sync, and BIOS need to program this bit before programming the one in Fabric Decoder. Once this bit is set, BIOS is not able to revert it back to Function Enable until next round of platform reset.
9	0h RW	**Unsupported Request Reporting Enable (URRE):** If set to 1 by software, it allows reporting of an Unsupported Request as a system error. If both URRE and PCI configuration SERR# Enable registers are set to a 1, then the agent must set the Signaled System Error bit in the PCI Status register and send a DO_SERR message in IOSF-SB interface.
8	0h RW/1C	**Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unsupported Request on IOSF Primary interface that is not considered Advisory Non-Fatal. Cleared to 0 by SW.
7	0h RW/O	**Alternate ID Enable (AIE):** When programmed to 0, HW will report the following device id's: 2822h for desktop or 282Ah for mobile. When programmed to a 1, HW will not report these device IDs. ***Notes:*** Programming this bit to a 1 will prevent the Windows in-box version of the Intel AHCI driver from loading on the platform - will require that the user perform an 'F6' install of the Intel driver that is appropriate for the reported DID. This field is applicable when the AHCI is configured for RAID mode of operation. It has no impact for AHCI and IDE modes of operation. BIOS is recommended to program this bit prior to programming the MAP.SMS field to reflect RAID. This field is reset by PLTRST# and BIOS is required to reprogram the value (either 0 or 1) after resuming from S3, S4 or S5.
6	0h RW/O	**AIE0 DevID Selection (DEVIDSEL):** This register allows BIOS to select Device ID when AIE=0 and Server Feature (SATA AIE DEVIDSEL) Disable Fuse =0. This bit only has effect in Desktop SKU. In Mobile SKU this bit has no effect at all. Refer to config register offset 09h PI for usage. ***Notes:*** WBG BIOS is required to program this field to 1 together with the write to the AIE bit in a single configuration write cycle. LPT BIOS is required to program this bit to 0 together with the write to the AIE bit in a single configuration write cycle. When Server Feature (SATA AIE DEVIDSEL) Disable Fuse is programmed to 1, this disables the writeability of this DEVIDSEL register bit, and becomes RO with a value of 0, which only allows a choice of 2822h. This field is not reset by FLR.
5	0h RW/O	**FLR Capability Selection (FLRCSSEL):** This allows the FLR Capability to be bypassed. Refer to config offset B0h. BIOS is required to program this bit to 1 and config offset A8h SATACR0.NEXT to 00h. This field is not reset by FLR.

Bit Range	Default and Access	Field Name (ID): Description
4:3	0h RW/O	**MXTBA Size Select (MSS):** These 2 bits select the size of the Memory space for the MSI-X Table defined in BAR 0 (Configuration space offset 10h). MSI-X Table Memory space size is 32k when MSS[1:0]=00, 16k when MSS[1:0]=01, 8k when MSS[1:0]=10. This field is not reset by FLR.
2:0	0h RW/O	**ABAR Size Select (ASSEL):** These 3 bits select the size of the Memory space for the ABAR in BAR 5 (Configuration space offset 24h). ABAR Memory space size is 2k when ASSEL[2:0]=000, 16k when ASSEL[2:0]=001, 32k when ASSEL[2:0]=010, 64k when ASSEL[2:0]=011, 128k when ASSEL[2:0]=100, 256k when ASSEL[2:0]=101, 512k when ASSEL[2:0]=110. This field is not reset by FLR.

24.9.1.27 SATA Initialization Register Index (SIRI)—Offset A0h

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 5

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
IDX						RSVD	

Bit Range	Default and Access	Field Name (ID): Description
7:2	0h RW	**Index (IDX):** 6-bit index pointer into the 256-byte space. Data is written into the SIRD register and read from the SIRD register. This point to a DWord register. The byte enables on the SIRD register affect what will be written. Refer to SATA Initialization Register section for detail of the register space.
1:0	0h RO	Reserved.

24.9.1.28 SATA Initialization Register Data (SIRD)—Offset A4h

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DTA																															

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Data (DTA):** 32-bit data value that is written to the register pointed to by SIRI, or read from the register pointed to by SIRI.

24.9.1.29 Serial ATA Capability Register 0 (SATACR0)—Offset A8h

Note that the SATACR0.NEXT is not changed from RO to become RWO because there is an existing method (SATAGC.FLRCSSEL bit) to bypass the FLR Capability structure. And FLR Capability ID.NEXT is already indicating end of capability structure, it does not need change to be RWO.

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 100012h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
RSVD								MAJREV				MINREV				NEXT								CAP							

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	1h RO	**Major Revision (MAJREV):** Major revision number of the SATA Capability Pointer implemented.
19:16	0h RO	**Minor Revision (MINREV):** Minor revision number of the SATA Capability Pointer implemented.
15:8	0h RW/L	**Next Capability Pointer (NEXT):** 00h indicating the final item in the Capability List. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.
7:0	12h RO	**Capability ID (CAP):** The value of 12h has been assigned by the PCI SIG to designate the SATA Capability pointer.

24.9.1.30 Serial ATA Capability Register 1 (SATACR1)—Offset ACh

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 0000000048h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0
RSVD																BAROFST												BARLOC			

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:4	4h RO	**BAR Offset (BAROFST):** Indicates the offset into the BAR where the AHCI Index/ Data pair are located (in Dword granularity). The Index and Data I/O registers are located at offset 10h within the I/O space defined by LBAR (BAR4). A value of 004h indicates offset 10h. 000h = 0h offset; 001h = 4h offset; 002h = 8h offset; 003h = Ch offset; 004h = 10h offset; ...; FFFh = 3FFFh offset (max 16 KB)
3:0	8h RO	**BAR Location (BARLOC):** Indicates the absolute PCI Configuration Register address of the BAR containing the Index/Data pair (in Dword granularity). The Index and Data I/O registers reside within the space defined by LBAR (BAR4) in the SATA controller. A value of 8h indicates offset 20h, which is LBAR (BAR4). 0000 - 0011b = reserved; 0100b = 10h => BAR0; 0101b = 14h => BAR1; 0110b = 18h => BAR2; 0111b = 1Ch => BAR3; 1000b = 20h => AIDPBA; 1001b = 24h => BAR5; 1010 - 1110b = reserved; 1111b = Index/Data pair in PCI Configuration space which is not supported.

24.9.1.31 FLR Capability ID (SP)—Offset B0h

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 5

Default: 00xxh

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
NCP								CID							

Bit Range	Default and Access	Field Name (ID): Description
15:8	00h RO	**Next Capability Pointer (NCP):** 00h indicating the final item in the Capability List.
7:0	RO	**Capability ID(CID)**: (to BD determined if 00h, or 13H)

24.9.1.32 FLR Capability Length and Version —Offset B2h

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 5

Default: 0306h

15			12				8				4				0
0	0	0	0	0	0	1	1	0	0	0	0	0	1	1	0
NCP								CID							

Bit Range	Default and Access	Field Name (ID): Description
15:10	00h RO	**Reserved (RSVD):**
9	1b RWO	**FLR Capability ID(FLRCAP)**: When set to 1b indicates that Function Level Reset is supported.

Bit Range	Default and Access	Field Name (ID): Description
8	1b RWO	TXP Capability (TXPCAP): A '1' in this bit indicates support for the Transactions pending (TXP) bit.
7:0	06h RO	Capability Length (CAPLEN): This field indicates the # of bytes as required by the PCI Express Specification and is 06h for FLR Capability

24.9.1.33 FLR Control —Offset B4h

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 5

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	1	1	0	0	0	0	0	1	1	0
RSVD							TXP	RSVD							IFLR

Bit Range	Default and Access	Field Name (ID): Description
15:9	00h RO	**Reserved (RSVD):**
8	0b RO	**Transactions Pending (TXP)**: When set to 1b indicates that the controller has issued non-posted request which has not completed. A 0b indicates that completions for all non-posted requests have been received by the controller
7:1	00h RO	**Reserved (RSVD).**
0	0b RW	**Initial FLR (IFLR):** A write of 1b initiates an FLR transition.

24.9.1.34 Scratch Pad (SP)—Offset C0h

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DT																															

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Data (DT):** This is a read/write register that is available for software to use. No hardware action is taken on this register.

24.9.1.35 MSI-X Identifiers (MXID)—Offset D0h

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 5

Default: 0011h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
NEXT								CID							

Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RW/L	**Next Pointer (NEXT):** Indicates the next item in the list. This may be other capability pointers or it may be the last item in the list.The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.
7:0	11h RO	**Capability ID (CID):** Capabilities ID indicates this is an MSI-X capability.

24.9.1.36 MSI-X Message Control (MXC)—Offset D2h

MSI-X Message Control

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 5

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
MXE	FM	RSVD								TS					

Bit Range	Default and Access	Field Name (ID): Description
15	0h RW	**MSI-X Enable (MXE):** If set to '1' and the MSI Enable bit in the MSI Message Control register is cleared to '0', the function is permitted to use MSI-X to request service and is prohibited from using its INTx# pin (if implemented). If cleared to '0', the function is prohibited from using MSI-X to request service.
14	0h RW	**Function Mask (FM):** If set to '1', all of the vectors associated with the function are masked, regardless of their per vector Mask bit states. If cleared to '0', each vector's Mask bit determines whether the vector is masked or not. Setting or clearing the MSI-X Function Mask bit has no effect on the state of the per vector Mask bits.
13:11	0h RO	Reserved.
10:0	0h RO	**Table Size (TS):** This value indicates the size of the MSI-X Table as the value n, which is encoded as n - 1. For example, a returned value of 3h corresponds to a table size of 4.

24.9.1.37 MSI-X Table Offset/Table BIR (MXT)—Offset D4h

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 00000000h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
TO																													TBIR		

Bit Range	Default and Access	Field Name (ID): Description
31:3	0h RO	**Table Offset (TO):** Used as an offset from the address contained by one of the function's Base Address registers to point to the base of the MSI-X Table. The lower three Table BIR bits are masked off (cleared to 000b) by system software to form a 32-bit Qword-aligned offset.
2:0	0h RO	**Table BIR (TBIR):** This field indicates which one of a function's Base Address registers, located beginning at 10h in Configuration Space, is used to map the function's MSI-X Table into system memory. A read-only value of '0' means 10h.

24.9.1.38 MSI-X PBA Offset/PBA BIR (MXP)—Offset D8h

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 0h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
PBAO																													PBIR		

Bit Range	Default and Access	Field Name (ID): Description
31:3	0h RO	**PBA Offset (PBAO):** Used as an offset from the address contained by one of the function's Base Address registers to point to the base of the MSI-X PBA. The lower three PBA BIR bits are masked off (cleared to 000b) by software to form a 32-bit Qword-aligned offset.
2:0	1h RO	**PBA BIR (PBIR):** This field indicates which one of a function's Base Address registers, located beginning at 10h in Configuration Space, is used to map the function's MSI-X PBA into system memory. A read-only value of '1' means 14h.

24.9.1.39 BIST FIS Control/Status (BFCS)—Offset E0h

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD																P5BFI	P4BFI	P3BFI	P2BFI	BFS	BFF	P1BFI	P0BFI	BFP					RSVD			

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW	**Port 5 BIST FIS Initiate (P5BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 5, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable the PCS.P5E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 5 physically.
14	0h RW	**Port 4 BIST FIS Initiate (P4BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 4, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P4E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 4 physically.
13	0h RW	**Port 3 BIST FIS Initiate (P3BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 3, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable the PCS.P3E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 3 physically.
12	0h RW	**Port 2 BIST FIS Initiate (P2BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 2, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P2E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 2 physically.
11	0h RW/1C	**BIST FIS Successful (BFS):** This bit is set any time a BIST FIS transmitted by the SATA controller receives an R_OK completion status from the device.
10	0h RW/1C	**BIST FIS Failed (BFF):** This bit is set any time that a BIST FIS transmitted by the SATA controller receives an R_ERR completion status from the device.
9	0h RW	**Port 1 BIST FIS Initiate (P1BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 1, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P1E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 1 physically.

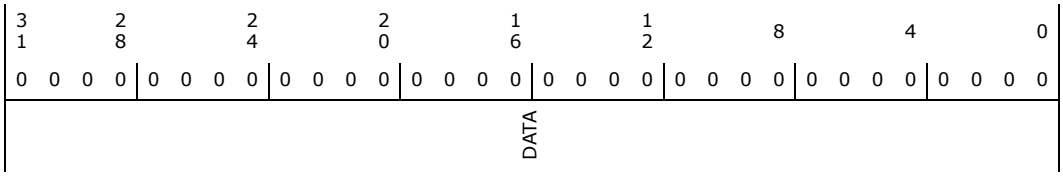
Bit Range	Default and Access	Field Name (ID): Description
8	0h RW	**Port 0 BIST FIS Initiate (P0BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 0, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P0E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 0 physically.
7:2	0h RW	**BIST FIS Parameters (BFP):** These bits form the contents of the upper 6 bits of the BIST FIS Pattern Definition in the BIST FIS transmitted by the SATA controller. This field is not port specific - its contents will be used for any BIST FIS initiated on the SATA controller. The specific bit definitions are: Bit 7 (T) Far End Transmit mode; bit 6 (A) Align Bypass mode; bit 5 (S) Bypass Scrambling; bit 4 (L) Far End Retimed Loopback; bit 3 (F) Far End Analog Loopback; bit 2 (P) Primitive bit for use with Transmit mode.
1:0	0h RO	Reserved.

24.9.1.40 BIST FIS Transmit Data 1 (BFTD1)—Offset E4h

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 00000000h



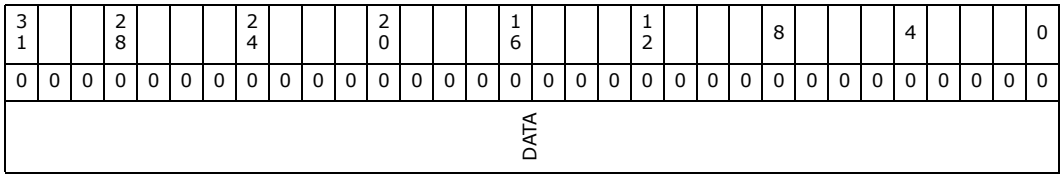
Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Data (DATA):** The data programmed into this register will form the contents of the second DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 2nd DW regardless of whether or not the T bit is indicated in the BFCS register.

24.9.1.41 BIST FIS Transmit Data 2 (BFTD2)—Offset E8h

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 00000000h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Data (DATA):** The data programmed into this register will form the contents of the third DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 3rd DW regardless of whether or not the T bit is set in the BFCS register.

24.9.2 SSATA ABAR Registers Summary

Table 24-7. Summary of SSATA ABAR Registers (Sheet 1 of 3)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	HBA Capabilities (GHC_CAP)—Offset 0h	FF36FF05h
4h	7h	Global HBA Control (GHC)—Offset 4h	80000000h
8h	Bh	Interrupt Status Register (IS)—Offset 8h	0h
Ch	Fh	Ports Implemented (GHC_PI)—Offset Ch	0h
10h	13h	AHCI Version (VS)—Offset 10h	10300h
1Ch	1Fh	Enclosure Management Location (EM_LOC)—Offset 1Ch	1600002h
20h	23h	Enclosure Management Control (EM_CTL)—Offset 20h	7010000h
24h	27h	HBA Capabilities Extended (GHC_CAP2)—Offset 24h	3Ch
A0h	A3h	Vendor Specific (VSP)—Offset A0h	48h
A4h	A7h	Vendor Specific Capabilities Register (VS_CAP)—Offset A4h	1002DEh
C0h	C3h	RAID Platform ID (RPID)—Offset C0h	311C02h
C4h	C5h	Premium Feature Block (PFB)—Offset C4h	0h
C8h	C9h	SW Feature Mask (SFM)—Offset C8h	3Fh
100h	103h	Port 0 Command List Base Address (P0CLB)—Offset 100h	0h
104h	107h	Port 0 Command List Base Address Upper 32-bits (P0CLBU)—Offset 104h	0h
108h	10Bh	Port 0 FIS Base Address (P0FB)—Offset 108h	0h
10Ch	10Fh	Port 0 FIS Base Address Upper 32-Bits (P0FBU)—Offset 10Ch	0h
110h	113h	Port 0 Interrupt Status (P0IS)—Offset 110h	0h
114h	117h	Port 0 Interrupt Enable (P0IE)—Offset 114h	0h
118h	11Bh	Port 0 Command (P0CMD)—Offset 118h	4h
120h	123h	Port 0 Task File Data (P0TFD)—Offset 120h	9h
124h	127h	Port 0 Signature (P0SIG)—Offset 124h	FFFFFFFFh
128h	12Bh	Port 0 Serial ATA Status (P0SSTS)—Offset 128h	0h
12Ch	12Fh	Port 0 Serial ATA Control (P0SCTL)—Offset 12Ch	0h
130h	133h	Port 0 Serial ATA Error (P0SERR)—Offset 130h	0h
134h	137h	Port 0 Serial ATA Active (P0SACT)—Offset 134h	0h
138h	13Bh	Port 0 Command Issue (P0CI)—Offset 138h	0h
13Ch	13Fh	Port 0 SNotification (P0SNTF)—Offset 13Ch	0h
144h	147h	Port 0 Device Sleep (P0DEVSLP)—Offset 144h	1E022852h
180h	183h	Port 1 Command List Base Address (P1CLB)—Offset 180h	0h
184h	187h	Port 1 Command List Base Address Upper 32-bits (P1CLBU)—Offset 184h	0h
188h	18Bh	Port 1 FIS Base Address (P1FB)—Offset 188h	0h

Table 24-7. Summary of SSATA ABAR Registers (Sheet 2 of 3)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
18Ch	18Fh	Port 1 FIS Base Address Upper 32-bits (P1FBU)—Offset 18Ch	0h
190h	193h	Port 1 Interrupt Status (P1IS)—Offset 190h	0h
194h	197h	Port 1 Interrupt Enable (P1IE)—Offset 194h	0h
198h	19Bh	Port 1 Command (P1CMD)—Offset 198h	0h
1A0h	1A3h	Port 1 Task File Data (P1TFD)—Offset 1A0h	0h
1A4h	1A7h	Port 1 Signature (P1SIG)—Offset 1A4h	0h
1A8h	1ABh	Port 1 Serial ATA Status (P1SSTS)—Offset 1A8h	0h
1ACh	1AFh	Port 1 Serial ATA Control (P1SCTL)—Offset 1ACh	0h
1B0h	1B3h	Port 1 Serial ATA Error (P1SERR)—Offset 1B0h	0h
1B4h	1B7h	Port 1 Serial ATA Active (P1SACT)—Offset 1B4h	0h
1B8h	1BBh	Port 1 Command Issue (P1CI)—Offset 1B8h	0h
1BCh	1BFh	Port 1 SNotification (P1SNTF)—Offset 1BCh	0h
1C4h	1C7h	Port 1 Device Sleep (P1DEVSLP)—Offset 1C4h	0h
200h	203h	Port 2 Command List Base Address (P2CLB)—Offset 200h	0h
204h	207h	Port 2 Command List Base Address Upper 32-bits (P2CLBU)—Offset 204h	0h
208h	20Bh	Port 2 FIS Base Address (P2FB)—Offset 208h	0h
20Ch	20Fh	Port 2 FIS Base Address Upper 32-bits (P2FBU)—Offset 20Ch	0h
210h	213h	Port 2 Interrupt Status (P2IS)—Offset 210h	0h
214h	217h	Port 2 Interrupt Enable (P2IE)—Offset 214h	0h
218h	21Bh	Port 2 Command (P2CMD)—Offset 218h	0h
220h	223h	Port 2 Task File Data (P2TFD)—Offset 220h	0h
224h	227h	Port 2 Signature (P2SIG)—Offset 224h	0h
228h	22Bh	Port 2 Serial ATA Status (P2SSTS)—Offset 228h	0h
22Ch	22Fh	Port 2 Serial ATA Control (P2SCTL)—Offset 22Ch	0h
230h	233h	Port 2 Serial ATA Error (P2SERR)—Offset 230h	0h
234h	237h	Port 2 Serial ATA Active (P2SACT)—Offset 234h	0h
238h	23Bh	Port 2 Command Issue (P2CI)—Offset 238h	0h
23Ch	23Fh	Port 2 SNotification (P2SNTF)—Offset 23Ch	0h
244h	247h	Port 2 Device Sleep (P2DEVSLP)—Offset 244h	0h
280h	283h	Port 3 Command List Base Address (P3CLB)—Offset 280h	0h
284h	287h	Port 3 Command List Base Address Upper 32-bits (P3CLBU)—Offset 284h	0h
288h	28Bh	Port 3 FIS Base Address (P3FB)—Offset 288h	0h
28Ch	28Fh	Port 3 FIS Base Address Upper 32-bits (P3FBU)—Offset 28Ch	0h
290h	293h	Port 3 Interrupt Status (P3IS)—Offset 290h	0h
294h	297h	Port 3 Interrupt Enable (P3IE)—Offset 294h	0h
298h	29Bh	Port 3 Command (P3CMD)—Offset 298h	0h
2A0h	2A3h	Port 3 Task File Data (P3TFD)—Offset 2A0h	0h
2A4h	2A7h	Port 3 Signature (P3SIG)—Offset 2A4h	0h
2A8h	2ABh	Port 3 Serial ATA Status (P3SSTS)—Offset 2A8h	0h
2ACh	2AFh	Port 3 Serial ATA Control (P3SCTL)—Offset 2ACh	0h
2B0h	2B3h	Port 3 Serial ATA Error (P3SERR)—Offset 2B0h	0h

Table 24-7. Summary of SSATA ABAR Registers (Sheet 3 of 3)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
2B4h	2B7h	Port 3 Serial ATA Active (P3SACT)—Offset 2B4h	0h
2B8h	2BBh	Port 3 Commands Issued (P3CI)—Offset 2B8h	0h
2BCh	2BFh	Port 3 SNotification (P3SNTF)—Offset 2BCh	0h
2C4h	2C7h	Port 3 Device Sleep (P3DEVSLP)—Offset 2C4h	0h
300h	303h	Port 4 Command List Base Address (P4CLB)—Offset 300h	0h
304h	307h	Port 4 Command List Base Address Upper 32-bits (P4CLBU)—Offset 304h	0h
308h	30Bh	Port 4 FIS Base Address (P4FB)—Offset 308h	0h
30Ch	30Fh	Port 4 FIS Base Address Upper 32-bits (P4FBU)—Offset 30Ch	0h
310h	313h	Port 4 Interrupt Status (P4IS)—Offset 310h	0h
314h	317h	Port 4 Interrupt Enable (P4IE)—Offset 314h	0h
318h	31Bh	Port 4 Command (P4CMD)—Offset 318h	0h
320h	323h	Port 4 Task File Data (P4TFD)—Offset 320h	0h
324h	327h	Port 4 Signature (P4SIG)—Offset 324h	0h
328h	32Bh	Port 4 Serial ATA Status (P4SSTS)—Offset 328h	0h
32Ch	32Fh	Port 4 Serial ATA Control (P4SCTL)—Offset 32Ch	0h
330h	333h	Port 4 Serial ATA Error (P4SERR)—Offset 330h	0h
334h	337h	Port 4 Serial ATA Active (P4SACT)—Offset 334h	0h
338h	33Bh	Port 4 Commands Issued (P4CI)—Offset 338h	0h
33Ch	33Fh	Port 4 SNotification (P4SNTF)—Offset 33Ch	0h
344h	347h	Port 4 Device Sleep (P4DEVSLP)—Offset 344h	0h
380h	383h	Port 5 Command List Base Address (P5CLB)—Offset 380h	0h
384h	387h	Port 5 Command List Base Address Upper 32-bits (P5CLBU)—Offset 384h	0h
388h	38Bh	Port 5 FIS Base Address (P5FB)—Offset 388h	0h
38Ch	38Fh	Port 5 FIS Base Address Upper 32-bits (P5FBU)—Offset 38Ch	0h
390h	393h	Port 5 Interrupt Status (P5IS)—Offset 390h	0h
394h	397h	Port 5 Interrupt Enable (P5IE)—Offset 394h	0h
398h	39Bh	Port 5 Command (P5CMD)—Offset 398h	0h
3A0h	3A3h	Port 5 Task File Data (P5TFD)—Offset 3A0h	0h
3A4h	3A7h	Port 5 Signature (P5SIG)—Offset 3A4h	0h
3A8h	3ABh	Port 5 Serial ATA Status (P5SSTS)—Offset 3A8h	0h
3ACh	3AFh	Port 5 Serial ATA Control (P5SCTL)—Offset 3ACh	0h
3B0h	3B3h	Port 5 Serial ATA Error (P5SERR)—Offset 3B0h	0h
3B4h	3B7h	Port 5 Serial ATA Active (P5SACT)—Offset 3B4h	0h
3B8h	3BBh	Port 5 Commands Issued (P5CI)—Offset 3B8h	0h
3BCh	3BFh	Port 5 SNotification (P5SNTF)—Offset 3BCh	0h
3C4h	3C7h	Port 5 Device Sleep (P5DEVSLP)—Offset 3C4h	0h
580h	583h	Enclosure Management Message Format (EM_MF)—Offset 580h	0h
584h	587h	Enclosure Management LED (EM_LED)—Offset 584h	0h

24.9.2.1 HBA Capabilities (GHC_CAP)—Offset 0h

HBA Capabilities. This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon PLTRST#. This register is not reset by FLR.

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: FF36FF05h

31			28				24				20				16				12				8				4				0
1	1	1	1	1	1	1	1	0	0	1	1	0	1	1	0	1	1	1	1	1	1	1	0	0	0	0	0	1	0	1
S64A	SCQA	SSNTF	SMPS	SSS	SALP	SAL	SCLO	ISS				RSVD	SAM	SPM	FBSS	PMD	SSC	PSC	NCS				CCCS	EMS	SXS	NP						

Bit Range	Default and Access	Field Name (ID): Description
31	1h RW/O	**Supports 64-bit Addressing (S64A):** Indicates the S-ATA controller can access 64-bit data structures. The 32-bit upper bits of the port DMA Descriptor, the PRD Base, and each PRD entry are read/write.
30	1h RW/O	**Supports Native Command Queuing Acceleration (SCQA):** Indicates the SATA controller supports Serial-ATA Native Command Queueing. The HBA will handle DMA Setup FISes in hardware, including support for auto-activate optimization through the FIS.
29	1h RW/O	**Supports SNotification Register (SSNTF):** When set to 1, indicates that the HBA supports the PxSNTF (SNotification) register and its associated functionality. When cleared to 0., the HBA does not support the PxSNTF (SNotification) register and its associated functionality.
28	1h RW/O	**Supports Mechanical Presence Switch (SMPS):** When set to 1, the HBA supports mechanical presence switches on its ports for use in hot plug operations. When cleared to 0, this function is not supported. This value is loaded by the BIOS prior to OS initialization.
27	1h RW/O	**Supports Staggered Spin-up (SSS):** Indicates whether the S-ATA controller supports staggered spin-up on its ports, for use in balancing power spikes. This value is loaded by platform BIOS prior to OS initialization.
26	1h RW/O	**Supports Aggressive Link Power Management (SALP):** Indicates the S-ATA controller supports auto-generating link requests to the partial or slumber states when there are no commands to process. When cleared to 0, software shall treat the PxCMD.ALPE and PxCMD.ASP bits as reserved.
25	1h RW/O	**Supports Activity LED (SAL):** Indicates the S-ATA controller supports a single output pin (SATALED#) which indicates activity.
24	1h RW/O	**Supports Command List Override (SCLO):** When set to 1, indicates that the HBA supports the PxCMD.CLO bit and it's associated function. When cleared to 0., The HBA is not capable of clearing the BSY and DRQ bits in the Status register in order to issue a software reset if these bits are still set from a previous operation.
23:20	3h RW/O	**Interface Speed Support (ISS):** Indicates the maximum speed the S-ATA controller can support on its ports. These encodings match the system software programmable PxSCTL.DET.SPD field. 0000 = Reserved 0001 = Gen 1 (1.5 Gbps) 0010 = Gen 2 (3 Gbps) 0011 = Gen 3 (6 Gbps) 0100 - 1111 = Reserved. ***Note:*** If (FFSATA0p0, FFSATA0p1, FFSATA0p2, FFSATA0p3, FFSATA0p4 and FFSATA0p5) is 1, this field is RWO defaulting to 0010 and ignores software write value of 0011. If either FFSATA0p0, FFSATA0p1, FFSATA0p2, FFSATA0p3, FFSATA0p4 or FFSATA0p5 is 0, this field is RWO defaulting to 0011.
19	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
18	1h RO	**Supports AHCI mode only (SAM):** The SATA controller may optionally support AHCI access mechanism only. A value of 0 indicates that in addition to the native AHCI mechanism (via ABAR), the SATA controller implements a legacy, task-file based register interface such as SFF-8038i. A value of 1 indicates that the SATA controller does not implement a legacy, task-file based register interface.
17	1h RO	**Supports Port Multiplier (SPM):** The SATA controller may optionally support command-based switching Port Multipliers. BIOS must clear this bit if Port Multipliers are not supported.
16	0h RO	**FIS-based Switching Supported (FBSS):** Not supported.
15	1h RO	**PIO Multiple DRQ Block (PMD):** If set to 1, the HBA supports multiple DRQ block data transfers for the PIO command protocol.
14	1h RW/O	**Slumber State Capable (SSC):** The SATA controller supports the slumber state.
13	1h RW/O	**Partial State Capable (PSC):** The SATA controller supports the partial state.
12:8	1Fh RO	**Number of Command Slots (NCS):** 1Fh indicating support for 32 slots.
7	0h RO	**Command Completion Coalescing Supported (CCCS):** When set to 1, indicates that the HBA supports command completion coalescing. When command completion coalescing is supported, the HBA has implemented the CCC_CTL and the CCC_PORTS global HBA registers. When cleared to 0, indicates that the HBA does not support command completion coalescing and the CCC_CTL and CCC_PORTS global HBA registers are not implemented.
6	0h RO	**Enclosure Management Supported (EMS):** When set to 1, indicates that the HBA supports enclosure management. When enclosure management is supported, the HBA has implemented the EM_LOC and EM_CTL global HBA registers. When cleared to 0, indicates that the HBA does not support enclosure management and the EM_LOC and EM_CTL global HBA registers are not implemented.
5	0h RW/O	**Supports External SATA (SXS):** When set to 1, indicates that the HBA has one or more Serial ATA ports that has a signal only connector that is externally accessible. If this bit is set, software may refer to the PxCMD.ESP bit to determine whether a specific port has its signal connector externally accessible as a signal only connector (i.e., power is not part of that connector). When the bit is cleared to 0, indicates that the HBA has no Serial ATA ports that have a signal only connector externally accessible.
4:0	5h RO	**Number of Ports (NP):** 0's based value indicating the maximum number of ports supported. Note that the number of ports indicated in this field may be more than the number of ports indicated in the PI register. Number of ports shall be dependent on MAP.SC, fuses (FFSATA7, FFSATA8) and PCIe/SATA muxing configuration where if ANY of these parameter disable a particular port then that port is disabled and not counted. The maximum number of ports supported by SIP is 6and the least is 0 (i.e., Function Disable). In the case of 0 port configuration, the value of NP is a don't care (while implementation has it fixed as 05h). Any combination in between is supported by SATA host controller. Indicates the number of supported ports.

24.9.2.2 Global HBA Control (GHC)—Offset 4h

Global HBA Control. This register controls various global actions of the HBA.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 80000000h

31			28				24				20				16				12				8				4			0
1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
AE	RSVD																											MRSM	IE	HR

Bit Range	Default and Access	Field Name (ID): Description
31	1h RO	**AHCI Enable (AE):** When set, indicates that an AHCI driver is loaded and communication to the HBA shall be via AHCI mechanisms. This can be used by an HBA that supports both legacy mechanisms (such as SFF-8038i) and AHCI to know when the HBA is running under an AHCI driver. When set, software shall only talk to the HBA using AHCI. The HBA will not have to allow command processing via both AHCI and legacy mechanisms. When cleared, software will only communicate with the HBA using legacy mechanisms. Software shall set this bit to 1 before accessing other AHCI registers. ***Note:*** The implementation of this bit is dependent upon the value of the CAP.SAM bit. If CAP.SAM is 0, then GHC.AE should be RW and shall have a reset value of 0. If CAP.SAM is 1, then AE shall be read only and shall have a reset value of 1.
30:3	0h RO	Reserved.
2	0h RO	**MSI Revert to Single Message (MRSM):** When set to 1 by hardware, indicates that the HBA requested more than one MSI vector but has reverted to using the first vector only. When this bit is cleared to 0, the HBA has not reverted to single MSI mode (i.e., hardware is already in single MSI mode, software has allocated the number of messages requested, or hardware is sharing interrupt vectors if MC.MME < MC.MMC). The HBA may revert to single MSI mode when the number of vectors allocated by the host is less than the number requested. This bit shall only be set to 1 when the following conditions hold: MC.MSIE = 1 (MSI is enabled); MC.MMC > 0 (multiple messages requested); MC.MME > 0 (more than one message allocated); MC.MME != MC.MMC (messages allocated not equal to number requested). When this bit is set to 1, single MSI mode operation is in use and software is responsible for clearing bits in the IS register to clear interrupts. This bit shall be cleared to 0 by hardware when any of the four conditions stated is false. This bit is also cleared to 0 when MC.MSIE = 1 and MC.MME = 0h. In this case, the hardware has been programmed to use single MSI mode, and is not reverting to that mode. The HBA shall always revert to single MSI mode when the number of vectors allocated by the host is less than the number requested. Value of MRSM is a don't care when GHC.HR=1.
1	0h RW	**Interrupt Enable (IE):** This global bit enables interrupts from the HBA. When cleared (reset default), all interrupt sources from all ports are disabled. When set, interrupts are enabled.
0	0h RW/1S	**HBA Reset (HR):** When set by SW, this bit causes an internal reset of the HBA. All state machines that relate to data transfers and native command queuing will return to an idle condition, and all ports will be re-initialized via COMRESET. When the HBA has performed the reset action, it will reset this bit to 0. A software write of 0 will have no effect. For a description on which bits are reset when this bit is set, see the *AHCI Specification*, Section 10.3.3.

24.9.2.3 Interrupt Status Register (IS)—Offset 8h

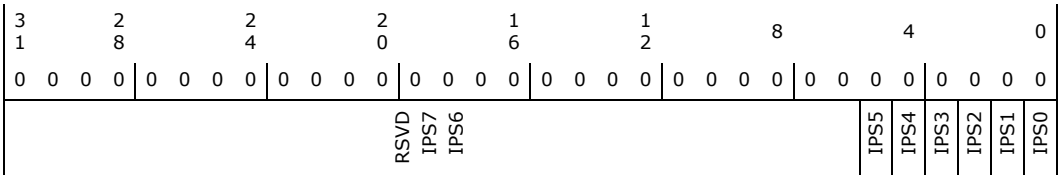
Interrupt Status Register. This register indicates which of the ports within the controller have an interrupt pending and require service.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 00000000h



Bit Range	Default and Access	Field Name (ID): Description
31:6	0h RO	Reserved.
5	0h RW/1C	**Interrupt Pending Status Port 5 (IPS5):** If set, indicates that port 5 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 5 physically.
4	0h RW/1C	**Interrupt Pending Status Port 4 (IPS4):** If set, indicates that port 4 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 4 physically.
3	0h RW/1C	**Interrupt Pending Status Port 3 (IPS3):** If set, indicates that port 3 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 3 physically.
2	0h RW/1C	**Interrupt Pending Status Port 2 (IPS2):** If set, indicates that port 2 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 2 physically.
1	0h RW/1C	**Interrupt Pending Status Port 1 (IPS1):** If set, indicates that port 1 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 1 physically.
0	0h RW/1C	**Interrupt Pending Status Port 0 (IPS0):** If set, indicates that port 0 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 0 physically.

24.9.2.4 Ports Implemented (GHC_PI)—Offset Ch

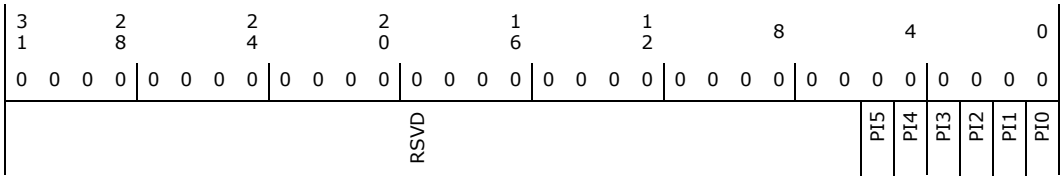
Ports Implemented. This register indicates which ports are exposed to the HBA. It is loaded by platform BIOS. It indicates which ports that the device supports are available for software to use. Any available port may not be implemented. This register is not reset by FLR.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:6	0h RO	Reserved.
5	0h RW/O	**Port 5 Implemented (PI5):** If set, then port 5 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 5 is not available.
4	0h RW/O	**Port 4 Implemented (PI4):** If set, then port 4 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 4 is not available.
3	0h RW/O	**Port 3 Implemented (PI3):** If set, then port 3 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 3 is not available.
2	0h RW/O	**Port 2 Implemented (PI2):** If set, then port 2 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 2 is not available.
1	0h RW/O	**Port 1 Implemented (PI1):** If set, then port 1 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 1 is not available.
0	0h RW/O	**Port 0 Implemented (PI0):** If set, then port 0 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 0 is not available.

24.9.2.5 AHCI Version (VS)—Offset 10h

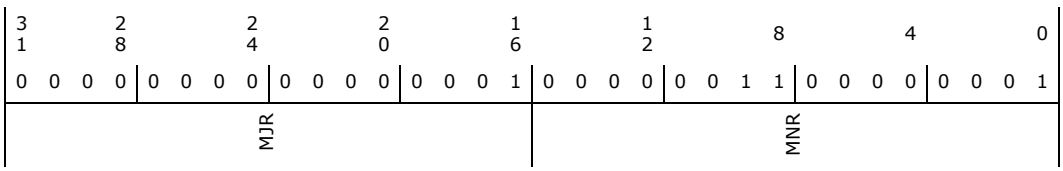
AHCI Version. This register indicates the major and minor version of the *AHCI Specification*. It is BCD encoded. The upper two bytes represent the major version number, and the lower two bytes represent the minor version number. Example: Version 3.12 would be represented as 00030102h.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 00010301h



Bit Range	Default and Access	Field Name (ID): Description
31:16	1h RO	**Major Version Number (MJR):** Indicates the major version is 1
15:0	300h RO	**Minor Version Number (MNR):** Indicates the minor version is 30

24.9.2.6 Enclosure Management Location (EM_LOC)—Offset 1Ch

Enclosure Management Location. The enclosure management location register identifies the location and size of the enclosure management message buffer.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 01600002h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	1	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
OFST																SZ															

Bit Range	Default and Access	Field Name (ID): Description
31:16	160h RO	**Offset (OFST):** The offset of the message buffer in Dwords from the beginning of the ABAR.
15:0	2h RO	**Buffer Size (SZ):** Specifies the size of the transmit message buffer area in Dwords. If both transmit and receive buffers are supported, then the transmit buffer begins at ABAR[EM_LOC.OFST*4] and the receive buffer directly follows it. If both transmit and receive buffers are supported, both buffers are of the size indicated in the Buffer Size field. A value of 0 is invalid. Note that SATA controller only supports transmit buffer.

24.9.2.7 Enclosure Management Control (EM_CTL)—Offset 20h

Enclosure Management Control. This register is used to control and obtain status for the enclosure management interface. The register includes information on the attributes of the implementation, enclosure management messages supported, the status of the interface, whether any messages are pending, and is used to initiate sending messages. This register is not implemented if enclosure management is not supported (i.e., CAP.EMS = 0).

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 07010000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	1	1	1	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD				ATTR_PM	ATTR_ALHD	ATTR_XMT	ATTR_SMB	RSVD				SUPP_SGPIO	SUPP_SES2	SUPP_SAFTE	SUPP_LED	RSVD				RST	CTL_TM	RSVD										STS_MR

Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27	0h RO	**Port Multiplier Support (ATTR_PM):** The HBA does not support enclosure management messages for devices attached via a Port Multiplier. Software should use the Serial ATA enclosure management bridge that is built into many Port Multipliers for enclosure services with these devices. For more information on Serial ATA enclosure management bridges, refer to the Serial ATA II: Extensions to Serial ATA 1.0a revision 1.2 specification.
26	1h RW/O	**Activity LED Hardware Driven (ATTR_ALHD):** If set to 1, the HBA drives the activity LED for the LED message type in hardware and does not utilize software settings for this LED. The HBA does not begin transmitting the hardware based activity signal until after software has written CTL.TM=1 after a reset condition.
25	1h RO	**Transmit Only (ATTR_XMT):** If set to 1, the HBA only supports transmitting messages and does not support receiving messages. If cleared to 0, the HBA supports transmitting and receiving messages.
24	1h RO	**Single Message Buffer (ATTR_SMB):** If set to 1, the HBA has one message buffer that is shared for messages to transmit and messages received. In this case, unsolicited receive messages are not supported and it is software's responsibility to manage access to this buffer. If cleared to 0, there are separate receive and transmit buffers such that unsolicited messages could be supported.
23:20	0h RO	Reserved.
19	0h RO	**SGPIO Enclosure Management Messages (SUPP_SGPIO):** If set to 1, the HBA supports the SGPIO register interface message type.
18	0h RO	**SES-2 Enclosure Management Messages (SUPP_SES2):** If set to 1, the HBA supports the SES-2 message type.
17	0h RO	**SAF-TE Enclosure Management Messages (SUPP_SAFTE):** If set to 1, the HBA supports the SAF-TE message type.
16	1h RO	**LED Message Types (SUPP_LED):** If set to 1, the HBA supports the LED message type defined in LED Message Type.
15:10	0h RO	Reserved.
9	0h RW/1S	**Reset (RST):** When set to 1 by software, the HBA shall reset all enclosure management message logic and take all appropriate reset actions to ensure messages can be transmitted/received after the reset. After the HBA completes the reset operation, the HBA shall set the value to 0. A write of 0 by software to this field shall have no effect.
8	0h RW/1S	**Transmit Message (CTL_TM):** When set to 1 by software, the HBA shall transmit the message contained in the message buffer. When the message is completely sent, the HBA shall clear this bit to 0. A write of 0 to this bit by software shall have no effect. Software shall not change the contents of the message buffer while CTL.TM is set to 1.
7:1	0h RO	Reserved.
0	0h RO	**Message Received (STS_MR):** Message received is not supported.

24.9.2.8 HBA Capabilities Extended (GHC_CAP2)—Offset 24h

HBA Capabilities Extended. This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon PLTRST#. This register is not reset by FLR.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 0000003Ch

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	0	0
RSVD																										DESO	SADM	SDS	APST	RSVD	BOH

Bit Range	Default and Access	Field Name (ID): Description
31:6	0h RO	Reserved.
5	1h RW/O	**DEVSLP Entrance from Slumber Only (DESO):** This field specifies that the HBA shall only assert DEVSLP if the interface is in Slumber. When this bit is set to 1, the HBA shall ignore software directed entrance to DEVSLP via PxCMD.ICC unless PxSSTS.IPM = 6h. When this bit is cleared to 0, the HBA may enter DEVSLP from any link state (active, Partial, or Slumber). BIOS is required to program this field to 1.
4	1h RW/O	**Supports Aggressive DEVSLP Management (SADM):** When set to 1, the HBA supports hardware assertion of the DEVSLP signal after the idle timeout expires. When cleared to 0, this function is not supported and software shall treat the PxDEVSLP.ADSE field as reserved. ***Note:*** If PHY I/O PM Disable Fuse is 1, this register will read 0. Else this register will read 1 with RWO attribute.
3	1h RW/O	**Supports DEVSLP (SDS):** When set to 1, the HBA supports the DEVSLP feature. When cleared to 0, DEVSLP is not supported. ***Note:*** If PHY I/O PM Disable Fuse is 1, this register will read 0. Else this register will read 1 with RWO attribute.
2	1h RW/O	**Automatic Partial to Slumber Transitions (APST):** When set to 1, the HBA supports Automatic Partial to Slumber Transitions. When cleared to 0, Automatic Partial to Slumber Transition is not supported. ***Note:*** If SATA PHY PM Disable Fuse is 1, this register will read only 0. Else this register will read 1 with RWO attribute.
1	0h RO	Reserved.
0	0h RO	**BIOS/OS Handoff (BOH):** Not supported.

24.9.2.9 Vendor Specific (VSP)—Offset A0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 00000048h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0
RSVD																									SFMS	PFS	PT	SRPIR	RSVD		

Bit Range	Default and Access	Field Name (ID): Description
31:7	0h RO	Reserved.
6	1h RO	**Software Feature Mask Supported (SFMS):** Set to 1 if the platform is enabled for premium storage features mask (SFM) as described in VS MMIO space at offset ABAR[RPID.(OFST*4)+4].
5	0h RO	**Premium Features Supported (PFS):** Set to 1 if the platform is enabled for premium storage features (PFB) as described in VS MMIO space at offset ABAR[RPID.OFST*4]. Set to 0 if the platform is not enabled for premium storage features.
4	0h RO	**Platform Type (PT):** 0b for servers.
3	1h RO	**Supports RAID Platform ID Reporting (SRPIR):** If set to 1, then indicates that the RAID Platform ID is reported via ABAR + C0h. Set to 0 if this ID is not reported via MMIO space.
2:0	0h RO	Reserved.

24.9.2.10 Vendor Specific Capabilities Register (VS_CAP)—Offset A4h

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 1002DEh

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	1	0	1	1	0	1	1	1	1	0
RSVD				NRMO												RSVD			MSL												NRMBE	

Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:16	10h RW/O	**NVM Remapped Register Offset (NRMO):** Specifies the offset (in 128B unit) within ABAR as to where the PCIe NAND memory BAR register space is remapped. For example, NRMO=1 means ABAR + 128B. This allows the remapped offset to shift between ABAR + 0B, and ABAR + 512KK - 128B, with 128B step. The remapped offset into the AHCI memory space must not overlap with the memory space used for SATA. The remapped offset into the AHCI memory space and the remapped size must not exceed the allocated AHCI memory space of the integrated AHCI controller. Only valid when NRMBE = 1. The reset default of this field is 10h, this places the start of the PCIe NAND memory BAR register space at ABAR + 2K. This field is not reset by FLR.
15:13	0h RO	Reserved.
12:1	16Fh RW/O	**Memory Space Limit. (MSL):** This field specifies the size (in 128B unit) of the remapped memory space for the PCIe NAND device. It is a 0-based field. For example, MSL=1 means 256B. This allows the remapped size to shift between 128B and 512K with the step of 128B.Memory BAR offset from 0 to MSL of the PCIe NAND device are remapped under the integrated AHCI controller memory space.The remapped offset into the AHCI memory space and the value programmed in this field must not exceed the allocated AHCI memory space of the integrated AHCI controller. Only valid when NRMBE = 1. The reset default of this field is 16Fh which specifies the size of the remapped memory space as 34k.This field is not reset by FLR.
0	0h RW/O	**PCIe NAND Memory BAR Remapped Enable (NRMBE):** Set to 1 if a PCIe NAND device is present and remapping of its memory BAR register space is enabled. Cleared to 0 if there is no PCIe NAND device present or the remapping of its memory BAR register space is disabled. This bit is not reset by FLR.

24.9.2.11 RAID Platform ID (RPID)—Offset C0h

RAID Platform ID. This register is used by the Intel Matrix Storage Manager OROM to match the features supported by the OROM with the platform on which the OROM is executing. This prevents the use of an OROM designed for newer chipsets from being use on older chipsets as this could reduce up-sell potential.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: A256h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	1	1	0	0	0	1	0	0	0	1	1	1	0	0	0	0	0	0	0	0	1	0
OFST																RPID																

Bit Range	Default and Access	Field Name (ID): Description
31:16	31h RO	**Offset (OFST):** The offset of the Premium Feature Block (PFB) in DWords from the beginning of the ABAR. SFM follows directly after PFB.
15:0	A184/ A204h RO	**RAID Platform ID (RPID):** Specifies the DID value that has been assigned to the platform. This is the same DID that is reported by the SATA controller when SATAGC.AIE is set to 1 except that the DID is always reported through this register, regardless if the programming of SATAGC.AIE.

24.9.2.12 Premium Feature Block (PFB)—Offset C4h

Premium Feature Block.

Note: Bits 4-0 are not bit-mapped to individual fuses and/or soft SKU settings; rather a single fuse FFSATA5 and FFSATA 3 /soft sku is used to indicate support for all of these features (refer to VSP.PFS). These registers indicate to the Intel Rapid Storage Technology AHCI driver that those premium RAID features that can be supported on the platform.

Type: MEM Register
(Size: 16 bits)

Device: 17
Function: 5

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD														SEA	SOI

Bit Range	Default and Access	Field Name (ID): Description
15:2	0h RO	Reserved.
1	0h RO	**Supports Email Alert (SEA):** Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.
0	0h RO	**Supports OEM IOCTL (SOI):** Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.

24.9.2.13 SW Feature Mask (SFM)—Offset C8h

SW Feature Mask. The following will be programmed by the BIOS when VS_CAP.SFMS == 1. The feature mask is used by SW to determine which non-premium features shall be supported by SW. These register bits are not reset by FLR since they are programmed by BIOS.

Access Method

Type: MEM Register
(Size: 16 bits)

Device: 17
Function: 5

Default: 3Fh

FBU																															

Bit Range	Default and Access	Field Name (ID): Description
31:0	xxxxxxxxh RW	**FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port. Note that these bits are not reset on a HBA reset.

24.9.2.18 Port 0 Interrupt Status (P0IS)—Offset 110h

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
CPDS	TFES	HBFS	HBDS	IFS	INFS	RSVD	OFS	IPMS	PRCS	RSVD														DMPS	PCS	DPS	UFS	SDBS	DSS	PSS	DHRS

Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	**Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW/1C	**Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0h RW/1C	**Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0h RW/1C	**Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0h RW/1C	**Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0h RW/1C	**Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0h RO	Reserved.
24	0h RW/1C	**Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0h RW/1C	**Incorrect Port Multiplier Status (IPMS):** Port multiplier is not supported. Multiplier.
22	0h RO	**PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0h RO	Reserved.
7	0h RW/1C	**Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0h RO	**Port Connect Change Status (PCS):** 1=Change in Current Connect Status. 0=No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0h RW/1C	**Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data.
4	0h RO	**Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.

Bit Range	Default and Access	Field Name (ID): Description
3	0h RW/1C	**Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0h RW/1C	**DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0h RW/1C	**PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0h RW/1C	**Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

24.9.2.19 Port 0 Interrupt Enable (P0IE)—Offset 114h

Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	**Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW	**Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.
29	0h RW	**Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0h RW	**Host Bus Data Error Enable (HBDE):** When set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0h RW	**Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0h RW	**Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0h RO	Reserved.
24	0h RW	**Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0h RW	**Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt. BIOS is required to program this field to '0'. The same applies to AHCI driver.
22	0h RW	**PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.

Bit Range	Default and Access	Field Name (ID): Description
21:8	0h RO	Reserved.
7	0h RW	**Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.
6	0h RW	**Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0h RW	**Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0h RW	**Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0h RW	**Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0h RW	**DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0h RW	**PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0h RW	**Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

24.9.2.20 Port 0 Command (P0CMD)—Offset 118h

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 4h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
ICC				ASP	ALPE	DLAE	ATAPI	APSTE	FBSCP	ESP	CPD	MPSP	HPCP	PMA	RSVD	CR	FR	MPSS	CCS				RSVD	PSP	RSVD	FRE	CLO	POD	SUD	ST		

Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RW	**Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect.
27	0h RW	**Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. If CAP.SALP is cleared to 0., software shall treat this bit as reserved.
26	0h RW	**Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit. Software shall only set this bit to 1 if CAP.SALP is set to 1. If CAP.SALP is cleared to 0, software shall treat this bit as reserved. BIOS is recommended to program this field to 1.

Bit Range	Default and Access	Field Name (ID): Description
25	0h RW	**Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0. This bit is set by software
24	0h RW	**Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0h RW	**Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved.
22	0h RO	**FIS-based Switching Capable Port (FBSCP):** The SSATA controller does not support FIS-Based Switching.
21	0h RW/O	**External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to '1', then the port may experience hot plug events.
20	0h RO	**Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect.
19	0h RW/O	**Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0h RW/O	**Hot Plug Capable Port (HPCP):** This indicates whether the this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0h RO	**Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port. When cleared, a Port Multiplier is not attached to the HBA for this port. This bit is a read only 0. when CAP.PMS = 0., and read/write when CAP.PMS = 1. Note that this bit is set by software; hardware does not auto-detect that a Port Multiplier is attached.
16	0h RO	Reserved.
15	0h RO	**Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running.
14	0h RO	**FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running. Note to software: When FR bit stays set, read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any
13	0h RO	**Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.
12:8	0h RO	**Current Command Slot (CCS):** Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7	0h RO	Reserved.
6	0h RO	**PHYSLP Present (PSP):** If set to '1', the platform supports PHYSLP on this port. If cleared to '0', the platform does not support PHYSLP on this port. This bit may only be set to '1' if CAP2.SPS is set to '1'.
5	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
4	0h RW	**FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0h RW/1S	**Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.
2	1h RO	**Power On Device (POD):** The SATA controller does not support cold presence detect.
1	0h RW	**Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1. for HBAs that do not support staggered spin-up. On an edge detect from 0. to 1, the HBA shall start a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0h RW	**Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

24.9.2.21 Port 0 Task File Data (P0TFD)—Offset 120h

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 00000009h

DIAG																ERR																

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW/1C	**Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes.
15:0	0h RW/1C	**Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer.

24.9.2.26 Port 0 Serial ATA Active (P0SACT)—Offset 134h

Port 0 Serial ATA Active

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DS																															

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/1S	**Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry. This field is cleared via the Set Device Bits FIS.

24.9.2.27 Port 0 Command Issue (P0CI)—Offset 138h

Port 0 Commands Issued

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
CI																															

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1.

24.9.2.28 Port 0 SNotification (P0SNTF)—Offset 13Ch

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 0h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RSVD																PMN															

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW/1C	**PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set. PM Port 0h sets bit 0. PM Port Fh sets bit 15. Individual bits are cleared by software writing 1's to the corresponding bit positions. Note that, while this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST

24.9.2.29 Port 0 Device Sleep (P0DEVSLP)—Offset 144h

Port 0 Device Sleep

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 1E022852h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	1	1	1	1	0	0	0	0	0	0	0	1	0	0	0	1	0	1	0	0	0	0	1	0	1	0	0	1	0
RSVD			DM				DITO										MDAT							DETO							DSP	ADSE

Bit Range	Default and Access	Field Name (ID): Description
31:29	0h RO	Reserved.
28:25	Fh RW/O	**DITO Multiplier (DM):** 0's based value that specifies the DITO multiplier that the HBA applies to the specified DITO value, effectively extending the range of DITO from 1ms to 16368ms. A value of 0h indicates a multiplier of 1. A maximum multiplier of 16 may be applied. The HBA computes the total idle timeout as a product of DM and DITO (i.e., DITO actual = DITO * DM).
24:15	4h RW	**DEVSLP Idle Timeout (DITO):** This field specifies the amount of the time (in approximate 1ms granularity) that the HBA shall wait before driving the DEVSLP signal.Hardware reloads its port specific DEVSLP timer with this value each time the port transitions out of DEVSLP state. For example: from DEVSLP to active or PxDEVSLP.ADSE transitions from 0 to a 1. If CAP2.SDS or CAP2.SADM or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0 and PxDEVSLP.ADSE is cleared to 0.
14:10	Ah RW	**DEVSLP Minimum Assertion Time (MDAT):** This field specifies the minimum amount of time (in 1ms granularity) that the HBA must assert the DEVSLP signal before it may be de-asserted. The nominal value is 10ms and the minimum is 1ms depending on device identification information. If CAP2.SDS is cleared to 0 or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0, PxDEVSLP.ADSE is cleared to 0, and prior to setting PxCMD.ICC to 8h.
9:2	14h RW	**DEVSLP Exit Timeout (DETO):** This field specifies the maximum duration (in approximate 1ms granularity) from DEVSLP de-assertion until the device is ready to accept OOB. The nominal value is 20ms while the max value is 255ms depending on device identification information. If CAP2.SDS is cleared to 0 or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0, PxDEVSLP.ADSE is cleared to 0, and prior to setting PxCMD.ICC to 8h.
1	1h RW/O	**DEVSLP Present (DSP):** If set to '1', the platform supports DEVSLP on this port. If cleared to '0', the platform does not support DEVSLP on this port. This bit may only be set to '1' if CAP2.SDS is set to '1'.DSP is mutually exclusive with the PxCMD.HPCP bit and PxCMD.ESP bit. Note that these bits are not reset on a HBA reset.
0	0h RW	**Aggressive DEVSLP Enable (ADSE):** This bit is read/write for HBAs that support aggressive DEVSLP management (CAP2. SADM = ?1?). When this bit is set to ?1?, the HBA shall assert the DEVSLP signal after the port has been idle (PxCI = 0h and PxSACT = 0h) for the amount of time specified by the PxDEVSLP.DITO register and the interface is in Slumber (PxSSTS.IPM = 6h). When this bit is cleared to ?0?, the HBA does not enter DEVSLP unless software directed via PxCMD.ICC. This bit shall only be set to ?1? if PxDEVSLP.DSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the DEVSLP signal if asserted. Note that these bits are not reset on a HBA reset. BIOS is recommended to program this field to 1 if the platform support the DEVSLP feature. If CAP2.SDS is cleared to 0 or CAP2.SADM is cleared to 0, or if PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved.

24.9.2.30 Port 1 Command List Base Address (P1CLB)—Offset 180h

Same bit definition as P0CLB.

24.9.2.31 Port 1 Command List Base Address Upper 32-bits (P1CLBU)—Offset 184h

Same bit definition as P0CLBU.

24.9.2.32 Port 1 FIS Base Address (P1FB)—Offset 188h

Same bit definition as P0FB.

24.9.2.33 Port 1 FIS Base Address Upper 32-bits (P1FBU)—Offset 18Ch

Same bit definition as P0FBU.

24.9.2.34 Port 1 Interrupt Status (P1IS)—Offset 190h

Same bit definition as P0IS.

24.9.3 Port 1 Interrupt Enable (P1IE)—Offset 194h

Same bit definition as P0IE.

24.9.3.1 Port 1 Command (P1CMD)—Offset 198h

Same bit definition as P0CMD.

24.9.3.2 Port 1 Task File Data (P1TFD)—Offset 1A0h

Same bit definition as P0TFD.

24.9.3.3 Port 1 Signature (P1SIG)—Offset 1A4h

Same bit definition as P0SIG.

24.9.3.4 Port 1 Serial ATA Status (P1SSTS)—Offset 1A8h

Same bit definition as P0SSTS.

24.9.3.5 Port 1 Serial ATA Control (P1SCTL)—Offset 1ACh

Same bit definition as P0SCTL.

24.9.3.6 Port 1 Serial ATA Error (P1SERR)—Offset 1B0h

Same bit definition as P0SERR.

24.9.3.7 Port 1 Serial ATA Active (P1SACT)—Offset 1B4h

Same bit definition as P0SACT.

24.9.3.8 Port 1 Command Issue (P1CI)—Offset 1B8h

Same bit definition as P0CI.

24.9.3.9 Port 1 SNotification (P1SNTF)—Offset 1BCh

Same bit definition as P0SNTF.

24.9.3.10 Port 1 Device Sleep (P1DEVSLP)—Offset 1C4h

Same bit definition as P0DEVSLP.

24.9.3.11 Port 2 Command List Base Address (P2CLB)—Offset 200h

Same bit definition as P0CLB.

24.9.3.12 Port 2 Command List Base Address Upper 32-bits (P2CLBU)—Offset 204h

Same bit definition as P0CLBU.

24.9.3.13 Port 2 FIS Base Address (P2FB)—Offset 208h

Same bit definition as P0FB.

24.9.3.14 Port 2 FIS Base Address Upper 32-bits (P2FBU)—Offset 20Ch

Same bit definition as P0FBU.

24.9.3.15 Port 2 Interrupt Status (P2IS)—Offset 210h

Same bit definition as P0IS.

24.9.3.16 Port 2 Interrupt Enable (P2IE)—Offset 214h

Same bit definition as P0IE.

24.9.3.17 Port 2 Command (P2CMD)—Offset 218h

Same bit definition as P0CMD.

24.9.3.18 Port 2 Task File Data (P2TFD)—Offset 220h

Same bit definition as P0TFD.

24.9.3.19 Port 2 Signature (P2SIG)—Offset 224h

Same bit definition as P0SIG.

24.9.3.20 Port 2 Serial ATA Status (P2SSTS)—Offset 228h

Same bit definition as P0SSTS.

24.9.3.21 Port 2 Serial ATA Control (P2SCTL)—Offset 22Ch

Same bit definition as P0SCTL.

24.9.3.22 Port 2 Serial ATA Error (P2SERR)—Offset 230h

Same bit definition as P0SERR.

24.9.3.23 Port 2 Serial ATA Active (P2SACT)—Offset 234h

Same bit definition as P0SACT.

24.9.3.24 Port 2 Command Issue (P2CI)—Offset 238h

Same bit definition as P0CI.

24.9.3.25 Port 2 SNotification (P2SNTF)—Offset 23Ch

Same bit definition as P0SNTF.

24.9.3.26 Port 2 Device Sleep (P2DEVSLP)—Offset 244h

Same bit definition as P0DEVSLP.

24.9.3.27 Port 3 Command List Base Address (P3CLB)—Offset 280h

Same bit definition as P0CLB.

24.9.3.28 Port 3 Command List Base Address Upper 32-bits (P3CLBU)—Offset 284h

Same bit definition as P0CLBU.

24.9.3.29 Port 3 FIS Base Address (P3FB)—Offset 288h

Same bit definition as P0FB.

24.9.3.30 Port 3 FIS Base Address Upper 32-bits (P3FBU)—Offset 28Ch

Same bit definition as P0FBU.

24.9.3.31 Port 3 Interrupt Status (P3IS)—Offset 290h

Same bit definition as P0IS.

24.9.3.32 Port 3 Interrupt Enable (P3IE)—Offset 294h

Same bit definition as P0IE.

24.9.3.33 Port 3 Command (P3CMD)—Offset 298h

Same bit definition as P0CMD.

24.9.3.34 Port 3 Task File Data (P3TFD)—Offset 2A0h

Same bit definition as P0TFD.

24.9.3.35 Port 3 Signature (P3SIG)—Offset 2A4h

Same bit definition as P0SIG.

24.9.3.36 Port 3 Serial ATA Status (P3SSTS)—Offset 2A8h

Same bit definition as P0SSTS.

24.9.3.37 Port 3 Serial ATA Control (P3SCTL)—Offset 2ACh

Same bit definition as P0SCTL.

24.9.3.38 Port 3 Serial ATA Error (P3SERR)—Offset 2B0h

Same bit definition as P0SERR.

24.9.3.39 Port 3 Serial ATA Active (P3SACT)—Offset 2B4h

Same bit definition as P0SACT.

24.9.3.40 Port 3 Commands Issued (P3CI)—Offset 2B8h

Same bit definition as P0CI.

24.9.3.41 Port 3 SNotification (P3SNTF)—Offset 2BCh

Same bit definition as P0SNTF.

24.9.3.42 Port 3 Device Sleep (P3DEVSLP)—Offset 2C4h

Same bit definition as P0DEVSLP.

24.9.3.43 Port 4 Command List Base Address (P4CLB)—Offset 300h

Same bit definition as P0CLB.

24.9.3.44 Port 4 Command List Base Address Upper 32-bits (P4CLBU)—Offset 304h

Same bit definition as P0CLBU.

24.9.3.45 Port 4 FIS Base Address (P4FB)—Offset 308h

Same bit definition as P0FB.

24.9.3.46 Port 4 FIS Base Address Upper 32-bits (P4FBU)—Offset 30Ch

Same bit definition as P0FBU.

24.9.3.47 Port 4 Interrupt Status (P4IS)—Offset 310h

Same bit definition as P0IS.

24.9.3.48 Port 4 Interrupt Enable (P4IE)—Offset 314h

Same bit definition as P0IE.

24.9.3.49 Port 4 Command (P4CMD)—Offset 318h

Same bit definition as P0CMD.

24.9.3.50 Port 4 Task File Data (P4TFD)—Offset 320h

Same bit description as P0TFD.

24.9.3.51 Port 4 Signature (P4SIG)—Offset 324h

Same bit description as P0SIG.

24.9.3.52 Port 4 Serial ATA Status (P4SSTS)—Offset 328h

Same bit description as P0SSTS.

24.9.3.53 Port 4 Serial ATA Control (P4SCTL)—Offset 32Ch

Same bit description as P0SCTL.

24.9.3.54 Port 4 Serial ATA Error (P4SERR)—Offset 330h

Same bit description as P0SERR.

24.9.3.55 Port 4 Serial ATA Active (P4SACT)—Offset 334h

Same bit description as P0SACT.

24.9.3.56 Port 4 Commands Issued (P4CI)—Offset 338h

Same bit description as P0CI.

24.9.3.57 Port 4 SNotification (P4SNTF)—Offset 33Ch

Same bit description as P0SNTF.

24.9.3.58 Port 4 Device Sleep (P4DEVSLP)—Offset 344h

Same bit description as P0DEVSLP.

24.9.3.59 Port 5 Command List Base Address (P5CLB)—Offset 380h

Same bit description as P0CLB.

24.9.3.60 Port 5 Command List Base Address Upper 32-bits (P5CLBU)—Offset 384h

Same bit definition as P0CLBU.

24.9.3.61 Port 5 FIS Base Address (P5FB)—Offset 388h

Same bit definition as P0FB.

24.9.3.62 Port 5 FIS Base Address Upper 32-bits (P5FBU)—Offset 38Ch

Same bit definition as P0FBU.

24.9.3.63 Port 5 Interrupt Status (P5IS)—Offset 390h

Same bit definition as P0IS.

24.9.3.64 Port 5 Interrupt Enable (P5IE)—Offset 394h

Same bit definition as P0IE.

24.9.3.65 Port 5 Command (P5CMD)—Offset 398h

Same bit definition as P0CMD.

24.9.3.66 Port 5 Task File Data (P5TFD)—Offset 3A0h

Same bit definition as P0TFD.

24.9.3.67 Port 5 Signature (P5SIG)—Offset 3A4h

Same bit definition as P0SIG.

24.9.3.68 Port 5 Serial ATA Status (P5SSTS)—Offset 3A8h

Same bit definition as P0SSTS.

24.9.3.69 Port 5 Serial ATA Control (P5SCTL)—Offset 3ACh

Same bit definition as P0SCTL.

24.9.3.70 Port 5 Serial ATA Error (P5SERR)—Offset 3B0h

Same bit definition as P0SERR.

24.9.3.71 Port 5 Serial ATA Active (P5SACT)—Offset 3B4h

Same bit definition as P0SACT.

24.9.3.72 Port 5 Commands Issued (P5CI)—Offset 3B8h

Same bit definition as P0CI.

24.9.3.73 Port 5 SNotification (P5SNTF)—Offset 3BCh

Same bit definition as P0SNTF.

24.9.3.74 Port 5 Device Sleep (P5DEVSLP)—Offset 3C4h

Same bit definition as P0DEVSLP.

24.9.3.75 Enclosure Management Message Format (EM_MF)—Offset 580h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD				MTYPE				DSIZE								MSIZE								RSVD								

Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:24	0h RW	**Message Type (MTYPE):** Specifies the type of the message. The message types are: 0h = LED; 1h = SAF-TE; 2h = SES-2; 3h = SGPIO (register based interface); All other values reserved.
23:16	0h RW	**Data Size (DSIZE):** Specifies the data size in bytes. If the message (enclosure services command) has a data buffer that is associated with it that is transferred, the size of that data buffer is specified in this field. If there is no separate data buffer, this field shall have a value of '0'. The data directly follows the message in the message buffer. This value should always be '0'.
15:8	0h RW	**Message Size (MSIZE):** Specifies the size of the message in bytes. The message size does not include the one Dword header. A value of '0'. is invalid. The message size is always 4 bytes.
7:0	0h RO	Reserved.

24.9.3.76 Enclosure Management LED (EM_LED)—Offset 584h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
VAL																PM								HBA								

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW	**Value (VAL):** This field describes the state of each LED for a particular location. There are three LEDs that may be supported by the HBA. Each LED has 3 bits of control. LED values are: 000b - LED shall be off 001b - LED shall be solid on as perceived by human eye; All other values reserved. The LED bit locations are: Bits 2:0 - Activity LED (may be driven by hardware) Bits 5:3 - Vendor Specific LED (e.g., locate) Bits 8:6 - Vendor Specific LED (e.g., fault) Bits 15:9 - Reserved. Vendor specific message is: Bit 3:0 - Vendor Specific Pattern; Bit 15:4 - Reserved. ***Note:*** If Activity LED Hardware Driven (ATTR.ALHD) bit is set, host will output the hardware LED value sampled internally and will ignore software written activity value on bit [2:0]. Since Enclosure Management does not support port multiplier based LED message, the LED message will be generated independently based on respective port's operation activity. Vendor specific LED values Locate (Bits 5:3) and Fault (Bits 8:6) always are driven by software.
15:8	0h RW	**Port Multiplier Information (PM):** Specifies slot specific information related to Port Multiplier. Bits 3:0 specify the Port Multiplier port number for the slot that requires the status update. If a Port Multiplier is not attached to the device in the affected slot, the Port Multiplier port number shall be '0'. Bits 7:4 are reserved. SATA does not support LED messages for devices behind a Port Multiplier. This byte should be 0.
7:0	0h RW	**HBA Information (HBA):** Specifies slot specific information related to the HBA. Bits 4:0 - HBA port number for the slot that requires the status update. Bit 5 - If set to '1', Value is a vendor specific message that applies to the entire enclosure. If cleared to '0', Value applies to the port specified in bits 4:0. Bits 7:6 - Reserved.

24.9.4 SATA AIDP Registers Summary

Table 24-8. Summary of SATA AIDP Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
10h	13h	AHCI Index Register (INDEX)—Offset 10h	0h
14h	17h	AHCI Data Register (DATA)—Offset 14h	0h

24.9.4.1 AHCI Index Register (INDEX)—Offset 10h

AHCI Index Register. This registers are only available if CC.SCC is not 01h to index into all memory registers defined in Memory Registers and the message buffer used for enclosure management. If CC.SCC is 01h, these AHCI Index Data Pair registers are not accessible and SINDEX/SDATA register pair shall be used to index into a subset of the memory registers defined in (See Memory Registers for more information on which registers could be indexed).

Access Method

Type: I/O Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD															INDEX															RSVD		

Bit Range	Default and Access	Field Name (ID): Description
31:19	0h RO	Reserved.
18:2	0h RW	**Index (INDEX):** This Index register is used to select the Dword offset of the Memory Mapped AHCI register to be accessed. A Dword, Word or Byte access is specified by the active byte enables of the I/O access to the Data register.
1:0	0h RO	Reserved.

24.9.4.2 AHCI Data Register (DATA)—Offset 14h

AHCI Data Register. This registers are index into all memory registers defined in Memory Registers and the message buffer used for enclosure management.

Access Method

Type: I/O Register
(Size: 32 bits)

Device: 17
Function: 5

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DATA																															

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Data (DATA):** This Data register is a window through which data is read or written to the memory mapped register pointed to by the Index register. Note that a physical register is not actually implemented as the data is actually stored in the memory mapped registers. Since this is not a physical register, the default value is the same as the default value of the register pointed to by Index.

24.9.5 SATA MXTBA Registers Summary

Table 24-9. Summary of SATA MXTBA Registers

Device: 17
Function: 5

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD																															MXVP

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO	**MSI-X vector Pending (MXVP):** For each Pending Bit that is set, the function has a pending message for the associated MSI-X Table entry. Pending bits that have no associated MSI-X Table entry are reserved. After reset, the state of reserved Pending bits must be 0. Software should never write, and should only read Pending Bits. If software writes to Pending Bits, the result is undefined. Each Pending Bit's state after reset is 0 (no message pending).

§

25 System Management Interface and SMLink

25.1 Acronyms

Acronyms	Description
BMC	Baseboard Management Controller

25.2 References

None

25.3 Overview

The PCH provides six SMLink interfaces, SMLink0B and SMLink0-4. These interfaces are intended for system management and are controlled by the Intel ME or IE. See the System Management chapter for more detail.

25.4 Signal Description

Name	Type	Description
INTRUDER#	I	**Intruder Detect**: This signal can be set to disable the system if the box is detected open.
GPP_C4_SML0DATA_IE	I/OD	**System Management Link 0 Data:** SMBus link to external device for transmitting/receiving data. When using the 1 GbE LAN with Intel ME 11, this would be connected to an external PHY. With SPS F/W, this is used to connect to other devices. An external pull-up is required. This can be controller by either the Intel ME or the IE.
GPP_D14_SML0BDATA_IE	I/OD	**Second Instant of System Management Link 0 Data:** SMBus link to external device for transmitting/receiving data. This pin can be controller by either the Intel ME or the IE. External pull-up is required.
GPP_C3_SML0CLK_IE	I/OD	**System Management Link 0 Clock:** SMBus link clock to external device. When using the 1GbE LAN with Intel ME 11, this would be connected to an external PHY. With SPS F/W, this is used to connect to other devices. An external pull-up is required. This can be controller by either the Intel ME or the IE.
GPP_D13_SML0BCLK_IE	I/OD	**Second Instant of System Management Link 0 Clock:**SMBus link clock to external device. This pin can be controller by either the Intel ME or the IE. External pull-up is required.
GPP_C5_SML0ALERT_IE#	I/OD	**SMLink 0 Alert:** Alert signal for SMLink0 External pull-up resistor is required.
GPP_D16_SML0BALERT_IE#	I/OD	**Second Instant of SMlink 0 Alert:** Alert signal for SMLink0B. External pull-up is required.
GPP_C6_SML1CLK_IE	I/OD	**System Management Link 1 Clock:** SMBus link clock to external device. This pin can be controller by either the Intel ME or the IE. External pull-up is required.
GPP_C7_SML1DATA_IE	I/OD	**System Management Link 1 Data:** External pull-up resistor is required. This signal is controlled by either the Intel ME or the IE.

Name	Type	Description
GPP_B23_MEIE_SML1ALERT#_PHOT#	I/OD	**System Management 1 Alert:** Alert for the device on SMLink1. A soft-strap determines the native function SML1ALERT# or PCHHOT# usage. External pull-up resistor is required on this pin.
GPP_H10_SML2CLK_IE	I/OD	**System Management Link 2 Clock:** External pull-up resistor is required. This signal is controlled by either the Intel ME or the IE.
GPP_H11_SML2DATA_IE	I/OD	**System Management Link 2 Data:** External pull-up resistor is required. This signal is controlled by either the Intel ME or the IE.
GPP_H12_SML2ALERT_IE#	I/OD	**System Management Link 2 Alert:** External pull-up resistor is required on this pin. This signal is controlled by either the Intel ME or the IE.
GPP_H13_SML3CLK_IE	I/OD	**System Management Link 3 Clock:** External pull-up resistor is required. This signal is controlled by either the Intel ME or the IE.
GPP_H14_SML3DATA_IE	I/OD	**System Management Link 3 Data:** External pull-up resistor is required. This signal is controlled by either the Intel ME or the IE.
GPP_H15 SML3ALERT_IE#	I/OD	**System Management Link 3 Alert:** External pull-up resistor is required on this pin. This signal is controlled by either the Intel ME or the IE.
GPP_H16 SML4CLK_IE	I/OD	**System Management Link 4 Clock:** External pull-up resistor is required. This signal is controlled by either the Intel ME or the IE.
GPP_H17_SML4DATA_IE	I/OD	**System Management Link 4 Data:** External pull-up resistor is required. This signal is controlled by either the Intel ME or the IE.
GPP_H18_SML4ALERT_IE#	I/OD	**System Management Link 4 Alert:** External pull-up resistor is required. This signal is controlled by either the Intel ME or the IE.

25.5 Integrated Pull-Ups and Pull-Downs

Signal	Resistor Type	Value	Notes
SML[2:0]ALERT#	Pull-down	9K - 50K	The internal pull-down resistor is disable after RSMRST# de-asserted.
Note: Integrated pull-ups and pull-downs will not be valid until all the voltages have reached a valid level.			

25.6 I/O Signal Planes and States

Signal Name	Power Plane	During Reset	Immediately After Reset	S3/S4/S5	Deep Sx
SML[4:0]DATA SML0BDATA	Primary	Undriven	Undriven	Undriven	Off
SML[4:0]CLK SML0BCLK	Primary	Undriven	Undriven	Undriven	Off
SML0BALERT# SML[3:5]ALERT#	Primary	Undriven	Undriven	Undriven	Off
SML[2:0]ALERT#	Primary	Internal Pull-down	Driven Low	Internal Pull-down	Off

25.7 Functional Description

The PCH provides six SMLink interfaces, SMLink0B and SMLink0-4. These interfaces are intended for system management and are controlled by the Intel ME or IE. See the System Management chapter for more detail.

With the addition of three more SMlink buses, there are three more SMT controllers.

SMLink0 is used for integrated LAN, connected to the external PHY, when using Intel ME 11. If SPS-4 is used, the SMLink0 is used as a connection to the external BMC. When an Intel LAN PHY is connected to SMLink0, a soft strap must be set to indicate that the PHY is connected to SMLink0. The interface will be running at the frequency of up to 1 MHz depending on different factors such as board routing or bus loading when the Fast Mode is enabled using a soft strap. Refer to the latest SPI Programming Guide for more detail.

All six SMlink bus can be accessed by either ME or IE. SMT2 has the option for three connections, Smlink0, Smlink0B and the TCO slave. It is the only SMT controller that can do so. SMT2 can not simultaneously connect to SMlink0 and Smlink0B. The current SPS driver only supports connecting SMT2 to SMlink0, not SMlink0B. This permits IE to use SMLink0B

25.8 SMBus TCO I/O Registers Summary

The TCO I/O registers reside in a 32-byte range that starts from the I/O Base Address described in the TCOBAR register in the SMBus PCI Configuration space.

Table 25-1. Summary of SMBus TCO I/O Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	1h	TCO_RLD Register (TRLD)—Offset 0h	4h
2h	2h	TCO_DAT_IN Register (TDI)—Offset 2h	0h
3h	3h	TCO_DAT_OUT Register (TDO)—Offset 3h	0h
4h	5h	TCO1_STS Register (TSTS1)—Offset 4h	0h
6h	7h	TCO2_STS Register (TSTS2)—Offset 6h	0h
8h	9h	TCO1_CNT Register (TCTL1)—Offset 8h	0h
Ah	Bh	TCO2_CNT Register (TCTL2)—Offset Ah	8h
Ch	Dh	TCO_MESSAGE1 and TCO_MESSAGE2 (TMSG)—Offset Ch	0h
Eh	Eh	TCO_WDSTATUS Register (TWDS)—Offset Eh	0h
10h	10h	LEGACY_ELIM Register (LE)—Offset 10h	3h
12h	13h	TCO_TMR Register (TTMR)—Offset 12h	4h

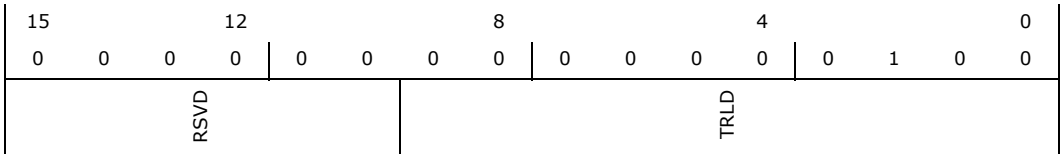
25.8.1 TCO_RLD Register (TRLD)—Offset 0h

Access Method

Type: I/O Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 4h



Bit Range	Default and Access	Field Name (ID): Description
15:10	0h RO	Reserved.
9:0	4h RW	**TCORLD (TRLD):** Reading this register will return the current count of the TCO timer. Writing any value to this register will reload the timer to prevent the timeout.

25.8.2 TCO_DAT_IN Register (TDI)—Offset 2h

Access Method

Type: I/O Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
TDI							

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**TCO_DAT_IN (TDI):** Data Register for passing commands from the OS to the SMI handler. Writes to this register will cause an SMI and set the OS_TCO_SMI bit in the TCO_STS register.

25.8.3 TCO_DAT_OUT Register (TDO)—Offset 3h

Access Method

Type: I/O Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
TDO							

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**TCO_DAT_OUT (TDO):** Data Register for passing commands from the SMI handler to the OS. Writes to this register will set the TCO_INT_STS bit in the TCO_STS register. It also causes an interrupt, as selected by the TCO_IRQ_SEL bits.

25.8.4 TCO1_STS Register (TSTS1)—Offset 4h

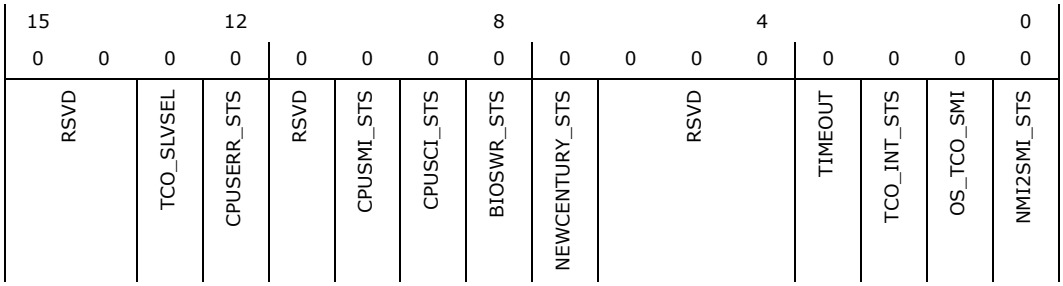
Unless otherwise indicated, these bits are sticky and are cleared by writing a 1 to the corresponding bit position.

Access Method

Type: I/O Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:14	0h RO	Reserved.
13	0h RO/Strap	**TCO Slave Select (TCO_SLVSEL):** This register bit indicates the value of TCO Slave Select Soft Strap.
12	0h RW/1C	**CPUSERR_STS (CPUSERR_STS):** This bit is set to 1 if the CPU complex sends a DMI special cycle message indicating that it wants to cause an SERR#. The software must read the MCH to find out why it wanted the SERR#. Software must write a 1 back to this bit to clear it.
11	0h RO	Reserved.
10	0h RW/1C	**CPUSMI_STS (CPUSMI_STS):** This bit is set to 1 if the CPU complex sends a DMI special cycle message indicating that it wants to cause an SMI. The software must read the CPU to find out why it wanted the SMI. Software must write a 1 back to this bit to clear it.
9	0h RW/1C	**CPUSCI_STS:** This bit is set to 1 if the CPU complex sends a DMI special cycle message indicating that it wants to cause an SCI. The software must read the CPU to find out why it wanted the SCI. Software must write a 1 back to this bit to clear it.
8	0h RW/1C	**BIOSWR_STS:** Intel PCH sets this bit to 1 and generates an SMI# to indicate an illegal attempt to write to the BIOS located in the FWH that is accessed over the LPC. This occurs when either: a. The BIOSWP bit is changed from 0 to 1 and the LE bit is also set, or b. Any write is attempted to the BIOS and the BIOSWP bit is also set. This bit does not get set to 1 when: 1. a or b above occurs on eSPI controller. 2. a or b above occurs on SPI Flash controller. ***Note:*** On write cycles attempted to the 4 MB lower alias to the BIOS space, the BIOSWR_STS bit will not be set.

Bit Range	Default and Access	Field Name (ID): Description
7	0h RW/1C	**NEWCENTURY_STS (NEWCENTURY_STS):** This bit will be set when the year rolls over from 1999 to 2000. If the bit is already 1, it will remain 1. This bit can be cleared either by software writing a 1 back to the bit position, or by RTCRST# going active. When this bit is set, an SMI# will be generated. However, this will not be a wake event (i.e., if the system is in a sleeping state when the NEWCENTURY_STS bit is set, the system will not wake up). ***Notes:*** This bit 7 is not valid when the RTC battery is first put in (or if the RTC battery does not provide sufficient power when the system is unplugged). Software can determine that the RTC well was not maintained by checking the RTC_PWR_STS bit (GEN_PMCON_3 register in the Power Management Controller, D31:F2:A4, bit 2) or by other means (such as doing a checksum on the RTC RAM array). If the RTC well is determined to not have been maintained, the BIOS should set the time to a legal value and then clear the NEWCENTURY_STS bit. This bit may take up to 3 RTCCLKs for the bit to be cleared when a 1 is written to the bit to clear it. After writing a 1 to the NEWCENTURY_STS bit, software should also not exit the SMI handler until after the bit has been cleared. This is to make sure the SMI is not re-entered. BIOS Assumption: When booting, the BIOS checks the NEWCENTURY_STS bit. If set, the BIOS should increment the value in the RTC RAM register associated with the century. The BIOS should then clear the NEWCENTURY_STS bit. This scenario would occur if the system was asleep when the century rolls over. If the system is in an S0 state (not sleeping) and the SMI# occurs with the NEWCENTURY_STS bit sets, the SMI handler should increment the value in the RTC RAM register and clear the NEWCENTURY_STS bit.
6:4	0h RO	Reserved.
3	0h RW/1C	**TIMEOUT (TIMEOUT):** Bit set to 1 by Intel PCH to indicate that the SMI was caused by TCO timer reaching 0. ***Note:*** The SMI handler should clear this bit to prevent an immediate re-entry to the SMI handler.
2	0h RW/1C	**TCO_INT_STS (TCO_INT_STS):** Bit set to 1 when SMI handler caused the interrupt by writing to the TCO_DAT_OUT register.
1	0h RW/1C	**OS_TCO_SMI:** Bit set to 1 when OS code caused an SMI# by writing to the TCO_DAT_IN register.
0	0h RO/V	**NMI2SMI_STS:** The PCH sets this bit when an SMI# occurs because an event occurred that would otherwise have caused an NMI.

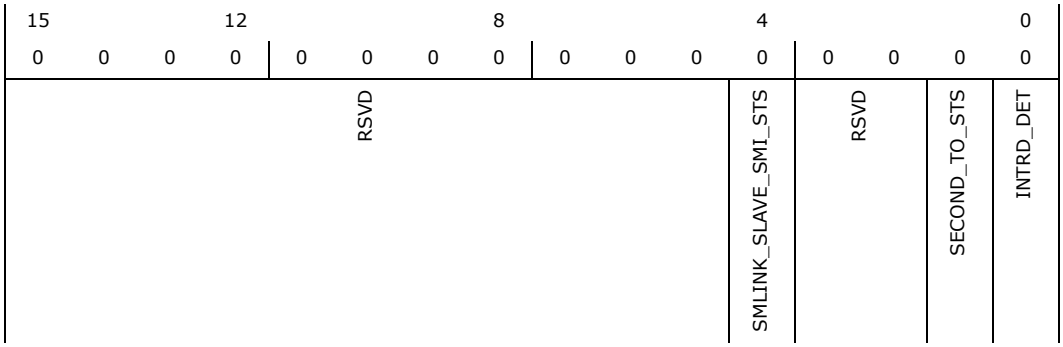
25.8.5 TCO2_STS Register (TSTS2)—Offset 6h

Access Method

Type: I/O Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:5	0h RO	Reserved.
4	0h RW/1C	**SMLINK_SLAVE_SMI_STS:** The PCH will set this bit to 1 when it receives the SMI message (encoding 08h in the command type) on the SMLinks Slave Interface. Software clears the bit by writing a 1 to this bit position. This bit is in the resume well. It is reset by RSMRST#, but not by the PCI Reset associated with exit from S3-S5 states. This allows the software (presumably BIOS) to get the interrupt, see this new bit set, and decidedly go into the pre-determined (by local policy) sleep state.
3:2	0h RO	Reserved.
1	0h RW/1C	**SECOND_TO_STS:** Intel PCH sets this bit to 1 to indicate that the TIMEOUT bit had been (or is currently) set and a second timeout occurred before the TCO_RLD register was written. If this bit is set and the NO_REBOOT config bit is 0, then the Intel PCH will reboot the system after the second timeout. The reboot is done by asserting PLTRST#. This bit is only cleared by writing a 1 to this bit or by a RSMRST#.
0	0h RW/1C	**INTRD_DET (INTRD_DET):** The bit is set to 1 by the PCH to indicate that an intrusion was detected. This bit is cleared by writing a 1 to this bit or by RTCRST#. ***Notes:*** This bit has a recovery time. After writing a 1 to this bit position (to clear it), the bit may be read back as a 1 for up 65 microseconds before it is read as a 0. Software must be aware of this recovery time when reading this bit after clearing it. If the INTRUDER# signal is active when the software attempts to clear the INTRD_DET bit, the bit will remain as a 1, and the SMI# will be generated again immediately. The SMI handler can clear the INTRD_SEL bits to avoid further SMIs. However, if the INTRUDER# signals goes inactive and then active again, there will not be further SMIs. If the INTRUDER# signal goes inactive some point after the INTRD_DET bit is written as a 1, then the INTRD_DET signal will go to a 0 when INTRUDER# input signal goes inactive. Note that this is slightly different than a classic sticky bit, since most sticky bits would remain active indefinitely when the signal goes active and would immediately go inactive when a 1 is written to the bit.

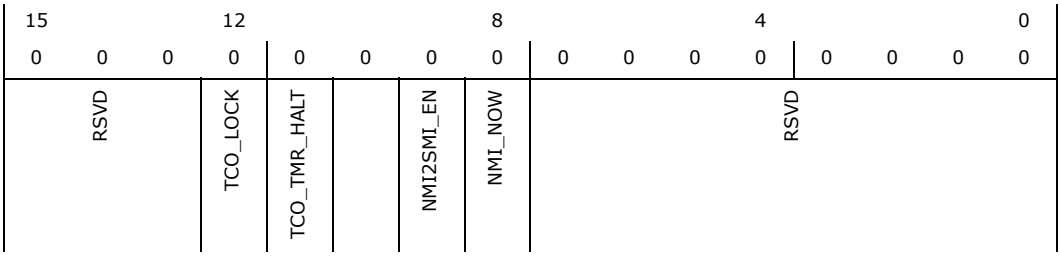
25.8.6 TCO1_CNT Register (TCTL1)—Offset 8h

Access Method

Type: I/O Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:13	0h RO	Reserved.
12	0h RW	**TCO_LOCK:** When set to 1, this bit prevents writes from changing the TCO_EN bit (in offset 30h of Power Management I/O space). Once this bit is set to 1, it can not be cleared by software writing a 0 to this bit location. A core-well reset is required to change this bit from 1 to 0. This bit defaults to 0.
11	0h RW	**TCO_TMR_HALT:** 1 = The TCO timer will halt. It will not count, and thus cannot reach a value that would cause an SMI# or to cause the SECOND_TO_STS bit to be set. This will also prevent rebooting. 0 = The TCO timer is enabled to count. This is the default.
10	0h RW	**Reserved**
9	0h RW	**NMI2SMI_EN:** Setting this bit 1 forces all NMIs to instead cause an SMI#, and will be reported in the TCO1_STS register. NMI2SMI_EN bit is set AND the NMI_EN# bit is set to 0, the NMI# will be routed to cause an SMI#. No NMI will be caused. However, if the GBL_SMI_EN bit is not set, then no SMI# will be generated, either. If NMI2SMI_EN is set but the NMI_EN# bit is set to 1, then no NMI or SMI# will be generated. The following table shows the possible combinations: NMI_EN#, GBL_SMI_EN 00: No SMI# based on NMI events (since no SMI# at all because SMI_EN = 0) 01: SMI# will be caused based on NMI events 10: No SMI# at all because SMI_EN is 0 11: No SMI# based on NMI events because NMI_EN#=1
8	0h RW	**NMI_NOW:** Writing a 1 to this bit causes an NMI. This allows the BIOS or SMI handler to force entry to the NMI handler. The NMI handler is expected to clear this bit. Another NMI will not be generated until the bit is cleared by writing a 1 back to the same bit position.
7:0	0h RO	Reserved.

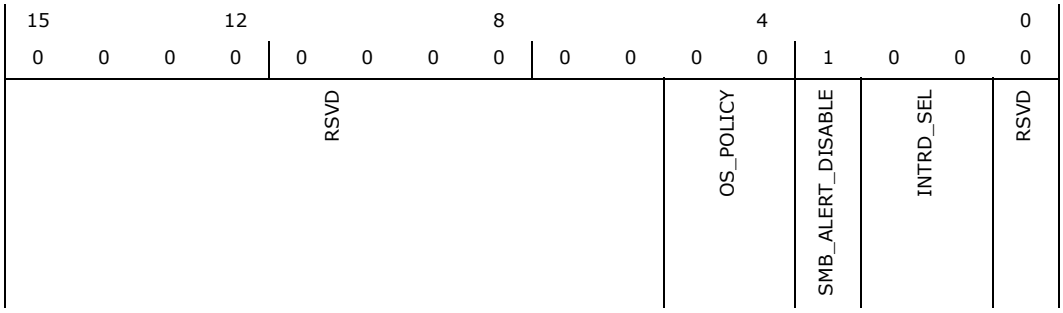
25.8.7 TCO2_CNT Register (TCTL2)—Offset Ah

Access Method

Type: I/O Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 8h



Bit Range	Default and Access	Field Name (ID): Description
15:6	0h RO	Reserved.
5:4	0h RW	**OS_POLICY (OS_POLICY):** OS-based software writes to these bits to select the policy that the BIOS will use after the platform resets due the WDT. The following convention is recommended for the BIOS and OS: 00 Boot normally 01 Shut down 10 Do not load OS. Hold in pre-boot state and use LAN to determine next step 11 Reserved Implementation. ***Note:*** These are just scratch pad bits. They should not be reset when the TCO logic resets the platform due to Watchdog Timer.
3	1h RW	**SMB_ALERT_DISABLE:** Disables muxed GPIO/SMBALERT# signal as an alert source for the heartbeats and the SMBus slave. At reset (RSMRST# pin assertion only), this bit is set and the muxed GPIO/SMBALERT# alerts are disabled.
2:1	0h RW	**INTRD_SEL (INTRD_SEL):** Selects the action to take if the INTRUDER# signal goes active. 11: Reserved 01: Interrupt (as selected by TCO_INT_SEL). 10: SMI# 00 INTRUDER# doesn't cause SMI# or interrupt
0	0h RO	Reserved.

25.8.8 TCO_MESSAGE1 and TCO_MESSAGE2 (TMSG)—Offset Ch

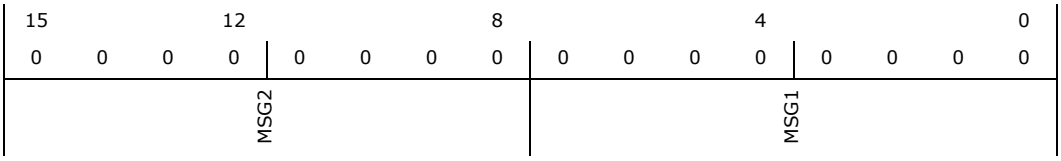
TCOBASE+0Ch (MSG1) TCOBASE+0Dh (MSG2) BIOS can write into these registers to indicate its boot progress. The external microcontroller can read these registers to monitor the boot progress.

Access Method

Type: I/O Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RW	**TCO_MESSAGE2 (MSG2)**
7:0	0h RW	**TCO_MESSAGE1 (MSG1)**

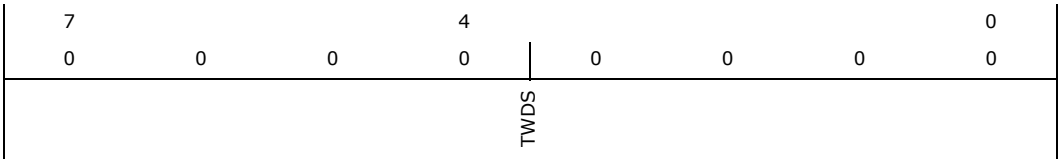
25.8.9 TCO_WDSTATUS Register (TWDS)—Offset Eh

Access Method

Type: I/O Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**TCO_WDSTATUS Register (TWDS):** The BIOS or system management software can write into this register to indicate more details on the boot progress. The register will rest to 00h based on a RSMRST# (but not PCI Reset). The external microcontroller can read this register to monitor boot progress.

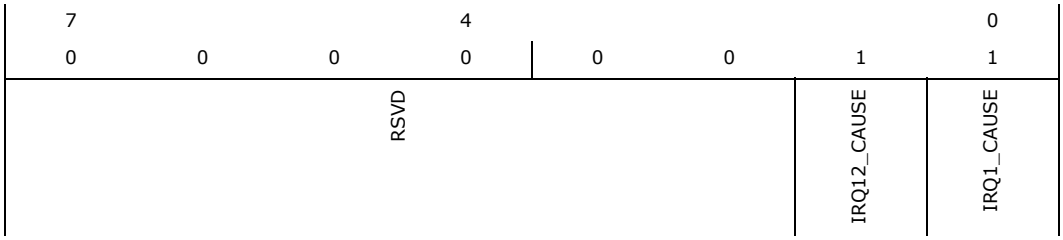
25.8.10 LEGACY_ELIM Register (LE)—Offset 10h

Access Method

Type: I/O Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 3h



Bit Range	Default and Access	Field Name (ID): Description
7:2	0h RO	Reserved.
1	1h RW	**IRQ12_CAUSE (IRQ12_CAUSE):** When software sets the bit to 1, IRQ12 will be high (asserted). When software sets the bit to 0, IRQ12 will be low (not asserted). Default for this bit is 1.
0	1h RW	**IRQ1_CAUSE (IRQ1_CAUSE):** When software sets the bit to 1, IRQ1 will be high (asserted). When software sets the bit to 0, IRQ1 will be low (not asserted). Default for this bit is 1.

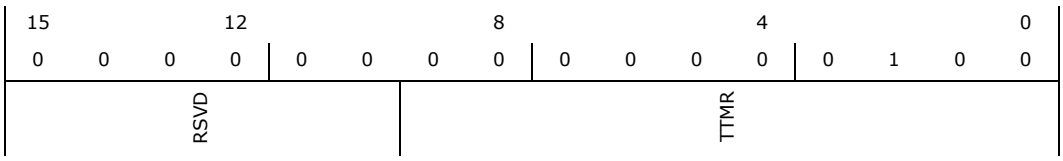
25.8.11 TCO_TMR Register (TTMR)—Offset 12h

Access Method

Type: I/O Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 4h



Bit Range	Default and Access	Field Name (ID): Description
15:10	0h RO	Reserved.
9:0	4h RW	**TCOTMR (TTMR):** Value that is loaded into the timer each time the TCO_RLD register is written. Values of 0000h or 0001h will be ignored and should not be attempted. The timer is clocked at approximately 0.6 seconds, and thus allows timeouts ranging from 1.2 second to 613.8 seconds. ***Note:*** The timer has an error of ± 1 tick (0.6s).

§

26 Host System Management Bus Controller

26.1 Acronyms

Acronyms	Description
ARP	Address Resolution Protocol
CRC	Cyclic Redundancy Check
PEC	Package Error Checking
SMBus	System Management Bus
INTR	Interrupt Status Message

26.2 References

Specification	Location
System Management Bus (SMBus) Specification, Version 2.0	http://www.smbus.org/specs/

26.3 Overview

The PCH provides a System Management Bus 2.0 host controller as well as an SMBus Slave Interface. The PCH is also capable of operating in a mode in which it can communicate with I^2C compatible devices.

The host SMBus controller supports up to 100 kHz clock speed.

26.4 Signal Description

Name	Type	Description
GPP_C0_SMBCLK	I/OD	**SMBus Clock.** External pull-up resistor is required.
GPP_C1_SMBDATA	I/OD	**SMBus Data.** External pull-up resistor is required.
GPP_C2_SMBALERT#	I/OD	**SMBus Alert:** This signal is used to wake the system or generate SMI#. External pull-up resistor is required.

26.5 Integrated Pull-ups and Pull-downs

Signal	Resistor Type	Value	Notes
SMBALERT#	Pull-Down	9K - 50K	The integrated pull down is disabled after RSMRST# de-assertion.
Note: Integrated pull-ups and pull-downs will not be valid until all the voltages have reached a valid level.			

26.6 I/O Signal Planes and States

Signal Name	Power Plane	During Reset	Immediately After Reset	S3/S4/S5	Deep Sx
SMBDATA	Primary	Undriven	Undriven	Undriven	Off
SMBCLK	Primary	Undriven	Undriven	Undriven	Off
SMBALERT#	Primary	Internal Pull-down	Driven Low	Internal Pull-down	Off

26.7 Functional Description

The PCH provides an System Management Bus 2.0 host controller as well as an SMBus Slave Interface.

- **Host Controller:** Provides a mechanism for the processor to initiate communications with SMBus peripherals (slaves). The PCH is also capable of operating in a mode in which it can communicate with I^2C compatible devices.
- **Slave Interface:** Allows an external master to read from or write to the PCH. Write cycles can be used to cause certain events or pass messages, and the read cycles can be used to determine the state of various status bits. The PCH's internal host controller cannot access the PCH's internal Slave Interface.

26.7.1 Host Controller

The host SMBus controller supports up to 100 kHz clock speed and is clocked by the RTC clock.

The PCH can perform SMBus messages with either Packet Error Checking (PEC) enabled or disabled. The actual PEC calculation and checking is performed in SW. The SMBus host controller logic can automatically append the CRC byte if configured to do so.

The SMBus Address Resolution Protocol is supported by using the existing host controller commands through software, except for the Host Notify command (which is actually a received message).

The programming model of the host controller is combined into two portions: a PCI configuration portion, and a system I/O mapped portion. All static configurations, such as the I/O base address, is done using the PCI configuration space. Real-time programming of the Host interface is done in system I/O space.

The PCH SMBus host controller checks for parity errors as a target. If an error is detected, the detected parity error bit in the PCI Status Register is set. If bit 6 and bit 8 of the PCI Command Register are set, an SERR# is generated and the signaled SERR# bit in the PCI Status Register is set.

26.7.1.1 Host Controller Operation Overview

The SMBus host controller is used to send commands to other SMBus slave devices. Software sets up the host controller with an address, command, and, for writes, data and optional PEC; and then tells the controller to start. When the controller has finished transmitting data on writes, or receiving data on reads, it generates an SMI# or interrupt, if enabled.

The host controller supports eight command protocols of the SMBus interface (see *System Management Bus (SMBus) Specification*, Version 2.0): Quick Command, Send Byte, Receive Byte, Write Byte/Word, Read Byte/Word, Process Call, Block Read/Write, Block Write–Block Read Process Call, and Host Notify.

The SMBus host controller requires that the various data and command fields be setup for the type of command to be sent. When software sets the START bit, the SMBus Host controller performs the requested transaction, and interrupts the processor (or generates an SMI#) when the transaction is completed. Once a START command has been issued, the values of the "active registers" (Host Control, Host Command, Transmit Slave Address, Data 0, Data 1) should not be changed or read until the interrupt status message bit has been set (indicating the completion of the command). Any register values needed for computation purposes should be saved prior to issuing of a new command, as the SMBus host controller updates all registers while completing the new command.

Slave functionality, including the Host Notify protocol, is available on the SMBus pins.

Using the SMB host controller to send commands to the PCH SMB slave port is not supported.

26.7.1.2 Command Protocols

In all of the following commands, the Host Status Register (offset 00h) is used to determine the progress of the command. While the command is in operation, the HOST_BUSY bit is set. If the command completes successfully, the INTR bit will be set in the Host Status Register. If the device does not respond with an acknowledge, and the transaction times out, the DEV_ERR bit is set.

If software sets the KILL bit in the Host Control Register while the command is running, the transaction will stop and the FAILED bit will be set after the PCH forces a time-out. In addition, if KILL bit is set during the CRC cycle, both the CRCE and DEV_ERR bits will also be set.

Quick Command

When programmed for a Quick Command, the Transmit Slave Address Register is sent. The PEC byte is never appended to the Quick Protocol. Software should force the PEC_EN bit to 0 when performing the Quick Command. Software must force the I2C_EN bit to 0 when running this command. See Section 5.5.1 of the *System Management Bus (SMBus) Specification,* Version 2.0 for the format of the protocol.

Send Byte/Receive Byte

For the Send Byte command, the Transmit Slave Address and Device Command Registers are sent. For the Receive Byte command, the Transmit Slave Address Register is sent. The data received is stored in the DATA0 register. Software must force the I2C_EN bit to 0 when running this command.

The Receive Byte is similar to a Send Byte, the only difference is the direction of data transfer. See Sections 5.5.2 and 5.5.3 of the *System Management Bus (SMBus) Specification,* Version 2.0 for the format of the protocol.

Write Byte/Word

The first byte of a Write Byte/Word access is the command code. The next one or two bytes are the data to be written. When programmed for a Write Byte/Word command, the Transmit Slave Address, Device Command, and Data0 Registers are sent. In

addition, the Data1 Register is sent on a Write Word command. Software must force the I2C_EN bit to 0 when running this command. See Section 5.5.4 of the *System Management Bus (SMBus) Specification,* Version 2.0 for the format of the protocol.

Read Byte/Word

Reading data is slightly more complicated than writing data. First the PCH must write a command to the slave device. Then it must follow that command with a repeated start condition to denote a read from that device's address. The slave then returns one or two bytes of data. Software must force the I2C_EN bit to 0 when running this command.

When programmed for the read byte/word command, the Transmit Slave Address and Device Command Registers are sent. Data is received into the DATA0 on the read byte, and the DAT0 and DATA1 registers on the read word. See Section 5.5.5 of the *System Management Bus (SMBus) Specification,* Version 2.0 for the format of the protocol.

Process Call

The process call is so named because a command sends data and waits for the slave to return a value dependent on that data. The protocol is simply a Write Word followed by a Read Word, but without a second command or stop condition.

When programmed for the Process Call command, the PCH transmits the Transmit Slave Address, Host Command, DATA0 and DATA1 registers. Data received from the device is stored in the DATA0 and DATA1 registers.

The Process Call command with I2C_EN set and the PEC_EN bit set produces undefined results. Software must force either I2C_EN or PEC_EN to 0 when running this command. See Section 5.5.6 of the *System Management Bus (SMBus) Specification,* Version 2.0 for the format of the protocol.

Note: For process call command, the value written into bit 0 of the Transmit Slave Address Register needs to be 0.

Note: If the I2C_EN bit is set, the protocol sequence changes slightly: the Command Code (Bits [18:11] in the bit sequence) are not sent - as a result, the slave will not acknowledge (Bit 19 in the sequence).

Block Read/Write

The PCH contains a 32-byte buffer for read and write data which can be enabled by setting bit 1 of the Auxiliary Control register at offset 0Dh in I/O space, as opposed to a single byte of buffering. This 32-byte buffer is filled with write data before transmission, and filled with read data on reception. In the PCH, the interrupt is generated only after a transmission or reception of 32 bytes, or when the entire byte count has been transmitted/received.

The byte count field is transmitted but ignored by the PCH as software will end the transfer after all bytes it cares about have been sent or received.

For a Block Write, software must either force the I2C_EN bit or both the PEC_EN and AAC bits to 0 when running this command.

The block write begins with a slave address and a write condition. After the command code the PCH issues a byte count describing how many more bytes will follow in the message. If a slave had 20 bytes to send, the first byte would be the number 20 (14h), followed by 20 bytes of data. The byte count may not be 0. A Block Read or Write is allowed to transfer a maximum of 32 data bytes.

When programmed for a block write command, the Transmit Slave Address, Device Command, and Data0 (count) registers are sent. Data is then sent from the Block Data Byte register; the total data sent being the value stored in the Data0 Register.

On block read commands, the first byte received is stored in the Data0 register, and the remaining bytes are stored in the Block Data Byte register. See Section 5.5.7 of the *System Management Bus (SMBus) Specification,* Version 2.0 for the format of the protocol.

Note: For Block Write, if the I2C_EN bit is set, the format of the command changes slightly. The PCH will still send the number of bytes (on writes) or receive the number of bytes (on reads) indicated in the DATA0 register. However, it will not send the contents of the DATA0 register as part of the message. Also, the Block Write protocol sequence changes slightly: the Byte Count (bits 27:20 in the bit sequence) are not sent - as a result, the slave will not acknowledge (bit 28 in the sequence).

Note: When operating in I^2C mode (I2C_EN bit is set), the PCH will never use the 32-byte buffer for any block commands.

I^2C* Read

This command allows the PCH to perform block reads to certain I^2C devices, such as serial E^2PROMs. The SMBus Block Read supports the 7-bit addressing mode only.

However, this does not allow access to devices using the I^2C "Combined Format" that has data bytes after the address. Typically these data bytes correspond to an offset (address) within the serial memory chips.

Note: This command is supported independent of the setting of the I2C_EN bit. The I^2C Read command with the PEC_EN bit set produces undefined results. Software must force both the PEC_EN and AAC bit to 0 when running this command.

For I^2C Read command, the value written into bit 0 of the Transmit Slave Address Register (SMB I/O register, offset 04h) needs to be 0.

The format that is used for the command is shown in Table 26-1.

Table 26-1. I^2C* Block Read (Sheet 1 of 2)

Bit	Description
1	Start
8:2	Slave Address – 7 bits
9	Write
10	Acknowledge from slave
18:11	Send DATA1 register
19	Acknowledge from slave
20	Repeated Start
27:21	Slave Address – 7 bits
28	Read
29	Acknowledge from slave
37:30	Data byte 1 from slave – 8 bits
38	Acknowledge
46:39	Data byte 2 from slave – 8 bits
47	Acknowledge
–	Data bytes from slave/Acknowledge

Table 26-1. I²C* Block Read (Sheet 2 of 2)

Bit	Description
–	Data byte N from slave – 8 bits
–	NOT Acknowledge
–	Stop

The PCH will continue reading data from the peripheral until the NAK is received.

Block Write–Block Read Process Call

The block write-block read process call is a two-part message. The call begins with a slave address and a write condition. After the command code the host issues a write byte count (M) that describes how many more bytes will be written in the first part of the message. If a master has six bytes to send, the byte count field will have the value 6 (0000 0110b), followed by the six bytes of data. The write byte count (M) cannot be 0.

The second part of the message is a block of read data beginning with a repeated start condition followed by the slave address and a Read bit. The next byte is the read byte count (N), which may differ from the write byte count (M). The read byte count (N) cannot be 0.

The combined data payload must not exceed 32 bytes. The byte length restrictions of this process call are summarized as follows:

- M ≥ 1 byte
- N ≥ 1 byte
- M + N ≤ 32 bytes

The read byte count does not include the PEC byte. The PEC is computed on the total message beginning with the first slave address and using the normal PEC computational rules. It is highly recommended that a PEC byte be used with the Block Write-Block Read Process Call. Software must do a read to the command register (offset 2h) to reset the 32 byte buffer pointer prior to reading the block data register.

Note: There is no STOP condition before the repeated START condition, and that a NACK signifies the end of the read transfer.

Note: E32B bit in the Auxiliary Control register must be set when using this protocol.

See Section 5.5.8 of the *System Management Bus (SMBus) Specification,* Version 2.0 for the format of the protocol.

26.7.1.3 Bus Arbitration

Several masters may attempt to get on the bus at the same time by driving the SMBDATA line low to signal a start condition. The PCH continuously monitors the SMBDATA line. When the PCH is attempting to drive the bus to a 1 by letting go of the SMBDATA line, and it samples SMBDATA low, then some other master is driving the bus and the PCH will stop transferring data.

If the PCH sees that it has lost arbitration, the condition is called a collision. The PCH will set the BUS_ERR bit in the Host Status Register, and if enabled, generate an interrupt or SMI#. The processor is responsible for restarting the transaction.

When the PCH is a SMBus master, it drives the clock. When the PCH is sending address or command as an SMBus master, or data bytes as a master on writes, it drives data relative to the clock it is also driving. It will not start toggling the clock until the start or stop condition meets proper setup and hold time. The PCH will also ensure minimum time between SMBus transactions as a master.

Note: The PCH supports the same arbitration protocol for both the SMBus and the System Management (SMLink) interfaces.

26.7.1.4 Clock Stretching

Some devices may not be able to handle their clock toggling at the rate that the PCH as an SMBus master would like. They have the capability of stretching the low time of the clock. When the PCH attempts to release the clock (allowing the clock to go high), the clock will remain low for an extended period of time.

The PCH monitors the SMBus clock line after it releases the bus to determine whether to enable the counter for the high time of the clock. While the bus is still low, the high time counter must not be enabled. Similarly, the low period of the clock can be stretched by an SMBus master if it is not ready to send or receive data.

26.7.1.5 Bus Timeout (PCH as SMBus Master)

If there is an error in the transaction, such that an SMBus device does not signal an acknowledge, or holds the clock lower than the allowed Timeout time, the transaction will time out. The PCH will discard the cycle and set the DEV_ERR bit. The timeout minimum is 25 ms (800 RTC clocks). The Timeout counter inside the PCH will start after the last bit of data is transferred by the PCH and it is waiting for a response.

The 25 ms Timeout counter will not count under the following conditions:

1. BYTE_DONE_STATUS bit (SMBus I/O Offset 00h, Bit 7) is set
2. The SECOND_TO_STS bit (TCO I/O Offset 06h, Bit 1) is not set (this indicates that the system has not locked up).

26.7.1.6 Interrupts/SMI#

The PCH SMBus controller uses PIRQB# as its interrupt pin. However, the system can alternatively be set up to generate SMI# instead of an interrupt, by setting the SMBUS_SMI_EN bit.

Table 26-2, Table 26-3 and Table 26-4 specify how the various enable bits in the SMBus function control the generation of the interrupt, Host and Slave SMI, and Wake internal signals. The rows in the tables are additive, which means that if more than one row is true for a particular scenario then the results for all of the activated rows will occur.

Table 26-2. Enable for SMBALERT#

Event	INTREN (Host Control I/O Register, Offset 02h, Bit 0)	SMB_SMI_EN (Host Configuration Register, D31:F4:Offset 40h, Bit 1)	SMBALERT_DIS (Slave Command I/O Register, Offset 11h, Bit 2)	Result
SMBALERT# asserted low (always reported in Host Status Register, Bit 5)	X	X	X	Wake generated
	X	1	0	Slave SMI# generated (SMBUS_SMI_STS)
	1	0	0	Interrupt generated

Table 26-3. Enables for SMBus Slave Write and SMBus Host Events

Event	INTREN (Host Control I/O Register, Offset 02h, Bit 0)	SMB_SMI_EN (Host Configuration Register, D31:F3:Offset 40h, Bit 1)	Event
Slave Write to Wake/SMI# Command	X	X	Wake generated when asleep. Slave SMI# generated when awake (SMBUS_SMI_STS).
Slave Write to SMLINK_SLAVE_SMI Command	X	X	Slave SMI# generated when in the S0 state (SMBUS_SMI_STS)
Any combination of Host Status Register [4:1] asserted	0	X	None
	1	0	Interrupt generated
	1	1	Host SMI# generated

Table 26-4. Enables for the Host Notify Command

HOST_NOTIFY_INTREN (Slave Control I/O Register, Offset 11h, Bit 0)	SMB_SMI_EN (Host Config Register, D31:F4:Off40h, Bit 1)	HOST_NOTIFY_WKEN (Slave Control I/O Register, Offset 11h, Bit 1)	Result
0	X	0	None
X	X	1	Wake generated
1	0	X	Interrupt generated
1	1	X	Slave SMI# generated (SMBUS_SMI_STS)

26.7.1.7 SMBus CRC Generation and Checking

If the AAC bit is set in the Auxiliary Control register, the PCH automatically calculates and drives CRC at the end of the transmitted packet for write cycles, and will check the CRC for read cycles. It will not transmit the contents of the PEC register for CRC. The PEC bit must not be set in the Host Control register if this bit is set, or unspecified behavior will result.

If the read cycle results in a CRC error, the DEV_ERR bit and the CRCE bit in the Auxiliary Status register at Offset 0Ch will be set.

26.7.2 SMBus Slave Interface

The PCH SMBus Slave interface is accessed using the SMBus. The SMBus slave logic will not generate or handle receiving the PEC byte and will only act as a Legacy Alerting Protocol device. The slave interface allows the PCH to decode cycles, and allows an external microcontroller to perform specific actions.

Key features and capabilities include:

- Supports decode of three types of messages: Byte Write, Byte Read, and Host Notify.
- Receive Slave Address register: This is the address that the PCH decodes. A default value is provided so that the slave interface can be used without the processor having to program this register.
- Receive Slave Data register in the SMBus I/O space that includes the data written by the external microcontroller.
- Registers that the external microcontroller can read to get the state of the PCH.

- Status bits to indicate that the SMBus slave logic caused an interrupt or SMI# due to the reception of a message that matched the slave address.
  - Bit 0 of the Slave Status Register for the Host Notify command
  - Bit 16 of the SMI Status Register for all others

Note: The external microcontroller should not attempt to access the PCH SMBus slave logic until either:

- 800 milliseconds after both: RTCRST# is high and RSMRST# is high, OR
- The PLTRST# deasserts

If a master leaves the clock and data bits of the SMBus interface at 1 for 50 µs or more in the middle of a cycle, the PCH slave logic's behavior is undefined. This is interpreted as an unexpected idle and should be avoided when performing management activities to the slave logic.

Note: When an external microcontroller accesses the SMBus Slave Interface over the SMBus a translation in the address is needed to accommodate the least significant bit used for read/write control. For example, if the PCH slave address (RCV_SLVA) is left at 44h (default), the external micro controller would use an address of 88h/89h (write/read).

26.7.2.1 Format of Slave Write Cycle

The external master performs Byte Write commands to the PCH SMBus Slave I/F. The "Command" field (bits 11:18) indicate which register is being accessed. The Data field (bits 20:27) indicate the value that should be written to that register.

Table 26-5 has the values associated with the registers.

Table 26-5. Slave Write Registers

Register	Function
0	Command Register. See Table 26-6 for valid values written to this register.
1–3	Reserved
4	Data Message Byte 0
5	Data Message Byte 1
6–7	Reserved
8	Reserved
9–FFh	Reserved
Note: The external microcontroller is responsible to make sure that it does not update the contents of the data byte registers until they have been read by the system processor. The PCH overwrites the old value with any new value received. A race condition is possible where the new value is being written to the register just at the time it is being read. The PCH will not attempt to cover this race condition (that is, unpredictable results in this case).	

Table 26-6. Command Types (Sheet 1 of 2)

Command Type	Description
0	Reserved
1	**WAKE/SMI#.** This command wakes the system if it is not already awake. If system is already awake, an SMI# is generated. ***Note:*** The SMB_WAK_STS bit will be set by this command, even if the system is already awake. The SMI handler should then clear this bit.
2	**Unconditional Power Down.** This command sets the PWRBTNOR_STS bit, and has the same effect as the power button override occurring.

Table 26-6. Command Types (Sheet 2 of 2)

Command Type	Description
3	**HARD RESET WITHOUT CYCLING:** This command causes a hard reset of the system (does not include cycling of the power supply). This is equivalent to a write to the CF9h register with Bits 2:1 set to 1, but Bit 3 set to 0.
4	**HARD RESET SYSTEM.** This command causes a hard reset of the system (including cycling of the power supply). This is equivalent to a write to the CF9h register with Bits 3:1 set to 1.
5	**Disable the TCO Messages.** This command will disable the PCH from sending Heartbeat and Event messages. Once this command has been executed, Heartbeat and Event message reporting can only be re-enabled by assertion and deassertion of the RSMRST# signal.
6	**WD RELOAD:** Reload watchdog timer.
7	Reserved
8	**SMLINK_SLV_SMI.** When the PCH detects this command type while in the S0 state, it sets the SMLINK_SLV_SMI_STS bit. This command should only be used if the system is in an S0 state. If the message is received during S1–S5 states, the PCH acknowledges it, but the SMLINK_SLV_SMI_STS bit does not get set. ***Note:*** It is possible that the system transitions out of the S0 state at the same time that the SMLINK_SLV_SMI command is received. In this case, the SMLINK_SLV_SMI_STS bit may get set but not serviced before the system goes to sleep. Once the system returns to S0, the SMI associated with this bit would then be generated. Software must be able to handle this scenario.
9–FFh	Reserved.

26.7.2.2 Format of Read Command

The external master performs Byte Read commands to the PCH SMBus Slave interface. The "Command" field (bits 18:11) indicate which register is being accessed. The Data field (bits 30:37) contain the value that should be read from that register.

Table 26-7. Slave Read Cycle Format

Bit	Description	Driven By	Comment
1	Start	External Microcontroller	
2–8	Slave Address - 7 bits	External Microcontroller	Must match value in Receive Slave Address register
9	Write	External Microcontroller	Always 0
10	ACK	PCH	
11–18	Command code – 8 bits	External Microcontroller	Indicates which register is being accessed. See Table 26-8 for a list of implemented registers.
19	ACK	PCH	
20	Repeated Start	External Microcontroller	
21–27	Slave Address - 7 bits	External Microcontroller	Must match value in Receive Slave Address register
28	Read	External Microcontroller	Always 1
29	ACK	PCH	
30–37	Data Byte	PCH	Value depends on register being accessed. See Table 26-8 for a list of implemented registers.
38	NOT ACK	External Microcontroller	
39	Stop	External Microcontroller	

Table 26-8. Data Values for Slave Read Registers (Sheet 1 of 2)

Register	Bits	Description
0	7:0	Reserved for capabilities indication. Should always return 00h. Future chips may return another value to indicate different capabilities.
1	2:0	**System Power State** 000 = S0 001 = S1 010 = Reserved 011 = S3 100 = S4 101 = S5 110 = Reserved 111 = Reserved
	7:3	Reserved
2	3:0	Reserved
	7:4	Reserved
3	5:0	**Watchdog Timer current value** ***Note:*** The Watchdog Timer has ten bits, but this field is only six bits. If the current value is greater than 3Fh, the PCH will always report 3Fh in this field.
	7:6	Reserved
4	0	**Intruder Detect**. 1 = The Intruder Detect (INTRD_DET) bit is set. This indicates that the system cover has probably been opened.
	1	**Temperature Event**. 1 = BTI Temperature Event occurred. This bit will be set if the PCH's THRM# input signal is active. Else this bit will read "0."
	2	**DOA Processor Status**. This bit will be 1 to indicate that the processor is dead
	3	1 = **SECOND_TO_STS** bit set. This bit will be set after the second Timeout (SECOND_TO_STS bit) of the Watchdog Timer occurs.
	6:4	Reserved. Will always be 0, but software should ignore.
	7	**SMBALERT# Status.** Reflects the value of the SMBALERT# pin (when the pin is configured to SMBALERT#). Valid only if SMBALERT_DISABLE = 0. Value always returns 1 if SMBALERT_DISABLE = 1.
5	0	**FWH bad bit.** This bit will be 1 to indicate that the FWH read returned FFh, which indicates that it is probably blank.
	1	**Battery Low Status.** Reserved
	2	**SYS_PWROK Failure Status:** This bit will be 1 if the SYSPWR_FLR bit in the GEN_PMCON_2 register is set.
	3	Reserved
	4	Reserved
	5	**POWER_OK_BAD:** Indicates the failure core power well ramp during boot/resume. This bit will be active if the SLP_S3# pin is deasserted and PCH_PWROK pin is not asserted.
	6	**Thermal Trip**: This bit will shadow the state of processor Thermal Trip status bit (CTS). Events on signal will not create a event message
	7	Reserved: Default value is "X" ***Note:*** Software should not expect a consistent value when this bit is read through SMBUS/SMLink
6	7:0	Contents of the Message 1 register.
7	7:0	Contents of the Message 2 register.
8	7:0	Contents of the WDSTATUS register.
9	7:0	Seconds of the RTC
A	7:0	Minutes of the RTC
B	7:0	Hours of the RTC
C	7:0	"Day of Week" of the RTC
D	7:0	"Day of Month" of the RTC
E	7:0	Month of the RTC
F	7:0	Year of the RTC

Table 26-8. Data Values for Slave Read Registers (Sheet 2 of 2)

Register	Bits	Description
10h–FFh	7:0	Reserved

26.7.2.2.1 Behavioral Notes

According to SMBus protocol, Read and Write messages always begin with a Start bit—Address—Write bit sequence. When the PCH detects that the address matches the value in the Receive Slave Address register, it will assume that the protocol is always followed and ignore the Write bit (Bit 9) and signal an Acknowledge during bit 10. In other words, if a Start—Address—Read occurs (which is invalid for SMBus Read or Write protocol), and the address matches the PCH's Slave Address, the PCH will still grab the cycle.

Also according to SMBus protocol, a Read cycle contains a Repeated Start—Address—Read sequence beginning at Bit 20. Once again, if the Address matches the PCH's Receive Slave Address, it will assume that the protocol is followed, ignore bit 28, and proceed with the Slave Read cycle.

Note: An external microcontroller must not attempt to access the PCH's SMBus Slave logic until at least one second after both RTCRST# and RSMRST# are deasserted (high).

Note: Until at least one second after both RTCRST# and RSMRST# are deasserted (high).

26.7.2.3 Slave Read of RTC Time Bytes

The PCH SMBus slave interface allows external SMBus master to read the internal RTC's time byte registers.

The RTC time bytes are internally latched by the PCH's hardware whenever RTC time is not changing and SMBus is idle. This ensures that the time byte delivered to the slave read is always valid and it does not change when the read is still in progress on the bus. The RTC time will change whenever hardware update is in progress, or there is a software write to the RTC time bytes.

The PCH SMBus slave interface only supports Byte Read operation. The external SMBus master will read the RTC time bytes one after another. It is software's responsibility to check and manage the possible time rollover when subsequent time bytes are read.

For example, assuming the RTC time is 11 hours: 59 minutes: 59 seconds. When the external SMBus master reads the hour as 11, then proceeds to read the minute, it is possible that the rollover happens between the reads and the minute is read as 0. This results in 11 hours: 0 minutes instead of the correct time of 12 hours: 0 minutes. Unless it is certain that rollover will not occur, software is required to detect the possible time rollover by reading multiple times such that the read time bytes can be adjusted accordingly if needed.

26.7.2.4 Format of Host Notify Command

The PCH tracks and responds to the standard Host Notify command as specified in the *System Management Bus (SMBus) Specification,* Version 2.0. The host address for this command is fixed to 0001000b. If the PCH already has data for a previously-received host notify command which has not been serviced yet by the host software (as indicated by the HOST_NOTIFY_STS bit), then it will NACK following the host address byte of the protocol. This allows the host to communicate non-acceptance to the master and retain the host notify address and data values for the previous cycle until host software completely services the interrupt.

Note: Host software must always clear the HOST_NOTIFY_STS bit after completing any necessary reads of the address and data registers.

Table 26-9 shows the Host Notify format.

Table 26-9. Host Notify Format

Bit	Description	Driven By	Comment
1	Start	External Master	
8:2	SMB Host Address – seven bits	External Master	Always 0001_000
9	Write	External Master	Always 0
10	ACK (or NACK)	PCH	PCH NACKs if HOST_NOTIFY_STS is 1
17:11	Device Address – seven bits	External Master	Indicates the address of the master; loaded into the Notify Device Address Register
18	Unused – Always 0	External Master	7-bit-only address; this bit is inserted to complete the byte
19	ACK	PCH	
27:20	Data Byte Low – eight bits	External Master	Loaded into the Notify Data Low Byte Register
28	ACK	PCH	
36:29	Data Byte High – eight bits	External Master	Loaded into the Notify Data High Byte Register
37	ACK	PCH	
38	Stop	External Master	

26.7.2.5 Format of Read Command

The external master performs Byte Read commands to the PCH SMBus Slave interface. The "Command" field (bits 18:11) indicate which register is being accessed. The Data field (bits 30:37) contains the value that should be read from that register.

Table 26-10. Slave Read Cycle Format

Bit	Description	Driven By	Comment
1	Start	External Microcontroller	
2–8	Slave Address - seven bits	External Microcontroller	Must match value in Receive Slave Address register
9	Write	External Microcontroller	Always 0
10	ACK	PCH	
11–18	Command code – eight bits	External Microcontroller	Indicates which register is being accessed. See Table 26-11 for a list of implemented registers.
19	ACK	PCH	
20	Repeated Start	External Microcontroller	
21–27	Slave Address - seven bits	External Microcontroller	Must match value in Receive Slave Address register
28	Read	External Microcontroller	Always 1
29	ACK	PCH	
30–37	Data Byte	PCH	Value depends on register being accessed. See Table 26-11 for a list of implemented registers.
38	NOT ACK	External Microcontroller	
39	Stop	External Microcontroller	

Table 26-11. Data Values for Slave Read Registers (Sheet 1 of 2)

Register	Bits	Description
0	7:0	Reserved for capabilities indication. Should always return 00h. Future chips may return another value to indicate different capabilities.
1	2:0	**System Power State** 000 = S0 001 = S1 010 = Reserved 011 = S3 100 = S4 101 = S5 110 = Reserved 111 = Reserved
	7:3	Reserved
2	3:0	Reserved
	7:4	Reserved
3	5:0	**Watchdog Timer current value** ***Note:*** The Watchdog Timer has 10 bits, but this field is only 6 bits. If the current value is greater than 3Fh, the PCH will always report 3Fh in this field.
	7:6	Reserved
4	0	**Intruder Detect.** 1 = The Intruder Detect (INTRD_DET) bit is set. This indicates that the system cover has probably been opened.
	1	**Temperature Event.** 1 = BTI Temperature Event occurred. This bit will be set if the PCH's THRM# input signal is active. Else this bit will read "0."
	2	**DOA Processor Status**. This bit will be 1 to indicate that the processor is dead
	3	1 = **SECOND_TO_STS** bit set. This bit will be set after the second Timeout (SECOND_TO_STS bit) of the Watchdog Timer occurs.
	6:4	Reserved. Will always be 0, but software should ignore.
	7	**SMBALERT# Status.** Reflects the value of the GPIO11/SMBALERT# pin (when the pin is configured as SMBALERT#). Valid only if SMBALERT_DISABLE = 0. Value always return 1 if SMBALERT_DISABLE = 1. (high = 1, low = 0).
5	0	**FWH bad bit.** This bit will be 1 to indicate that the FWH read returned FFh, which indicates that it is probably blank.
	1	**Battery Low Status**. Reserved.
	2	**SYS_PWROK Failure Status:** This bit will be 1 if the SYSPWR_FLR bit in the GEN_PMCON_2 register is set.
	3	Reserved
	4	Reserved
	5	**POWER_OK_BAD.** Indicates the failure core power well ramp during boot/resume. This bit will be active if the SLP_S3# pin is deasserted and PCH_PWROK pin is not asserted.
	6	**Thermal Trip**. This bit will shadow the state of processor Thermal Trip status bit (CTS). Events on signal will not create a event message
	7	Reserved: Default value is "X" ***Note:*** Software should not expect a consistent value when this bit is read through SMBUS/SMLink
6	7:0	Contents of the Message 1 register.
7	7:0	Contents of the Message 2 register.
8	7:0	Contents of the WDSTATUS register.
9	7:0	Seconds of the RTC
A	7:0	Minutes of the RTC
B	7:0	Hours of the RTC
C	7:0	"Day of Week" of the RTC
D	7:0	"Day of Month" of the RTC
E	7:0	Month of the RTC
F	7:0	Year of the RTC

Table 26-11. Data Values for Slave Read Registers (Sheet 2 of 2)

Register	Bits	Description
10h–FFh	7:0	Reserved

Table 26-12. Enables for SMBus Slave Write and SMBus Host Events

Event	INTREN (Host Control I/O Register, Offset 02h, Bit 0)	SMB_SMI_EN (Host Configuration Register, D31:F3:Offset 40h, Bit 1)	Event
Slave Write to Wake/SMI# Command	X	X	Wake generated when asleep. Slave SMI# generated when awake (SMBUS_SMI_STS).
Slave Write to SMLINK_SLAVE_SMI Command	X	X	Slave SMI# generated when in the S0 state (SMBUS_SMI_STS)
Any combination of Host Status Register [4:1] asserted	0	X	None
	1	0	Interrupt generated
	1	1	Host SMI# generated

26.8 SMBus Configuration Registers Summary

Table 26-13. Summary of SMBus Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	1h	Vendor ID (VID)—Offset 0h	8086h
2h	3h	Device ID (DID)—Offset 2h	A223
4h	5h	Command (CMD)—Offset 4h	0h
6h	7h	Device Status (DS)—Offset 6h	280h
8h	8h	Revision ID (RID)—Offset 8h	0h
9h	9h	Programming Interface (PI)—Offset 9h	0h
Ah	Ah	Sub Class Code (SCC)—Offset Ah	5h
Bh	Bh	Base Class Code (BCC)—Offset Bh	Ch
10h	13h	SMBus Memory Base Address_31_0 (SMBMBAR_31_0)—Offset 10h	4h
14h	17h	SMBus Memory Base Address_63_32 (SMBMBAR_63_32)—Offset 14h	0h
20h	23h	SMB Base Address (SBA)—Offset 20h	1h
2Ch	2Dh	SVID (SVID)—Offset 2Ch	0h
2Eh	2Fh	SID (SID)—Offset 2Eh	0h
3Ch	3Ch	Interrupt Line (INTLN)—Offset 3Ch	0h
3Dh	3Dh	Interrupt Pin (INTPN)—Offset 3Dh	1h
40h	40h	Host Configuration (HCFG)—Offset 40h	0h
50h	53h	TCO Base Address (TCOBASE)—Offset 50h	1h
54h	57h	TCO Control (TCOCTL)—Offset 54h	0h

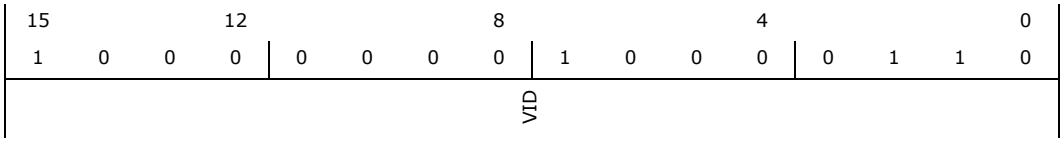
26.8.1 Vendor ID (VID)—Offset 0h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 8086h



Bit Range	Default and Access	Field Name (ID): Description
15:0	8086h RO	**Vendor ID (VID):** Value indicates Intel as the vendor

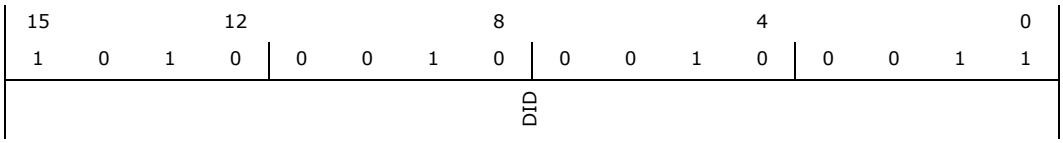
26.8.2 Device ID (DID)—Offset 2h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 4

Default: A223h



Bit Range	Default and Access	Field Name (ID): Description
15:0	A223h RO	**Device ID (DID):** Indicates the value assigned to the PCH SMBus controller.

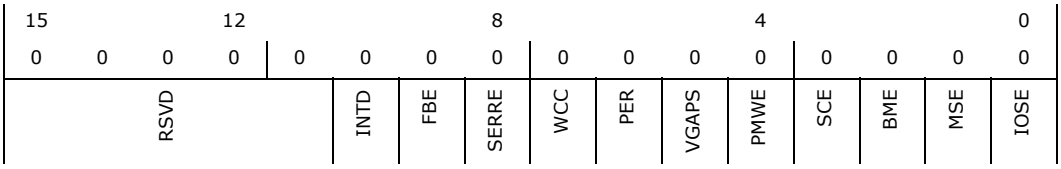
26.8.3 Command (CMD)—Offset 4h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:11	0h RO	Reserved.
10	0h RW	**Interrupt Disable (INTD):** 1 = Disables SMBus to assert its PIRQB# signal. Defaults to 0.
9	0h RW	**Fast Back to Back Enable (FBE):** Reserved as 0. Read Only.
8	0h RW	**SERR# Enable (SERRE):** 1 = Enables SERR# generation
7	0h RW	**Wait Cycle Control (WCC):** Reserved as 0. Read Only.
6	0h RW	**Parity Error Response (PER):** 1 = Sets Detected Parity Error bit when parity error is detected
5	0h RW	**VGA Palette Snoop (VGAPS):** Reserved as 0. Read Only.
4	0h RW	**Postable Memory Write Enable (PMWE):** Reserved as 0. Read Only.
3	0h RW	**Special Cycle Enable (SCE):** Reserved as 0. Read Only.
2	0h RW	**Bus Master Enable (BME):** Reserved as 0. Read Only.
1	0h RW	**Memory Space Enable (MSE):** 1= Enables memory mapped config space.
0	0h RW	**I/O Space Enable (IOSE):** 1= enables access to the SM Bus I/O space registers as defined by the Base Address Register.

26.8.4 Device Status (DS)—Offset 6h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 280h

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
DPE	SSE	RMA	RTA	STA	DEVT		DPED	FBC	UDF	C_66M	CLI	INTS	RSVD		

Bit Range	Default and Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE):** 1 = Parity error detected
14	0h RW/1C	**Signaled System Error (SSE):** 1 = System error detected
13	0h RO	**Received Master Abort (RMA):** Reserved as 0.
12	0h RO	**Received Target Abort (RTA):** Reserved as '0'.
11	0h RO	**Signaled Target-Abort Status (STA):** Reserved as 0.
10:9	1h RO	**DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion. These read only bits indicate the Intel PCH's DEVSEL# timing when performing a positive decode. ***Note:*** Intel PCH generates DEVSEL# with medium time.
8	0h RO	**Data Parity Error Detected (DPED):** Reserved as 0.
7	1h RO	**Fast Back-to-Back Capable (FBC):** Reserved as '1'.
6	0h RO	**User Definable Features (UDF):** Reserved as 0.
5	0h RO	**66 MHz Capable (C_66M):** Reserved as 0.
4	0h RO	**Capabilities List Indicator (CLI):** Hardwired to 0 because there are no capability list structures in this function.
3	0h RO	**Interrupt Status (INTS):** This bit indicates that an interrupt is pending. It is independent from the state of the Interrupt Enable bit in the command register.
2:0	0h RO	Reserved.

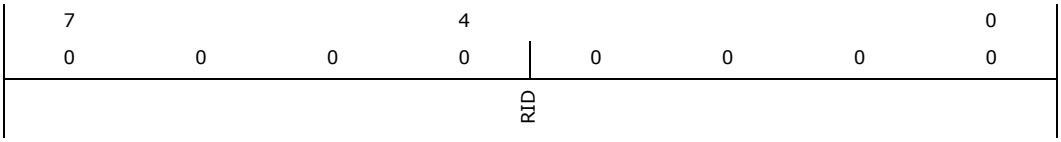
26.8.5 Revision ID (RID)—Offset 8h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Revision ID (RID):** The value reported in this register depends on the global revision ID for the PCH.

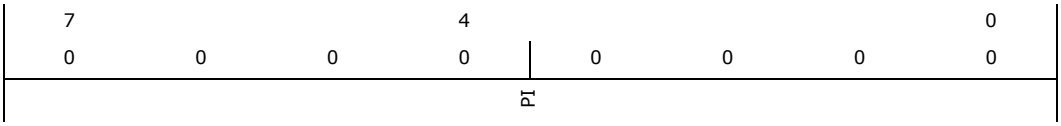
26.8.6 Programming Interface (PI)—Offset 9h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Programming Interface (PI):** No programming interface defined.

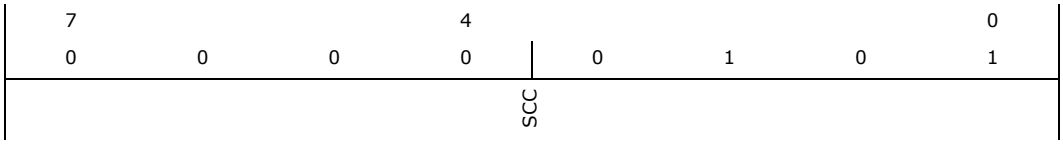
26.8.7 Sub Class Code (SCC)—Offset Ah

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 5h



Bit Range	Default and Access	Field Name (ID): Description
7:0	5h RO	**Sub Class Code (SCC):** A value of 05h indicates that this device is a SM Bus serial controller.

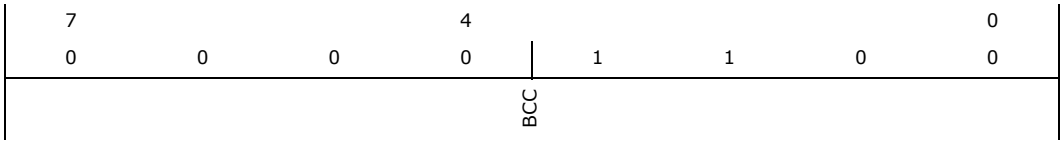
26.8.8 Base Class Code (BCC)—Offset Bh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 4

Default: Ch



Bit Range	Default and Access	Field Name (ID): Description
7:0	Ch RO	**Base Class Code (BCC):** A value of 0Ch indicates that this device is a serial controller

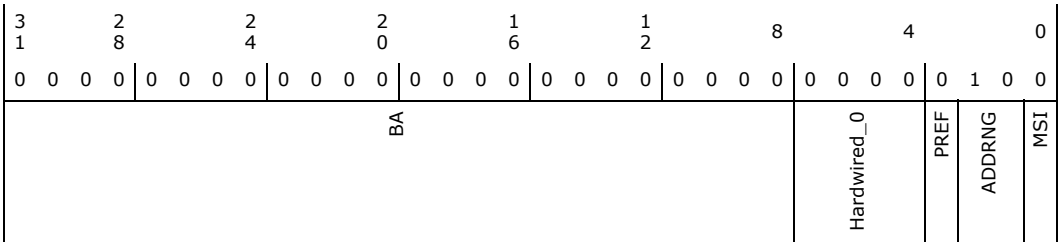
26.8.9 SMBus Memory Base Address_31_0 (SMBMBAR_31_0)—Offset 10h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 4

Default: 4h



Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RW	**Base Address (BA):** Provides the 32 byte system memory base address for the Intel PCH SMB logic.
7:4	0h RO	**Hardwired_0 (Hardwired_0):** Hardwired to 0.
3	0h RO	**Prefetchable (PREF):** Hardwired to 0. Indicated that SMBMBAR is not pre-fetchable
2:1	2h RO	**Address Range (ADDRNG):** Indicates that this SMBMBAR can be located anywhere in 64 bit address space
0	0h RO	**Memory Space Indicator (MSI):** Indicates that the SMB logic is memory mapped.

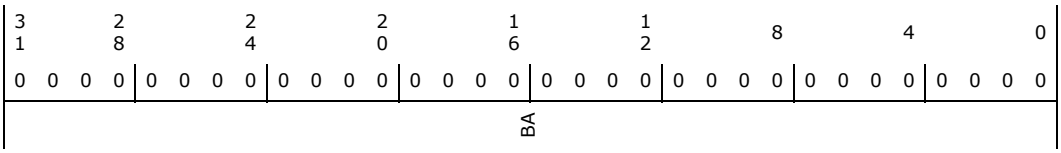
26.8.10 SMBus Memory Base Address_63_32 (SMBMBAR_63_32)—Offset 14h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Base Address (BA):** Bits 63-32 of SMbus Memory Base Address

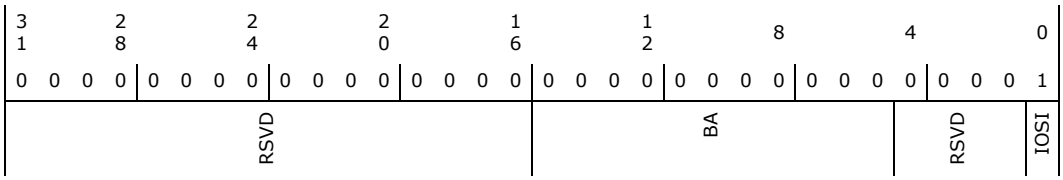
26.8.11 SMB Base Address (SBA)—Offset 20h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 4

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:5	0h RW	**Base Address (BA):** Provides the 32 byte t system I/O base address for the SMB logic.
4:1	0h RO	Reserved.
0	1h RO	**IO Space Indicator (IOSI):** This read-only bit always is 1, indicating that the SMB logic is I/O mapped.

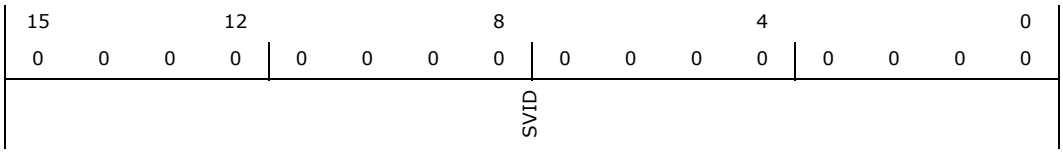
26.8.12 SVID (SVID)—Offset 2Ch

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:0	0h RW/O	**SVID (SVID):** BIOS sets the value in this register to identify the Subsystem Vendor ID. The SMBus SVID register, in combination with the SMBus Subsystem ID register, enables the operating system to distinguish each subsystem from the others. ***Note:*** Software can write to this register only once per core well reset. Writes should be done as a single 16-bit cycle.

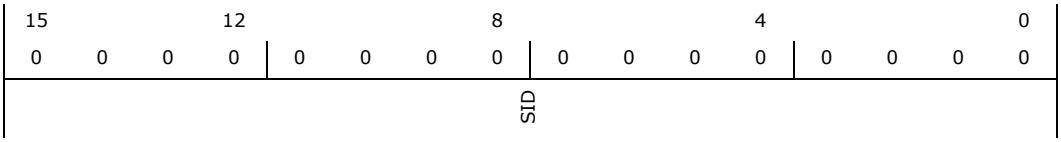
26.8.13 SID (SID)—Offset 2Eh

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:0	0h RW/O	**SID (SID):** BIOS can write to this register to identify the Subsystem ID. The SID register, in combination with the SVID, enable the operating system to distinguish each subsystem from other(s). ***Note:*** The software can write to this register only once per core well reset. Writes should be done as a single 16-bit cycle.

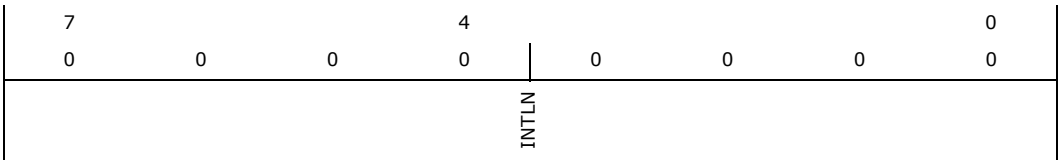
26.8.14 Interrupt Line (INTLN)—Offset 3Ch

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Line (INTLN):** This data is not used by the hardware. It is to communicate to software the interrupt line that the interrupt pin is connected to PIRQB#.

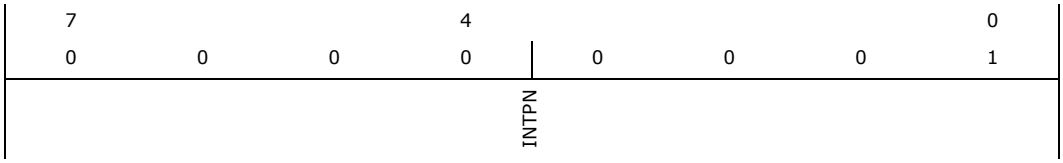
26.8.15 Interrupt Pin (INTPN)—Offset 3Dh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
7:0	1h RW/O	**Interrupt Pin (INTPN):** This defines the interrupt pin to be used by the SMBus controller. Bits : Pins 0h : No Interrupt 1h : INTA# 2h : INTB# 3h : INTC# 4h : INTD# 5h-Fh : Reserved

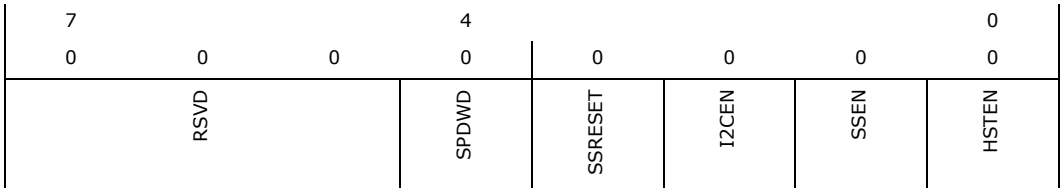
26.8.16 Host Configuration (HCFG)—Offset 40h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:5	0h RO	Reserved.
4	0h RW/O	**SPD Write Disable (SPDWD):** When this bit is set to 1, writes to SMBus addresses A0h – AEh are disabled. ***Note:*** This bit is R/WO and will be reset on PLTRST# assertion. This bit should be set by BIOS to '1'. Software can only program this bit when both the START bit and Host Busy bit are '0'; otherwise, the write may result in undefined behavior.
3	0h RW	**SSRESET (SSRESET):** Soft SMBUS Reset: When this bit is 1, the SMbus state machine and logic in PCH is reset. The HW will reset this bit to 0 when reset operation is completed.
2	0h RW	**I2C_EN (I2CEN):** When this bit is 1, the Intel PCH is enabled to communicate with I2C devices. This will change the formatting of some commands. When this bit is 0, behavior is for SMBus.

Bit Range	Default and Access	Field Name (ID): Description
1	0h RW	**SMB_SMI_EN (SSEN):** When this bit is set, any source of an SMB interrupt will instead be routed to generate an SMI#.
0	0h RW	**HST_EN (HSTEN):** When set, the SMB Host Controller interface is enabled to execute commands. The HST_INT_EN bit needs to be enabled in order for the SMB Host Controller to interrupt or SMI#. Additionally, the SMB Host Controller will not respond to any new requests until all interrupt requests have been cleared.

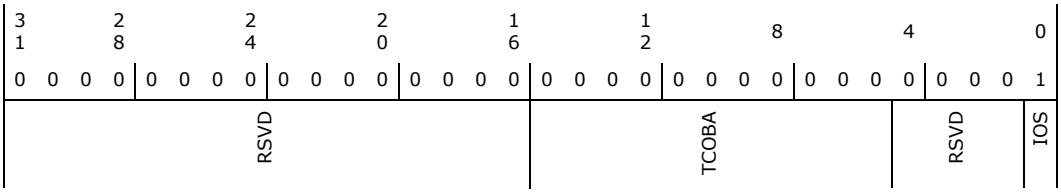
26.8.17 TCO Base Address (TCOBASE)—Offset 50h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 4

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:5	0h RW	**TCO Base Address (TCOBA):** Provides the 32 bytes of I/O space for TCO logic, mappable anywhere in the 64k I/O space on 32-byte boundaries.
4:1	0h RO	Reserved.
0	1h RO	**I/O Space (IOS):** Indicates an I/O Space

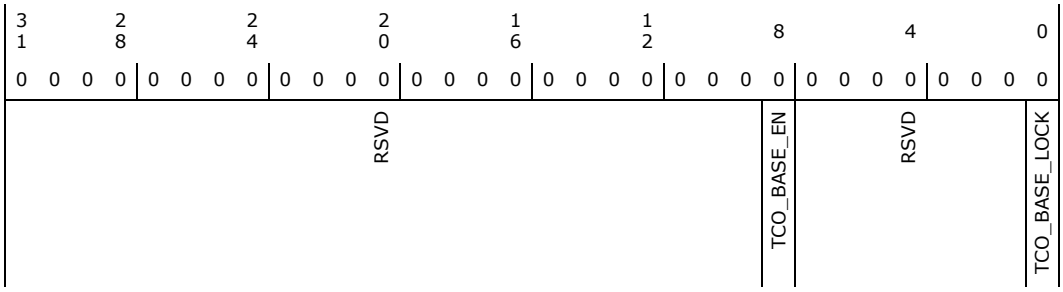
26.8.18 TCO Control (TCOCTL)—Offset 54h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8	0h RW	**TCO Base Enable (TCO_BASE_EN):** When set, decode of the I/O range pointed to by the TCO base register is enabled.
7:1	0h RO	Reserved.
0	0h RW/O	**TCO Base Lock (TCO_BASE_LOCK):** If set to 1, the TCO Base Address register (TCOBASE) at offset 50 is locked. If set to 0, then the base register is writable. ***Note:*** This bit is Write Once. If you write a 0 to it, it will remain a 0 until a reset occurs. If you write a 1 to it, it will remain a 1 until a reset occurs. So the first write to this register locks this bit.

26.9 SMBus I/O and Memory Mapped I/O Registers Summary

The SMBus registers can be accessed through I/O BAR or Memory BAR registers in PCI configuration space. The offsets are the same for both I/O and Memory Mapped I/O registers.

Table 26-14. Summary of SMBus I/O and Memory Mapped I/O Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	0h	Host Status Register Address (HSTS)—Offset 0h	0h
2h	2h	Host Control Register (HCTL)—Offset 2h	0h
3h	3h	Host Command Register (HCMD)—Offset 3h	0h
4h	4h	Transmit Slave Address Register (TSA)—Offset 4h	0h
5h	5h	Data 0 Register (HD0)—Offset 5h	0h
6h	6h	Data 1 Register (HD1)—Offset 6h	0h
7h	7h	Host Block Data (HBD)—Offset 7h	0h

Table 26-14. Summary of SMBus I/O and Memory Mapped I/O Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
8h	8h	Packet Error Check Data Register (PEC)—Offset 8h	0h
9h	9h	Receive Slave Address Register (RSA)—Offset 9h	44h
Ah	Bh	Slave Data Register (SD)—Offset Ah	0h
Ch	Ch	Auxiliary Status (AUXS)—Offset Ch	0h
Dh	Dh	Auxiliary Control (AUXC)—Offset Dh	0h
Eh	Eh	SMLINK_PIN_CTL Register (SMLC)—Offset Eh	4h
Fh	Fh	SMBUS_PIN_CTL Register (SMBC)—Offset Fh	4h
10h	10h	Slave Status Register (SSTS)—Offset 10h	0h
11h	11h	Slave Command Register (SCMD)—Offset 11h	0h
14h	14h	Notify Device Address Register (NDA)—Offset 14h	0h
16h	16h	Notify Data Low Byte Register (NDLB)—Offset 16h	0h
17h	17h	Notify Data High Byte Register (NDHB)—Offset 17h	0h

26.9.1 Host Status Register Address (HSTS)—Offset 0h

All status bits are set by hardware and cleared by the software writing a one to the particular bit position. Writing a zero to any bit position has no affect.

Access Method

Type: IO Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
BDS	IUS	SMSTS	FAIL	BERR	DERR	INTR	HBSY

Bit Range	Default and Access	Field Name (ID): Description
7	0h RW/1C	**BYTE_DONE_STS (BDS):** This bit will be set to 1 when the host controller has received a byte (for Block Read commands) or if it has completed transmission of a byte (for Block Write commands) when the 32-byte buffer is not being used. Note that this bit will be set, even on the last byte of the transfer. Software clears the bit by writing a 1 to the bit position. This bit has no meaning for block transfers when the 32- byte buffer is enabled. ***Note:*** When the last byte of a block message is received, the host controller will set this bit. However, it will not immediately set the INTR bit (bit 1 in this register). When the interrupt handler clears the BYTE_DONE_STS bit, the message is considered complete, and the host controller will then set the INTR bit (and generate another interrupt). Thus, for a block message of n bytes, the Intel PCH will generate n+1 interrupts. The interrupt handler needs to be implemented to handle these cases.
6	0h RW	**In Use Status (IUS):** After a full PCI reset, a read to this bit returns a 0. After the first read, subsequent reads will return a 1. A write of a 1 to this bit will reset the next read value to 0. Writing a 0 to this bit has no effect. Software can poll this bit until it reads a 0, and will then own the usage of the host controller. This bit has no other effect on the hardware, and is only used as semaphore among various independent software threads that may need to use the Intel PCHs SMBus logic.
5	0h RW/1C	**SMBALERT_STS (SMSTS):** Intel PCH sets this bit to a 1 to indicates source of the interrupt or SMI# was the SMBAlert# signal. Software resets this bit by writing a 1 to this location. This bit should also be cleared by RSMRST# (but not PLTRST#).
4	0h RW/1C	**Failed (FAIL):** When set, this indicates that the source of the interrupt or SMI# was a failed bus transaction. This is set in response to the KILL bit being set to terminate the host transaction.
3	0h RW/1C	**Bus Error (BERR):** When set, this indicates the source of the interrupt or SMI# was a transaction collision.
2	0h RW/1C	**Device Error (DERR):** When set, this indicates that the source of the interrupt or SMI# was due one of the following: Illegal Command Field Unclaimed Cycle (host initiated) Host Device Time-out Error. CRC Error
1	0h RW/1C	**Interrupt (INTR):** When set, this indicates that the source of the interrupt or SMI# was the successful completion of its last command.
0	0h RW/1C	**Host Busy (HBSY):** A 1 indicates that the Intel PCH is running a command from the host interface. No SMB registers should be accessed while this bit is set. Exception: The BLOCK DATA REGISTER can be accessed when this bit is set ONLY when the SMB_CMD bits (in Host control register) are programmed for Block command or I2C Read command. This is necessary in order to check the DONE_STS bit.

26.9.2 Host Control Register (HCTL)—Offset 2h

Note: A read to this register will clear the pointer in the 32-byte buffer.

Access Method

Type: IO Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
PEC_EN	START	LAST_BYTE	SMB_CMD			KILL	INTREN

Bit Range	Default and Access	Field Name (ID): Description
7	0h RW	**PEC_EN (PEC_EN):** When set to 1, this bit causes the host controller to perform the SMBus transaction with the Packet Error Checking phase appended. For writes, the value of the PEC byte is transferred from the PEC Register. For reads, the PEC byte is loaded in to the PEC Register. When this bit is cleared to 0, the SMBus host controller does not perform the transaction with the PEC phase appended. This bit must be written prior to the write in which the START bit is set.
6	0h RW	**START (START):** This write-only bit is used to initiate the command described in the SMB_CMD field. All registers should be setup prior to writing a 1 to this bit position. This bit always reads zero. The HOST_BUSY bit in the Host Status register (offset 00h) can be used to identify when the Intel PCH has finished the command.
5	0h RW	**LAST_BYTE (LAST_BYTE):** This bit is used for I2C Read commands. Software sets this bit to indicate that the next byte will be the last byte to be received for the block. This causes the PCH to send a NACK (instead of an ACK) after receiving the last byte. ***Note:*** This bit may be set when the TCO timer causes the SECOND_TO_STS bit to be set. SW should clear the LAST_BYTE bit (if it is set) before starting any new command. In addition to I2C Read Commands, the LAST_BYTE bit will also cause Block Read/Write cycles to stop prematurely (at the end of the next byte).
4:2	0h RW	**SMB_CMD (SMB_CMD):** As shown by the bit encoding below, indicates which command the Intel PCH is to perform. If enabled, the Intel PCH will generate an interrupt or SMI# when the command has completed If the value is for a non-supported or reserved command, the Intel PCH will set the device error (DEV_ERR) status bit and generate an interrupt when the START bit is set. The Intel PCH will perform no command, and will not operate until DEV_ERR is cleared. Val - Command Description: 000 - Quick: The slave address and read/write value (bit 0) are stored in the tx slave address register. 001 - Byte: This command uses the transmit slave address and command registers. Bit 0 of the slave address register determines if this is a read or write command. 010 - Byte Data: This command uses the transmit slave address, command, and DATA0 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, the DATA0 register will contain the read data. 011 - Word Data: This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, after the command completes the DATA0 and DATA1 registers will contain the read data. 100 - Process Call: This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. After the command completes, the DATA0 and DATA1 registers will contain the read data. 101 - Block: This command uses the transmit slave address,command, and DATA0 registers, and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block reads, the count is received and stored in the DATA0 register. Bit 0 of the slave address register selects if this is a read or write command. For writes, data is retrieved from the first n (where n is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. 110 - I2C Read: This command uses the transmit slave address, command, DATA0, DATA1 registers, and the Block Data Byte register. The read data is stored in the Block Data Byte register. The Intel PCH will continue reading data until the NAK is received. 111 - Block-Process: This command uses the transmit slave address, command, DATA0 and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block read, the count is received and stored in the DATA0 register. Bit 0 of the slave address register always indicate a write command. For writes, data is retrieved from the first m (where m is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. ***Note:*** E32B bit in the Auxiliary Control Register must be set for this command to work.
1	0h RW	**KILL (KILL):** When set, kills the current host transaction taking place, sets the FAILED status bit, and asserts the interrupt (or SMI#) selected by the SMB_INTRSEL field. This bit, once set, must be cleared to allow the SMB Host Controller to function normally.
0	0h RW	**INTREN (INTREN):** Enable the generation of an interrupt or SMI# upon the completion of the command.

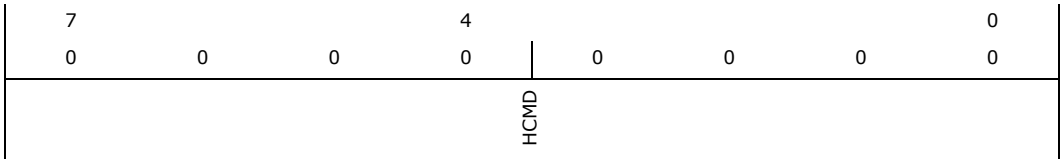
26.9.3 Host Command Register (HCMD)—Offset 3h

Access Method

Type: IO Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**Host Command Register (HCMD):** This eight bit field is transmitted by the host controller in the command field of the SMB protocol during the execution of any command.

26.9.4 Transmit Slave Address Register (TSA)—Offset 4h

This register is transmitted by the host controller in the slave address field of the SMB protocol. This is the address of the target.

Access Method

Type: IO Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:1	0h RW	**ADDRESS (ADDR):** 7-bit address of the targeted slave. ***Note:*** Writes to TSA values of A0h - AEh are blocked depending on the setting of the SPD write disable bit in HCFG - HostConfiguration.
0	0h RW	**RW (RW):** Direction of the host transfer. 1 = read, 0 = write

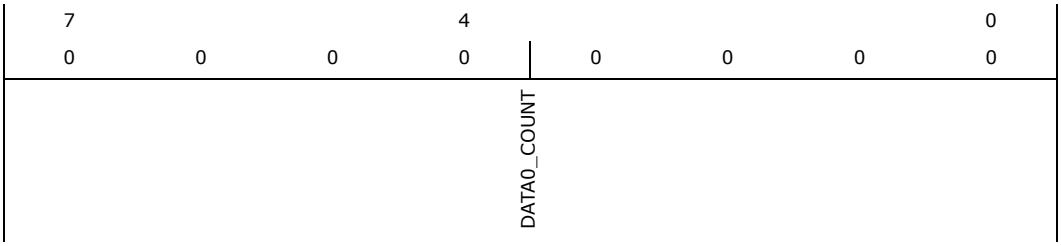
26.9.5 Data 0 Register (HD0)—Offset 5h

Access Method

Type: IO Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**DATA0/COUNT (DATA0_COUNT):** This field contains the eight bit data sent in the DATA0 field of the SMB protocol. For block write commands, this register reflects the number of bytes to transfer. This register should be programmed to a value between 1 and 32 for block counts. A count of 0 or a count above 32 will result in unpredictable behavior. The host controller does not check or log illegal block counts.

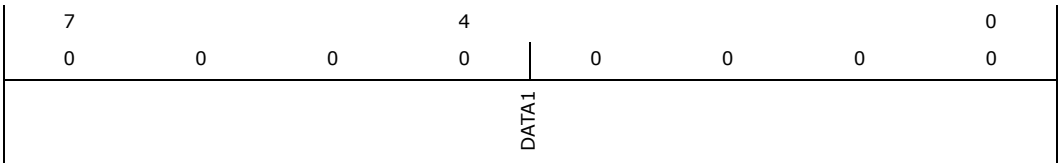
26.9.6 Data 1 Register (HD1)—Offset 6h

Access Method

Type: IO Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**DATA1 (DATA1):** This eight bit register is transmitted in the DATA1 field of the SMB protocol during the execution of any command.

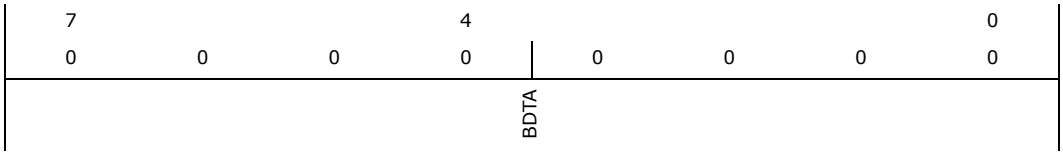
26.9.7 Host Block Data (HBD)—Offset 7h

Access Method

Type: IO Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**Block Data (BDTA):** This is either a register, or a pointer into a 32- byte block array, depending upon whether the E32B bit is set in the Auxiliary Control register. When the E32B bit is cleared, this is a register containing a byte of data to be sent on a block write or read from on a block read, just as it behaved on the INTEL PCH. When the E32B bit is set, reads and writes to this register are used to access the 32-byte block data storage array. An internal index pointer is used to address the array, which is reset to 0 by reading the HCTL register (offset 02h). The index pointer then increments automatically upon each access to this register. The transfer of block data into (read) or out of (write) this storage array during an SMBus transaction always starts at index address 0. When the E2B bit is set, for writes, software will write up to 32-bytes to this register as part of the setup for the command. After the Host Controller has sent the Address, Command, and Byte Count fields, it will send the bytes in the SRAM pointed to by this register. When the E2B bit is cleared for writes, software will place a single byte in this register. After the host controller has sent the address, command, and byte count fields, it will send the byte in this register. If there is more data to send, software will write the next series of bytes to the SRAM pointed to by this register and clear the DONE_STS bit. The controller will then send the next byte. During the time between the last byte being transmitted to the next byte being transmitted, the controller will insert wait-states on the interface. When the E2B bit is set for reads, after receiving the byte count into the Data0 register, the first series of data bytes go into the SRAM pointed to by this register. If the byte count has been exhausted or the 32-byte SRAM has been filled, the controller will generate an SMI# or interrupt (depending on configuration) and set the DONE_STS bit. Software will then read the data. During the time between when the last byte is read from the SRAM to when the DONE_STS bit is cleared, the controller will insert wait states on the interface.

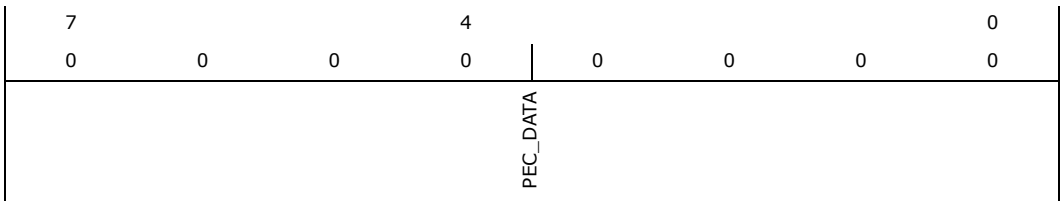
26.9.8 Packet Error Check Data Register (PEC)—Offset 8h

Access Method

Type: IO Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**PEC_DATA (PEC_DATA):** This 8-bit register is written with the SMBus PEC data prior to a write transaction. For read transactions, the PEC data is loaded from the SMBus into this register and is then read by software. Software must ensure that the INUSE_STS bit is properly maintained to avoid having this field over-written by a write transaction following a read transaction.

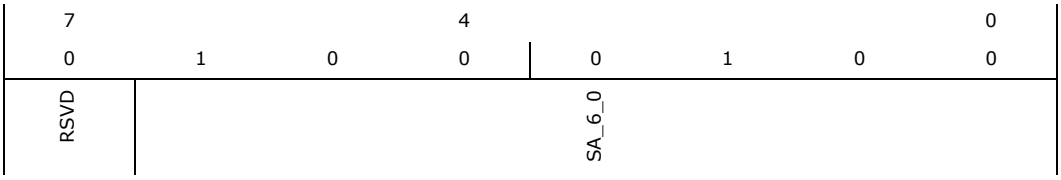
26.9.9 Receive Slave Address Register (RSA)—Offset 9h

Access Method

Type: IO Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 44h



Bit Range	Default and Access	Field Name (ID): Description
7	0h RO	Reserved.
6:0	44h RW	**SLAVE_ADDR[6:0] (SA_6_0):** This field is the slave address that the Intel PCH decodes for read and write cycles. The default is not 0 so that it can respond even before the CPU comes up (or if the CPU is dead). This register is reset by RSMRST#, but not by PLTRST#.

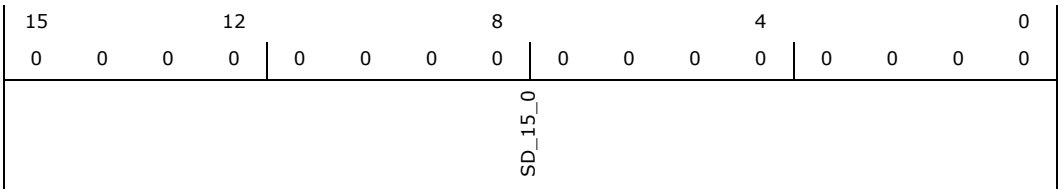
26.9.10 Slave Data Register (SD)—Offset Ah

Access Method

Type: IO Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:0	0h RW	**SLAVE_DATA[15:0] (SD_15_0):** This field is the 16-bit data value written by the external SMBus master. The CPU can then read the value from this register. This register is reset by RSMRST#, but not by PLTRST#. SLAVE_DATA(7:0) corresponds to the Data Message Byte 0 at Slave Write Register 4 in the table. SLAVE_(15:8) corresponds to the Data Message Byte 1 at Slave Write Register 5 in the table.

26.9.11 Auxiliary Status (AUXS)—Offset Ch

All bits in this register are in the core well.

Access Method

Type: IO Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
RSVD			Reserved	Reserved	Reserved	RSVD	CRCE

Bit Range	Default and Access	Field Name (ID): Description
7:5	0h RO	Reserved.
4	0h RO	**Reserved**
3	0h RO	**Reserved**
2	0h RO	**Reserved**
1	0h RO	Reserved.
0	0h RW/1C	**CRC Error (CRCE):** This bit is set if a received message contained a CRC error. When this bit is set, the DERR bit of the host status register will also be set. This bit will be set by the controller if a software abort occurs in the middle of the CRC portion of the cycle or an abort happens after Intel PCH has received the final data bit transmitted by external slave.

26.9.12 Auxiliary Control (AUXC)—Offset Dh

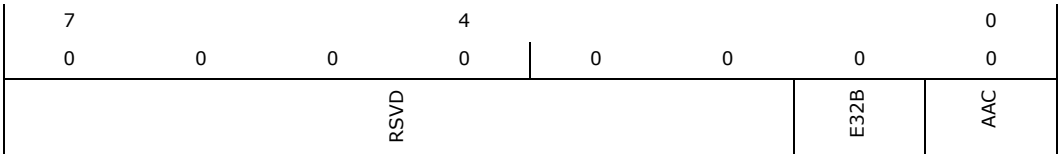
All bits in this register are in the resume well.

Access Method

Type: IO Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:2	0h RO	Reserved.
1	0h RW	**Enable 32-byte Buffer (E32B):** When set, the Host Block Data register is a pointer into a 32-byte buffer, as opposed to a single register. This enables the block commands to transfer or receive up to 32-bytes before the Intel PCH generates an interrupt.
0	0h RW	**Automatically Append CRC (AAC):** When set, the Intel PCH will automatically append the CRC. This bit must not be changed during SM Bus transactions, or undetermined behavior will result. It should be programmed only once during the lifetime of the function.

26.9.13 SMLINK_PIN_CTL Register (SMLC)—Offset Eh

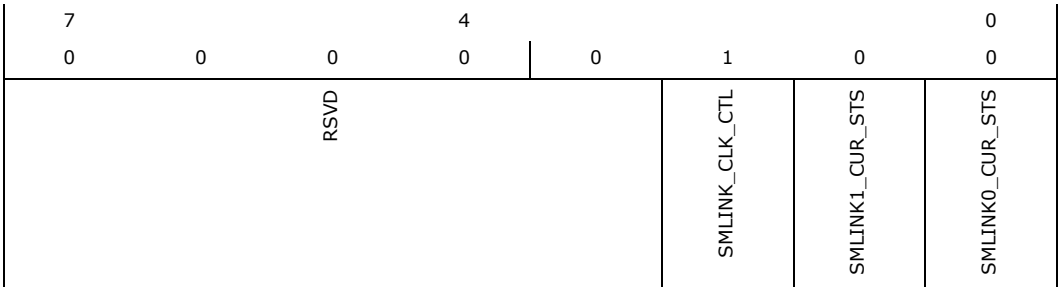
Note: This register is in the resume well and is reset by RSMRST#.

Access Method

Type: IO Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 4h



Bit Range	Default and Access	Field Name (ID): Description
7:3	0h RO	Reserved.
2	1h RW	**SMLINK_CLK_CTL (SMLINK_CLK_CTL):** 0 = Intel PCH will drive the SMLINK(0) pin low, independent of what the other SMLINK logic would otherwise indicate for the SMLINK(0) pin. 1 = The SMLINK(0) pin is Not overdriven low. The other SMLINK logic controls the state of the pin.
1	0h RO	**SMLINK[1]_CUR_STS (SMLINK1_CUR_STS):** This bit has a default value that is dependent on an external signal level. This returns the value on the SMLINK(1) pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.
0	0h RO	**SMLINK[0]_CUR_STS (SMLINK0_CUR_STS):** This bit has a default value that is dependent on an external signal level. This returns the value on the SMLINK(0) pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.

26.9.14 SMBUS_PIN_CTL Register (SMBC)—Offset Fh

Note: This register is in the resume well and is reset by RSMRST#

Access Method

Type: IO Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 4h

7	6	5	4	3	2	1	0
0	0	0	0	0	1	0	0
RSVD					SMBCLK_CTL	SMBDATA_CUR_STS	SMBCLK_CUR_STS

Bit Range	Default and Access	Field Name (ID): Description
7:3	0h RO	Reserved.
2	1h RW	**SMBCLK_CTL (SMBCLK_CTL):** 0 = Intel PCH will drive the SMBCLK pin low, independent of what the other SMB logic would otherwise indicate for the SMBCLK pin. 1 = The SMBCLK pin is Not overdriven low. The other SMBus logic controls the state of the pin.
1	0h RO	**SMBDATA_CUR_STS (SMBDATA_CUR_STS):** This bit has a default value that is dependent on an external signal level. This returns the value on the SMBDATA pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.
0	0h RO	**SMBCLK_CUR_STS (SMBCLK_CUR_STS):** This bit has a default value that is dependent on an external signal level. This returns the value on the SMBCLK pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.

26.9.15 Slave Status Register (SSTS)—Offset 10h

All bits in this register are implemented in the 64 kHz clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally.

Access Method

Type: IO Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
RSVD							HNS

Bit Range	Default and Access	Field Name (ID): Description
7:1	0h RO	Reserved.
0	0h RW/1C	**HOST_NOTIFY_STS (HNS):** The Intel PCH sets this bit to a 1 when it has completely received a successful Host Notify Command on the SMBus pins. Software reads this bit to determine that the source of the interrupt or SMI# was the reception of the Host Notify Command. Software clears this bit after reading any information needed from the Notify address and data registers by writing a 1 to this bit. Note that the Intel PCH will allow the Notify Address and Data registers to be over-written once this bit has been cleared. When this bit is 1, the Intel PCH will NACK the first byte (host address) of any new Host Notify commands on the SMBus. Writing a 0 to this bit has no effect.

26.9.16 Slave Command Register (SCMD)—Offset 11h

All bits in this register are implemented in the 64 kHz clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally. Also, software must confirm the prior written value before writing to the register again.

Access Method

Type: IO Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
RSVD					SMB_D	HNW	HNI

Bit Range	Default and Access	Field Name (ID): Description
7:3	0h RO	Reserved.
2	0h RW	**SMBALERT_DIS (SMB_D):** Software sets this bit to 1 to block the generation of the interrupt or SMI# due to the SMBALERT# source. This bit is logically inverted and ANDed with the SMBALERT_STS bit. The resulting signal is distributed to the SMI# and/or interrupt generation logic. This bit does not effect the wake logic.
1	0h RW	**HOST_NOTIFY_WKEN (HNW):** Software sets this bit to 1 to enable the reception of a Host Notify command as a wake event. When enabled this event is ORed in with the other SMBus wake events and is reflected in the SMB_WAK_STS bit of the General Purpose Event 0 Status register.
0	0h RW	**HOST_NOTIFY_INTREN (HNI):** Software sets this bit to 1 to enable the generation of interrupt or SMI# when HOST_NOTIFY_STS is 1. This enable does not affect the setting of the HOST_NOTIFY_STS bit. When the interrupt is generated, either PIRQB or SMI# is generated, depending on the value of the SMB_SMI_EN bit (D31, F3, Off40h, B1). If the HOST_NOTIFY_STS bit is set when this bit is written to a 1, then the interrupt (or SMI#) will be generated. The interrupt (or SMI#) is logically generated by ANDing the STS and INTREN bits.

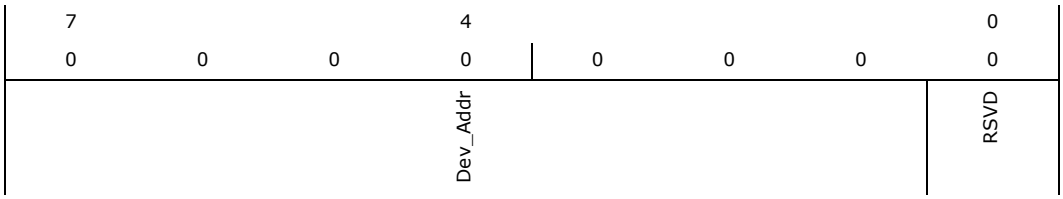
26.9.17 Notify Device Address Register (NDA)—Offset 14h

Access Method

Type: IO Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:1	0h RW	**DEVICE_ADDRESS (Dev_Addr):** This field contains the 7-bit device address received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.
0	0h RO	Reserved.

26.9.18 Notify Data Low Byte Register (NDLB)—Offset 16h

Access Method

Type: IO Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
DLB							

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**DATA_LOW_BYTE (DLB):** This field contains the first (low) byte of data received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.

26.9.19 Notify Data High Byte Register (NDHB)—Offset 17h

Access Method

Type: IO Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
DHB							

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**DATA_HIGH_BYTE (DHB):** This field contains the second (high) byte of data received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.

26.10 SMBus PCR Registers Summary

These registers are within the PCH Private Configuration Space which is accessible through the PCH Sideband Interface. They can be accessed via (SBREG_BAR + PortID + Register Offset). The offsets are DWORD aligned byte addresses.

Table 26-15. Summary of SMBus PCR Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	TCO Configuration (TCOCFG)—Offset 0h	0h
Ch	Fh	General Control (GC)—Offset Ch	0h

26.10.1 TCO Configuration (TCOCFG)—Offset 0h

Access Method

Type: MSG Register (Size: 32 bits)

Device: 31
Function: 4

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD																							IE	RSVD					IS		

Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7	0h RW	**TCO IRQ Enable (IE):** When set, TCO IRQ is enabled, as selected by the TCO_IRQ_SEL field. When cleared, TCO IRQ is disabled.
6:3	0h RO	Reserved.
2:0	0h RW	**TCO IRQ Select (IS):** Specifies on which IRQ the TCO will internally appear. If not using the APIC, the TCO interrupt must be routed to IRQ9-11, and that interrupt is not sharable with the SERIRQ stream, but is shareable with other PCI interrupts. If using the APIC, the TCO interrupt can also be mapped to IRQ20-23, and can be shared with other interrupt. Bits TCO Map 000 IRQ9 (maps to 8259 and APIC) 001 IRQ10 maps to 8259 and APIC) 010 IRQ11 (maps to 8259 and APIC) 011 Reserved 100 IRQ20 (maps to APIC) 101 IRQ21 (maps to APIC) 110 IRQ22 (maps to APIC) 111 IRQ23 (maps to APIC) When setting the these bits, the IE bit should be cleared to prevent glitching. When the interrupt is mapped to APIC interrupts 9, 10 or 11, the APIC should be programmed for active-high reception. When the interrupt is mapped to APIC interrupts 20 through 23, the APIC should be programmed for active-low reception.

26.10.2 General Control (GC)—Offset Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device: 31
Function: 4

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD																														NR	FD

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1	0h RW	**No Reboot (NR):** This bit is set when the No Reboot strap is sampled high on PWROK. This bit may be set or cleared by software if the strap is sampled low but may not override the strap when it indicates No Reboot. When set, the TCO timer will count down and generate the SMI# on the first timeout, but will not reboot on the second timeout.
0	0h RW	**Function Disable (FD):** When set to one, this disables the PCI config register space for the SMBus device.

27 Serial Peripheral Interface

27.1 Acronyms

Acronyms	Description
MISO	Mater In Slave Out
MOSI	Mater Out Slave In
SPI	Serial Peripheral Interface
SFDP	Serial Flash Discoverable Parameter

27.2 References

None

27.3 Overview

The SPI interface, implementing three chip select signals, allows up to two flash devices and one TPM device to be connected to the PCH.

The SPI interfaces support either 1.8V or 3.3V.

27.4 Signal Description

Name	Type	Description
SPI0_CLK	O	**SPI Clock**: SPI clock signal for the common flash/TPM interface. Supports 17MHz, 30 MHz and 40 MHz.
SPI0_FLASH_ CS0_N	O	**SPI FLASH Chip Select 0**: Used to select the primary SPI Flash device. ***Note:*** This signal cannot be used for any other type of device than SPI Flash.
SPI0_FLASH_CS1_N	O	**SPI FLASH Chip Select 1**: Used to select an optional secondary SPI Flash device. ***Note:*** This signal cannot be used for any other type of device than SPI Flash.
SPI0_TPM_CS_N	O	**SPI TPM Chip Select:** Used to select the TPM device if it is connected to the SPI interface; it cannot be used for any other type of device. ***Note:*** TPM can be configured through soft straps to operate over LPC or SPI, but no more than 1 TPM is allowed in the system.
SPI0_MOSI_IO0	I/O	**SPI Master OUT Slave IN**: Defaults as a data output pin for PCH in Dual Output Fast Read mode. Can be configured with a Soft Strap as a bidirectional signal (SPI_IO0) to support the new Dual I/O Fast Read, Quad I/O Fast Read and Quad Output Fast Read modes.
SPI0_MISO_IO1	I/O	**SPI Master IN Slave OUT**: Defaults as a data input pin for PCH in Dual Output Fast Read mode. Can be configured with a Soft Strap as a bidirectional signal (SPI_IO1) to support the new Dual I/O Fast Read, Quad I/O Fast Read and Quad Output Fast Read modes.
SPI0_IO[3:2]	I/O	**SPI Data I/O:** Bidirectional signals used to support Quad I/O Fast Read and Quad Output Fast Read modes.

27.5 Integrated Pull-Ups and Pull-Downs

Signal	Resistor Type	Value	Notes
SPI0_CLK	Pull-up	15K - 40K	
SPI0_MOSI_IO0	Pull-up	15K - 40K	1
SPI0_MISO_IO1	Pull-up	15K - 40K	
SPI0_FLASH_CS0_N, SPI0_FLASH_CS1_N, SPI0_TPM_CS_N	Pull-up	15K - 40K	
SPI0_IO[2:3]	Pull-up	15K - 40K	

Notes:
1. Weak internal pull-up resistor is enabled when RSMRST# is asserted and is switched to a weak internal pull-down when RSMRST# is de-asserted.
2. Integrated pull-ups and pull-downs will not be valid until all the voltages have reached a valid level.

27.6 I/O Signal Planes and States

Signal Name	Power Plane	During Reset	Immediately after Reset	S3/S4/S5	Deep Sx
SPI0_CLK	Primary	Driven Low (See Note 1)	Driven Low	Driven Low	Off
SPI0_MOSI_IO0	Primary	Internal Pull up/ (See Note 1)	Driven Low	Driven Low	Off
SPI0_MISO_IO1	Primary	Internal Pull-up	Internal Pull-up	Internal Pull-up	Off
SPI0_FLASH_CS0_N	Primary	Driven High (See Note 1)	Driven High	Driven High	Off
SPIO_FLASH_CS1_N	Primary	Internal Pull-up (See Note 1)	Driven High	Driven High	Off
SPI0_TPM_CS_N	Primary	Driven High (See Note 1)	Driven High	Driven High	Off
SPI0_IO[2:3]	Primary	Internal Pull-up (See Note 1)	Internal Pull-up	Internal Pull-up	Off

Notes:
1. Pins are tri-stated (with weak internal pull-up) prior to RSMRST# de-assertion.
2. Integrated pull-ups and pull-downs will not be valid until all the voltages have reached a valid level.

27.7 Functional Description

27.7.1 SPI for Flash

27.7.1.1 Overview

The PCH supports up to two SPI flash devices using two separate Chip Select pins. The maximum size of flash supported is determined by the SFDP-discovered addressing capability of each device. Each component can be up to 16 MB using 3-byte addressing or 64 MB using 4-byte addressing.

The PCH SPI interface supports 17 MHz, 30 MHz, and 40 MHz SPI devices. Note that a flash device meeting 66 MHz timing is required for 40 MHz operation.

Flash devices used with the SPI controller must contain the SFDP table.

The SPI interface supports either 3.3V or 1.8V.

A SPI Flash device on Chip Select 0 (SPIO_Flash_CS0#) with a valid descriptor MUST be attached directly to the PCH.

The PCH supports fast read which consist of:

1. Dual Output Fast Read (Single Input Dual Output)
2. Dual I/O Fast Read (Dual Input Dual Output)
3. Quad Output Fast Read (Single Input Quad Output)
4. Quad I/O Fast Read (Quad Input Quad Output)

The PCH SPI has a third chip select SPI0_TPM_CS# for TPM support over SPI. TPM Bus will use SPI0_CLK, SPI0_Flash_MISO, SPI0_Flash_MOSI and SPI_Flash_CS1# SPI signals.

Notes:

1. If Boot BIOS Strap ='1', then LPC/eSPI is selected as the location for the BIOS. If the LPC bus is replaced with the eSPI bus, then the BIOS will be located off of eSPI.
2. When SPI is selected by the Boot BIOS Destination Strap and a SPI device is detected by the PCH, LPC based BIOS flash is disabled.
3. If LPC is disabled through soft straps (Soft Strap 120, Bit 13), the SPI TPM will not function as part of the SPI TPM control is done via the LPC logic. This has nothing to do with the selection of LPC/eSPI via hardstrap. It is easy to make the erroneous assumption that if eSPI is selected, then LPC should be disabled through SS 120.

27.7.1.2 SPI Supported Features

27.7.1.2.1 Descriptor Mode

Descriptor Mode is required for all SKUs of the PCH. Non-Descriptor Mode is not supported.

27.7.1.2.2 SPI Flash Regions

In Descriptor Mode the Flash is divided into multiple separate regions:

Table 27-1. SPI Flash Regions

Region	Content
0	Flash Descriptor
1	BIOS
2	Intel Management Engine
3	Gigabit Ethernet
4	Platform Data
5	Device Expansion
6	Secondary BIOS
7	RSVD
8	BMC
9	Device Expansion 2
10	Innovation Engine
11	10 GbE region #1
12	Option ROM
13-15	Reserved

Access to the SPI flash can be done by the following masters 1) TPM Device (via CS# to a TPM device on the SPI bus), 2) Host Processor, 3) Management Engine, 4) Innovation Engine, 5) Integrated 1 GbE MAC, 6) 10 GbE LAN controllers and 7) eSPI. An external BMC would get access to SPI via the eSPI interface.

The Flash Descriptor and Intel ME region are the only required regions. The Flash Descriptor has to be in region 0 and region 0 must be located in the first sector of Device 0 (Offset 0).

Regions can extend across multiple components, but must be contiguous.

Flash Region Sizes

SPI flash space requirements differ by platform and configuration. The Flash Descriptor requires one 4 KB or larger block. GbE requires two 4KB or larger blocks. The amount of flash space consumed is dependent on the erase granularity of the flash part and the platform requirements for the Intel ME and BIOS regions. The Intel ME region contains firmware to support Intel Active Management Technology and other Intel ME capabilities.

Table 27-2. Region Size Versus Erase Granularity of Flash Components

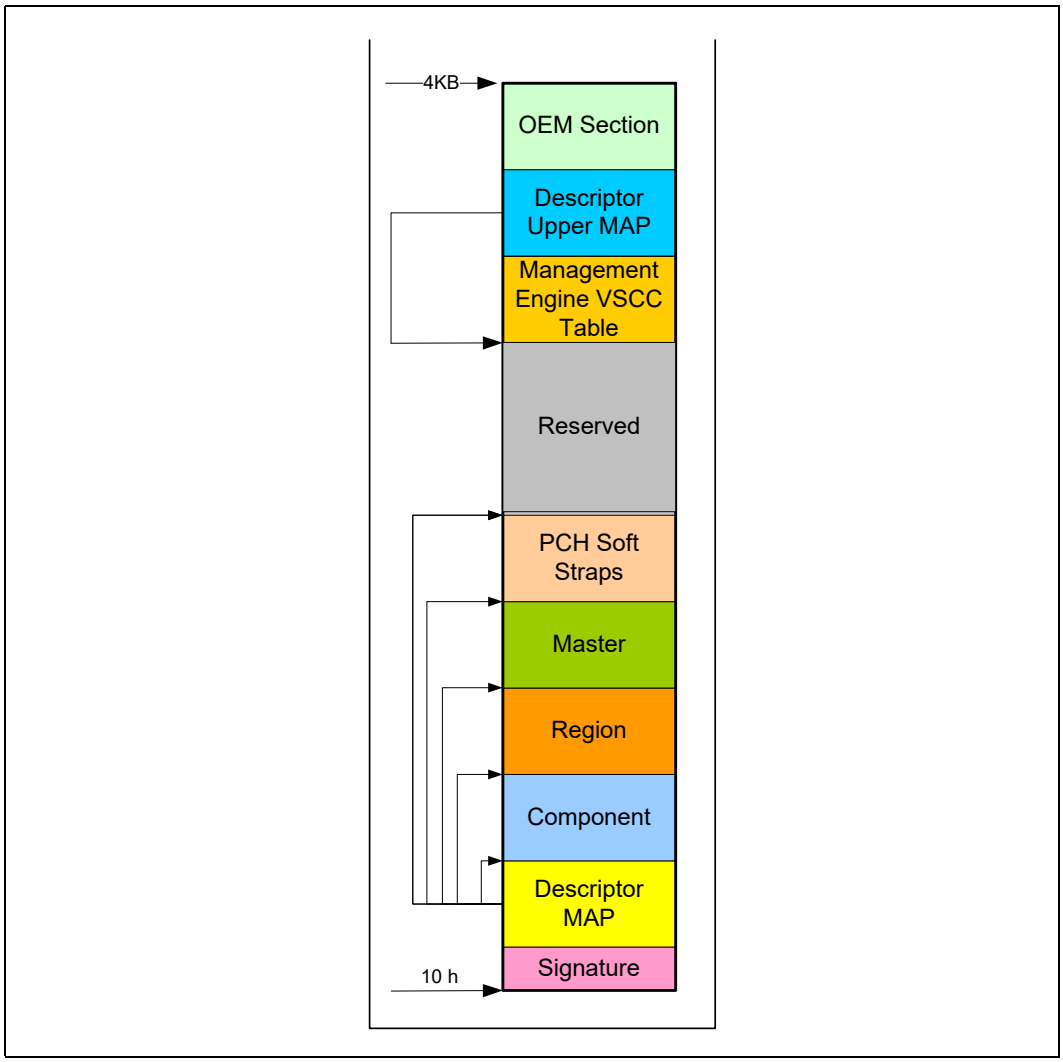
Region	Size with 4 KB Blocks	Size with 8 KB Blocks	Size with 64 KB Blocks
Descriptor	4 KB	8 KB	64 KB
Legacy GbE	8 KB	16 KB	128 KB
BIOS	Varies by Platform	Varies by Platform	Varies by Platform
Intel ME	Varies by Platform	Varies by Platform	Varies by Platform
BMC	Varies by Platform	Varies by Platform	Varies by Platform
10/1 GbE	Varies by Platform	Varies by Platform	Varies by Platform

27.7.1.3 Flash Descriptor

The bottom sector of the flash component 0 contains the Flash Descriptor. The maximum size of the Flash Descriptor is 4 KB. If the block/sector size of the SPI flash device is greater than 4 KB, the flash descriptor will only use the first 4 KB of the first block. The flash descriptor requires its own block at the bottom of memory (00h). The information stored in the Flash Descriptor can only be written during the manufacturing process as its read/write permissions must be set to read only when the computer leaves the manufacturing floor.

The Flash Descriptor is made up of eleven sections as shown in Figure 27-1.

Figure 27-1. Flash Descriptor Regions



- The Flash signature selects Descriptor Mode as well as verifies if the flash is programmed and functioning. The data at the bottom of the flash (offset 10h) must be 0FF0A55Ah in order to be in Descriptor mode.
- The Descriptor map has pointers to the other five descriptor sections as well as the size of each.
- The component section has information about the SPI flash in the system including: the number of components, density of each, invalid instructions (such as chip erase), and frequencies for read, fast read and write/erase instructions.
- The Region section points to the three other regions as well as the size of each region.
- The master region contains the security settings for the flash, granting read/write permissions for each region and identifying each master by a requestor ID.
- The processor and PCH Soft Strap sections contain processor and PCH configurable parameters.
- The Reserved region between the top of the processor strap section and the bottom of the OEM Section is reserved for future chipset usages.

- The Descriptor Upper MAP determines the length and base address of the Management Engine VSCC Table.
- The Management Engine VSCC Table holds the JEDEC ID and the VSCC information of the entire SPI Flash supported by the NVM image.
- OEM Section is 256 Bytes reserved at the top of the Flash Descriptor for use by OEM.

27.7.1.3.1 Descriptor Master Region

The master region defines read and write access setting for each region of the SPI device. The master region recognizes four masters: BIOS, Gigabit Ethernet, Management Engine, and EC. Each master is only allowed to do direct reads of its primary regions.

Note: The 10 GbE Region #2 is not used by the Intel® C620 Series Chipset.

Table 27-3. Region Access Control Table (Sheet 1 of 2)

Master Read/Write Access						
Region	**Processor and BIOS**	**Intel ME**	**1 GbE Controller**	**EVA**	**EC/BMC**	**Innovation Engine**
Descriptor	N/A	N/A	N/A	N/A	N/A	N/A
BIOS	Processor and BIOS can always read from and write to BIOS Region	Read/Write	Read/Write	Read/Write	Read/Write	Read/Write
Intel Management Engine (Intel ME)	Read/Write	Intel ME can always read from and write to Intel ME Region	Read/Write	Read/Write	Read/Write	Read/Write
1 Gigabit Ethernet	Read/Write	Read/Write	GbE software can always read from and write to GbE region	Read/Write	Read/Write	Read/Write
Platform Data Region	Read/Write	read/write	N/A	Read/write	Read/write	Read/write
Device Expansion Region	Read/Write	Read/Write	N/A	EVA can always read from and write to the DER	Read/write	Read/Write
Secondary BIOS	Processor and BIOS can always read from and write to BIOS Region	Read/Write	Read/Write	Read/Write	Read/write	Read/Write
RSVD	RO	N/A	N/A	N/A	N/A	N/A
BMC	Read/Write	Read/Write	Read/Write	Read/Write	EC can always read from and write to EC region	Read/Write
Device Expansion Region #2	Read/Write	Read/Write	Read/Write	EVA can always read from and write to the DER	Read/write	Read/Write
Innovation Engine	Read/Write	Read/Write		Read/Write	Read/write	I/E can always read from and write to the DER
10 GbE Region #1	Read/Write	Read/Write	Read/Write	Read/Write	Read/Write	

Table 27-3. Region Access Control Table (Sheet 2 of 2)

Master Read/Write Access						
Region	**Processor and BIOS**	**Intel ME**	**1 GbE Controller**	**EVA**	**EC/BMC**	**Innovation Engine**
Option ROM	Read/Write	Read/Write	Read/Write	Read/Write	Read/Write Read/Write	Read/Write

27.7.1.4 Flash Access

There are two types of accesses: Direct Access and Program Register Accesses.

27.7.1.4.1 Direct Access

- Masters are allowed to do direct read only of their primary region.
  - Gigabit Ethernet region can only be directly accessed by the Gigabit Ethernet controller. Gigabit Ethernet software must use Program Registers to access the Gigabit Ethernet region.
- Master's Host or Management Engine virtual read address is converted into the SPI Flash Linear Address (FLA) using the Flash Descriptor Region Base/Limit registers.

Direct Access Security

- Requester ID of the device must match that of the primary Requester ID in the Master Section
- Calculated Flash Linear Address must fall between primary region base/limit
- Direct Write not allowed
- Direct Read Cache contents are reset to 0's on a read from a different master.
  - Supports the same cache flush mechanism in ICH7 which includes Program Register Writes.

27.7.1.4.2 Program Register Access

- Program Register Accesses are not allowed to cross a 4-KB boundary and can not issue a command that might extend across two components.
- Software programs the FLA corresponding to the region desired
  - Software must read the devices Primary Region Base/Limit address to create a FLA.

Register Access Security

- Only primary region masters can access the registers

Note: Processor running Gigabit Ethernet software can access Gigabit Ethernet registers

- Masters are only allowed to read or write those regions they have read/write permission.
- Using the Flash Region Access Permissions, one master can give another master read/write permissions to their area.
- Using the five Protected Range registers, each master can add separate read/write protection above that granted in the Flash Descriptor for their own accesses.
  - Example: The BIOS may want to protect different regions of BIOS from being erased.
  - Ranges can extend across region boundaries.

27.7.2 SPI Support for TPM

The PCH's SPI flash controller supports a discrete TPM on the platform via its dedicated SPI0_TPM_CS# signal. The platform must have no more than 1 TPM.

SPI controller supports accesses to SPI TPM at approximately 17 MHz, 30 MHz or 40 MHz depending on the PCH soft strap. 17 MHz is the reset default; a valid PCH soft strap setting overrides the requirement for the 17 MHz.

TPM requires the support for the interrupt routing. However, the TPM's interrupt pin is routed to the PCH's PIRQ pin. Thus, TPM interrupt is completely independent from the SPI controller.

Note: The SPI controller is configurable to prevent TPM access when the descriptor is invalid (or no flash is attached).

27.8 SPI Configuration Registers Summary

Table 27-4. Summary of SPI Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Device ID and Vendor ID (BIOS_SPI_DID_VID)—Offset 0h	9D248086h
4h	7h	Status and Command (BIOS_SPI_STS_CMD)—Offset 4h	400h
8h	Bh	Revision ID (BIOS_SPI_CC_RID)—Offset 8h	0h
Ch	Fh	BIST, Header Type, Latency Timer, Cache Line Size (BIOS_SPI_BIST_HTYPE_LT_CLS)—Offset Ch	0h
10h	13h	SPI BAR0 MMIO (BIOS_SPI_BAR0)—Offset 10h	0h
D0h	D3h	SPI Unsupported Request Status (BIOS_SPI_UR_STS_CTL)—Offset D0h	0h
D8h	DBh	BIOS Decode Enable (BIOS_SPI_BDE)—Offset D8h	FFCFh
DCh	DFh	BIOS Control (BIOS_SPI_BC)—Offset DCh	28h

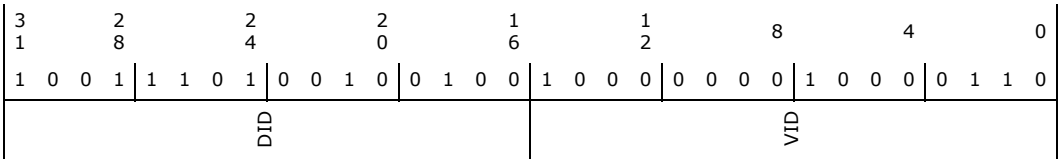
27.8.1 Device ID and Vendor ID (BIOS_SPI_DID_VID)—Offset 0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 9D248086h



Bit Range	Default and Access	Field Name (ID): Description
31:16	9D24h RO/V	**Device Identification (DID):** Identifier for the SPI Flash Controller in Host Root Space.
15:0	8086h RO	**Vendor Identification (VID):** This field identifies the manufacturer of the device. 0x8086 indicates Intel

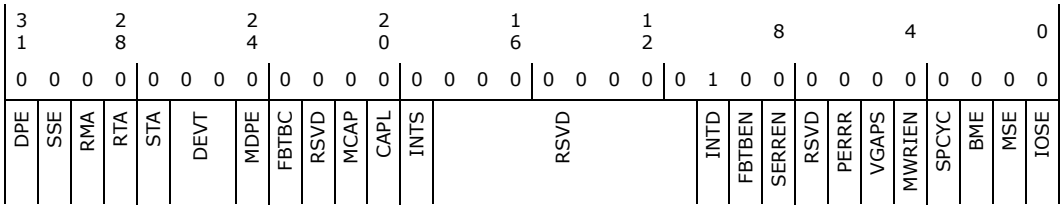
27.8.2 Status and Command (BIOS_SPI_STS_CMD)—Offset 4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 400h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/1C/V	**Detected Parity Error (DPE):** Detected Parity Error (DPE)
30	0h RW/1C/V	**Signaled System Error (SSE):** Signaled System Error (SSE)
29	0h RO	**Received Master Abort (RMA):** Received Master Abort (RMA)
28	0h RO	**Received Target Abort (RTA):** Received Target Abort (RTA)
27	0h RW/1C/V	**Signaled Target Abort (STA):** Signaled Target Abort (STA)
26:25	0h RO	**Devsel Timing (DEVT):** Devsel Timing (DEVT)
24	0h RO	**Master Data Parity Error (MDPE):** Master Data Parity Error (MDPE)
23	0h RO	**Fast Back to Back Capable (FBTBC):** Fast Back to Back Capable (FBTBC)
22	0h RO	Reserved.
21	0h RO	**66 MHz Capable (MCAP):** Not 66MHz Capable Device
20	0h RO	**Capabilities List (CAPL):** Capabilities List
19	0h RO	**Interrupt Status (INTS):** Interrupt Status

Bit Range	Default and Access	Field Name (ID): Description
18:11	0h RO	Reserved.
10	1h RO	**Interrupt Disable (INTD):** Interrupt Disable
9	0h RO	**Fast Back to Back Enable (FBTBEN):** Fast Back to Back Enable
8	0h RW	**System Error Enable (SERREN):** System Error Enable
7	0h RO	Reserved.
6	0h RW	**Parity Error Response (PERRR):** Parity Error Response
5	0h RO	**VGA Palette Snoop (VGAPS):** VGA Palette Snoop
4	0h RO	**Memory Write and Invalidate Enable (MWRIEN):** Memory Write and Invalidate Enable.
3	0h RO	**Special Cycles (SPCYC):** Special Cycles
2	0h RW	**Bus Master Enable (BME):** Bus Master Enable
1	0h RW	**Memory Space Enable (MSE):** Memory Space Enable
0	0h RO	**IO Space Enable (IOSE):** IO Space Enable

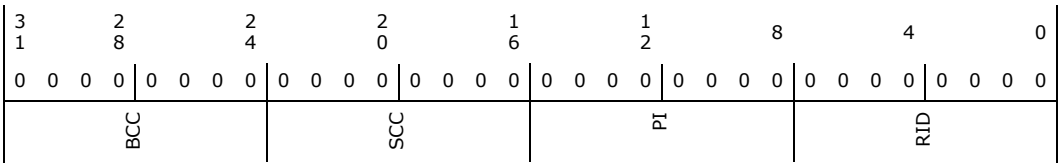
27.8.3 Revision ID (BIOS_SPI_CC_RID)—Offset 8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	**Base Class Code (BCC):** Base Class Code

Bit Range	Default and Access	Field Name (ID): Description
23:16	0h RO	**Sub-Class Code (SCC):** Sub-Class Code
15:8	0h RO	**Programming Interface (PI):** Programming Interface
7:0	0h RO/V	**Revision ID (RID):** Revision ID (RID): Indicates the part revision.

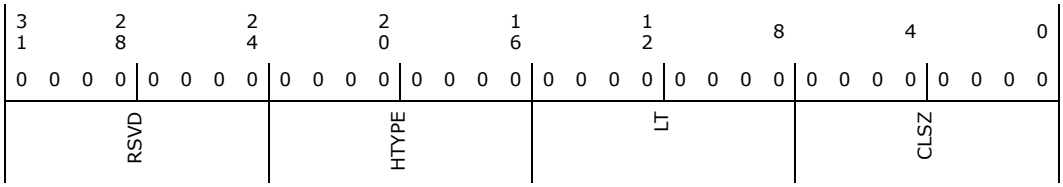
27.8.4 BIST, Header Type, Latency Timer, Cache Line Size (BIOS_SPI_BIST_HTYPE_LT_CLS)—Offset Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:16	0h RO	**Header Type (HTYPE):** Header Type
15:8	0h RO	**Latency Timer (LT):** Latency Timer
7:0	0h RO	**Cacheline Size (CLSZ):** Cacheline Size

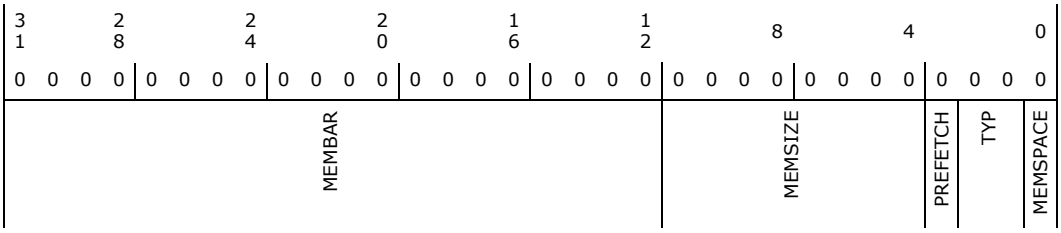
27.8.5 SPI BAR0 MMIO (BIOS_SPI_BAR0)—Offset 10h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:12	0h RW	**Memory BAR (MEMBAR):** Software programs this register with the base address of the device's memory region. The Host/BIOS MMIO registers in the flash controller are offset from this BAR.
11:4	0h RO	**Memory Size (MEMSIZE):** Hardwired to 0 to indicate 4 KB of memory space.
3	1h RO	**Prefetchable (PREFETCH):** A device can mark a range as prefetchable if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables. Hardwired to 1 to indicate the device's memory space as prefetchable.
2:1	0h RO	**Type (TYP):** Hardwired to 0 to indicate that Base register is 32 bits wide and mapping can be done anywhere in the 32-bit memory space.
0	0h RO	**Memory Space Indicator (MEMSPACE):** Hardwired to 0 to identify a Memory BAR.

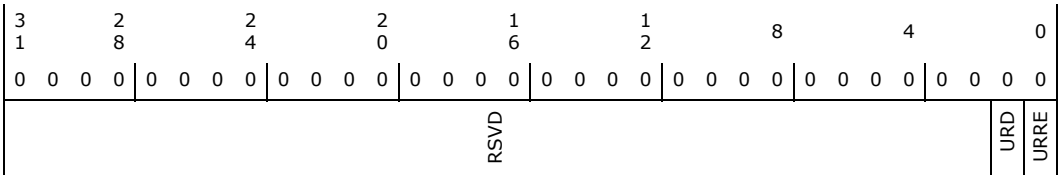
27.8.6 SPI Unsupported Request Status (BIOS_SPI_UR_STS_CTL)—Offset D0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1	0h RW/1C/V	**Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unsupported Request that is not considered an Advisory Non-Fatal error. Cleared to 0 when software writes a 1 to this register.
0	0h RW	**Unsupported Request Reporting Enabled (URRE):** If set to 1 by software, the flash controller generates a DoSERR sideband message when the URD bit transitions from 0 to 1.

27.8.7 BIOS Decode Enable (BIOS_SPI_BDE)—Offset D8h

This register only effects BIOS decode if BIOS is resident on SPI.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 5

Default: FFCFh

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RSVD																EF8	EF0	EE8	EE0	ED8	ED0	EC8	EC0	LFE	LEE	RSVD		E70	E60	E50	E40

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	1h RO	**F8-FF Enable (EF8):** F8-FF Enable (EF8): Enables decoding of 512K of the following BIOS range: Data space: FFF80000h - FFFFFFFFh
14	1h RW	**F0-F8 Enable (EF0):** F0-F8 Enable (EF0): Enables decoding of 512K of the following BIOS range: Data space: FFF00000h - FFF7FFFFh
13	1h RW	**E8-EF Enable (EE8):** E8-EF Enable (EE8): Enables decoding of 512K of the following BIOS range: Data space: FFE80000h - FFEFFFFFh
12	1h RW	**E0-E8 Enable (EE0):** E0-E8 Enable (EE0): Enables decoding of 512K of the following BIOS range: Data space: FFE00000h - FFE7FFFFh
11	1h RW	**D8-DF Enable (ED8):** D8-DF Enable (ED8): Enables decoding of 512K of the following BIOS range: Data space: FFD80000h - FFDFFFFFh
10	1h RW	**D0-D7 Enable (ED0):** D0-D7 Enable (ED0): Enables decoding of 512K of the following BIOS range: Data space: FFD00000h - FFD7FFFFh
9	1h RW	**C8-CF Enable (EC8):** C8-CF Enable (EC8): Enables decoding of 512K of the following BIOS range: Data space: FFC80000h - FFCFFFFFh

Bit Range	Default and Access	Field Name (ID): Description
8	1h RW	**C0-C7 Enable (EC0):** C0-C7 Enable (EC0): Enables decoding of 512K of the following BIOS range: Data space: FFC00000h - FFC7FFFFh
7	1h RW	**Legacy F Segment Enable (LFE):** Legacy F Segment Enable (LFE): This enables the decoding of the legacy 64KB range at F0000h - FFFFFh
6	1h RW	**Legacy E Segment Enable (LEE):** Legacy E Segment Enable (LFE): This enables the decoding of the legacy 64KB range at E0000h - EFFFFh
5:4	0h RO	Reserved.
3	1h RW	**70-7F Enable (E70):** 70-7F Enable (E70): Enables decoding of 1MB of the following BIOS range: Data space: FF700000h - FF7FFFFFh
2	1h RW	**60-6F Enable (E60):** 60-6F Enable (E60): Enables decoding of 1MB of the following BIOS range: Data space: FF600000h - FF6FFFFFh
1	1h RW	**50-5F Enable (E50):** 50-5F Enable (E50): Enables decoding of 1MB of the following BIOS range: Data space: FF500000h - FF5FFFFFh
0	1h RW	**40-4F Enable (E40):** 40-4F Enable (E40): Enables decoding of 1MB of the following BIOS range: Data space: FF400000h - FF4FFFFFh

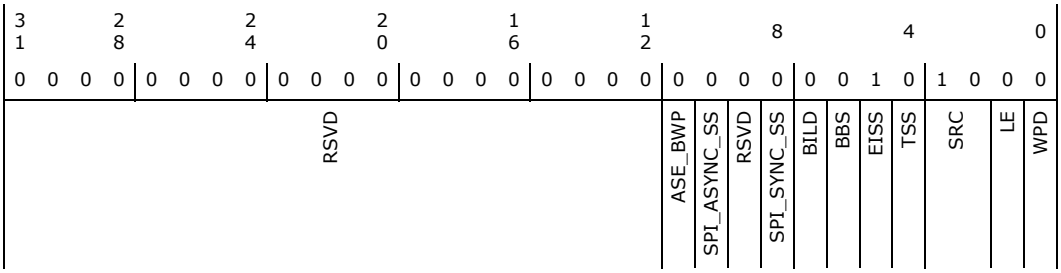
27.8.8 BIOS Control (BIOS_SPI_BC)—Offset DCh

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 28h



Bit Range	Default and Access	Field Name (ID): Description
31:12	0h RO	Reserved.
11	0h RW/L	**Async SMI Enable for BIOS Write Protection (ASE_BWP):** When set to '1' the flash controller will generate an SMI when it blocks a BIOS write or erase due to WPD=0. The value in this field can be written by software as long as the BIOS Interface Lock-Down (BILD) is not set.

Bit Range	Default and Access	Field Name (ID): Description
10	0h RO/V	**Asynchronous SMI Status (SPI_ASYNC_SS):** Status indication that the SPI Flash Controller has asserted an asynchronous SMI. Hardware clears the bit when it sends the De-assert SMI message. 0: default state 1: SPI flash controller asserted asynchronous SMI
9	0h RO	Reserved.
8	0h RO/V	**Synchronous SMI Status (SPI_SYNC_SS):** Status indication that the SPI Flash Controller has asserted a synchronous SMI. Hardware clears the bit when it sends the De-assert Synchronous SMI message. 0: default state 1: SPI flash controller asserted Synchronous SMI
7	0h RW/L	**BIOS Interface Lock-Down (BILD):** BIOS Interface Lock-Down (BILD): When set, prevents TS and BBS from being changed. This bit can only be written from 0 to 1 once.
6	0h RW/V/L	**Boot BIOS Strap (BBS):** Boot BIOS Strap (BBS): This field determines the destination of accesses to the BIOS memory range. Bit Description 0 SPI 1 LPC When SPI or LPC is selected, the range that is decoded is further qualified by BIOS Decode Enable. The value in this field can be overwritten by software as long as the BIOS Interface Lock-Down (BILD) is not set
5	1h RW/L	**Enable InSMM.STS (EISS):** Enable InSMM.STS (EISS): When this bit is set, the BIOS region is not writable until the CPU sets the InSMM.STS bit. If this bit [5] is set, then WPD must be a '1' and InSMM.STS (0xFED3_0880[0]) must be '1' also in order to write to BIOS region of SPI Flash. If this bit [5] is clear, then the InSMM.STS is a don't care. This bit is locked by LE
4	0h RO/V	**Top Swap Status (TSS):** Top Swap Status (TSS): This bit provides a read-only path to view the state of the Top Swap bit. It is duplicated here to be consistent with the LPC version of the BC register.
3:2	2h RW	**SPI Read Configuration (SRC):** SPI Read Configuration (SRC): These bits are located in PCI Config space to allow them to be set early in the boot flow. This 2-bit field controls two policies related to BIOS reads on the SPI interface: Bit 3- Prefetch Enable Bit 2- Cache Disable Settings are summarized below: Bits 3:2 Description 00 No prefetching, but caching enabled. Direct Memory reads load the read buffer cache with [quote]valid[/quote] data, allowing repeated reads to the same range to complete quickly 01 No prefetching and no caching. One-to-one correspondence of host BIOS reads to SPI cycles. This value can be used to invalidate the cache. 10 Prefetching and Caching enabled. This mode is used for long sequences of short reads to consecutive addresses (i.e., shadowing) 11 Illegal. Caching must be enabled when Prefetching is enabled. This eliminates the need for a complex prefetch-flushing mechanism.
1	0h RW/L	**Lock Enable (LE):** When set, setting the WPD bit will cause SMI. When cleared, setting the WPD bit will not cause SMI. Once set, this bit can only be cleared by a PLTRST#. When this bit is set, EISS - bit [5] of this register is locked down.
0	0h RW	**Write Protect Disable (WPD):** When set, access to the BIOS space is enabled for both read and write cycles to BIOS. When cleared, only read cycles are permitted to the FWH or SPI flash. When this bit is written from a '0' to a '1' and the LE bit is also set, an SMI# is generated. This ensures that only SMM code can update BIOS.

27.9 SPI Memory Mapped Registers Summary

The SPI memory mapped registers are accessed based upon offsets from SPI_BAR0 (in PCI config SPI_BAR0 register).

Table 27-5. Summary of SPI Memory Mapped Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	SPI BIOS MMIO PRI (BIOS_BFPREG)—Offset 0h	0h
4h	7h	Hardware Sequencing Flash Status and Control (BIOS_HSFSTS_CTL)—Offset 4h	2000h
8h	Bh	Flash Address (BIOS_FADDR)—Offset 8h	0h
Ch	Fh	Discrete Lock Bits (BIOS_DLOCK)—Offset Ch	0h
10h	13h	Flash Data 0 (BIOS_FDATA0)—Offset 10h	0h
14h	17h	Flash Data 1 (BIOS_FDATA1)—Offset 14h	0h
18h	1Bh	Flash Data 2 (BIOS_FDATA2)—Offset 18h	0h
1Ch	1Fh	Flash Data 3 (BIOS_FDATA3)—Offset 1Ch	0h
20h	23h	Flash Data 4 (BIOS_FDATA4)—Offset 20h	0h
24h	27h	Flash Data 5 (BIOS_FDATA5)—Offset 24h	0h
28h	2Bh	Flash Data 6 (BIOS_FDATA6)—Offset 28h	0h
2Ch	2Fh	Flash Data 7 (BIOS_FDATA7)—Offset 2Ch	0h
30h	33h	Flash Data 8 (BIOS_FDATA8)—Offset 30h	0h
34h	37h	Flash Data 9 (BIOS_FDATA9)—Offset 34h	0h
38h	3Bh	Flash Data 10 (BIOS_FDATA10)—Offset 38h	0h
3Ch	3Fh	Flash Data 11 (BIOS_FDATA11)—Offset 3Ch	0h
40h	43h	Flash Data 12 (BIOS_FDATA12)—Offset 40h	0h
44h	47h	Flash Data 13 (BIOS_FDATA13)—Offset 44h	0h
48h	4Bh	Flash Data 14 (BIOS_FDATA14)—Offset 48h	0h
4Ch	4Fh	Flash Data 15 (BIOS_FDATA15)—Offset 4Ch	0h
50h	53h	Flash Region Access Permissions (BIOS_FRACC)—Offset 50h	42C2h
54h	57h	Flash Region 0 (BIOS_FREG0)—Offset 54h	0h
58h	5Bh	Flash Region 1 (BIOS_FREG1)—Offset 58h	0h
5Ch	5Fh	Flash Region 2 (BIOS_FREG2)—Offset 5Ch	0h
60h	63h	Flash Region 3 (BIOS_FREG3)—Offset 60h	0h
64h	67h	Flash Region 4 (BIOS_FREG4)—Offset 64h	0h
68h	6Bh	Flash Region 5 (BIOS_FREG5)—Offset 68h	0h
6Ch	6Fh	Flash Region 6(BIOS_FREG6)—Offset 6Ch	0h
70h	73h	Flash Region 7(BIOS_FREG7)—Offset 70h	0h
74h	77h	Flash Region 8(BIOS_FREG8)—Offset 74h	0h
78h	7Bh	Flash Region 9(BIOS_FREG9)—Offset 78h	0h
7Ch	7Fh	Flash Region 10(BIOS_FREG10)—Offset 7Ch	0h
80h	84h	Flash Region 11(BIOS_FREG11)—Offset 80h	0h
84h	87h	Flash Protected Range 0 (BIOS_FPR0)—Offset 84h	0h
88h	8Bh	Flash Protected Range 1 (BIOS_FPR1)—Offset 88h	0h
8Ch	8Fh	Flash Protected Range 2 (BIOS_FPR2)—Offset 8Ch	0h

Table 27-5. Summary of SPI Memory Mapped Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
90h	93h	Flash Protected Range 3 (BIOS_FPR3)—Offset 90h	0h
94h	97h	Flash Protected Range 4 (BIOS_FPR4)—Offset 94h	0h
98h	9Bh	Global Protected Range 0 (BIOS_GPR0)—Offset 98h	0h
A0h	A3h	Software Sequencing Flash Status and Control (BIOS_SSFSTS_CTL)—Offset A0h	6000000h
A4h	A7h	Prefix Opcode and Opcode Type Configuration (BIOS_PREOP_OPTYPE)—Offset A4h	0h
A8h	ABh	Opcode Menu0 Configuration (BIOS_OPMENU0)—Offset A8h	0h
ACh	AFh	Opcode Menu1 Configuration (BIOS_OPMENU1)—Offset ACh	0h
B0h	B3h	Secondary Flash Region Access Permissions (BIOS_SFRACC)—Offset B0h	0h
B4h	B7h	Flash Descriptor Observability Control (BIOS_FDOC)—Offset B4h	0h
B8h	BBh	Flash Descriptor Observability Data (BIOS_FDOD)—Offset B8h	0h
C0h	C3h	Additional Flash Control (BIOS_AFC)—Offset C0h	0h
C4h	C7h	Vendor Specific Component Capabilities for Component 0 (BIOS_SFDP0_VSCC0)—Offset C4h	2000h
C8h	CBh	Vendor Specific Component Capabilities for Component 1 (BIOS_SFDP1_VSCC1)—Offset C8h	2000h
CCh	CFh	Parameter Table Index (BIOS_PTINX)—Offset CCh	0h
D0h	D3h	Parameter Table Data (BIOS_PTDATA)—Offset D0h	0h
D4h	D7h	SPI Bus Requester Status (BIOS_SBRS)—Offset D4h	0h

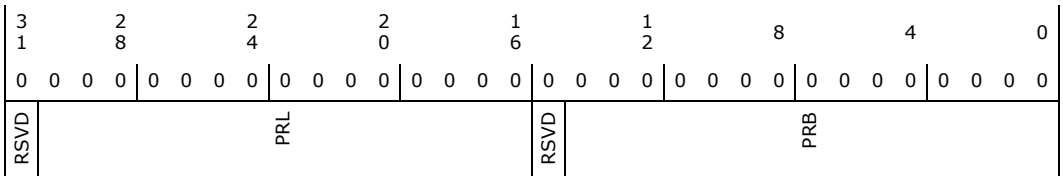
27.9.1 SPI BIOS MMIO PRI (BIOS_BFPREG)—Offset 0h

Access Method

Type: MEM Register (Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
30:16	0h RO/V	**BIOS Flash Primary Region Limit (PRL):** This specifies address bits 26:12 for the Primary Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Limit, or the Flash Descriptor.FLREG6.Region Limit depending on the BFPREG.SBRS bit.
15	0h RO	Reserved.
14:0	0h RO/V	**BIOS Flash Primary Region Base (PRB):** This specifies address bits 26:12 for the Primary Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Base, or the Flash Descriptor.FLREG6.Region Base depending on the BFPREG.SBRS bit.

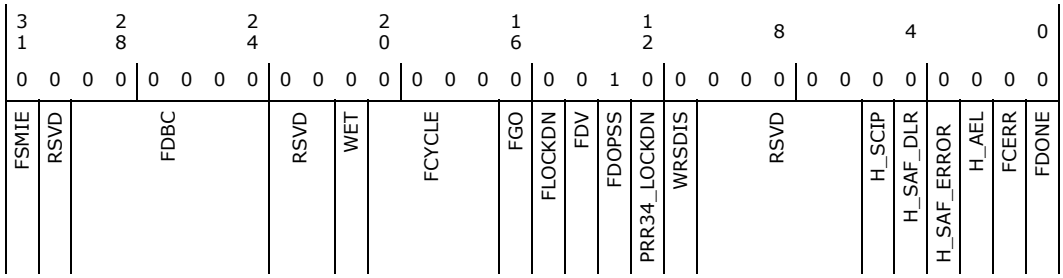
27.9.2 Hardware Sequencing Flash Status and Control (BIOS_HSFSTS_CTL)—Offset 4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 2000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW	**Flash SPI SMI# Enable (FSMIE):** When set to 1, the SPI asserts an SMI# request whenever the Flash Cycle Done bit is 1.
30	0h RO	Reserved.
29:24	0h RW	**Flash Data Byte Count (FDBC):** This field specifies the number of bytes to shift in or out during the data portion of the SPI cycle. The contents of this register are 0s based with 0b representing 1 byte and 3Fh representing 64 bytes. The number of bytes transferred is the value of this field plus 1. This field is ignored for the Block Erase command.
23:22	0h RO	Reserved.
21	0h RW	**Write Enable Type (WET):** Write Enable Type (WET) 0 Use 06h as the write enable instruction 1 Use 50h as the write enable instruction

Bit Range	Default and Access	Field Name (ID): Description
20:17	0h RW	**FLASH Cycle (FCYCLE):** This field defines the Flash SPI cycle type generated to the FLASH when the FGO bit is set as defined below: 0 Read (1 up to 64 bytes by setting FDBC) 1 Reserved 2 Write (1 up to 64 bytes by setting FDBC) 3 4k Block Erase 4 64k Sector erase 5 Read SFDP 6 Read JEDEC ID 7 write status 8 read status 9 RPMC Op1 A RPMC Op2 Flash controller hardware automatically inserts a write enable opcode prior to Write and erase operations. Hardware automatically polls for device not-busy using read status after write and erase operations. Flash controller hardware automatically polls for device not-busy using read status and RPMC Op2 after RPMC Op1 operations. Read status is repeated until the device is not-busy, then RPMC Op2 is repeated until the device is not-busy. If the device does not support 64k erase size (or if it doesn't support SFDP) then only 4k is allowed. ***Note:*** If reserved 1 is programmed to this field, flash controller will handle it as if it is 0 (Read)
16	0h RW/1S/V	**Flash Cycle Go (FGO):** A write to this register with a 1 in this bit initiates a request to the Flash SPI Arbiter to start a cycle. This register is cleared by hardware when the cycle is granted by the SPI arbiter to run the cycle on the SPI bus. When the cycle is complete, the FDONE bit is set. Software is forbidden to write to any register in the HSFLCTL register between the FGO bit getting set and the FDONE bit being cleared. Any attempt to violate this rule will be ignored by hardware. Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1. This saves an additional memory write. This bit always returns 0 on reads.
15	0h RW/L	**Flash Configuration Lock-Down (FLOCKDN):** When set to 1, those Flash Program Registers that are locked down by this FLOCKDN bit cannot be written. Once set to 1, this bit can only be cleared by a hardware reset.
14	0h RO/V	**Flash Descriptor Valid (FDV):** This bit is set to a 1 if the Flash Controller read the correct Flash Descriptor Signature. If the Flash Descriptor Valid bit is not 1, software cannot use the Hardware Sequencing registers, but must use the software sequencing registers. Any attempt to use the Hardware Sequencing registers will result in the FCERR bit being set
13	1h RO/V	**Flash Descriptor Override Pin-Strap Status (FDOPSS):** This register reflects the value the Flash Descriptor Override Pin-Strap. '1': No override '0': The Flash Descriptor Override strap is set
12	0h RW/L	**PRR3 PRR4 Lock-Down (PRR34_LOCKDN):** When set to 1, the BIOS PRR3 and PRR4 registers cannot be written. Once set to 1, this bit can only be cleared by a hardware reset.
11	0h RW/L	**Flash Configuration Lock-Down (WRSDIS):** '0': write status operation may be issued using Hardware Sequencing '1': write status is not allowed as a Hardware Sequencing operation. The flash controller will block the operation and set the FCERR bit when software sets the 'go' bit.
10:6	0h RO	Reserved.
5	0h RO/V	**SPI Cycle In Progress (H_SCIP):** Hardware sets this bit when software sets the Flash Cycle Go (FGO) bit in the Hardware Sequencing Flash Control register. This bit remains set until the cycle completes on the SPI interface. Hardware automatically sets and clears this bit so that software can determine when read data is valid and/or when it is safe to begin programming the next command. Software must only program the next command when this bit is 0.
4	0h RW/1C/V	**SAF Data Length Error (H_SAF_DLE)**: Hardware sets this bit to 1 when a transaction is returned from the eSPI channel with an incorrect data length.
3	0h RW/1C/V	**SAF Error (H_SAF_ERROR)**: Hardware sets this bit to 1 when a transaction that is requested that is not supported by slave attached flash, e.g. read status.

Bit Range	Default and Access	Field Name (ID): Description
2	0h RW/1C/V	**Access Error Log (H_AEL):** Hardware sets this bit to a 1 when an attempt was made to access the BIOS region using the direct access method or an access to the BIOS Program Registers that violated the security restrictions. This bit is simply a log of an access security violation. This bit is cleared by software writing a '1'.
1	0h RW/1C/V	**Flash Cycle Error (FCERR):** Hardware sets this bit to 1 when a program register access is blocked to the FLASH due to one of the protection policies or when any of the programmed cycle registers is written while a programmed access is already in progress. This bit remains asserted until cleared by software writing a 1 or until hardware reset occurs. Software must clear this bit before setting the FLASH Cycle GO bit in this register.
0	0h RW/1C/V	**Flash Cycle Done (FDONE):** The PCH sets this bit to 1 when the SPI Cycle completes after software previously set the FGO bit. This bit remains asserted until cleared by software writing a 1 or hardware reset. When this bit is set and the SPI SMI# Enable bit is set, an internal signal is asserted to the SMI# generation block. Software must make sure this bit is cleared prior to enabling the SPI SMI# assertion for a new programmed access.

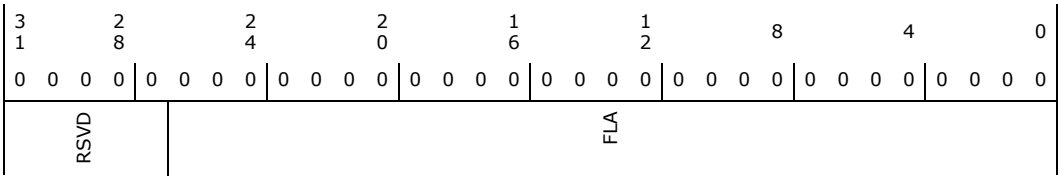
27.9.3 Flash Address (BIOS_FADDR)—Offset 8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:27	0h RO	Reserved.
26:0	0h RW	**Flash Linear Address (FLA):** The FLA is the starting byte linear address of a SPI Read or Write cycle or an address within a Block for the Block Erase command. The Flash Linear Address must fall within a region for which BIOS has access permissions. Hardware must convert the FLA into a Flash Physical Address (FPA) before running this cycle on the SPI bus.

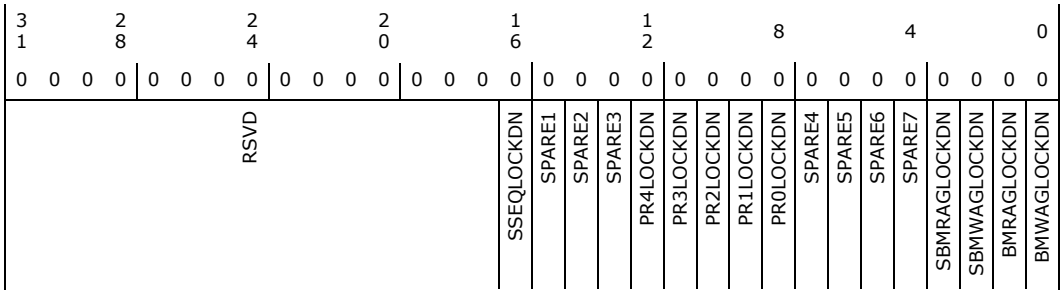
27.9.4 Discrete Lock Bits (BIOS_DLOCK)—Offset Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:17	0h RO	Reserved.
16	0h RW/L	**SSEQ Lock-Down (SSEQLOCKDN)**
15	0h RW/L	**Spare1 (SPARE1)**
14	0h RW/L	**Spare2 (SPARE2)**
13	0h RW/L	**Spare3 (SPARE3)**
12	0h RW/L	**PR4 Lock-Down (PR4LOCKDN)**
11	0h RW/L	**PR3 Lock-Down (PR3LOCKDN)**
10	0h RW/L	**PR2 Lock-Down (PR2LOCKDN)**
9	0h RW/L	**PR1 Lock-Down (PR1LOCKDN)**
8	0h RW/L	**PR0 Lock-Down (PR0LOCKDN)**
7	0h RW/L	**Spare4 (SPARE4)**
6	0h RW/L	**Spare5 (SPARE5)**
5	0h RW/L	**Spare6 (SPARE6)**
4	0h RW/L	**Spare7 (SPARE7)**
3	0h RW/L	**SBMRAG Lock-Down (SBMRAGLOCKDN)**

Bit Range	Default and Access	Field Name (ID): Description
2	0h RW/L	**SBMWAG Lock-Down (SBMWAGLOCKDN)**
1	0h RW/L	**BMRAG Lock-Down (BMRAGLOCKDN)**
0	0h RW/L	**BMWAG Lock-Down (BMWAGLOCKDN)**

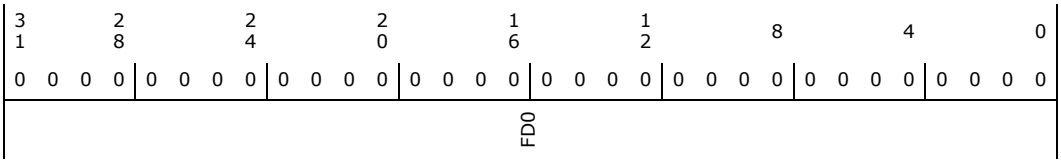
27.9.5 Flash Data 0 (BIOS_FDATA0)—Offset 10h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 0 (FD0):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13-...8-23-22-...16-31...24. Bit 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

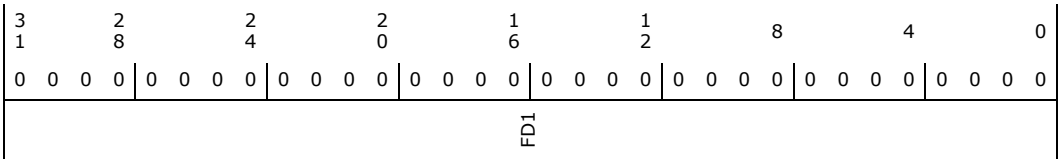
27.9.6 Flash Data 1 (BIOS_FDATA1)—Offset 14h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 1 (FD1):** Flash Data 1 (FD1): Similar definition as Flash Data 0. However, this register does not begin shifting until FD0 has completely shifted in/out.

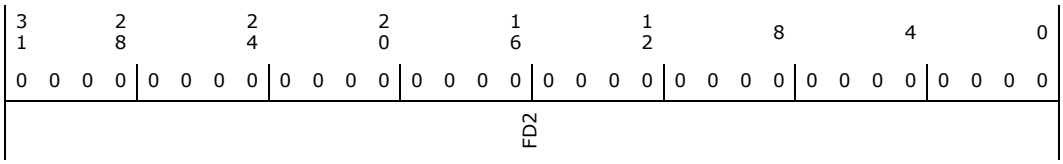
27.9.7 Flash Data 2 (BIOS_FDATA2)—Offset 18h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 2 (FD2):** Flash Data 2 (FD2): Similar definition as Flash Data 0. However, this register does not begin shifting until FD1 has completely shifted in/out.

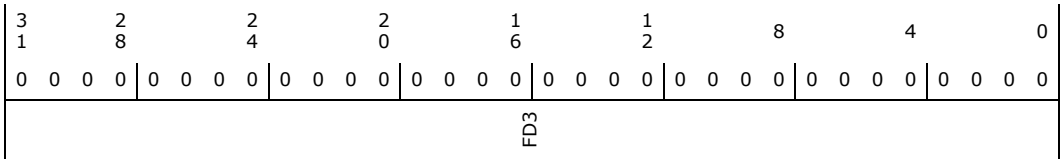
27.9.8 Flash Data 3 (BIOS_FDATA3)—Offset 1Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 3 (FD3):** Flash Data 3 (FD3): Similar definition as Flash Data 0. However, this register does not begin shifting until FD2 has completely shifted in/out.

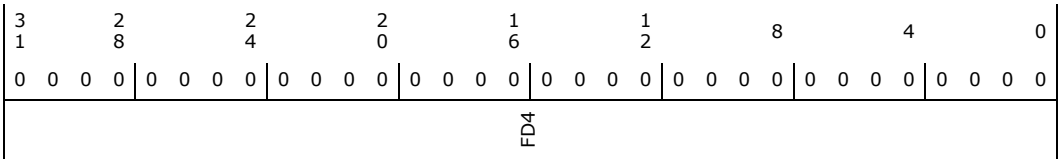
27.9.9 Flash Data 4 (BIOS_FDATA4)—Offset 20h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 4 (FD4):** Flash Data 4 (FD4): Similar definition as Flash Data 0. However, this register does not begin shifting until FD3 has completely shifted in/out.

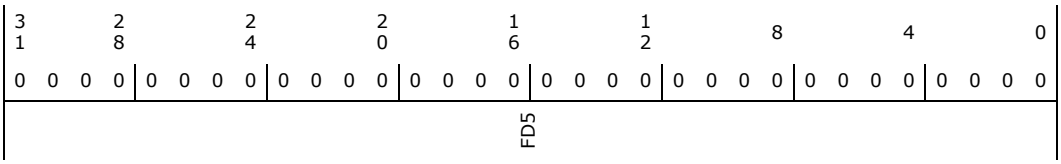
27.9.10 Flash Data 5 (BIOS_FDATA5)—Offset 24h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 5 (FD5):** Flash Data 5 (FD5): Similar definition as Flash Data 0. However, this register does not begin shifting until FD4 has completely shifted in/out.

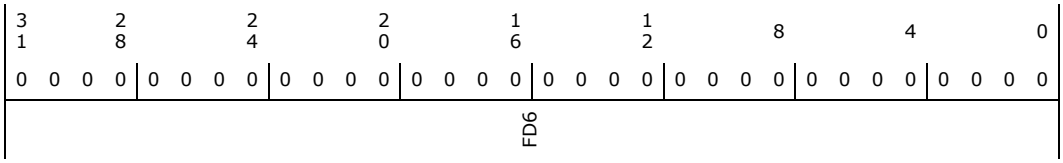
27.9.11 Flash Data 6 (BIOS_FDATA6)—Offset 28h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 6 (FD6):** Flash Data 6 (FD6): Similar definition as Flash Data 0. However, this register does not begin shifting until FD5 has completely shifted in/out.

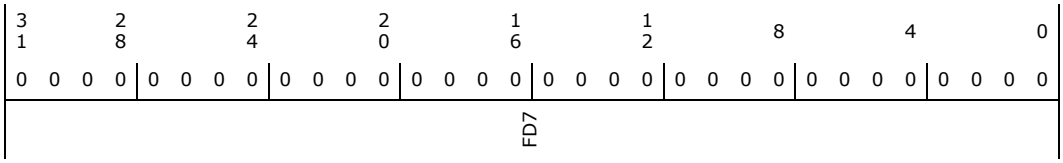
27.9.12 Flash Data 7 (BIOS_FDATA7)—Offset 2Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 7 (FD7):** Flash Data 7 (FD7): Similar definition as Flash Data 0. However, this register does not begin shifting until FD6 has completely shifted in/out.

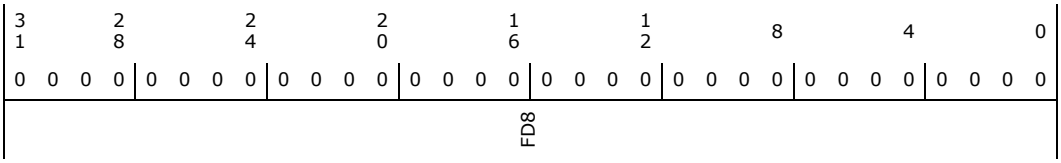
27.9.13 Flash Data 8 (BIOS_FDATA8)—Offset 30h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 8 (FD8):** Flash Data 8 (FD8): Similar definition as Flash Data 0. However, this register does not begin shifting until FD7 has completely shifted in/out.

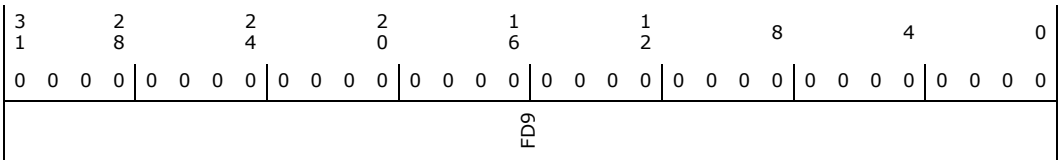
27.9.14 Flash Data 9 (BIOS_FDATA9)—Offset 34h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 9 (FD9):** Flash Data 9 (FD9): Similar definition as Flash Data 0. However, this register does not begin shifting until FD8 has completely shifted in/out.

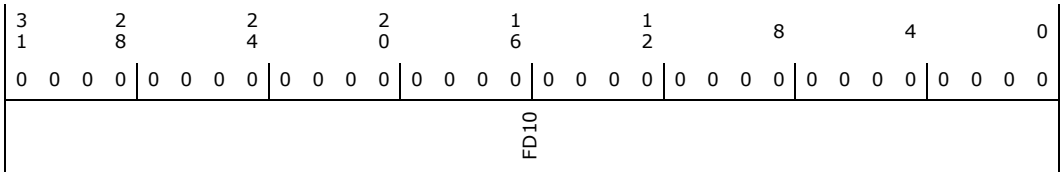
27.9.15 Flash Data 10 (BIOS_FDATA10)—Offset 38h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 10 (FD10):** Flash Data 10 (FD10): Similar definition as Flash Data 0. However, this register does not begin shifting until FD9 has completely shifted in/out.

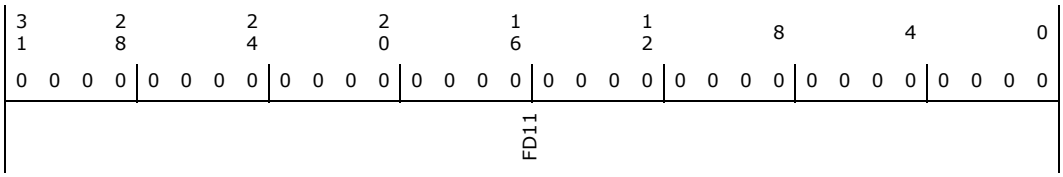
27.9.16 Flash Data 11 (BIOS_FDATA11)—Offset 3Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 11 (FD11):** Flash Data 11 (FD11): Similar definition as Flash Data 0. However, this register does not begin shifting until FD10 has completely shifted in/out.

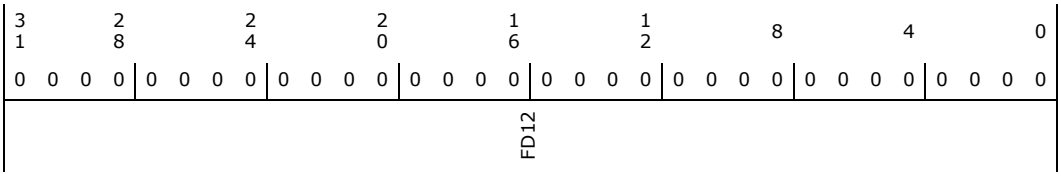
27.9.17 Flash Data 12 (BIOS_FDATA12)—Offset 40h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 12 (FD12):** Flash Data 12 (FD12): Similar definition as Flash Data 0. However, this register does not begin shifting until FD11 has completely shifted in/out.

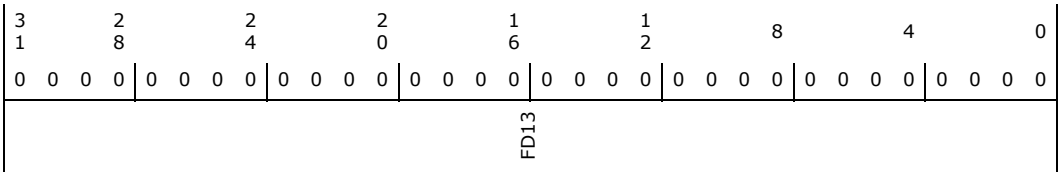
27.9.18 Flash Data 13 (BIOS_FDATA13)—Offset 44h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 13 (FD13):** Flash Data 13 (FD13): Similar definition as Flash Data 0. However, this register does not begin shifting until FD12 has completely shifted in/out.

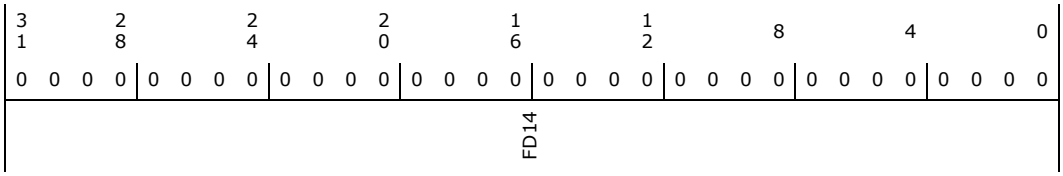
27.9.19 Flash Data 14 (BIOS_FDATA14)—Offset 48h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 14 (FD14):** Flash Data 14 (FD14): Similar definition as Flash Data 0. However, this register does not begin shifting until FD13 has completely shifted in/out.

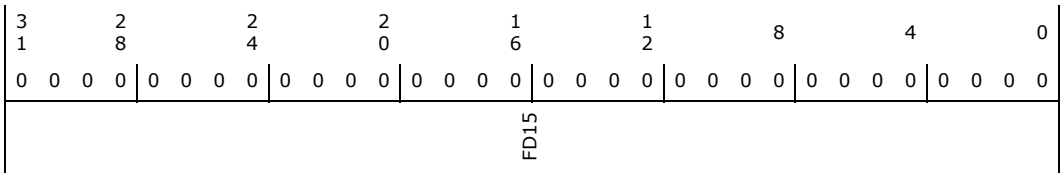
27.9.20 Flash Data 15 (BIOS_FDATA15)—Offset 4Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 15 (FD15):** Flash Data 15 (FD15): Similar definition as Flash Data 0. However, this register does not begin shifting until FD14 has completely shifted in/out.

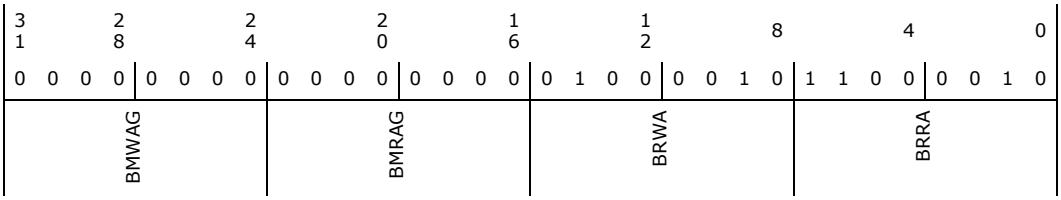
27.9.21 Flash Region Access Permissions (BIOS_FRACC)—Offset 50h

Access Method

Type: MEM Register (Size: 32 bits)

Device: 31
Function: 5

Default: 42C2h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RW/L	**BIOS Master Write Access Grant (BMWAG):** BIOS Master Write Access Grant (BMWAG): Each bit [31:24] corresponds to Master[7:0]. BIOS can grant one or more masters write access to the BIOS region 1 overriding the permissions in the Flash Descriptor. The contents of this register are locked by the FLOCKDN bit.
23:16	0h RW/L	**BIOS Master Read Access Grant (BMRAG):** BIOS Master Read Access Grant (BMRAG): Each bit [23:16] corresponds to Master[7:0]. BIOS can grant one or more masters read access to the BIOS region 1 overriding the read permissions in the Flash Descriptor. The contents of this register are locked by the FLOCKDN bit
15:8	42h RO/V	**BIOS Region Write Access (BRWA):** BIOS Region Write Access (BRWA): Each bit [15:8] corresponds to Regions [7:0]. If the bit is set, this master can erase and write that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Write Access OR a particular master has granted BIOS write permissions in their Master Write Access Grant register OR the Flash Descriptor Security Override strap is set. BIOS always have the write access to its own Region 1 and Region 6 by default.
7:0	C2h RO/V	**BIOS Region Read Access (BRRA):** BIOS Region Read Access (BRRA): Each bit [7:0] corresponds to Regions [7:0]. If the bit is set, this master can read that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Write Access OR a particular master has granted BIOS read permissions in their Master Read Access Grant register OR the Flash Descriptor Security Override strap is set. BIOS always have the read access to its own Region 1 and Region 6 by default.

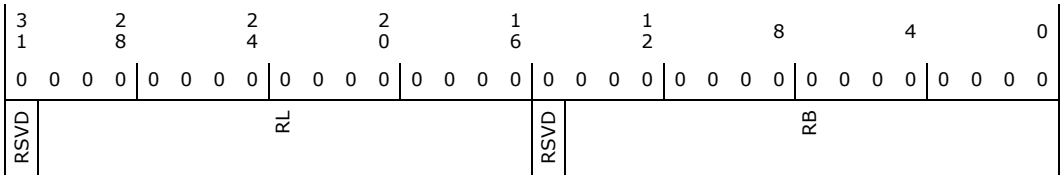
27.9.22 Flash Region 0 (BIOS_FREG0)—Offset 54h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 00000000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	Reserved.
30:16	0h RO/V	**Region Limit (RL):** Region Limit (RL): This specifies address bits 26:12 for the Region 0 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG0.Region Limit
15	0h RO	Reserved.
14:0	0h RO/V	**Region Base (RB):** Region Base (RB): This specifies address bits 26:12 for the Region 0 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG0.Region Base

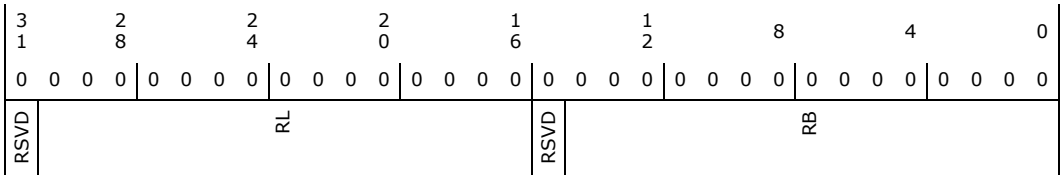
27.9.23 Flash Region 1 (BIOS_FREG1)—Offset 58h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 00000000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	Reserved.
30:16	0h RO/V	**Region Limit (RL):** Region Limit (RL): This specifies address bits 26:12 for the Region 1 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Limit
15	0h RO	Reserved.
14:0	0h RO/V	**Region Base (RB):** Region Base (RB): This specifies address bits 26:12 for the Region 1 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Base

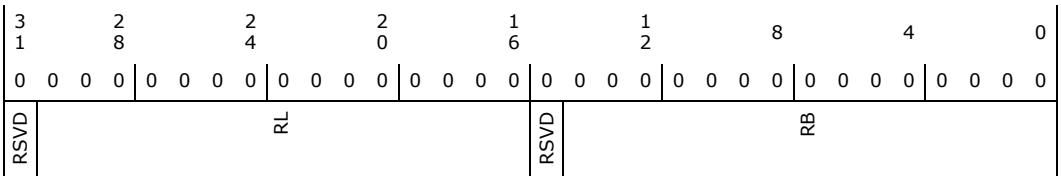
27.9.24 Flash Region 2 (BIOS_FREG2)—Offset 5Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 00000000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	Reserved.
30:16	0h RO/V	**Region Limit (RL):** Region Limit (RL): This specifies address bits 26:12 for the Region 2 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG2.Region Limit
15	0h RO	Reserved.
14:0	0h RO/V	**Region Base (RB):** Region Base (RB): This specifies address bits 26:12 for the Region 2 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG2.Region Base

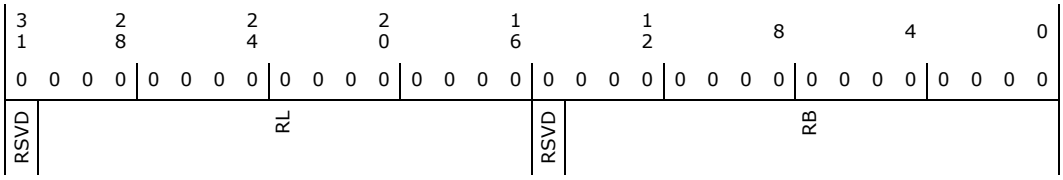
27.9.25 Flash Region 3 (BIOS_FREG3)—Offset 60h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 00000000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	Reserved.
30:16	0h RO/V	**Region Limit (RL):** Region Limit (RL): This specifies address bits 26:12 for the Region 3 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG3.Region Limit
15	0h RO	Reserved.
14:0	0h RO/V	**Region Base (RB):** Region Base (RB): This specifies address bits 26:12 for the Region 3 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG3.Region Base

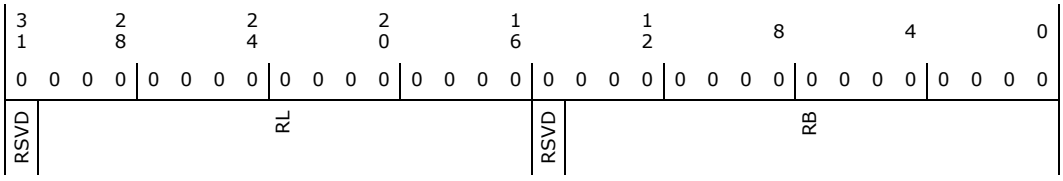
27.9.26 Flash Region 4 (BIOS_FREG4)—Offset 64h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 00000000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	Reserved.
30:16	0h RO/V	**Region Limit (RL):** Region Limit (RL): This specifies address bits 26:12 for the Region 4 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG4.Region Limit
15	0h RO	Reserved.
14:0	0h RO/V	**Region Base (RB):** Region Base (RB): This specifies address bits 26:12 for the Region 4 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG4.Region Base

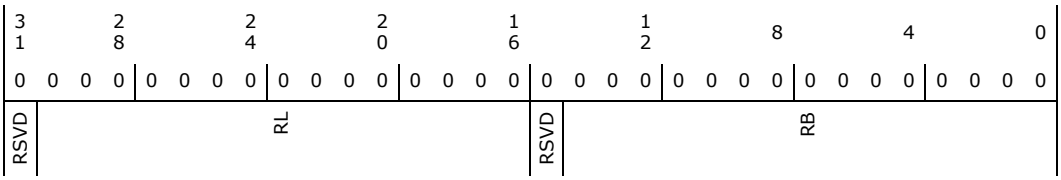
27.9.27 Flash Region 5 (BIOS_FREG5)—Offset 68h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 00000000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	Reserved.
30:16	0h RO/V	**Region Limit (RL):** Region Limit (RL): This specifies address bits 26:12 for the Region 5 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG5.Region Limit
15	0h RO	Reserved.
14:0	0000h RO/V	**Region Base (RB):** Region Base (RB): This specifies address bits 26:12 for the Region 5 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG5.Region Base

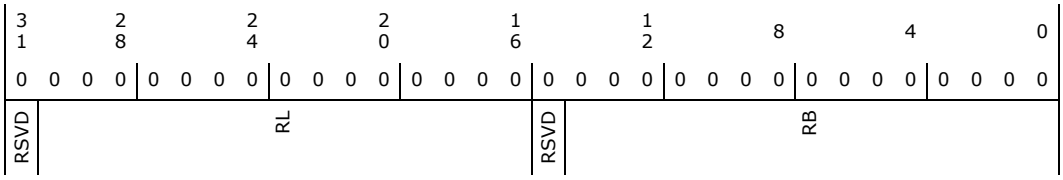
27.9.28 Flash Region 6 (BIOS_FREG6)—Offset 6Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 00000000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	Reserved.
30:16	0h RO/V	**Region Limit (RL):** Region Limit (RL): This specifies address bits [26:12] for the Region 5 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG5.Region Limit
15	0h RO	Reserved.
14:0	0h RO/V	**Region Base (RB):** Region Base (RB): This specifies address bits [26:12] for the Region 5 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG5.Region Base

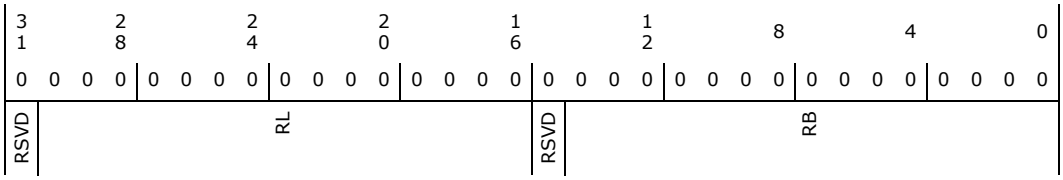
27.9.29 Flash Region 7(BIOS_FREG7)—Offset 70h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 00000000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	Reserved.
30:16	0h RO/V	**Region Limit (RL):** Region Limit (RL): This specifies address bits [26:12] for the Region 7Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG7.Region Limit
15	0h RO	Reserved.
14:0	0h RO/V	**Region Base (RB):** Region Base (RB): This specifies address bits [26:12] for the Region 7Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG7.Region Base

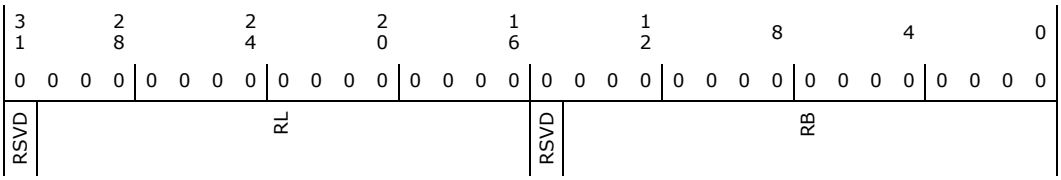
27.9.30 Flash Region 8(BIOS_FREG8)—Offset 74h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 00000000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	Reserved.
30:16	0h RO/V	**Region Limit (RL):** Region Limit (RL): This specifies address bits 26:12 for the Region 8Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG8.Region Limit
15	0h RO	Reserved.
14:0	0h RO/V	**Region Base (RB):** Region Base (RB): This specifies address bits 26:12 for the Region 8Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG8.Region Base

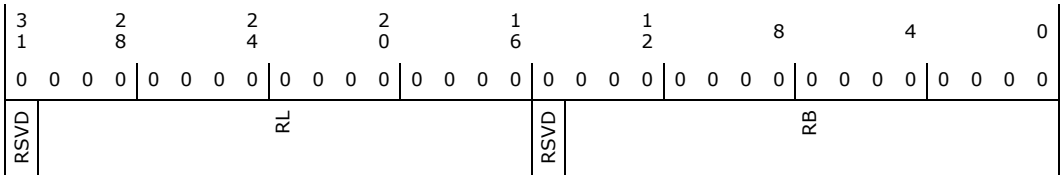
27.9.31 Flash Region 9(BIOS_FREG9)—Offset 78h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 00000000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	Reserved.
30:16	0h RO/V	**Region Limit (RL):** Region Limit (RL): This specifies address bits [26:12] for the Region 9Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG9.Region Limit
15	0h RO	Reserved.
14:0	0h RO/V	**Region Base (RB):** Region Base (RB): This specifies address bits [26:12] for the Region 9Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG9.Region Base

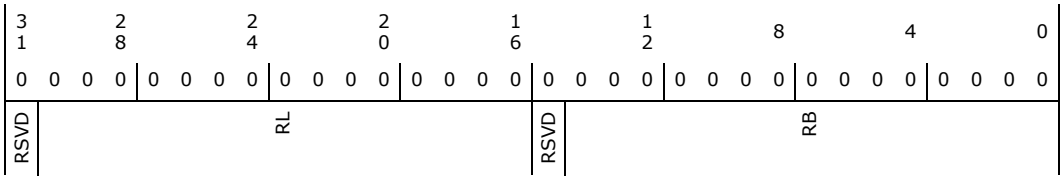
27.9.32 Flash Region 10(BIOS_FREG10)—Offset 7Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 00000000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	Reserved.
30:16	0h RO/V	**Region Limit (RL):** Region Limit (RL): This specifies address bits [26:12] for the Region 10Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG510Region Limit
15	0h RO	Reserved.
14:0	0h RO/V	**Region Base (RB):** Region Base (RB): This specifies address bits [26:12] for the Region 10Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG510Region Base

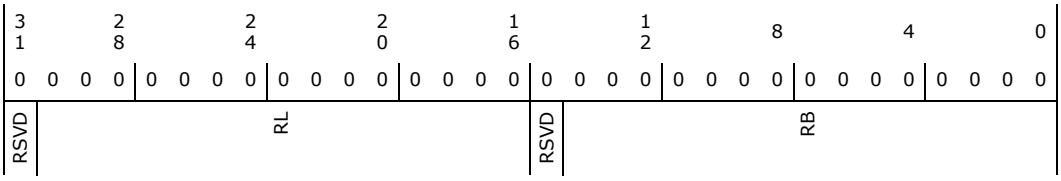
27.9.33 Flash Region 11 (BIOS_FREG11)—Offset 80h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 00000000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	Reserved.
30:16	0h RO/V	**Region Limit (RL):** Region Limit (RL): This specifies address bits [26:12] for the Region11 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG11.Region Limit
15	0h RO	Reserved.
14:0	0h RO/V	**Region Base (RB):** Region Base (RB): This specifies address bits [26:12] for the Region 11Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG11.Region Base

27.9.34 Flash Protected Range 0 (BIOS_FPR0)—Offset 84h

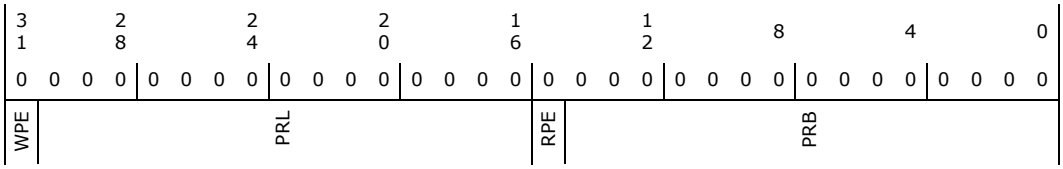
This register cannot be written when the FLOCKDN bit is set to 1.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** Write Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0h RW/L	**Protected Range Limit (PRL):** Protected Range Limit: This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RW/L	**Read Protection Enable (RPE):** Read Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0h RW/L	**Protected Range Base (PRB):** Protected Range Base: This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

27.9.35 Flash Protected Range 1 (BIOS_FPR1)—Offset 88h

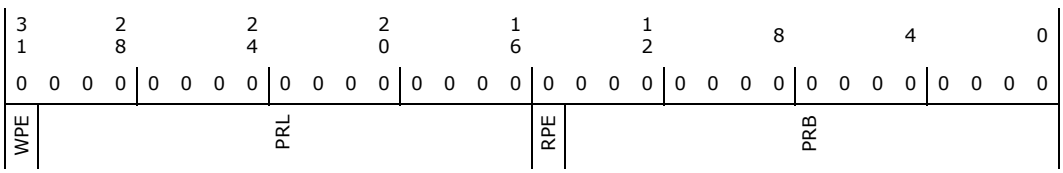
This register cannot be written when the FLOCKDN bit is set to 1.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** Write Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0h RW/L	**Protected Range Limit (PRL):** Protected Range Limit: This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RW/L	**Read Protection Enable (RPE):** Read Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0h RW/L	**Protected Range Base (PRB):** Protected Range Base: This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

27.9.36 Flash Protected Range 2 (BIOS_FPR2)—Offset 8Ch

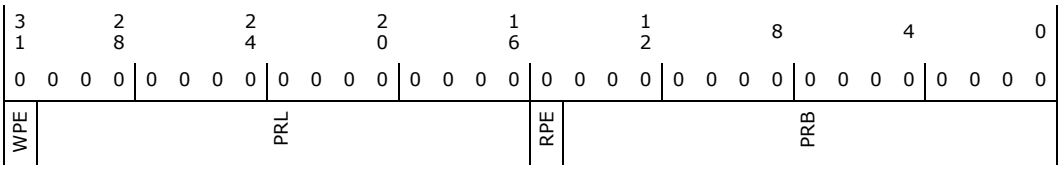
This register cannot be written when the FLOCKDN bit is set to 1.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** Write Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0h RW/L	**Protected Range Limit (PRL):** Protected Range Limit: This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RW/L	**Read Protection Enable (RPE):** Read Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.

Bit Range	Default and Access	Field Name (ID): Description
14:0	0h RW/L	**Protected Range Base (PRB):** Protected Range Base: This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

27.9.37 Flash Protected Range 3 (BIOS_FPR3)—Offset 90h

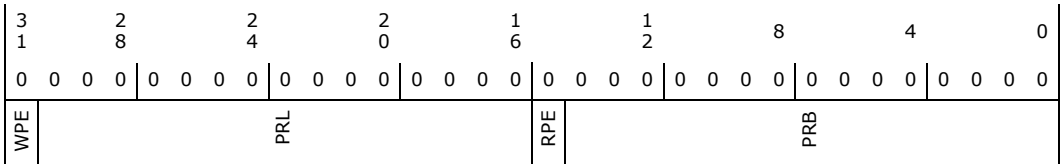
This register cannot be written when the PRR34_LOCKDN bit is set to 1.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** Write Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0h RW/L	**Protected Range Limit (PRL):** Protected Range Limit: This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RW/L	**Read Protection Enable (RPE):** Read Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0h RW/L	**Protected Range Base (PRB):** Protected Range Base: This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

27.9.38 Flash Protected Range 4 (BIOS_FPR4)—Offset 94h

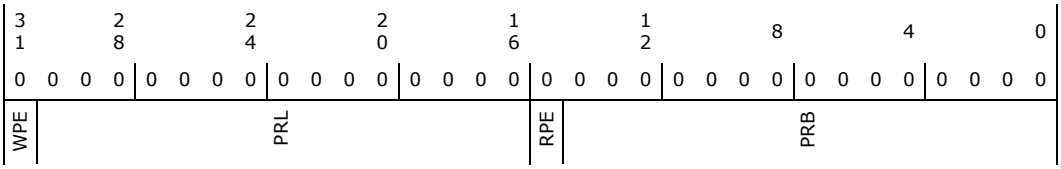
This register cannot be written when the PRR34_LOCKDN bit is set to 1.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** Write Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0h RW/L	**Protected Range Limit (PRL):** Protected Range Limit: This field corresponds to FLA address bits [26:12] and specifies the upper limit of the protected range. Address bits [11:0] are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RW/L	**Read Protection Enable (RPE):** Read Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0h RW/L	**Protected Range Base (PRB):** Protected Range Base: This field corresponds to FLA address bits [26:12] and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

27.9.39 Global Protected Range 0 (BIOS_GPR0)—Offset 98h

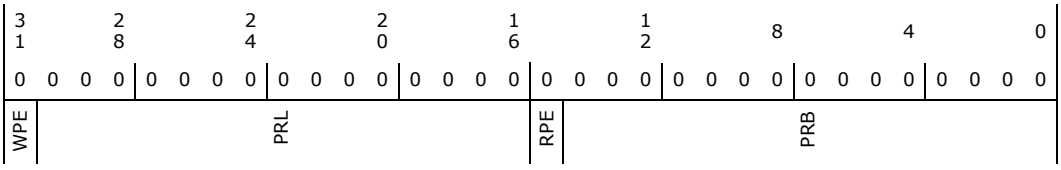
This register is initialized via softstraps. This protected range applies globally to all masters / flash requesters.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** Write Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0h RO/V	**Protected Range Limit (PRL):** Protected Range Limit: This field corresponds to FLA address bits [26:12] and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RO/V	**Read Protection Enable (RPE):** Read Protection Enable: When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0h RO/V	**Protected Range Base (PRB):** Protected Range Base: This field corresponds to FLA address bits [26:12] and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

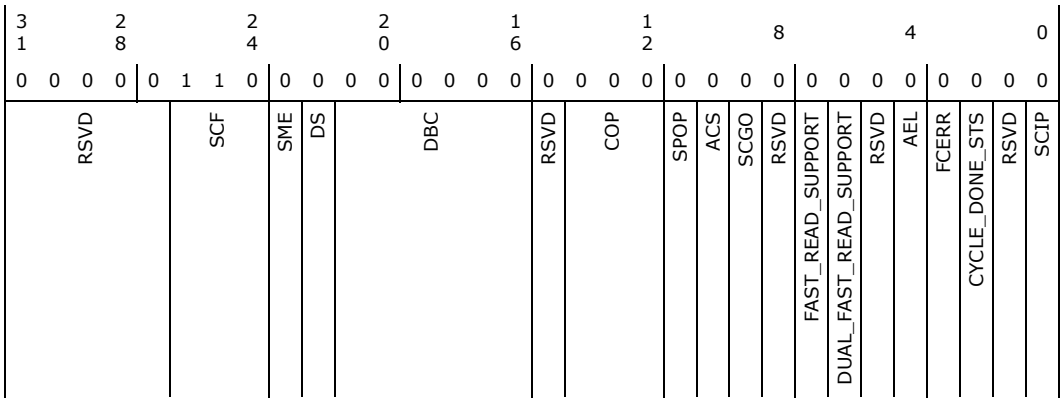
27.9.40 Software Sequencing Flash Status and Control (BIOS_SSFSTS_CTL)—Offset A0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 6000000h



Bit Range	Default and Access	Field Name (ID): Description
31:27	0h RO	Reserved.
26:24	6h RW/L	**SPI Cycle Frequency (SCF):** SPI Cycle Frequency (SCF): The listed frequencies are approximate. See 31.11. 000 : 120 MHz (not supported in the Intel® C620 Series Chipset) 001 : 60 MHz (not supported in the Intel® C620 Series Chipset) 010 : 48 MHz not supported in the Intel® C620 Series Chipset 011 : 40 MHz 100 : 30 MHz 101 : 24 MHz (not supported in the Intel® C620 Series Chipset) 110 : 17 MHz All Others: Reserved This register sets frequency to use for all SPI Software Sequencing cycles (write, erase, fast read, read status, etc.) except for the Read cycle which always run at 20 MHz. This register is locked when the SPI Configuration Lock-Down (FLOCKDN) bit is set. ***Note:*** Fast Reset Test mode overrides the value programmed into this register.
23	0h RW	**SPI SMI# Enable (SME):** SPI SMI# Enable (SME): When set to 1, the SPI asserts an SMI# request whenever the Cycle Done Status bit is 1.
22	0h RW	**Data Cycle (DS):** Data Cycle (DS): When set to 1, there is data that corresponds to this transaction. When 0, no data is delivered for this cycle, and the DBC and data fields themselves are don t cares.
21:16	0h RW	**Data Byte Count (DBC):** Data Byte Count (DBC): This field specifies the number of bytes to shift in or out during the data portion of the SPI cycle. The valid settings (in decimal) are any value from 0 to 63. The number of bytes transferred is the value of this field plus 1. Note that when this field is 00_0000b, then there is 1 byte to transfer and that 11_1111b means there are 64 bytes to transfer.
15	0h RO	Reserved.
14:12	0h RW	**Cycle Opcode Pointer (COP):** Cycle Opcode Pointer (COP): This field selects one of the programmed opcodes in the Opcode Menu to be used as the SPI Command/ Opcode. In the case of an Atomic Cycle Sequence, this determines the second command.
11	0h RW	**Sequence Prefix Opcode Pointer (SPOP):** Sequence Prefix Opcode Pointer (SPOP): This field selects one of the two programmed prefix opcodes for use when performing an Atomic Cycle Sequence. A value of 0 points to the opcode in the least significant byte of the Prefix Opcodes register. By making this programmable, the ICH supports flash devices that have different opcodes for enabling writes to the data space vs. status register.
10	0h RW	**Atomic Cycle Sequence (ACS):** Atomic Cycle Sequence (ACS): When set to 1 along with the SCGO assertion, the PCH will execute a sequence of commands on the SPI interface without allowing another master to arbitrate and interleave cycles. The sequence is composed of: - Atomic Sequence Prefix Command (8-bit opcode only) - Primary Command specified below by software (can include address and data) - Polling the Flash Status Register (opcode 05h) until bit 0 becomes 0b. The SPI Cycle in Progress bit remains set and the Cycle Done Status bit remains unset until the Busy bit in the Flash Status Register returns 0.
9	0h RW/1S/V	**SPI Cycle Go (SCGO):** SPI Cycle Go (SCGO): This bit always returns 0 on reads. However, a write to this register with a '1' in this bit starts the SPI cycle defined by the other bits of this register. The [quote]SPI Cycle in Progress[/quote] (SCIP) bit gets set by this action. Hardware must ignore writes to this bit while the Cycle In Progress bit is set. Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1. This saves an additional memory write.
8	0h RO	Reserved.
7	0h RO/V	**Fast Read Supported (FAST_READ_SUPPORT):** Fast Read Supported: This bit reflects the value of the Fast Read Support bit in the Flash Descriptor Component Section.
6	0h RO/V	**Dual Output Fast Read Supported (DUAL_FAST_READ_SUPPORT):** Dual Output Fast Read Supported: This bit reflects the value of the Dual Output Fast Read Support bit Anthe Flash Descriptor Component Section.
5	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
4	0h RO/V	**Access Error Log (AEL):** Access Error Log (AEL): This bit reflects the value of the Hardware Sequencing Status.AEL register.
3	0h RW/1C/V	**Flash Cycle Error (FCERR):** Flash Cycle Error (FCERR): Hardware sets this bit to 1 when a programmed access is blocked from running on the SPI interface due to one of the protection policies or when any of the programmed cycle registers is written while a programmed access is already in progress. This bit remains asserted until cleared by software writing a 1 or hardware reset.
2	0h RW/1C/V	**Cycle Done Status (CYCLE_DONE_STS):** Cycle Done Status: The PCH sets this bit to 1 when the SPI Cycle completes (i.e., SCIP bit is 0) after software sets the GO bit. This bit remains asserted until cleared by software writing a 1 or hardware reset. When this bit is set and the SPI SMI# Enable bit is set, an internal signal is asserted to the SMI# generation block. Software must make sure this bit is cleared prior to enabling the SPI SMI# assertion for a new programmed access.
1	0h RO	Reserved.
0	0h RO/V	**SPI Cycle In Progress (SCIP):** SPI Cycle In Progress (SCIP): Hardware sets this bit when software sets the SPI Cycle Go bit in the Command register. This bit remains set until the cycle completes on the SPI interface. Hardware automatically sets and clears this bit so that software can determine when read data is valid and/or when it is safe to begin programming the next command. Software must only program the next command when this bit is 0.

27.9.41 Prefix Opcode and Opcode Type Configuration (BIOS_PREOP_OPTYPE)—Offset A4h

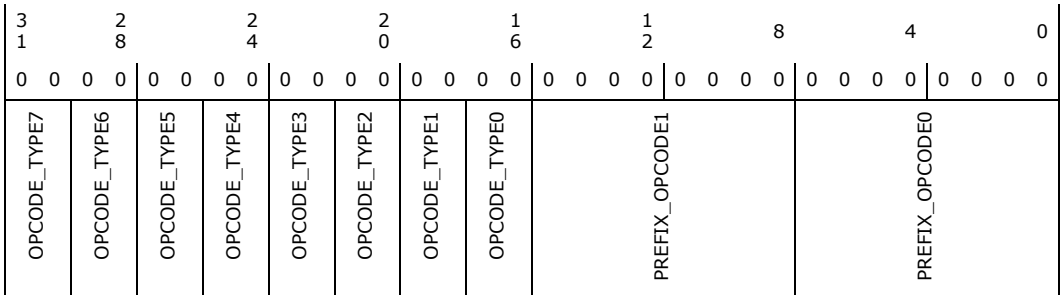
This register is not writable when the Flash Configuration Lock-Down (FLOCKDN) bit is set. Entries in this register correspond to the entries in the Opcode Menu Configuration register.
Note that the definition below only provides write protection for opcodes that have addresses associated with them. Therefore, any erase or write opcodes that do not use an address should be avoided.

Access Method

Type: MEM Register (Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:30	0h RW/L	**Opcode Type 7 (OPCODE_TYPE7):** Same description as OPCODE_TYPE0.
29:28	0h RW/L	**Opcode Type 6 (OPCODE_TYPE6):** Same description as OPCODE_TYPE0.
27:26	0h RW/L	**Opcode Type 5 (OPCODE_TYPE5):** Same description as OPCODE_TYPE0.
25:24	0h RW/L	**Opcode Type 4 (OPCODE_TYPE4):** Same description as OPCODE_TYPE0.
23:22	0h RW/L	**Opcode Type 3 (OPCODE_TYPE3):** Same description as OPCODE_TYPE0.
21:20	0h RW/L	**Opcode Type 2 (OPCODE_TYPE2):** Same description as OPCODE_TYPE0.
19:18	0h RW/L	**Opcode Type 1 (OPCODE_TYPE1):** Same description as OPCODE_TYPE0.
17:16	0h RW/L	**Opcode Type 0 (OPCODE_TYPE0):** This field specifies information about the corresponding Opcode 0. This information allows the hardware to 1) know whether to use the address field and 2) provide BIOS and Shared Flash protection capabilities. The hardware implementation also uses the read vs. write information for modifying the behavior of the SPI interface logic. The encoding of the two bits is: 00 = No Address associated with this Opcode and Read Cycle type 01 = No Address associated with this Opcode and Write Cycle type 10 = Address required; Read cycle type 11 = Address required; Write cycle type
15:8	0h RW/L	**Prefix Opcode 1 (PREFIX_OPCODE1):** Software programs an SPI opcode into this field that is permitted to run as the first command in an atomic cycle sequence.
7:0	0h RW/L	**Prefix Opcode 0 (PREFIX_OPCODE0):** Software programs an SPI opcode into this field that is permitted to run as the first command in an atomic cycle sequence.

27.9.42 Opcode Menu0 Configuration (BIOS_OPMENU0)—Offset A8h

This register is not writable when the SPI Configuration Lock-Down bit (FLOCKDN) is set. Eight entries are available in this register to give BIOS a sufficient set of commands for communicating with the flash device, while also restricting what malicious software can do. This keeps the hardware flexible enough to operate with a wide variety of SPI devices.

It is recommended that BIOS avoid programming Write Enable opcodes in this menu. Malicious software could then perform writes and erases to the SPI flash without using the atomic cycle mechanism. This could cause functional failures in a shared flash environment.

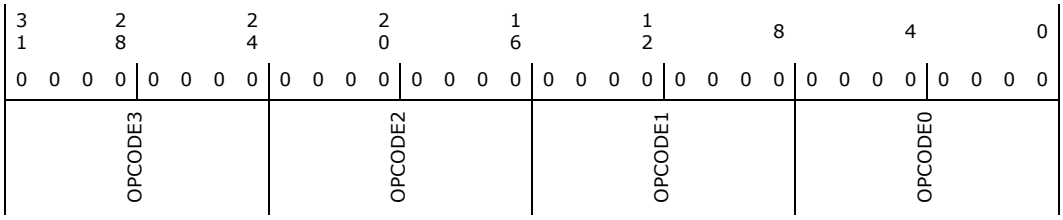
Write Enable opcodes should only be programmed in the Prefix Opcodes.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RW/L	**Allowable Opcode 3 (OPCODE3):** See the description for bits 7:0
23:16	0h RW/L	**Allowable Opcode 2 (OPCODE2):** See the description for bits 7:0
15:8	0h RW/L	**Allowable Opcode 1 (OPCODE1):** See the description for bits 7:0
7:0	0h RW/L	**Allowable Opcode 0 (OPCODE0):** Software programs an SPI opcode into this field for use when initiating SPI commands through the Control Register.

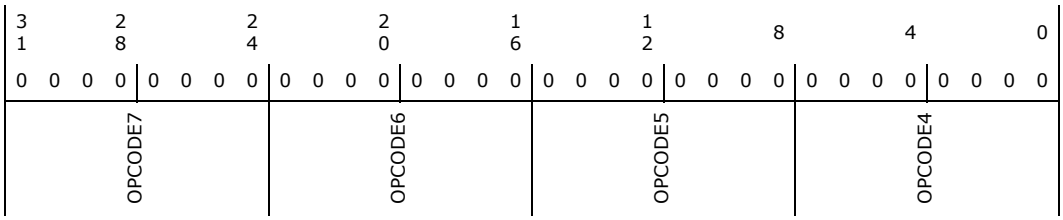
27.9.43 Opcode Menu1 Configuration (BIOS_OPMENU1)—Offset ACh

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RW/L	**Allowable Opcode 7 (OPCODE7):** See the description for bits 7:0 in BIOS_OPMENU0 Register.
23:16	0h RW/L	**Allowable Opcode 6 (OPCODE6):** See the description for bits 7:0 in BIOS_OPMENU0 Register.
15:8	0h RW/L	**Allowable Opcode 5 (OPCODE5):** See the description for bits 7:0 in BIOS_OPMENU0 Register.
7:0	0h RW/L	**Allowable Opcode 4 (OPCODE4):** See the description for bits 7:0 in BIOS_OPMENU0 Register.

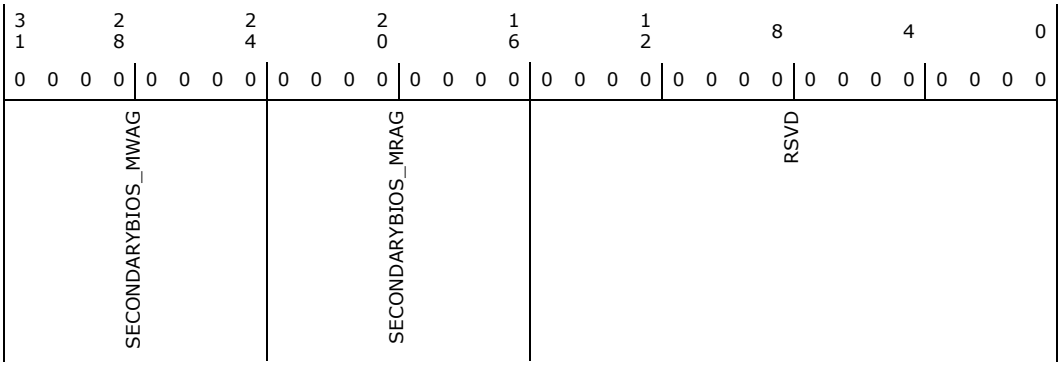
27.9.44 Secondary Flash Region Access Permissions (BIOS_SFRACC)—Offset B0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RW/L	**Secondary BIOS Master Write Access Grant (SECONDARYBIOS_MWAG):** Each bit 31:29 corresponds to Master7:0. BIOS can grant one or more masters write access to the Secondary BIOS region 6 overriding the permissions in the Flash Descriptor. Bits for unassigned masters are reserved. The contents of this register are locked by the FLOCKDN bit.
23:16	0h RW/L	**Secondary BIOS Master Read Access Grant (SECONDARYBIOS_MRAG):** Each bit 28:16 corresponds to Master7:0. BIOS can grant one or more masters read access to the Secondary BIOS region 6 overriding the read permissions in the Flash Descriptor. Bits for unassigned masters are reserved. The contents of this register are locked by the FLOCKDN bit.
15:0	0h RO	Reserved.

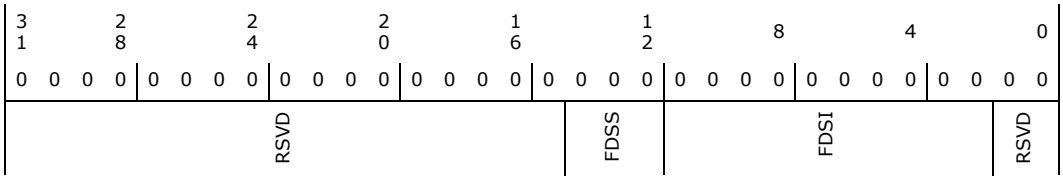
27.9.45 Flash Descriptor Observability Control (BIOS_FDOC)—Offset B4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:15	0h RO	Reserved.
14:12	0h RW	**Flash Descriptor Section Select (FDSS):** Selects which section within the loaded Flash Descriptor to observe. 000: Flash Signature and Descriptor Map 001: Component 010: Region 011: Master Others: Reserved
11:2	0h RW	**Flash Descriptor Section Index (FDSI):** Selects the DW offset within the Flash Descriptor Section to observe.
1:0	0h RO	Reserved.

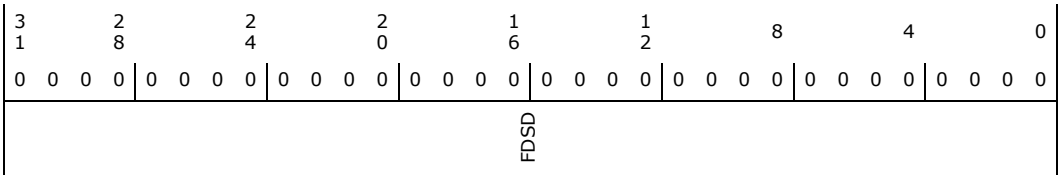
27.9.46 Flash Descriptor Observability Data (BIOS_FDOD)—Offset B8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**Flash Descriptor Section Data (FDSD):** Returns the DW of data to observe as selected in the Flash Descriptor Observability Control.

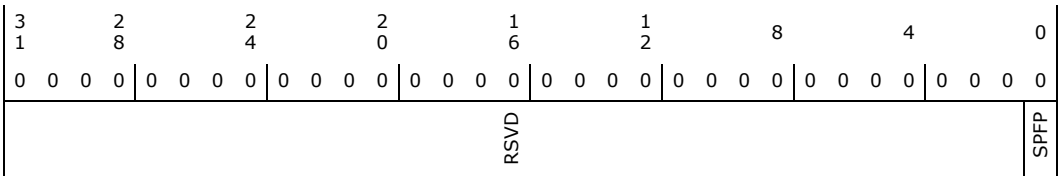
27.9.47 Additional Flash Control (BIOS_AFC)—Offset C0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RW/V/P	**Stop Prefetch on Flush Pending (SPFP):** When set to 1, the in progress of a prefetch will be ended if subsequence access from the master of the same interface is detected to be a cache-miss and read cache will be flushed. When set to 0, the prefetch will be allowed to complete prior to flushing.

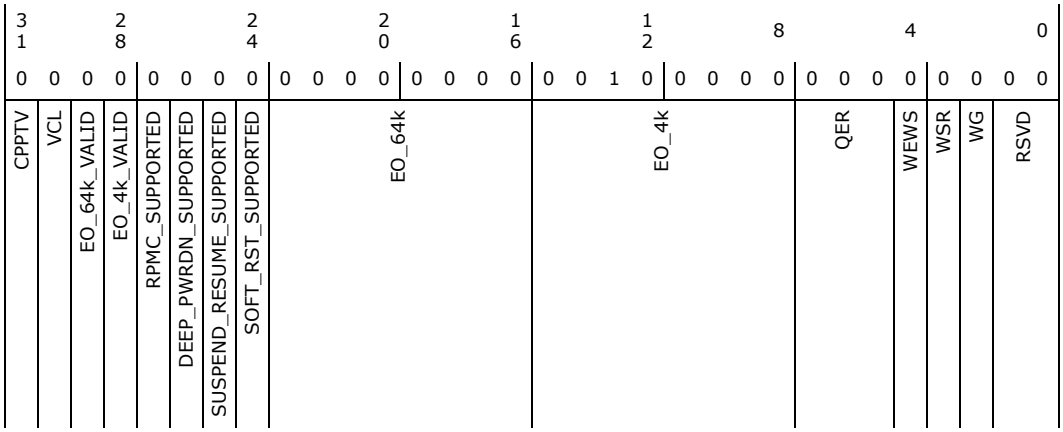
27.9.48 Vendor Specific Component Capabilities for Component 0 (BIOS_SFDP0_VSCC0)—Offset C4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 2000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO/V	**Component Property Parameter Table Valid (CPPTV):** This bit is set to a 1 if the Flash Controller detects a valid SFDP Component Property Parameter Table in Component 0. ***Note:*** If this bit is set software must not overwrite bits that were initialized by hardware via SFDP discovery.
30	0h RW/L	**Vendor Component Lock (VCL):** 0: The lock bit is not set 1: The Vendor Component Lock bit is set. This register locks itself when set.
29	0h RW/V/L	**64k Erase Valid (EO_64k_VALID):** 0: The EO_64k opcode is not valid. 1: The EO_64k opcode is valid.
28	0h RW/V/L	**4k Erase Valid (EO_4k_VALID):** 0: The EO_4k opcode is not valid. 1: The EO_4k opcode is valid.
27	0h RW/L	**RPMC Supported (RPMC_SUPPORTED):** 0 the device does not support RPMC 1 the device supports RPMC
26	0h RW/V/L	**Deep Power Down Supported (DEEP_PWRDN_SUPPORTED):** 0 the device does not support Deep Power down. 1 the device supports Deep Power down.
25	0h RW/V/L	**Suspend/Resume Supported (SUSPEND_RESUME_SUPPORTED):** 0 the device does not support Suspend/Resume 1 the device supports Suspend/Resume
24	0h RW/V/L	**Soft Reset Supported (SOFT_RST_SUPPORTED):** 0 the device does not support Soft Reset 1 the device supports Soft Reset
23:16	0h RW/V/L	**64k Erase Opcode (EO_64k):** This register is programmed with the Flash 64k sector erase instruction opcode for component 0. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit.

Bit Range	Default and Access	Field Name (ID): Description
15:8	20h RW/V/L	**4k Erase Opcode (EO_4k):** This register is programmed with the Flash 64k sector erase instruction opcode for component 0. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit.
7:5	0h RW/V/L	**Quad Enable Requirements (QER):** 000 = Part does not require a Quad Enable bit to be set, either because Quad is not supported or because the manufacturer somehow permanently enables Quad capability. 001 = Part requires bit 9 in status register 2 to be set to enable quad IO. Writing one byte to status register clears all bits in register 2, therefore status register writes MUST be two bytes. 010 = Part requires bit 6 of status register 1 to be set to enable quad IO. 011 = Part requires bit 7 of the configuration register to be set to enable Quad. 100 = Part requires bit 9 in status register 2 to be set to enable quad IO. Writing one byte to the status register does not clear the second byte. This register is locked by the Vendor Component Lock (VCL) bit. If the SFDP table contains this information, the flash controller loads these bits from the table. The flash controller uses this information to prevent clearing the QE bit in the flash device's status register when WSR=1.
4	0h RW/V/L	**Write Enable on Write Status (WEWS):** 0 = 50h is the opcode to enable a status register write 1 : 06h is the opcode to enable a status register write This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. ***Note:*** Hardware ignores the state of this bit.
3	0h RW/V/L	**Write Status Required (WSR):** 0 = No requirement to write to the Write Status Register prior to a write 1 = A write is required to the Write Status Register prior to write and erase to remove any protection. This is required for SST components. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. ***Note:*** Hardware ignores the state of this bit.
2	0h RW/V/L	**Write Granularity (WG):** 0: Reserved 1: 64 Byte This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. ***Note:*** Hardware ignores the state of this bit.
1:0	0h RO	Reserved.

27.9.49 Vendor Specific Component Capabilities for Component 1 (BIOS_SFDP1_VSCC1)—Offset C8h

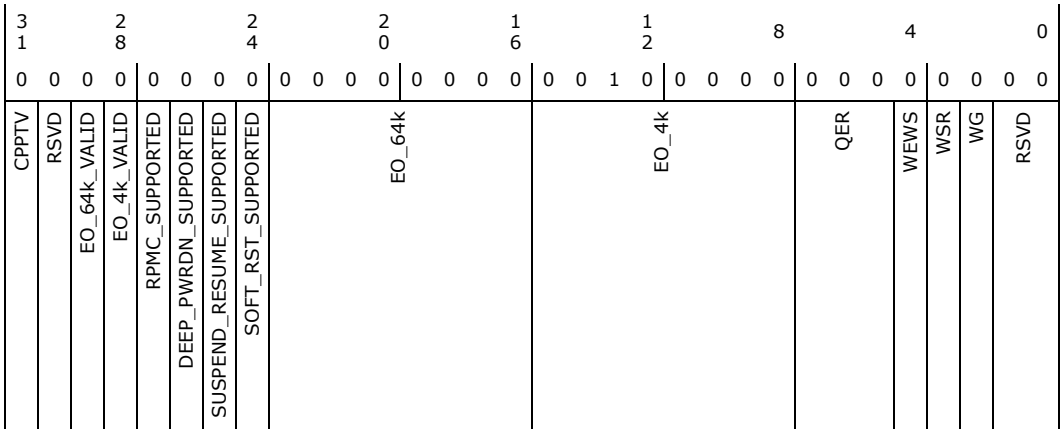
This register pertain to cycles targeting addresses outside of Component 0. The lockable bits in this register are locked when either CPPTV is set to 1 by hardware or when VCL is 1.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 2000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO/V	**Component Property Parameter Table Valid (CPPTV):** This bit is set to a 1 if the Flash Controller detects a valid SFDP Component Property Parameter Table in Component 1. ***Note:*** If this bit is set software must not overwrite bits that were initialized by hardware via SFDP discovery RO
30	0h RO	Reserved.
29	0h RW/V/L	**64k Erase Valid (EO_64k_VALID):** 0: The EO_64k opcode is not valid. 1: The EO_64k opcode is valid.
28	0h RW/V/L	**4k Erase Valid (EO_4k_VALID):** 0: The EO_4k opcode is not valid. 1: The EO_4k opcode is valid.
27	0h RW/L	**RPMC Supported (RPMC_SUPPORTED):** 0 the device does not support RPMC 1 the device supports RPMC
26	0h RW/V/L	**Deep Power Down Supported (DEEP_PWRDN_SUPPORTED):** 0 the device does not support Deep Power Down 1 the device supports Deep Power Down
25	0h RW/V/L	**Suspend/Resume Supported (SUSPEND_RESUME_SUPPORTED):** 1 the device supports Suspend/Resume
24	0h RW/V/L	**Soft Reset Supported (SOFT_RST_SUPPORTED):** 0 the device does not support Soft Reset 1 the device supports Soft Reset
23:16	0h RW/V/L	**64k Erase Opcode (EO_64k):** This register is programmed with the Flash 64k sector erase instruction opcode for component 1. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit.
15:8	20h RW/V/L	**4k Erase Opcode (EO_4k):** This register is programmed with the Flash 4k subsector erase instruction opcode for component 1. Software must program this register if the SFDP table for this component does not show 4 KB erase capability. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit.

Bit Range	Default and Access	Field Name (ID): Description
7:5	0h RW/V/L	**Quad Enable Requirements (QER):** 000 = Part does not require a Quad Enable bit to be set, either because Quad is not supported or because the manufacturer somehow permanently enables Quad capability. 001 = Part requires bit 9 in status register 2 to be set to enable quad IO. Writing one byte to status register clears all bits in register 2, therefore status register writes MUST be two bytes. 010 = Part requires bit 6 of status register 1 to be set to enable quad IO. 011 = Part requires bit 7 of the configuration register to be set to enable Quad. 100 = Part requires bit 9 in status register 2 to be set to enable quad IO. Writing one byte to the status register does not clear the second byte. This register is locked by the Vendor Component Lock (VCL) bit. If the SFDP table contains this information, the flash controller loads these bits from the table. The flash controller uses this information to prevent clearing the QE bit in the flash device's status register when WSR=1.
4	0h RW/V/L	**Write Enable on Write Status (WEWS):** 0: 50h is the opcode to enable a status register write 1: 06h is the opcode to enable a status register write This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit.
3	0h RW/V/L	**Write Status Required (WSR):** 0: No requirement to write to the Write Status Register prior to a write 1: A write is required to the Write Status Register prior to write and erase to remove any protection. This is required for SST components. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit.
2	0h RW/V/L	**Write Granularity (WG):** 0: Reserved 1: 64 Byte This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. ***Note:*** Hardware ignores the state of this bit.
1:0	0h RO	Reserved.

27.9.50 Parameter Table Index (BIOS_PTINX)—Offset CCh

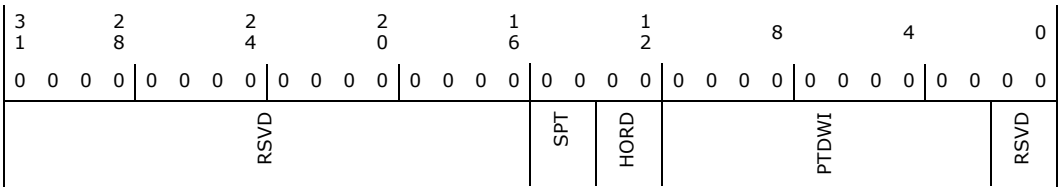
Observability control for Component Property Tables

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:14	0h RW	**Supported Parameter Table (SPT):** Selects which supported parameter table to observe. 00 : Component 0 Property Parameter Table 01 : Component 1 Property Parameter Table 10 - 11 : Reserved
13:12	0h RW	**Header or Data (HORD):** Select parameter table header DW vs. Data DW. 00 : SFDP Header 01 : Parameter Table Header 10 : Data 11 : Reserved
11:2	0h RW	**Parameter Table DW Index (PTDWI):** Selects the DW offset within the parameter table to observe.
1:0	0h RO	Reserved.

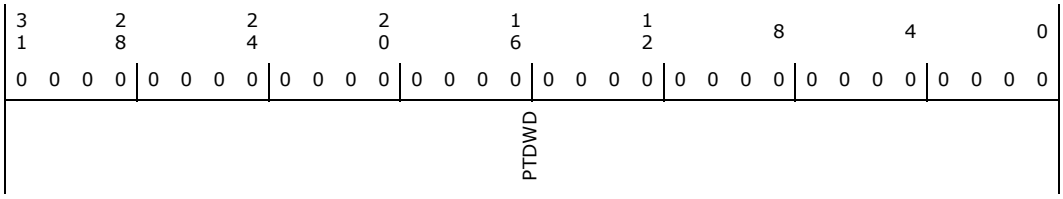
27.9.51 Parameter Table Data (BIOS_PTDATA)—Offset D0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**Parameter Table DW Data (PTDWD):** Returns the DW of data to observe as selected in the Parameter Table Index register. ***Note:*** The returned value of reserved fields in the SFDP header or table must be ignored by software. The flash controller may return either 0 or 1 for these fields.

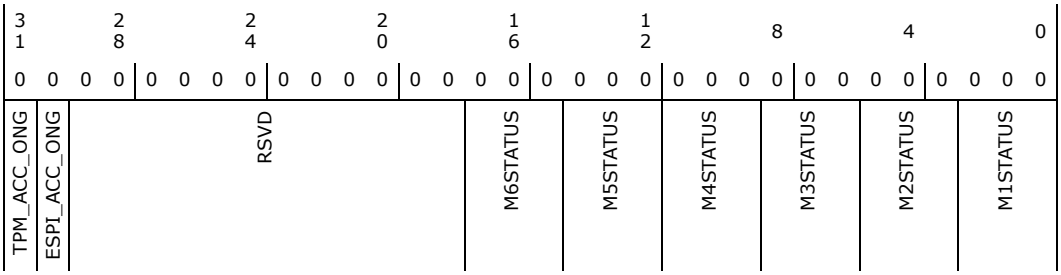
27.9.52 SPI Bus Requester Status (BIOS_SBRS)—Offset D4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO/V	**TPM access ongoing (TPM_ACC_ONG)**
30	0h RO/V	**eSPI access ongoing (ESPI_ACC_ONG)**
29:18	0h RO	Reserved.
17:15	0h RO/V	**Master 6 Status (M6STATUS):** Master 6 Status (M6STATUS): See description under M1STATUS
14:12	0h RO/V	**Master 5 Status (M5STATUS):** Master 5 Status (M5STATUS): See description under M1STATUS
11:9	0h RO/V	**Master 4 Status (M4STATUS):** Master 4 Status (M4STATUS): See description under M1STATUS
8:6	0h RO/V	**Master 3 Status (M3STATUS):** Master 3 Status (M3STATUS): See description under M1STATUS
5:3	0h RO/V	**Master 2 Status (M2STATUS):** Master 2 Status (M2STATUS): See description under M1STATUS
2:0	0h RO/V	**Master 1 Status (M1STATUS):** Indicates whether this master has an outstanding transaction enqueued or in flight and the transaction type. 0xx : no transaction 100 : flash read transaction 101 : flash write transaction 110 : flash erase transaction 111 : flash RPMC transaction

27.10 BIOS Flash Program Registers Summary

Table 27-6. Summary of BIOS Flash Program Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
F0h	F3h	Set Strap Msg Lock (SSML)—Offset F0h	0h
F4h	F7h	Set Strap Msg Control (SSMC)—Offset F4h	0h
F8h	FBh	Set Strap Msg Data (SSMD)—Offset F8h	0h

27.10.1 Set Strap Msg Lock (SSML)—Offset F0h

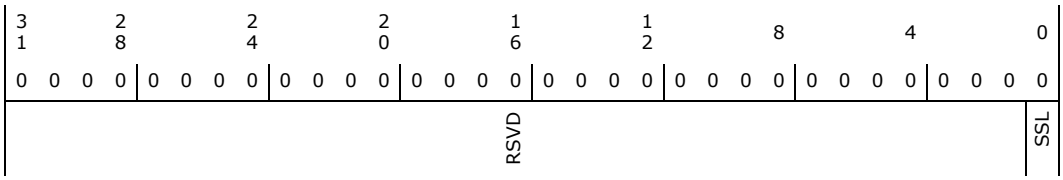
Lockable: Yes
Power Well: Resume
reset_type= wrsmrst#

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RW/L	**Set_Strap Lock (SSL):** When set to '1', all of SSML, SSMC and SSMD is locked, including this Lock bit. Note that this bit is reset on CF9 resets.

27.10.2 Set Strap Msg Control (SSMC)—Offset F4h

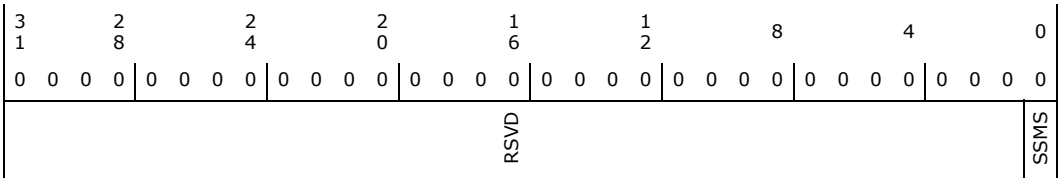
Lockable: Yes
Power Well: DSW
reset_type= dsw_pok
The DSW bits are all cleared by dsw_pok, but must not be cleared by CF9h resets.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RW/L	**Set_Strap Mux Select (SSMS):** When set to '1', the Set strap message bits [47:32] come from the Set_Strap Msg Data register. This bit is reset by the RSMRST# pin only. When '0', the Set-Strap data continues to come from the soft straps themselves. This register field is locked by the Set Strap Lock (SSML.SSL) bit.

27.10.3 Set Strap Msg Data (SSMD)—Offset F8h

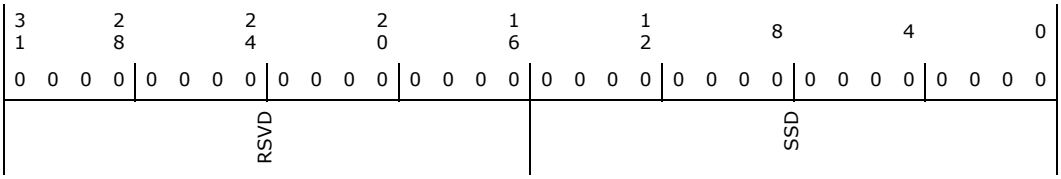
Lockable: Yes
Power Well: DSW
Reset Type: dsw_pok
This register is used to provide a BIOS programmable sticky register which contains data that will be used in the Set-Strap type 1 msg on subsequent resets. These bits are in the resume well, so only reset on G3.
The usage model is that on each reset BIOS will check the state of the CPU. If the state is correct then BIOS continues. If not, then BIOS writes the SSMD and SSMC registers and does a CF9 reset.
On the reset the value of what was written to SSMD takes effect.
Note that some mobile platforms force G3 on S5 requests. For those platforms, if the user/BIOS wants to have these bits set, there will be 2 resets on every power-on. If the platform accepts the default of '0' for these controls, then there is only one reset.
The bits are in DSW and not RTC well because this allows a user upgrade, assuming the user unplugged the system before doing the upgrade, to revert to a setting of 0. This should reduce any interoperability concerns regarding user upgrades.
The DSW bits are all cleared dsw_pok, and must not be cleared by CF9h resets.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 5

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW/L	**Set_Strap Data (SSD):** When SSMS is '1', then this data is sent in the Set-Strap msg Type 1 upon reset. This data is sent in the 2nd DW of data, bits [15:0]. This register field is locked by the Set Strap Lock (SSML.SSL) bit.

§

28 Testability

28.1 Acronyms

Acronyms	Description
BSDL	Boundary Scan Description Language
IEEE	Institute of Electrical and Electronics Engineers
I/O	Input/Output
I/OD	Input/Output Open Drain
JTAG	Joint Test Action Group
TAP	Test Access Port

28.2 References

Specification	Location
IEEE Standard Test Access Port and Boundary Scan Architecture*	http://standards.ieee.org/findstds/standard/1149.1-2013.html

28.3 Overview

This section contains information regarding the PCH testability signals that provides access to JTAG, run control, system control, and observation resources. PCH JTAG TAP ports are compatible with the IEEE Standard Test Access Port and Boundary Scan Architecture 1149.1 and 1149.6 Specification, as detailed per device in each BSDL file. JTAG Pin definitions are from IEEE Standard Test Access Port and Boundary-Scan. Architecture (IEEE Std. 1149.1-2001).

28.4 Signal Description

Table 28-1. Testability Signals (Sheet 1 of 2)

Name	Type	Description
JTAG_TCK	I/O	**Test Clock Input (TCK):** The test clock input provides the clock for the JTAG test logic.
JTAG_TMS	I/OD	**Test Mode Select (TMS):** The signal is decoded by the Test Access Port (TAP) controller to control test operations.
JTAG_TDI	I/OD	**Test Data Input (TDI):** Serial test instructions and data are received by the test logic at TDI.
JTAG_TDO	I/OD	**Test Data Output (TDO):** TDO is the serial output for test instructions and data from the test logic defined in this standard.
JTAGx	I/O	This pin is used to support merged debug port topologies.
ITP_PMODE	O	This signal is used to transmit CPU and PCH power/reset information to the ITP Debugger.
TRIGGER_IN	I	From the CPU, for cross die triggering for debug trace
TRIGGER_OUT	O	To the CPU IOT for cross die triggering
PRDY_N	I/OD	Acknowledge from CPU for Run control.
PREQ_N	I/OD	From the PCH to the CPU for run control by DCI for closed chassis testing.

Table 28-1. Testability Signals (Sheet 2 of 2)

Name	Type	Description
CPU_TRST_N	O	JTAG output from DCI to CPU
POWER_DEBUG_N	OD	Connect to PWR_DEBUG_N pin on CPU.

28.5 I/O Signal Planes and States

Table 28-2. Power Planes and States for PCH Testability Signals

Signal Name	Power Plane	During Reset	Immediately after Reset	S3/S4/S5	Deep Sx
JTAG_TCK	Primary	Internal PD	Internal PD	Internal PD	Off
JTAG_TMS	Primary	Internal PU	Internal PU	Internal PU	Off
JTAG_TDI	Primary	Internal PU	Internal PU	Internal PU	Off
JTAG_TDO	Primary	Undriven	Undriven	Undriven	Off
JTAGx[1]	Primary	Internal PU (as TDO)/Internal PD (as TCK)	Internal PU/ Internal PD	Internal PU/ Internal PD	Off
ITP_PMODE	Primary	Internal PU	Internal PU	Internal PU	Off
TRIGGER_IN	Primary	Internal PD	Internal PD	Undriven	Off
TRIGGER_OUT	Primary	Internal PD	Internal PD	Undriven	Off
PRDY_N	Primary	External PU	External PU	Undriven	Off
PREQ_N	Primary	Internal PU	Internal PU	Undriven	Off
CPU_TRST_N	Primary	Internal PD	Internal PD	Internal PD	Off

Notes: This signal is used in common JTAG topology to take in last device's TDO to DCI. The only planned supported topology is the Shared Topology, so this pin will operate as TCK mode.
Notes: Internal pull-ups and pull-downs will not be valid until all the voltages are valid.

28.6 Intel® Trace Hub (Intel® TH)

28.6.1 Overview

Intel Trace Hub is a debug architecture that unifies hardware and software system visibility. Intel Trace Hub is not merely intended for hardware debug or software debug, but full system debug. This includes debugging hardware and software as they interact and produce complex system behavior. Intel Trace Hub defines new features and also leverages some existing debug technologies to provide a complete framework for hardware and software co-debug, software development and tuning, as well as overall system performance optimization.

Intel Trace Hub is a set of silicon features with supported software API. The primary purpose is to collect trace data from different sources in the system and combine them into a single output stream with time-correlated to each other. Intel Trace Hub uses common hardware interface for collecting time-correlated system traces through standard destinations. Intel Trace Hub adopts industry standard (MIPI* STPv2) debug methodology for system debug and software development.

There are multiple destinations to receive the trace data from Intel Trace Hub:

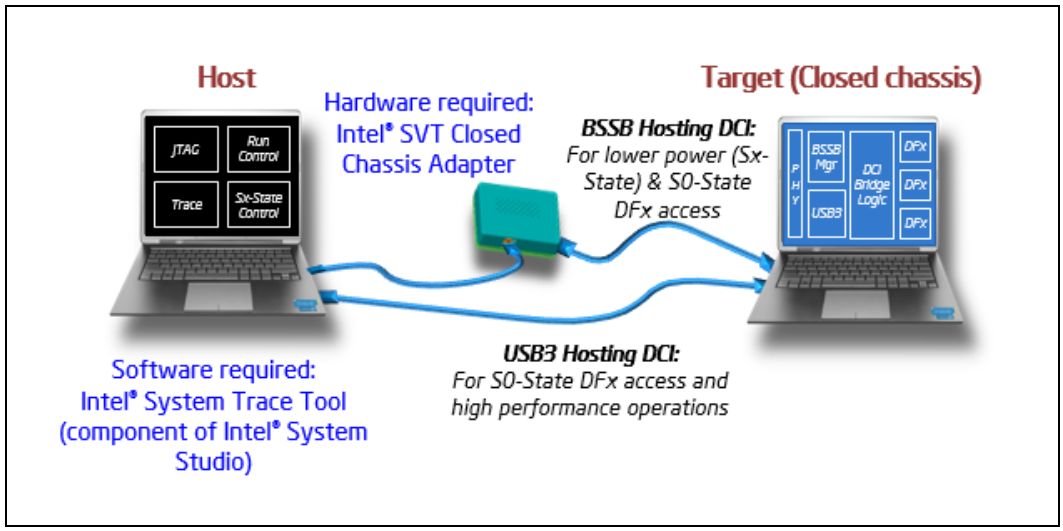
- Direct Connect Interface (DCI)
    - BSSB Hosting DCI
    - USB3 Hosting DCI
- System Memory

There are multiple trace sources planned to be supported:

- BIOS
- Intel ME
- AET (Architecture Event Trace)
- PCH Power Management Event Trace
- IE (IE FS add source debug message)
- Windows* ETW (for driver or application)

28.6.2 Platform Setup

Figure 28-1. Platform Setup with Intel Trace Hub



28.7 Direct Connect Interface (DCI)

Direct Connect Interface (DCI) is a new debug transport technology to enable closed chassis debug through any of USB3 ports out from Intel silicon. Some bridging logic is embedded in the silicon to "bridge" the gap between standard IO ports and the debug interfaces including JTAG, probe mode, hooks, trace infrastructure, and etc. To control the operation of this embedded logic, a DCI packet based protocol is invented which controls and data can be sent or received. This protocol can operate over a few different physical transport paths to the target which known as "hosting interfaces".

There are two types of DCI hosting interfaces:

- BSSB Hosting DCI
- USB3 Hosting DCI

Supported capabilities in DCI are:

- Closed Chassis Debug at S0 and Sx State

- JTAG Access and Run Control (Probe Mode)
- System Tracing with Intel Trace Hub

Debug host software that support DCI are:

- Intel® In-Target Probe (Intel® ITP) II Platform Debug Toolkit (PDT)
- Intel® System Studio (ISS)

28.7.1 BSSB Hosting DCI

BSSB stands for Boundary Scan Side Band. It was developed to provide an alternate path to convey controls and data to or from the embedded logic by connecting physically to the target through a USB3 port. BSSB provides an alternate side band path around the USB3 controller, so that the embedded logic can be accessed, even when the USB controller is not alive (such as in low power states), or is malfunctioning. This path does not rely on USB protocol, link layer, or physical layer, because the xHCI functions are generally not available in such conditions. Instead, this path relies on a special adapter that developed by Intel called Intel® Silicon View Technology (Intel® SVT) Closed Chassis Adapter (CCA). It is a simple data transformation device. This adapter generates a BSSB signaling protocol operating at up to 400 MHz and serializes data flowing through it. This adapter works together with debug host software and the embedded logic, contain a back-pressure scheme that makes both sides tolerant of overflow and starvation conditions, which is the moral equivalent of the USB link layer. This path also uses native DCI packet protocol instead of USB protocol.

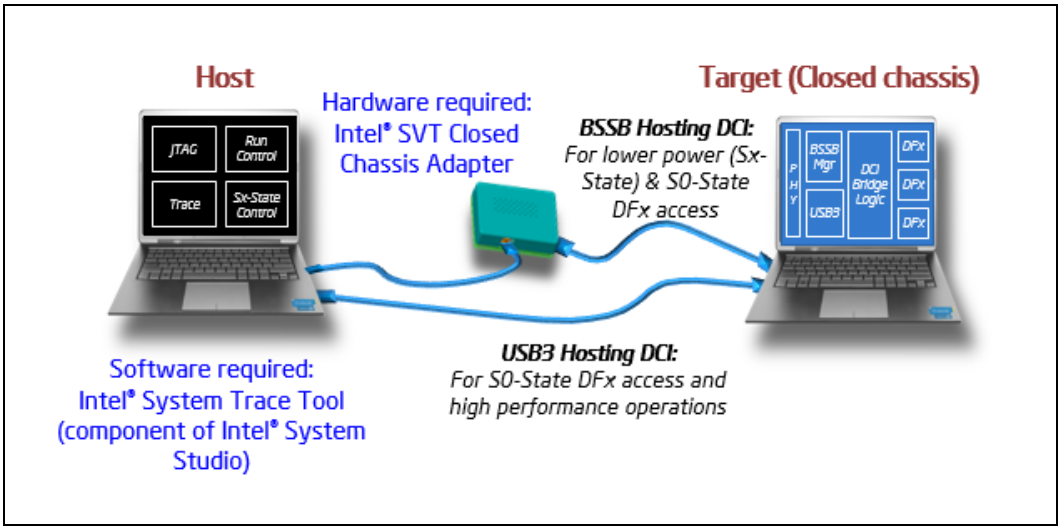
Intel SVT CCA (MM#:921521) can be purchased through Intel® Design-In Tools Store at https://designintools.intel.com/product_p/itpxdpsvt.htm.

28.7.2 USB3 Hosting DCI

It relies on Debug Class Devices (DbC) which is comprised of a set of logic that is bolted to the side of the xHCI host controller and enable the target to act the role of a USB device for debug purpose. This path uses the USB packet protocol layer, USB link layer flow control and USB3 physical layer at 5 GHz.

28.7.3 Platform Setup

Figure 28-2. Platform Setup with DCI Connection



28.8 Intel Trace Huh Configuration Registers Summary

Table 28-3. Summary of Intel Trace Huh Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Vendor and Device Identification (VID)—Offset 0h	X_8086h
4h	7h	Command and Status Register (CMD)—Offset 4h	100000h
8h	Bh	Revision ID (RID)—Offset 8h	1300h
Ch	Fh	Header Type (HT)—Offset Ch	0h
10h	13h	MTB Low BAR (MTB_LBAR)—Offset 10h	4h
14h	17h	MTB Upper BAR (MTB_UBAR)—Offset 14h	0h
18h	1Bh	SW Low BAR (SW_LBAR)—Offset 18h	4h
1Ch	1Fh	SW Upper BAR (SW_UBAR)—Offset 1Ch	0h
20h	23h	RTIT Low BAR (RTIT_LBAR)—Offset 20h	4h
24h	27h	RTIT Upper BAR (RTIT_UBAR)—Offset 24h	0h
34h	37h	Capabilities Pointer (CAP)—Offset 34h	40h
3Ch	3Fh	Interrupt Line and Interrupt Pin (INTL)—Offset 3Ch	1FFh

48h	4Bh	MSI Upper Message Address (MSIUMA)—Offset 48h	0h
4Ch	4Fh	MSI Message Data (MSIMD)—Offset 4Ch	0h
80h	83h	Device Specific Control and Device Specific Status (NPKDSC)—Offset 80h	1h

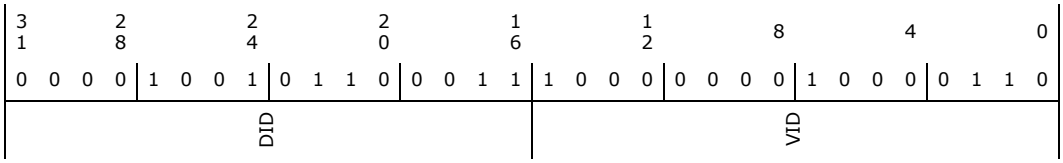
28.8.1 Vendor and Device Identification (VID)—Offset 0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 7

Default: 9638086h



Bit Range	Default and Access	Field Name (ID): Description
31:16	-- RO	**Device ID (DID):** The value that uniquely identifies the Intel® Trace Hub from all other PCI devices. See the Device and Version ID Table in Volume 1 of the datasheet for the default value.
15:0	8086h RO	**Vendor ID (VID):** 8086 is Intel Vendor Identification code

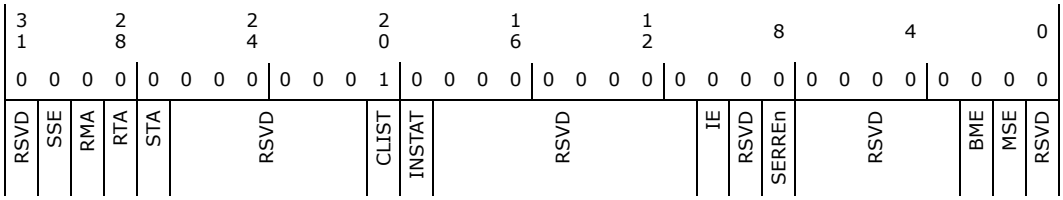
28.8.2 Command and Status Register (CMD)—Offset 4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 7

Default: 100000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	Reserved.
30	0h RW/1C	**SSE:** This bit is set when the device has detected an un-correctable error and reported it via SERR message over sideband. This requires SERR Enable bit to be set in Command register.
29	0h RW/1C	**RMA:** This bit is set when device receives a Completion transaction with Unsupported Request completion status. No error will be reported
28	0h RW/1C	**RTA:** This bit is set when device receives a Completion transaction with Completer Abort completion status. No error will be reported

Bit Range	Default and Access	Field Name (ID): Description
27	0h RW/1C	**STA:** Set by the device when aborting a request that violates the device programming model. When SERR Enable is set SERR message will be send over sideband
26:21	0h RO	Reserved.
20	1h RO	**CLIST:** Indicates the controller contains a capabilities pointer list and the capability pointer register is implemented at offset 0x40 in the configuration space
19	0h RO	**INSTAT:** Interrupt Status: Reflects the state of the interrupt pin at the input of the enable/disable circuit. When the interrupt is asserted, and cleared when the interrupt is cleared (independent of the state of Interrupt Disable bit in command register. This bit is only associated with the INTx messages and has no meaning if the device is using MSI
18:11	0h RO	Reserved.
10	0h RW	**Interrupt Disable (IE):** Disables the function to generate INTx interrupt. A value of 0 enables the function to generate INTA messages on IOSF sideband. ***Note:*** This bit has no effect on MSI generation.
9	0h RO	Reserved.
8	0h RW	**System Error Enable (SERREn):** Setting this bit enables the generation of System Error message.
7:3	0h RO	Reserved.
2	0h RW	**Bus Master Enable (BME):** When set enables the ability to issue Memory or IO requests, including MSI.
1	0h RW	**Memory Space Enable (MSE):** When set, Memory Space Decoding is enabled and memory transactions targeting the device are accepted. ***Note:*** The MSE has to be set to accept any memory transaction on the primary interface targeting any of the Trace Hub's BARs
0	0h RO	Reserved.

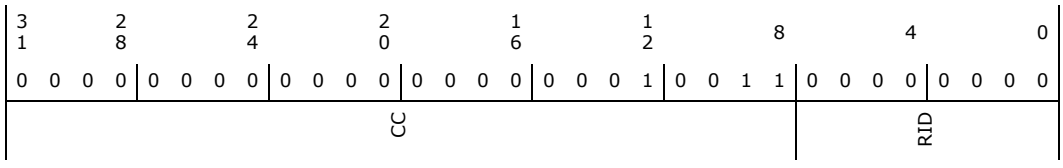
28.8.3 Revision ID (RID)—Offset 8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 7

Default: 1300h



Bit Range	Default and Access	Field Name (ID): Description
31:8	13h RO	**Class Code (CC)**
7:0	0h RO	**Revision ID (RID):** Indicates stepping of the host controller. Refer to Device and Revision ID table in Vol1 of the datasheet for specific value.

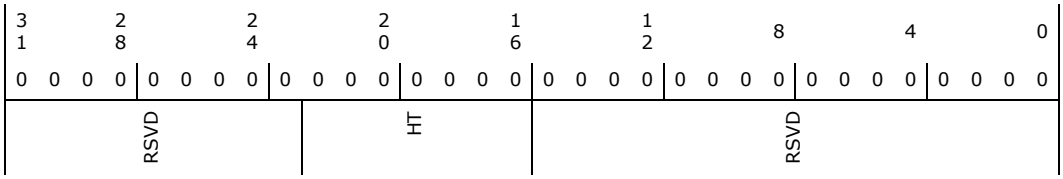
28.8.4 Header Type (HT)—Offset Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 7

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:16	0h RO	**Header Type (HT):** Implements a Type 0 configuration header
15:0	0h RO	Reserved.

28.8.5 MTB Low BAR (MTB_LBAR)—Offset 10h

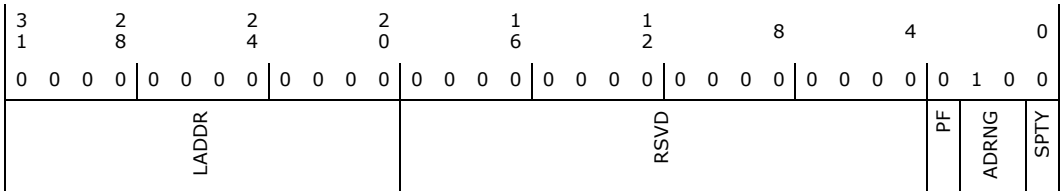
This register sets the lower BAR value for all memory mapped CSRs and the MTB.MSC Trace Buffer.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 7

Default: 4h



Bit Range	Default and Access	Field Name (ID): Description
31:20	0h RW	**Lower Base Address (LADDR):** Lower programmable Base Address.
19:4	0h RO	Reserved.
3	0h RO	**Prefetchable (PF):** Value of 0 indicates the BAR cannot be prefetched
2:1	2h RO	**Address Range (ADRNG):** Value of 0x2 indicates that the BAR is located anywhere system memory space (i.e., 64-bit addressing)
0	0h RO	**Space Type (SPTY):** Value of 0 indicates the BAR is located in memory space.

28.8.6 MTB Upper BAR (MTB_UBAR)—Offset 14h

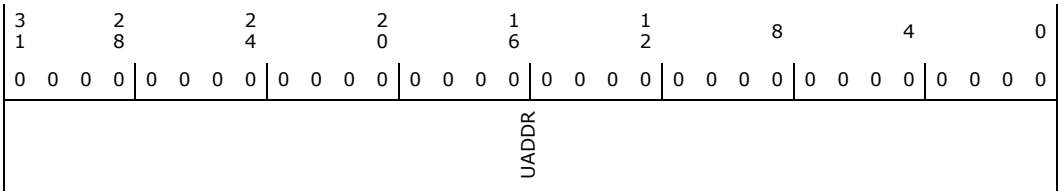
This register sets the upper BAR value for all memory mapped CSRs and the MTB.MSC Trace Buffer

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 7

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Upper Base Address (UADDR):** Upper programmable Base Address

28.8.7 SW Low BAR (SW_LBAR)—Offset 18h

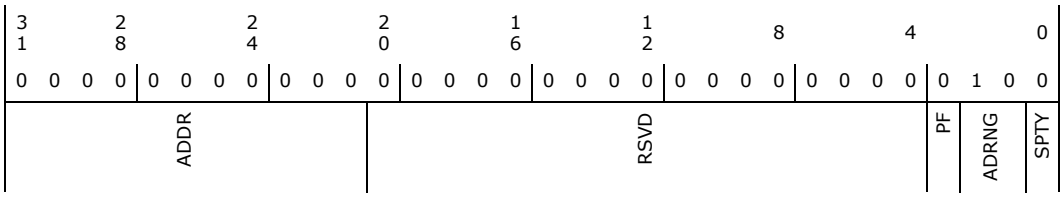
This register sets the lower 32 bits of the BAR value for the STMR STH target.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 7

Default: 4h



Bit Range	Default and Access	Field Name (ID): Description
31:21	0h RW	**Lower Base Address (ADDR):** Lower programmable Base Address
20:4	0h RO	Reserved.
3	0h RO	**Prefetchable (PF):** Value of 0 indicates the BAR cannot be prefetched
2:1	2h RO	**Address Range (ADRNG):** Value of 0x2 indicates that the BAR is located anywhere system memory space (i.e., 64-bit addressing)
0	0h RO	**Space Type (SPTY):** Value of 0 indicates the BAR is located in memory space

28.8.8 SW Upper BAR (SW_UBAR)—Offset 1Ch

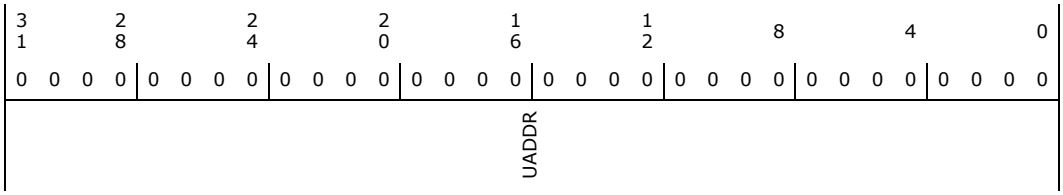
This register sets the upper 32 bits of the BAR value for the STMR STH target.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 7

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Upper Base Address (UADDR):** Upper programmable Base Address

28.8.9 RTIT Low BAR (RTIT_LBAR)—Offset 20h

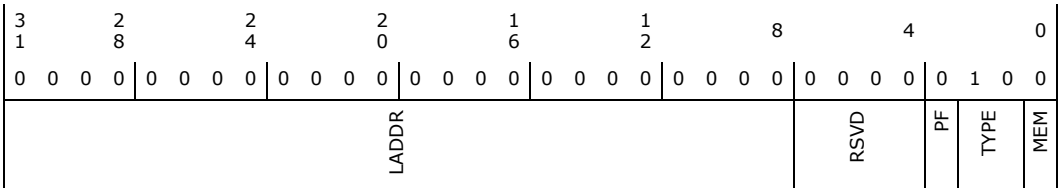
This register sets the lower BAR value for the STH RTIT trace sources. It is to be noted that if the RTIT_PRESENT parameter is not set, this register will become read-only and will return all zeros if read.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 7

Default: 4h



Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RW	**Lower Base Address (LADDR):** Lower programmable Base Address
7:4	0h RO	Reserved.
3	0h RO	**Prefetchable (PF):** Value of 0 indicates the BAR cannot be prefetched
2:1	2h RO	**Address Range (TYPE):** Value of 0x2 indicates that the BAR is located anywhere system memory space (i.e., 64-bit addressing)
0	0h RO	**Space Type (MEM):** Value of 0 indicates the BAR is located in memory space

28.8.10 RTIT Upper BAR (RTIT_UBAR)—Offset 24h

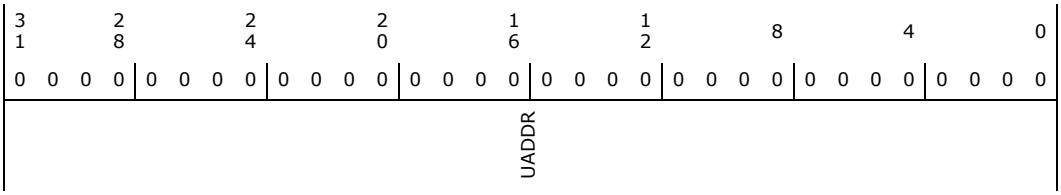
This register sets the upper BAR value for the Software Trace Hub RTIT trace sources. It is to be noted that if the RTIT_PRESENT parameter is not set, this register will become read-only and will return all zeros if read.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 7

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Upper Base Address (UADDR):** Upper programmable Base Address

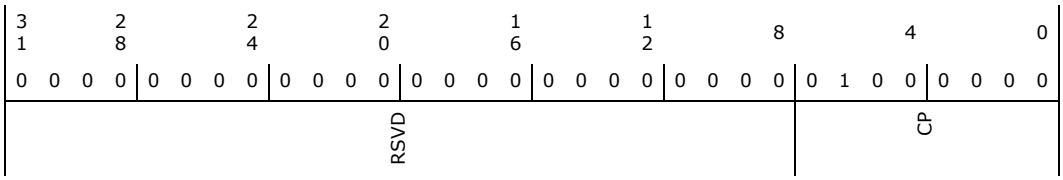
28.8.11 Capabilities Pointer (CAP)—Offset 34h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 7

Default: 40h



Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	40h RO	**Capability Pointer (CP):** Pointer to first capability structure at 40h

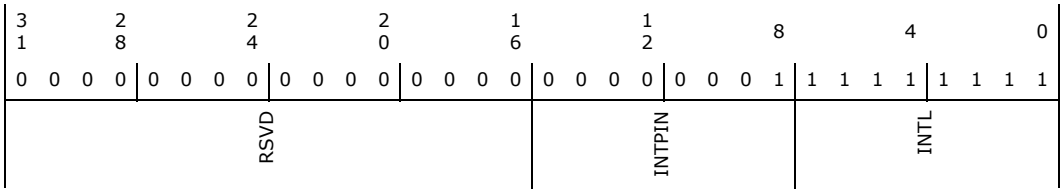
28.8.12 Interrupt Line and Interrupt Pin (INTL)—Offset 3Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 7

Default: 1FFh



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:8	1h RO	**Interrupt Pin (INTPIN):** The Trace Hub uses a single INTx interrupt bonded to INTA.
7:0	FFh RW	**Interrupt Line (INTL):** Hardware does not use this field. Rather it is programmed by system software and device drivers to communicate interrupt line routing information.

28.8.13 MSI Capability (MSICID)—Offset 40h

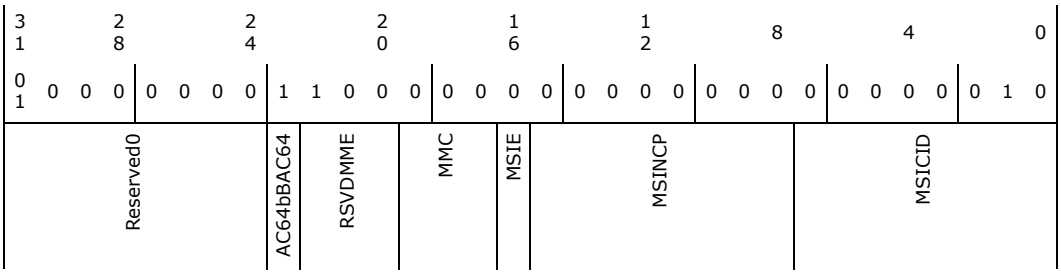
MSI Capability ID, MSI Next Capability Pointer, MSI Message Control Register

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 7

Default: 2800005h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	**Reserved0**
23	1h RO	**AC64b**
22:24	0h RO	Reserved.
23	1h RO	**64-bit Address Capable (BAC64):** Trace Hub is capable of generating 64-bit memory addresses.
22:20	0h RW	**Multiple Message Enable (MME):** Indicates the number of messages allocated to the device.
19:17	0h RO	**Multiple Message Capable (MMC):** Value of 0 indicates the device only support single interrupt message.
16	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and the legacy interrupts messages will not be generated.
15:8	0h RO	**Multiple Message Enable (MSINCP):** Indicates the number of messages allocated to the device.
7:0	5h RO	**MSI Capability ID (MSICID):** A value of 05h indicating the presence of the MSI capability register set.

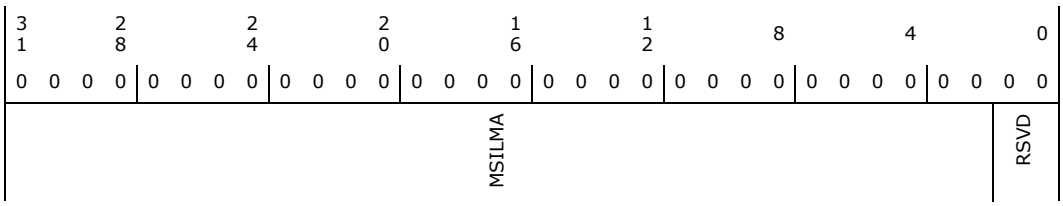
28.8.14 MSI Lower Message Address (MSILMA)—Offset 44h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 7

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**MSI Message Lower Address (MSILMA):** Lower 32-bits of system software assigned message address to the device with bits [1:0] always cleared indicating message address has to always be DW aligned.
1:0	0h RO	Reserved.

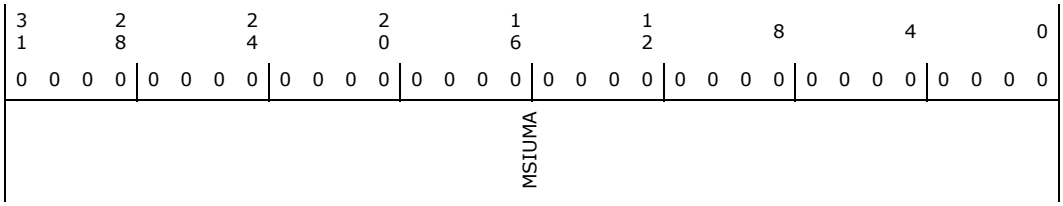
28.8.15 MSI Upper Message Address (MSIUMA)—Offset 48h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 7

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI Message Upper Address (MSIUMA):** Upper 32-bits of system software assigned message address to the device

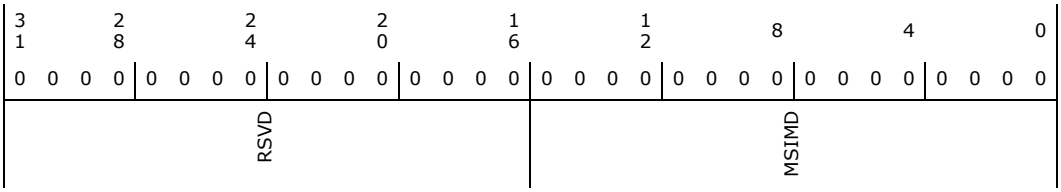
28.8.16 MSI Message Data (MSIMD)—Offset 4Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 7

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW	**MSI Message Data (MSIMD):** 16-bit message data pattern assigned by the system software to the device. When MSI is generated the actual data is 32-bit and the upper 16 bits are always 0.

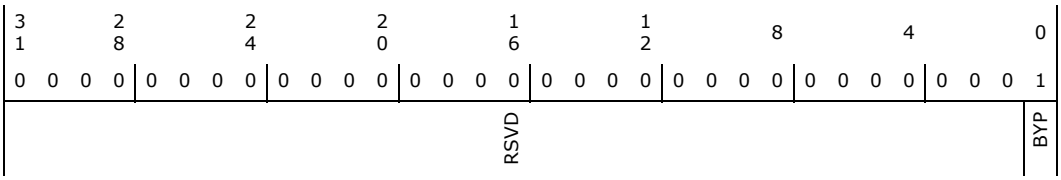
28.8.17 Device Specific Control and Device Specific Status (NPKDSC)—Offset 80h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 7

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	1h RW	**Trace Hub Bypass (BYP):** If set, the Trace Hub logic will be bypassed.

§

29 Universal Serial Bus

29.1 Acronyms

Acronyms	Description
USB	Universal Serial Bus
xHCI	eXtensible Host Controller Interface
UASP	USB Attached SCIS Protocol

29.2 References

Specification	Location
USB 3.0 Specification	www.usb.org
USB 2.0 Specification	www.usb.org

29.3 Overview

The PCH implements an xHCI USB controller which provides support for up to 14 USB 2.0 signal pairs and 10 SuperSpeed USB 3.0 signal pairs.

Use of USB devices certified by the USB-IF (http://usb.org) is recommended. Devices not certified by the USB-IF may have lower electrical margin and may not function reliably

Note: Each walk-up USB 3.0 capable port must have USB 3.0 signaling and USB 2.0 signaling.

Note: EHCI is no longer supported in PCH.

29.4 Signal Description

Name	Type	Description
USB3_1_RXN **USB3_1_RXP**	I	**USB 3.0 Differential Receive Pair 1:** These are USB 3.0-based high-speed differential signals for Port #1 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins.
USB3_1_TXN **USB3_1_TXP**	O	**USB 3.0 Differential Transmit Pair 1:** These are USB 3.0-based high-speed differential signals for Port #1 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins.
USB3_2_RXN **USB3_2_RXP**	I	**USB 3.0 Differential Receive Pair 2:** These are USB 3.0-based high-speed differential signals for Port #2 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins.
USB3_2_TXN **USB3_2_TXP**	O	**USB 3.0 Differential Transmit Pair 2:** These are USB 3.0-based high-speed differential signals for Port #2 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins.
USB3_3_RXN **USB3_3_RXP**	I	**USB 3.0 Differential Receive Pair 3:** These are USB 3.0-based high-speed differential signals for Port #3 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins.
USB3_3_TXN **USB3_3_TXP**	O	**USB 3.0 Differential Transmit Pair 3:** These are USB 3.0-based high-speed differential signals for Port #3 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins.

Name	Type	Description
USB3_4_RXN, USB3_4_RXP	I	**USB 3.0 Differential Receive Pair 4:** These are USB 3.0-based high-speed differential signals for Port #4 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins.
USB3_4_TXN, USB3_4_TXP	O	**USB 3.0 Differential Transmit Pair 4:** These are USB 3.0-based high-speed differential signals for Port #4 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins.
USB3_5_RXN USB3_5_RXP	I	**USB 3.0 Differential Receive Pair 5:** These are USB 3.0-based high-speed differential signals for Port #5 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins.
USB3_5_TXN USB3_5_TXP	O	**USB 3.0 Differential Transmit Pair 5:** These are USB 3.0-based high-speed differential signals for Port #5 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins.
USB3_6_RXN USB3_6_RXP	I	**USB 3.0 Differential Receive Pair 6:** These are USB 3.0-based high-speed differential signals for Port #6 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins.
USB3_6_TXN USB3_6_TXP	O	**USB 3.0 Differential Transmit Pair 6:** These are USB 3.0-based high-speed differential signals for Port #6 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins.
USB3_7_PCIE0_RXN USB3_7_PCIE0_RXP	I	**USB 3.0 Differential Receiver Pair 7**: These are USB 3.0-based high-speed differential signals for Port #7 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins. The pins also have PCIe root port 0 muxed on them. The function selection is via FITC
USB3_7_PCIE0_TXN USB3_7_PCIE0_TXP	O	**USB 3.0 Differential Transmitter Pair 7**: These are USB 3.0-based high-speed differential signals for Port #7 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins. The pins also have PCIe root port 0 muxed on them. The function selection is via FITC
USB3_8_PCIE1_RXN USB3_8_PCIE1_RXP	I	**USB 3.0 Differential Receiver Pair 8**: These are USB 3.0-based high-speed differential signals for Port #8 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins. The pins also have PCIe root port 1 muxed on them. The function selection is via FITC
USB3_8_PCIE1_TXN USB3_8_PCIE1_TXP	O	**USB 3.0 Differential Transmitter Pair 8**: These are USB 3.0-based high-speed differential signals for Port #8 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins. The pins also have PCIe root port 1 muxed on them. The function selection is via FITC
USB3_9_PCIE2_RXN USB3_9_PCIE2_RXP	I	**USB 3.0 Differential Receiver Pair 9**: These are USB 3.0-based high-speed differential signals for Port #9 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins. The pins also have PCIe root port 2 muxed on them. The function selection is via FITC
USB3_9_PCIE2_TXN USB3_9_PCIE2_TXP	O	**USB 3.0 Differential TransmitterPair 9**: These are USB 3.0-based high-speed differential signals for Port #9 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins. The pins also have PCIe root port 2 muxed on them. The function selection is via FITC
USB3_10_PCIE3_GBE_ RXN USB3_10_PCIE3_GBE_ RXP	I	**USB 3.0 Differential Receiver Pair 10**: These are USB 3.0-based high-speed differential signals for Port #10 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins. The pins also have PCIe root port 3 and the PHY connection for the integrated 1GbE MAC muxed on them. The function selection is via FITC
USB3_10_PCIE3_GBE_T XN USB3_10_PCIE3_GBE_T XP	O	**USB 3.0 Differential Transmitter Pair 10**: These are USB 3.0-based high-speed differential signals for Port #10 and the xHCI Controller. It should map to a USB connector with one of the OC (overcurrent) pins. The pins also have PCIe root port 3 and the PHY connection for the integrated 1GbE MAC muxed on them. The function selection is via FITC
USB2P_1, USB2N_1	I/O	**USB 2.0 Port 1 Transmit/Receive Differential Pair 1:** This USB 2.0 signal pair are routed to xHCI Controller and should map to a USB connector with one of the overcurrent OC pins.
USB2P_2, USB2N_2	I/O	**USB 2.0 Port 2 Transmit/Receive Differential Pair 2:** This USB 2.0 signal pair are routed to xHCI Controller and should map to a USB connector with one of the overcurrent OC pins.
USB2P_3, USB2N_3	I/O	**USB 2.0 Port 3Transmit/Receive Differential Pair 3:** This USB 2.0 signal pair are routed to xHCI Controller and should map to a USB connector with one of the overcurrent OC pins.

Name	Type	Description
USB2P_4, USB2N_4	I/O	**USB 2.0 Port 4 Transmit/Receive Differential Pair 4:** This USB 2.0 signal pair are routed to xHCI Controller and should map to a USB connector with one of the overcurrent OC pins.
USB2P_5, USB2N_5	I/O	**USB 2.0 Port 5 Transmit/Receive Differential Pair 5:** This USB 2.0 signal pair are routed to xHCI Controller and should map to a USB connector with one of the overcurrent OC pins.
USB2P_6, USB2N_6	I/O	**USB 2.0 Port 6 Transmit/Receive Differential Pair 6:** This USB 2.0 signal pair are routed to xHCI Controller and should map to a USB connector with one of the overcurrent OC pins.
USB2P_7, USB2N_7	I/O	**USB 2.0 Port 7 Transmit/Receive Differential Pair 7:** This USB 2.0 signal pair are routed to xHCI Controller and should map to a USB connector with one of the overcurrent OC pins.
USB2P_8, USB2N_8	I/O	**USB 2.0 Port 8 Transmit/Receive Differential Pair 8:** This USB 2.0 signal pair are routed to xHCI Controller and should map to a USB connector with one of the overcurrent OC pins.
USB2P_9, USB2N_9	I/O	**USB 2.0 Port 9 Transmit/Receive Differential Pair 9:** This USB 2.0 signal pair are routed to xHCI Controller and should map to a USB connector with one of the overcurrent OC pins.
USB2P_10, USB2N_10	I/O	**USB 2.0 Port 10 Transmit/Receive Differential Pair 10:** This USB 2.0 signal pair are routed to xHCI Controller and should map to a USB connector with one of the overcurrent OC pins.
USB2P_11 USB2N_11	I/O	**USB 2.0 Port 11 Transmit/Receive Differential Pair 11:** This USB 2.0 signal pair are routed to xHCI Controller and should map to a USB connector with one of the overcurrent OC pins.
USB2P_12 USB2N_12	I/O	**USB 2.0 Port 12 Transmit/Receive Differential Pair 12:** This USB 2.0 signal pair are routed to xHCI Controller and should map to a USB connector with one of the overcurrent OC pins.
USB2P_13 USB2N_13	I/O	**USB 2.0 Port 13 Transmit/Receive Differential Pair 13:** This USB 2.0 signal pair are routed to xHCI Controller and should map to a USB connector with one of the overcurrent OC pins.
USB2P_14 USB2N_14	I/O	**USB 2.0 Port 14 Transmit/Receive Differential Pair 14:** This USB 2.0 signal pair are routed to xHCI Controller and should map to a USB connector with one of the overcurrent OC pins.
GPP_E9_USB2_OC0#	I	**Overcurrent Indicators**: These signals set corresponding bits in the USB controller to indicate that an overcurrent condition has occurred.
GPP_E10_USB2_OC1#	I	**Overcurrent Indicators**: These signals set corresponding bits in the USB controller to indicate that an overcurrent condition has occurred.
GPP_E11_USB2_OC2#	I	**Overcurrent Indicators**: These signals set corresponding bits in the USB controller to indicate that an overcurrent condition has occurred.
GPP_E12_USB2_OC3#	I	**Overcurrent Indicators**: These signals set corresponding bits in the USB controller to indicate that an overcurrent condition has occurred.
GPP_F15_USB2_OC4#	I	**Overcurrent Indicators**: These signals set corresponding bits in the USB controller to indicate that an overcurrent condition has occurred.
GPP_F16_USB2_OC5#	I	**Overcurrent Indicators**: These signals set corresponding bits in the USB controller to indicate that an overcurrent condition has occurred.
GPP_F17_USB2_OC6#	I	**Overcurrent Indicators**: These signals set corresponding bits in the USB controller to indicate that an overcurrent condition has occurred.
GPP_F18_USB2_OC7#	I	**Overcurrent Indicators**: These signals set corresponding bits in the USB controller to indicate that an overcurrent condition has occurred.
USB2_COMP	I	USB Resistor Bias, analog connection points for an external resistor to ground.
USB2_VBUS	I	Not used in the Intel® C620 Series Chipset. This signal can either be tied to ground via external resistor for simple termination, or it can be left floating.

29.5 Integrated Pull-Ups and Pull-Downs

Signal	Resistor Type	Value	Notes
USB2N_[14:1]	Internal Pull-Down	14.25k-24.8k	1,2
USB2P_[14:1]	Internal Pull-Down	14.25k-24.8k	1,2
USB2_OC[7:0]#	None		
USB2_COMP	External bias resistor		

Notes:
1. Internal Pull-Down (14.25k-24.8k) and series resistors (45 ohm ±10%)
2. Internal pull-ups and pull-downs will not be valid until all the voltages are valid.

29.6 I/O Signal Planes and States

Signal Name	Power Plane	During Reset	Immediately after Reset	S3/S4/S5	Deep Sx
USB3_[10:1]_RXN10 **USB3_[10:1]_RXP10**	Primary	Internal Pull-down	Internal Pull-down	Internal Pull-down	OFF
USB3_[10:1]_TXN10 **USB3_[10:1]_TXP10**	Primary	Internal Pull-down	Internal Pull-down	Internal Pull-down	OFF
USB2N_[14:1]	DSW	Internal Pull-down	Internal Pull-down	Internal Pull-down	Internal Pull-down
USB2P_[14:1]	DSW	Internal Pull-down	Internal Pull-down	Internal Pull-down	Internal Pull-down
USB2_OC[7:0]#	Primary	Undriven	Undriven	Undriven	OFF
USB2_COMP	Primary	Undriven	Undriven	Undriven	OFF

29.7 Functional Description

29.7.1 eXtensible Host Controller Interface Controller (D20:F0)

The PCH contains an eXtensible Host Controller Interface host controller which supports up to 1 USB 2.0 ports and up to 10 USB 3.0 ports with board routing, ACPI table and BIOS considerations. This controller allows data transfers of up to 5 Gb/s. The controller supports SuperSpeed, High-Speed, Full-Speed and Low-Speed traffic on the bus. The xHCI controller supports USB Debug port on all USB3.0 capable ports. The xHCI supports USB debug capability on all USB 3.0 capable ports. The xHCI also supports USB Attached SCIS Protocol.

29.8 xHCI Configuration Registers Summary

Table 29-1. Summary of xHCI Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	1h	Vendor ID (VID)—Offset 0h	8086h
2h	3h	Device ID (DID)—Offset 2h	8C31h
4h	5h	Command (CMD)—Offset 4h	0h

Table 29-1. Summary of xHCI Configuration Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
6h	7h	Device Status (STS)—Offset 6h	290h
8h	8h	Revision ID (RID)—Offset 8h	0h
9h	9h	Programming Interface (PI)—Offset 9h	30h
Ah	Ah	Sub Class Code (SCC)—Offset Ah	3h
Bh	Bh	Base Class Code (BCC)—Offset Bh	Ch
Dh	Dh	Master Latency Timer (MLT)—Offset Dh	0h
Eh	Eh	Header Type (HT)—Offset Eh	0h
10h	17h	Memory Base Address (MBAR)—Offset 10h	4h
2Ch	2Dh	USB Subsystem Vendor ID (SSVID)—Offset 2Ch	0h
2Eh	2Fh	USB Subsystem ID (SSID)—Offset 2Eh	0h
34h	34h	Capabilities Pointer (CAP_PTR)—Offset 34h	70h
3Ch	3Ch	Interrupt Line (ILINE)—Offset 3Ch	0h
3Dh	3Dh	Interrupt Pin (IPIN)—Offset 3Dh	0h
40h	43h	XHC System Bus Configuration 1 (XHCC1)—Offset 40h	1FDh
44h	47h	XHC System Bus Configuration 2 (XHCC2)—Offset 44h	3C000h
50h	53h	Clock Gating (XHCLKGTEN)—Offset 50h	0h
58h	5Bh	Audio Time Synchronization (AUDSYNC)—Offset 58h	0h
60h	60h	Serial Bus Release Number (SBRN)—Offset 60h	30h
61h	61h	Frame Length Adjustment (FLADJ)—Offset 61h	60h
62h	62h	Best Effort Service Latency (BESL)—Offset 62h	0h
70h	70h	PCI Power Management Capability ID (PM_CID)—Offset 70h	1h
71h	71h	Next Item Pointer #1 (PM_NEXT)—Offset 71h	80h
72h	73h	Power Management Capabilities (PM_CAP)—Offset 72h	C1C2h
74h	75h	Power Management Control/Status (PM_CS)—Offset 74h	8h
80h	80h	Message Signaled Interrupt CID (MSI_CID)—Offset 80h	5h
81h	81h	Next item pointer (MSI_NEXT)—Offset 81h	0h
82h	83h	Message Signaled Interrupt Message Control (MSI_MCTL)—Offset 82h	86h
84h	87h	Message Signaled Interrupt Message Address (MSI_MAD)—Offset 84h	0h
88h	8Bh	Message Signaled Interrupt Upper Address (MSI_MUAD)—Offset 88h	0h
8Ch	8Dh	Message Signaled Interrupt Message Data (MSI_MD)—Offset 8Ch	0h
94h	97h	Vendor Specific Header (VSHDR)—Offset 94h	1400010h
A2h	A3h	Power Control Enable (PCE_REG) —Offset A2h	0008h
B0h	B3h	XHCI USB2 Overcurrent Pin Mapping N (U2OCM)—Offset B0h	0h
D0h	D3h	XHCI USB3 Overcurrent Pin Mapping N (U3OCM)—Offset D0h	0h

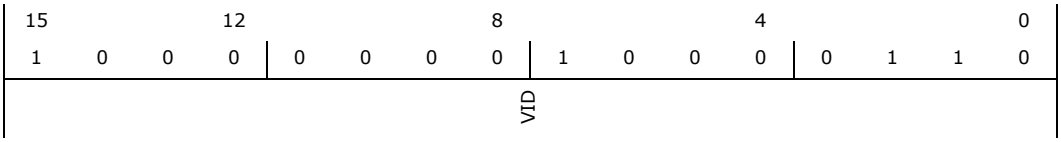
29.8.1 Vendor ID (VID)—Offset 0h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: 8086h



Bit Range	Default and Access	Field Name (ID): Description
15:0	8086h RO	**Vendor ID (VID)**

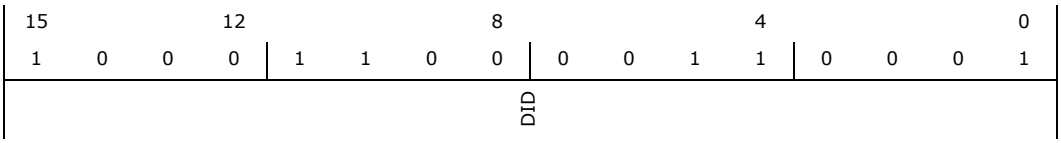
29.8.2 Device ID (DID)—Offset 2h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: 8C31h



Bit Range	Default and Access	Field Name (ID): Description
15:0	8C31h RO/V	**Device ID (DID):** See Global Device ID table in Chap. 6 for value

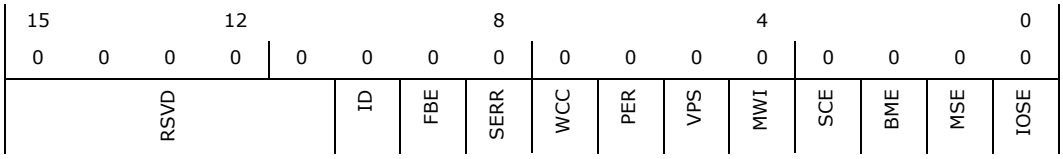
29.8.3 Command (CMD)—Offset 4h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:11	0h RO	Reserved.
10	0h RW	**Interrupt Disable (ID):** When cleared to 0, the function is capable of generating interrupts. When 1, the function can not generate its interrupt to the interrupt controller. Note that the corresponding Interrupt Status bit is not affected by the interrupt enable.
9	0h RO	**Fast Back to Back Enable (FBE)**
8	0h RW	**SERR# Enable (SERR):** When set to 1, the XHC is capable of generating (internally) SERR#. See section on error handling.
7	0h RO	**Wait Cycle Control (WCC)**
6	0h RW	**Parity Error Response (PER):** When set to 1, the XHCI Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the XHCI specification. Note that this applies to both requests and completions from the system interface. This bit must be set in order for the parity errors to generate SERR#.
5	0h RO	**VGA Palette Snoop (VPS)**
4	0h RO	**Memory Write Invalidate (MWI)**
3	0h RO	**Special Cycle Enable (SCE)**
2	0h RW	**Bus Master Enable (BME):** When set, it allows XHC to act as a bus master. When cleared, it disable XHC from initiating transactions on the system bus.
1	0h RW	**Memory Space Enable (MSE):** This bit controls access to the XHC Memory Space registers. If this bit is set, accesses to the XHC registers are enabled. The Base Address register for the XHC should be programmed before this bit is set.
0	0h RO	**I/O Space Enable (IOSE):** Reserved as 0. Read-Only.

29.8.4 Device Status (STS)—Offset 6h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: 290h

15			12				8				4				0
0	0	0	0	0	0	1	0	1	0	0	1	0	0	0	0
DPE	SSE	RMA	RTA	STA	DEVT		MDPED	FBBC	UDF	MC	CL	IS	RSVD		

Bit Range	Default and Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE):** This bit is set by the Intel PCH whenever a parity error is seen on the internal interface to the XHC host controller, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a 1 to this bit location.
14	0h RW/1C	**Signaled System Error (SSE):** This bit is set by the Intel PCH whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. See error handling section for complete list of conditions handled. Software clears this bit by writing a 1 to this bit location.
13	0h RW/1C	**Received Master-Abort Status (RMA):** This bit is set when XHC, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.
12	0h RW/1C	**Received Target Abort Status (RTA):** This bit is set when XHC, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.
11	0h RW/1C	**Signaled Target-Abort Status (STA):** This bit is used to indicate when the XHC function responds to a cycle with a target abort.
10:9	1h RO	**DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion. Read-Only.
8	0h RW/1C	**Master Data Parity Error Detected (MDPED):** This bit is set by the Intel PCH whenever a data parity error is detected on a XHC read completion packet on the internal interface to the XHC host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a 1 to this bit location.
7	1h RO	**Fast Back-to-Back Capable (FBBC):** Reserved as 1 Read-Only.
6	0h RO	**User Definable Features (UDF):** Reserved as 0. Read-Only.
5	0h RO	**66 MHz Capable (MC):** Reserved as 0. Read-Only.
4	1h RO	**Capabilities List (CL):** Hardwired to 1 indicating that offset 34h contains a valid capabilities pointer.
3	0h RO/V	**Interrupt Status (IS):** This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit.
2:0	0h RO	Reserved.

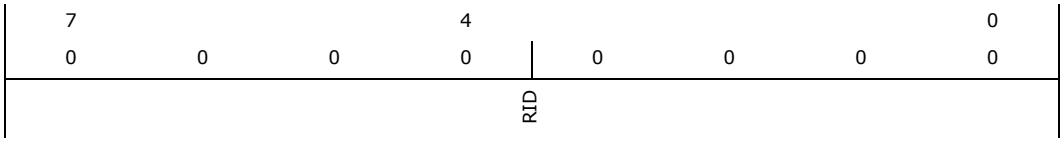
29.8.5 Revision ID (RID)—Offset 8h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO/V	**Revision ID (RID):** See Chap 2 for value.

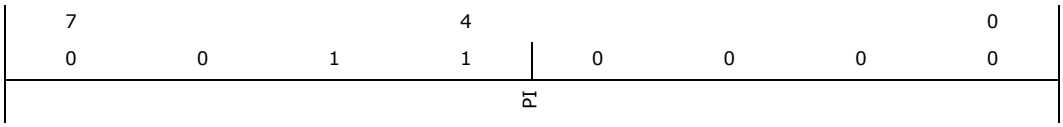
29.8.6 Programming Interface (PI)—Offset 9h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 30h



Bit Range	Default and Access	Field Name (ID): Description
7:0	30h RO	**Programming Interface (PI):** A value of 30h indicates that this USB Host Controller conforms to the XHCI specification.

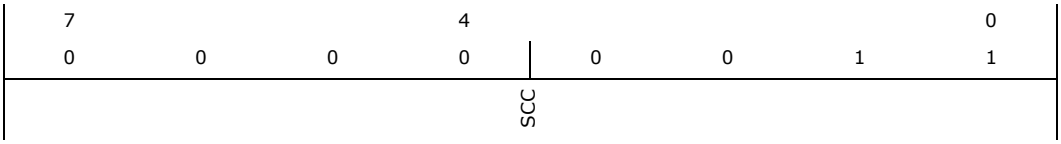
29.8.7 Sub Class Code (SCC)—Offset Ah

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 3h



Bit Range	Default and Access	Field Name (ID): Description
7:0	3h RO	**Sub Class Code (SCC):** A value of 03h indicates that this is a Universal Serial Bus Host Controller.

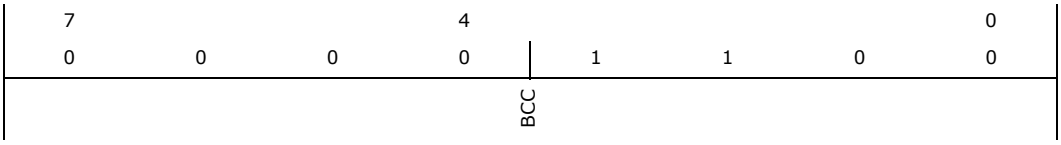
29.8.8 Base Class Code (BCC)—Offset Bh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: Ch



Bit Range	Default and Access	Field Name (ID): Description
7:0	Ch RO	**Base Class Code (BCC):** A value of 0Ch indicates that this is a Serial Bus controller.

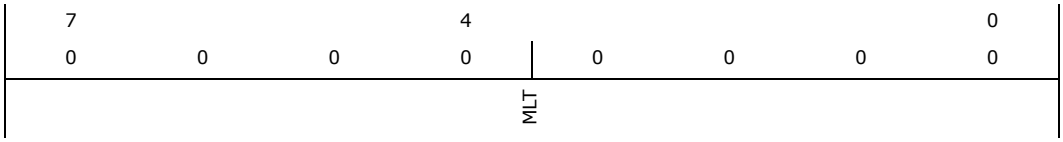
29.8.9 Master Latency Timer (MLT)—Offset Dh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Master Latency Timer (MLT):** Because the XHC controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0.

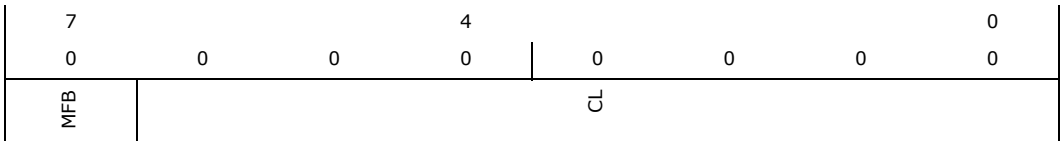
29.8.10 Header Type (HT)—Offset Eh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7	0h RO	**Multi-Function Bit (MFB):** Read only indicating single function device.
6:0	0h RO	**Configuration layout (CL):** Hardwired to 0 to indicate a standard PCI configuration layout.

29.8.11 Memory Base Address (MBAR)—Offset 10h

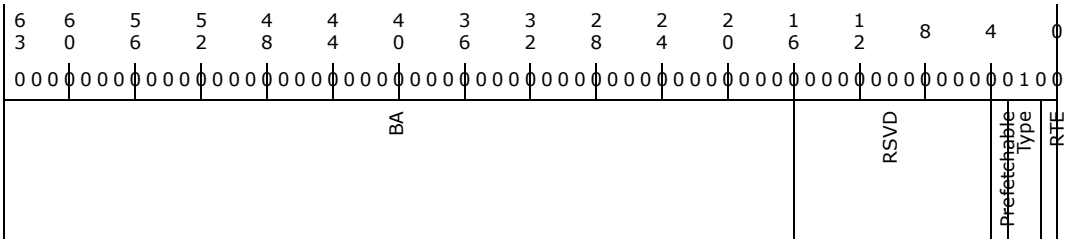
Value in this register will be different after the enumeration process.

Access Method

Type: CFG Register
(Size: 64 bits)

Device: 20
Function: 0

Default: 4h



Bit Range	Default and Access	Field Name (ID): Description
63:16	0h RW	**Base Address (BA):** Bits (63:16) correspond to memory address signals (63:16), respectively. This gives 64 KB of relocatable memory space aligned to 64 KB boundaries.
15:4	0h RO	Reserved.
3	0h RO	**Prefetchable (Prefetchable):** This bit is hardwired to 0 indicating that this range should not be prefetched.
2:1	2h RO	**Type (Type):** If this field is hardwired to 00 it indicates that this range can be mapped anywhere within 32-bit address space. If this field is hardwired to 10 it indicates that this range can be mapped anywhere within 64-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** This bit is hardwired to 0 indicating that the base address field in this register maps to memory space

29.8.12 USB Subsystem Vendor ID (SSVID)—Offset 2Ch

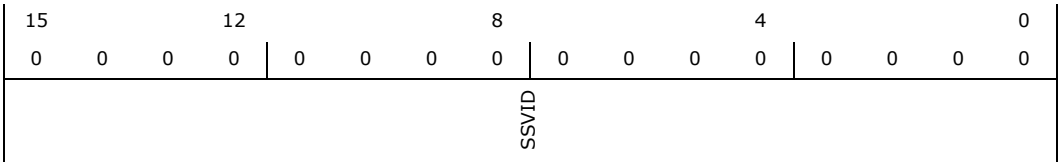
This register is modified and maintained by BIOS.

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:0	0h RW/L	**USB Subsystem Vendor ID (SSVID):** This register, in combination with the USB Subsystem ID register, enables the operating system to distinguish each subsystem from the others.

29.8.13 USB Subsystem ID (SSID)—Offset 2Eh

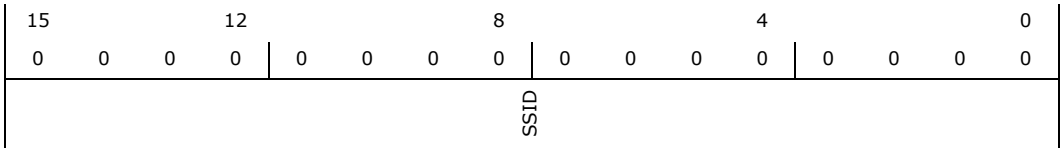
This register is modified and maintained by BIOS.

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:0	0h RW/L	**USB Subsystem ID (SSID):** BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s).

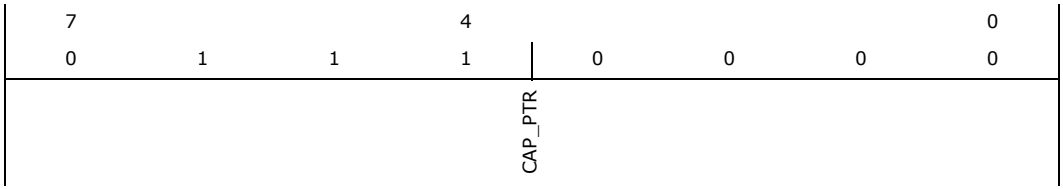
29.8.14 Capabilities Pointer (CAP_PTR)—Offset 34h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 70h



Bit Range	Default and Access	Field Name (ID): Description
7:0	70h RO	**Capabilities Pointer (CAP_PTR):** This register points to the starting offset of the capabilities ranges.

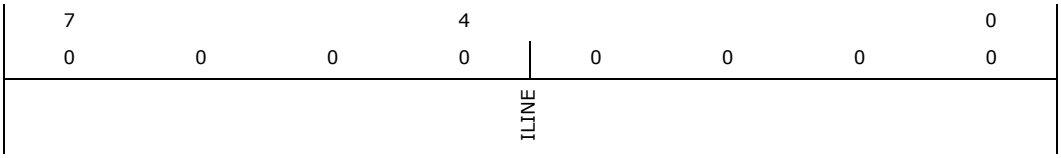
29.8.15 Interrupt Line (ILINE)—Offset 3Ch

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Line (ILINE):** This data is not used by the Intel PCH. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to.

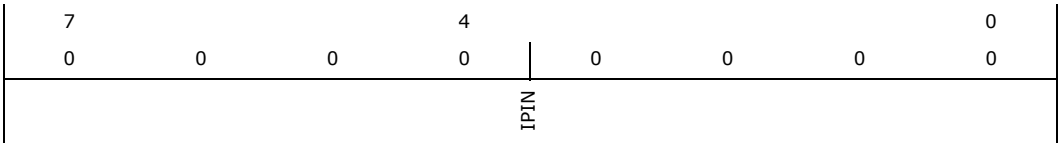
29.8.16 Interrupt Pin (IPIN)—Offset 3Dh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW/L	**Interrupt pin (IPIN):** Bits 7:0 reflect the Interrupt Pin assigned to the host controller by the platform (and are hardwired).

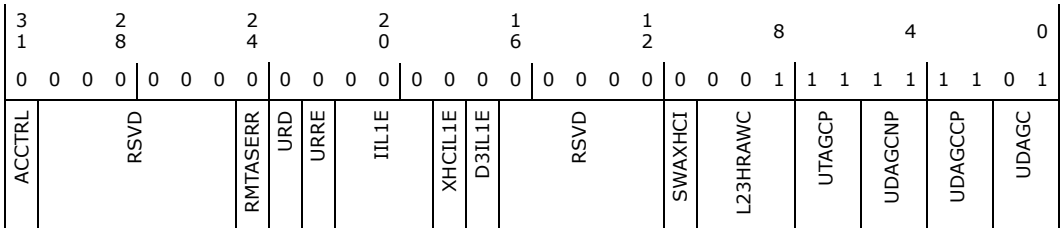
29.8.17 XHC System Bus Configuration 1 (XHCC1)—Offset 40h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 1FDh



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/O	**Access Control (ACCTRL):** This bit is used by BIOS to lock/unlock lockable bits. When set to '1' the write access to bits locked by this bit is disabled (locked state). When set to '0', the write access to bit locked by this bit is enabled (unlocked state). Writable once after platform reset.
30:25	0h RO	Reserved.
24	0h RW	**Master/Target Abort SERR (RMTASERR):** When set, it allows the out-of-band error reporting from the xHCI Controller to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.
23	0h RW/C	**Unsupported Request Detected (URD):** Set the HW when xHCI Controller received an unsupported request posted cycle. Cleared by SW when the bit is written with value of '1'.
22	0h RW	**Unsupported Request Report Enable (URRE):** When set this bit allows the URD bit to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.
21:19	0h RW	**Inactivity Initiated L1 Enable (IIL1E):** If programmed to non-zero, it allows L1 power managed to be enabled after the time-out period specified. 000: Disabled 001: 32 bb_cclk 010: 64 bb_cclk 011: 128 bb_cclk 100: 256 bb_cclk 101: 512 bb_cclk 110: 1024 bb_cclk 111: 131072 bb_cclk
18	0h RW	**XHC Initiated L1 Enable (XHCIL1E):** If set, allow the XHC initiated L1 power management to be enabled.
17	0h RW	**D3 Initiated L1 Enable (D3IL1E):** If set, allow PCI device state D3 initiated L1 power management to be enables. This bit can only be set if the XHCI L1 Override P2 chicken bit is set.
16:12	0h RO	Reserved.
11	0h RW	**SW Assisted xHC Idle (SWAXHCI):** This bit being set will indicate xHC idleness (through SW means), which must be a '1' to allow L1 entry, and subsequently allow backbone clock to be gated. This bit is to be set by Intel xHCI driver after checking that the xHCI Controller will stay in idle state for a significant period of time e.g., all ports disconnected. This bit can be cleared under the following conditions (see SWAXHCI Policy bits in xHC System Bus Configuration 2 register) SW: SW could write 0 to clear this bit.n HW: HW, under policy control, will clear this bit on an MMIO access to the Host Controller.n HW: HW, under policy control, will clear this bit when HW exits Idle state.

Bit Range	Default and Access	Field Name (ID): Description
10:8	1h RW	**L23 to Host Reset Acknowledge Wait Count (L23HRAWC):** If programmed to non zero, it allows a wait period after the L23 PHY has shutdown before returning host reset acknowledge to PMC. 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk
7:6	3h RW	**Upstream Type Arbiter Grant Count Posted (UTAGCP):** Grant count for IOSF upstream L2 request type arbiter for posted type
5:4	3h RW	**Upstream Type Arbiter Grant Count Non Posted (UDAGCNP):** Grant count for IOSF upstream L2 type arbiter for non-posted type
3:2	3h RW	**Upstream Type Arbiter Grant Count Completion (UDAGCCP) (UDAGCCP):** Grant count for IOSF upstream L2 type arbiter for completion type
1:0	1h RW	**Upstream Device Arbiter Grant Count (UDAGC) (UDAGC):** Grant count for IOSF upstream L1 device arbiter

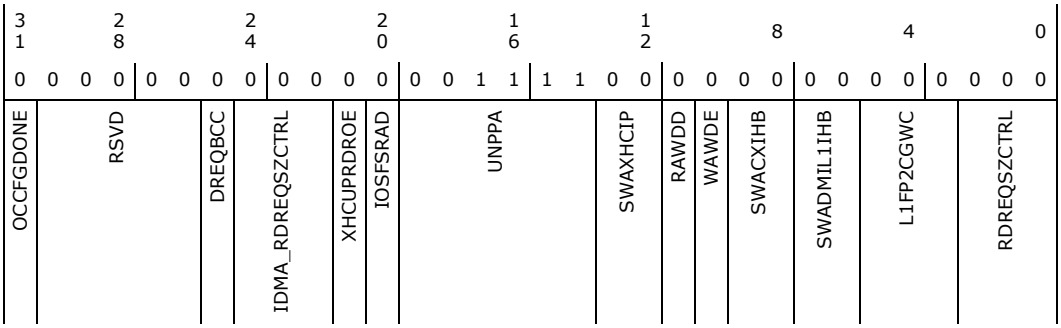
29.8.18 XHC System Bus Configuration 2 (XHCC2)—Offset 44h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 3C000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW	**OC Configuration Done (OCCFGDONE):** This bit is used by BIOS to prevent spurious switching during OC configuration. It must be set by BIOS after configuration of the OC mapping bits is complete. Once this bit is set, OC mapping shall not be changed by SW.
30:26	0h RO	Reserved.
25	0h RW	**DMA Request Boundary Crossing Control (DREQBCC):** This bit controls the boundary crossing limit of each Read/Write Request. 0: 4 KB 1: 64B

Bit Range	Default and Access	Field Name (ID): Description
24:22	0h RW	**IDMA Read Request Size Control (IDMA_RDREQSZCTRL):** Read Request Size Control: This bit controls the maximum size of each Read Request. 000: 128B 001: 256B 011 - 110: Reserved 111: 64B
21	0h RW	**XHC Upstream Read Relaxed Ordering Enable (XHCUPRDROE):** This policy controls the Relaxed Ordering attribute for upstream reads. 0 - xHC will clear RO for all upstream read requests. 1 - xHC will set RO for all upstream read requests.
20	0h RW	**IOSF Sideband Register Access Disable (IOSFSRAD):** When set, it disables the IOSF sideband interface from accepting any host space register access.
19:14	Fh RW	**Upstream Non-Posted Pre-Allocation (UNPPA):** This field reserves data sizes, in 64 byte chunks, of the downstream completion resource. This value is zero based. 000000 - 111111: Pre-allocate 64 bytes - 4096 bytes If set greater than the default allows over-allocation If set less than default allows under-allocation Only allowed to be programmed when BME = 0 and no outstanding downstream completion
13:12	0h RW	**SW Assisted xHC Idle Policy (SWAXHCIP):** ***Note:*** Irrespective of the setting of this field, SW write of 0 to SWAXHCI will clear the bit. 00b (default): xHC HW clears SWAXHCI bit upon OR xHC HW exits Idle state 01b: xHC HW does not autonomously clear SWAXHCI bit. The bit could be cleared only by SW. 10b: xHC HW clears SWAXHCI upon MMIO access to Host Controller. xHC HW exit from Idle state will not clear SWAXHCI. 11b: Reserved
11	0h RW	**MMIO Read After MMIO Write Delay Disable (RAWDD):** This field controls delay on MMIO Read after MMIO Write. 0b (Default): Delay MMIO Read after MMIO Write 1b: Do not delay MMIO Read after MMIO Write Note that this delay applies after the second of the two DW writes in the case where the IOSF Gasket splits a QW write into two single DW writes to the IP.
10	0h RW	**MMIO Write After MMIO Write Delay Enable (WAWDE):** This field controls delay on MMIO Write after previous MMIO Write. 0b (Default): Do not delay MMIO Write after previous MMIO Write 1b: Delay MMIO Write after previous MMIO Write Note that the delay count does not apply on the second of the two DW writes that are generated by IOSF Gasket when it splits a QW write into two. In other words, the second of the two DW writes could happen without any delay with respect to the first DW write. This choice is being made for ease of ECO. The delay count, in this case, will apply after the second of the two DW writes.
9:8	0h RW	**SW Assisted Cx Inhibit (SWACXIHB):** This field controls how the DMI L1 inhibit signal from USB3 to PMC will behave. 00: Never inhibit Cx 01: Inhibit Cx when Isochronous Endpoint is active (PPT Behavior) 10: Inhibit Cx when Periodic Active as defined in 40.4.3.2. 111: Always inhibit Cx
7:6	0h RW	**SW Assisted DMI L1 Inhibit (SWADMIL1IHB):** This field controls how the DMI L1 inhibit signal from USB3 to DMI will behave. 00: Never inhibit DMI L1. 01: Inhibit DMI L1 when Isochronous Endpoint is active (PPT Behavior). 10: Inhibit DMI L1 when Periodic Active as defined in 40.4.3.2.1. 11: Inhibit DMI L1 if XHCC1.SWAXHCI = 0.
5:3	0h RW	**L1 Force P2 Clock Gating Wait Count (L1FP2CGWC):** If programmed to non zero, it allows L1 force P2 gating off the clock to be delayed after the time-out period specified. If wake up event is detected before the time-out, pclk remains alive and trigger L1 exit as though CPU host is causing the wake, 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk
2:0	0h RW	**Read Request Size Control (RDREQSZCTRL):** Read Request Size Control: This bit controls the maximum size of each Read Request. 000: 128B 001: 256B 010: 512B 011 - 110: Reserved 111: 64B

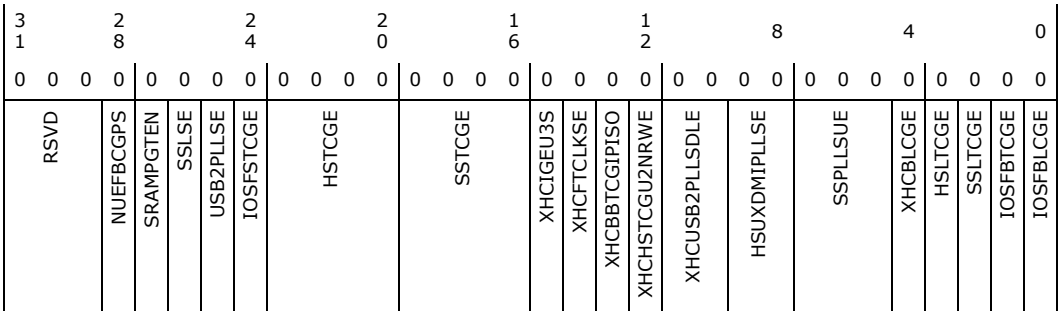
29.8.19 Clock Gating (XHCLKGTEN)—Offset 50h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:29	0h RO	Reserved.
28	0h RW	**Naking USB2.0 EPs for Backbone Clock Gating and PLL Shutdown (NUEFBCGPS):** This field controls whether Naking USB2.0 EPs, once in Naking low priority schedule, should be considered as active for the considerations for backbone clock gating and PLL shutdown or not. 0: Naking USB2.0 EPs are not considered to be active for Backbone Clock Gating and PLL Shutdown evaluation. 1: Naking USB2.0 EPs are considered to be active for Backbone clock gating and PLL shutdown evaluation.
27	0h RW	**SRAM Power Gate Enable (SRAMPGTEN):** This register enables the SRAM Power Gating when PLL shutdown conditions for all clock domains have been met 0 - Disallow SRAM Power Gating. 1 - Allow SRAM Power Gating
26	0h RW	**SS Link PLL Shutdown Enable (SSLSE):** This register enables the SS P3 state to be exposed to PXP PLL Shutdown conditions on behalf of all USB SS Ports on top of trunk clock gating. 0 - P3 state NOT allowed to result in PXP PLL shutdown. 1- P3 state allowed to result in PXP PLL shutdown
25	0h RW	**USB2 PLL Shutdown Enable (USB2PLLSE):** When set, this bit allows USB2 PLL to be shutdown when HS Link trunk clock is gated, and xHC can tolerate PLL spin up time for subsequent clock request. ***Note:*** If USB2 PLL Shutdown Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
24	0h RW	**IOSF Sideband Trunk Clock Gating Enable (IOSFSTCGE):** When set, this bit allows the IOSF sideband clock trunk to be gated when idle conditions are met.
23:20	0h RW	**HS Backbone PXP Trunk Clock Gate Enable (HSTCGE):** This register determines the HS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) NA (no support for U1) (2) ==) U2 (L1) or deeper (3) ==) U3 (L2) or deeper
19:16	0h RW	**SS Backbone PXP Trunk Clock Gate Enable (SSTCGE):** This register determines the SS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==> U0 or deeper (1) ==> U1 or deeper (2) ==> U2 or deeper (3) ==> U3 or deeper

Bit Range	Default and Access	Field Name (ID): Description
15	0h RW	**XHC Ignore_EU3S (XHCIGEU3S):** This register determines if the xHC will use the EU3S as a condition to allow for Frame timer gating. 0 - xHC may allow frame timer to be gated when EU3S is set and all ports are in the required state. 1 - xHC may allow frame timer to be gated regardless of EU3S.
14	0h RW	**XHC Frame Timer Clock Shutdown Enable (XHCFTCLKSE):** This register determines if the xHC will allow the frame timer clock to be gated. 0 - xHC will not allow ICC PLL 96MHz output to be shutdown thus keeping the frame timer running. 1 - xHC will allow ICC PLL 96MHz output to be shutdown under specific conditions.
13	0h RW	**XHC Backbone PXP Trunk Clock Gate In Presence of ISOCH EP (XHCBBTCGIPISO):** This register controls the policy on allowing Backbone PXP trunk clock gate in the presence of IDLE ISOCH EP s with active DB. Allows the periodic active to be used in enabling Backbone PXP trunk clock gating of core clock. 0 - Trunk gate of core clock is not allowed when ISOCH EP DB is set and ISOCH EP s are idle. 1 - Allow trunk gate of core clock when ISOCH EP DB is set and ISOCH EP s are idle.
12	0h RW	**XHC HS Backbone PXP Trunk Clock Gate U2 non RWE (XHCHSTCGU2NRWE):** This register controls the policy on allowing Backbone PXP trunk gating of core clock when there is at least 1 non Remote Wake Enabled HS Port in U2. 0 - Prevent trunk gate of core clock when a non RWE HS Port is in U2. 1 - Allow trunk gate of core clock when a non RWE HS Port is in U2.
11:10	0h RW	**XHC USB2 PLL Shutdown Lx Enable (XHCUSB2PLLSDLE):** This register determines the HS Link state(s) which will be exposed to USB2 PLL Shutdown conditions on behalf of all USB2 HS Ports. Ly is a state allowed to result in USB2 PLL Shutdown when en(x) is asserted. (0) ==> L1 or deeper (1) ==> L2 or deeper
9:8	0h RW	**HS Backbone PXP PLL Shutdown Ux Enable (HSUXDMIPLLSE):** This register determines the Ux state(s) which will be exposed to PXP PLL Shutdown conditions. PLL Shutdown is allowed in: 00b Disabled (Link states shall be disabled for DMI PLL shutdown) 01b U0 or conditions for 10b setting. 10b U2 or conditions for 11b setting. 10b U3, Disconnected, Disabled or Powered-Off.
7:5	0h RW	**SS Backbone PXP PLL Shutdown Ux Enable (SSPLLSUE):** This register determines the Ux state(s) which will be exposed to DMI PLL Shutdown conditions. PLL Shutdown is allowed in: 000b Disabled (Link states shall be ignored for DMI PLL shutdown). 001b U0 or conditions for 010b setting. 010b U1 or conditions for 011b setting. 011b U2 or conditions for 100b setting. 100b U3, Disconnected, Disabled or Powered-Off
4	0h RW	**XHC Backbone Local Clock Gating Enable (XHCBLCGE):** When set, this bit allows XHCI Controller IP backbone clock to be locally gated when idle conditions are met. ***Note:*** If XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
3	0h RW	**HS Link Trunk Clock Gating Enable (HSLTCGE):** When set, this bit allows High Speed Link control's 480 MHz and its 48/60 MHz link clock trunk to be gated when idle conditions are met. ***Note:*** If XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.
2	0h RW	**SS Link Trunk Clock Gating Enable (SSLTCGE):** When set, this bit allows the SuperSpeed Link control's 250 MHz and its divided 125 MHz link clock trunk to GE gated when idle conditions are met. ***Note:*** If XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.
1	0h RW	**IOSF Backbone Trunk Clock Gating Enable (IOSFBTCGE):** When set, this bit allows the IOSF backbone clock trunk to be gated when idle conditions are met.
0	0h RW	**IOSF Gasket Backbone Local Clock Gating Enable (IOSFBLCGE):** When set, this bit allows the IOSF Gasket backbone clock to be locally gated when idle conditions are met. ***Note:*** If XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.

29.8.20 Audio Time Synchronization (AUDSYNC)—Offset 58h

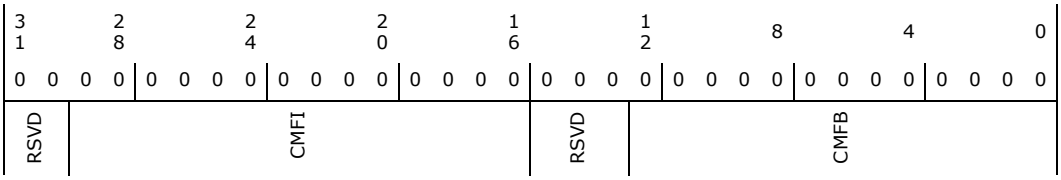
This 32 bit register is used for audio stream synchronization across different devices. Global signal sample_now captures a value in AUDSYNC register.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:16	0h RO/V	**Captured Frame List Current Index/Frame Number (CMFI):** The value in this register is updated in response to sample_now signal. Bits (29:16) reflect state of bits (13:0) of FRINDEX
15:13	0h RO	Reserved.
12:0	0h RO/V	**Captured Micro-frame BLIF (CMFB):** The value is updated in response to sample_now signal and provides information about offset within micro-frame. Captured value represents number of 8 high-speed bit time units from start of micro-frame. At the beginning of micro-frame captured value will be 0 and increase to maximum value at the end. Default maximum value is 7499 but it may be changed as result of adjustment done in FLA.

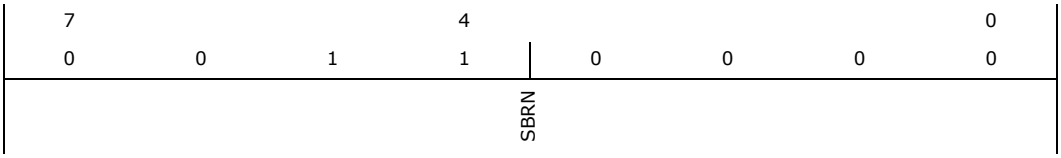
29.8.21 Serial Bus Release Number (SBRN)—Offset 60h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 30h



Bit Range	Default and Access	Field Name (ID): Description
7:0	30h RO	**Serial Bus Release Number (SBRN):** A value of 30h indicates that this controller follows USB release 3.0.

29.8.22 Frame Length Adjustment (FLADJ)—Offset 61h

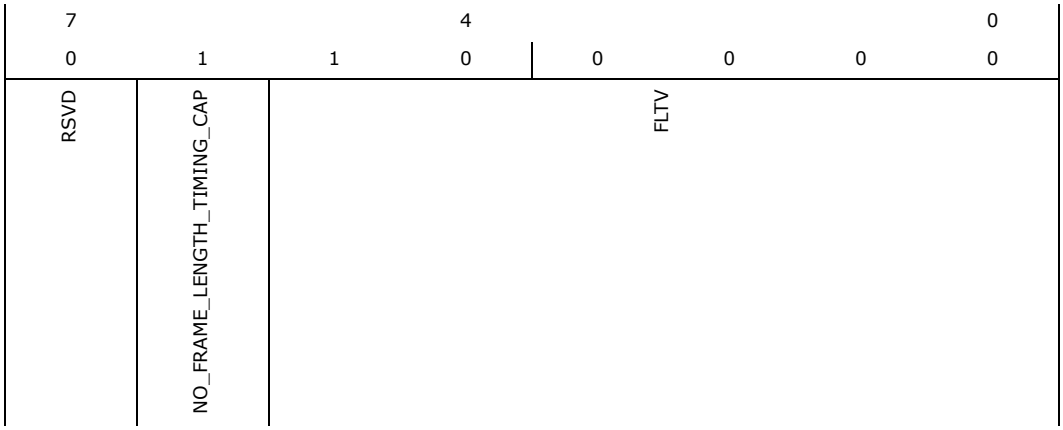
This feature is used to adjust any offset from the clock source that generates the clock that drives the SOF counter. When a new value is written into these six bits, the length of the frame is adjusted. Its initial programmed value is system dependent based on the accuracy of hardware USB clock and is initialized by system BIOS. This register should only be modified when the HChalted bit in the USBSTS register is a one. Changing value of this register while the host controller is operating yields undefined results.

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 60h



Bit Range	Default and Access	Field Name (ID): Description
7	0h RO	Reserved.
6	1h RO	**No Frame Length Timing Capability (NO_FRAME_LENGTH_TIMING_CAP):** This flag is set to 1 to indicate that the host controller does not support a programmable Frame Length Timing Value field.
5:0	20h RO	**Frame Length Timing Value (FLTV):** SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (number of High Speed bit times) FLADJ Value (decimal) (decimal) 59488 0 (00h) 59504 1 (01h) 59520 2 (02h)... 59984 31 (1Fh) 60000 32 (20h)... 60480 62 (3Eh) 60496 63 (3Fh) Each decimal value change to this register corresponds to 16 high-speed bit times. The SOF cycle time (number of SOF counter clock periods to generate a SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (# High Speed bit times) FLADJ Value

29.8.23 Best Effort Service Latency (BESL)—Offset 62h

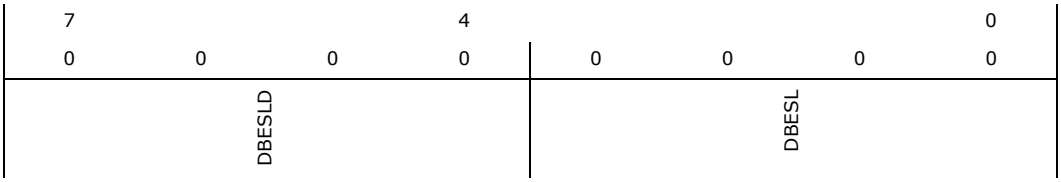
Bset Effort Service Latency.

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:4	0h RW/L	**Default Best Effort Service Latency Deep (DBESLD):** Default Best Effort Service Latency (DBESLD) If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESLD field. This is programmed by BIOS based on platform parameters.
3:0	0h RW/L	**Default Best Effort Service Latency (DBESL):** If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESL field. This is programmed by BIOS based on platform parameters.

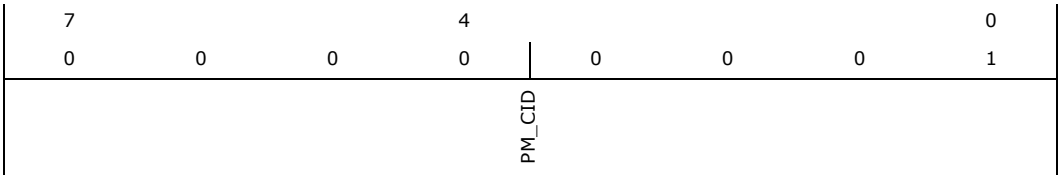
29.8.24 PCI Power Management Capability ID (PM_CID)—Offset 70h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
7:0	1h RO	**PCI Power Management Capability ID (PM_CID):** A value of 01h indicates that this is a PCI Power Management capabilities field.

29.8.25 Next Item Pointer #1 (PM_NEXT)—Offset 71h

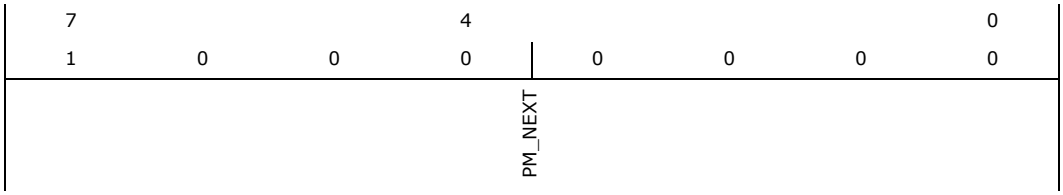
This register is modified and maintained by BIOS.

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 80h



Bit Range	Default and Access	Field Name (ID): Description
7:0	80h RW/L	**Next Item Pointer #1 (PM_NEXT):** This register defaults to 80h, which indicates that the next capability registers begin at configuration offset 80h. This register is writable when the Access Control bit is set to '0'. This allows BIOS to effectively hide the next capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of: 80h implies next capability is MSI 00h implies that MSI capability is hidden. ***Note:*** This value is never expected to be programmed.

29.8.26 Power Management Capabilities (PM_CAP)—Offset 72h

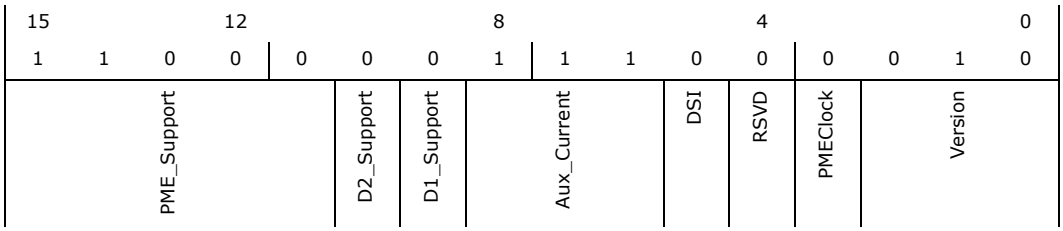
Normally, this register is read-only to report capabilities to the power management software. In order to report different power management capabilities depending on the system in which the Intel PCH is used, the write access to this register is controlled by the Access Control bit (ACCTRL). The value written to this register does not affect the hardware other than changing the value returned during a read. This register is modified and maintained by BIOS.

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: C1C2h



Bit Range	Default and Access	Field Name (ID): Description
15:11	18h RW/L	**PME_Support (PME_Support):** This 5-bit field indicates the power states in which the function may assert PME#. The Intel PCH XHC does not support the D1 or D2 states. For all other states, the Intel PCH XHC is capable of generating PME#. Software should never need to modify this field.
10	0h RW/L	**D2_Support (D2_Support):** The D2 state is not supported.
9	0h RW/L	**D1_Support (D1_Support):** The D1 state is not supported.
8:6	7h RW/L	**Aux_Current (Aux_Current):** The Intel PCH XHC reports 375mA maximum Suspend well current required when in the $D3_{COLD}$ state. This value can be written by BIOS when a more accurate value is known.
5	0h RW/L	**DSI (DSI):** The Intel PCH reports 0, indicating that no device-specific initialization is required.
4	0h RO	Reserved.
3	0h RW/L	**PME Clock (PMEClock):** The Intel PCH reports 0, indicating that no PCI clock is required to generate PME#.
2:0	2h RW/L	**Version (Version):** The Intel PCH reports 010, indicating that it complies with Revision 1.1 of the PCI Power Management Specification.

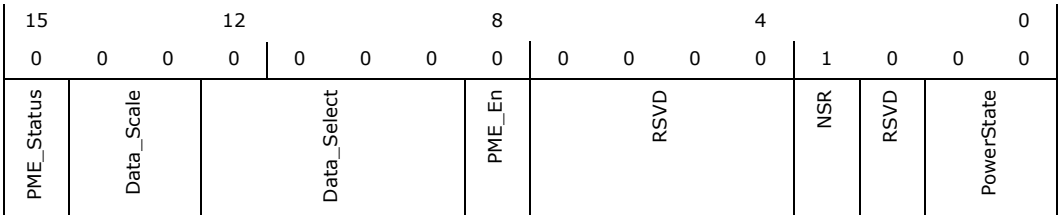
29.8.27 Power Management Control/Status (PM_CS)—Offset 74h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: 8h



Bit Range	Default and Access	Field Name (ID): Description
15	0h RW/1C	**PME_Status (PME_Status):** This bit is set when the Intel PCH XHC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded.
14:13	0h RO	**Data_Scale (Data_Scale):** The Intel PCH hardwires these bits to 00 because it does not support the associated Data register.
12:9	0h RO	**Data_Select (Data_Select):** The Intel PCH hardwires these bits to 0000 because it does not support the associated Data register.
8	0h RW	**PME_En (PME_En):** A 1 enables the Intel PCH XHC to generate an internal PME signal when PME_Status is 1. This bit must be explicitly cleared by the operating system each time it is initially loaded.

Bit Range	Default and Access	Field Name (ID): Description
7:4	0h RO	Reserved.
3	1h RO	**No Soft Reset (NSR):**), this bit indicates that devices transitioning from $D3_{HOT}$ to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the $D3_{HOT}$ to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. Transition from $D3_{HOT}$ to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	Reserved.
1:0	0h RW	**PowerState (PowerState):** This 2-bit field is used both to determine the current power state of XHC function and to set a new power state. The definition of the field values are: 00b - D0 state 11b - $D3_{HOT}$ state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the $D3_{HOT}$ state, the Intel PCH must not accept accesses to the XHC memory range, but the configuration space must still be accessible.

29.8.28 Message Signaled Interrupt CID (MSI_CID)—Offset 80h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 5h

7			4				0
0	0	0	0	0	1	0	1
CID							

Bit Range	Default and Access	Field Name (ID): Description
7:0	5h RO	**Capability ID (CID):** Indicates that this is an MSI capability

29.8.29 Next item pointer (MSI_NEXT)—Offset 81h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
NEXT							

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW/L	**Next Pointer (NEXT):** Indicates that this is the last item on the capability list

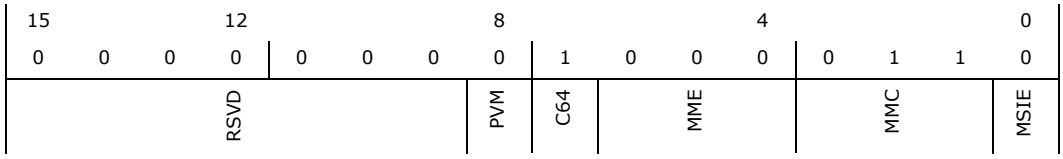
29.8.30 Message Signaled Interrupt Message Control (MSI_MCTL)—Offset 82h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: 86h



Bit Range	Default and Access	Field Name (ID): Description
15:9	0h RO	Reserved.
8	0h RO	**Per-Vector Masking Capable (PVM):** Specifies whether controller supports MSI per vector masking. Not supported
7	1h RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages. This device is 64-bit capable.
6:4	0h RW	**Multiple Message Enable (MME):** Indicates the number of messages the controller should assert. This device supports multiple message MSI.
3:1	3h RO	**Multiple Message Capable (MMC):** Indicates the number of messages the controller wishes to assert.This field must be set by HW to reflect the number of Interrupters supported. Encoding number of Vectors requested (number of Interrupters) 000 1 001 2 010 4 011 8 100 16 101 32 110-111 Reserved
0	0h RW	**MSI Enable (MSIE):** If set to 1, MSI is enabled and the traditional interrupt pins are not used to generate interrupts. If cleared to 0, MSI operation is disabled and the traditional interrupt pins are used.

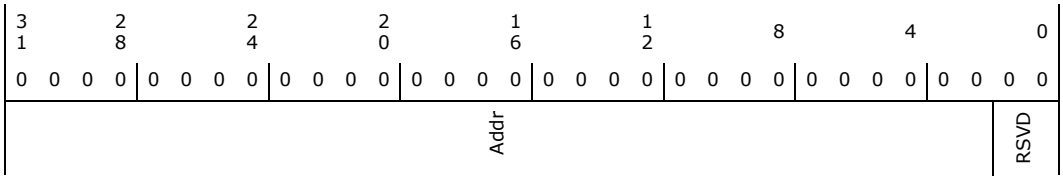
29.8.31 Message Signaled Interrupt Message Address (MSI_MAD)—Offset 84h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**Addr (Addr):** Lower DW of system specified message address, always DWORD aligned
1:0	0h RO	Reserved.

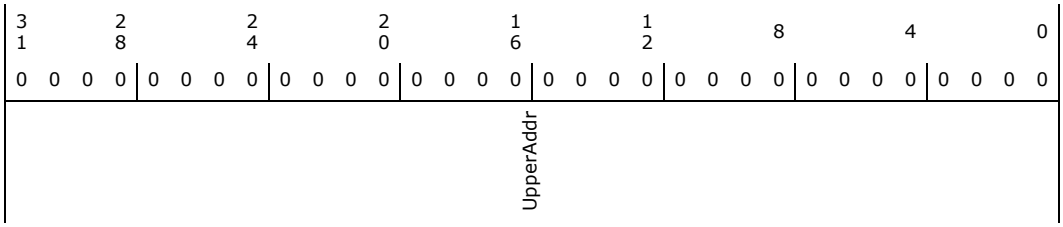
29.8.32 Message Signaled Interrupt Upper Address (MSI_MUAD)—Offset 88h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Upper Addr (UpperAddr):** Upper DW of system specified message address.

29.8.33 Message Signaled Interrupt Message Data (MSI_MD)—Offset 8Ch

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
15:0	0h RW	**Data (Data):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD(15:0)) during the data phase of the MSI memory write transaction. The Multiple Message Enable field (bits 6-4 of the Message Control register) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010 indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000, the function is not permitted to modify the message data.

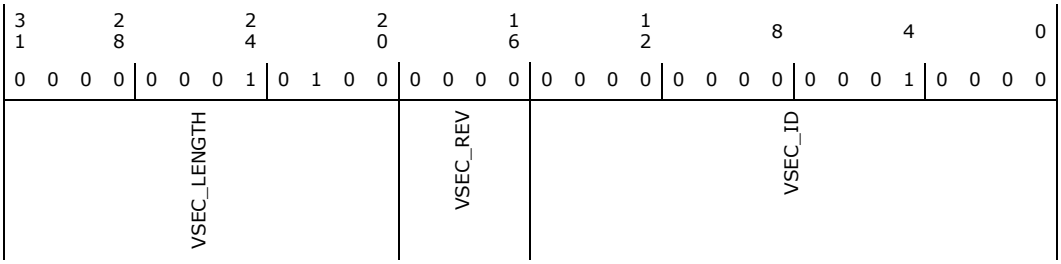
29.8.34 Vendor Specific Header (VSHDR)—Offset 94h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 1400010h



Bit Range	Default and Access	Field Name (ID): Description
31:20	14h RO	**VSEC Length (VSEC_LENGTH):** This field indicates the number of bytes in the entire VSEC structure, including the PCI Extended Capability header, the Vendor-Specific header, and the Vendor-Specific register
19:16	0h RO	**VSEC Rev (VSEC_REV):** This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field.
15:0	10h RO	**VSEC ID (VSEC_ID):** This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field.

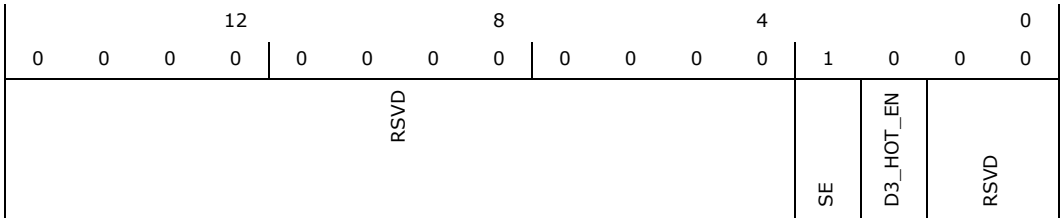
29.8.35 Power Control Enable (PCE_REG) —Offset A2h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0008h



Bit Range	Default and Access	Field Name (ID): Description
31:4	0000000h RO	**Reserved**
3	1b RW	**Sleep Enable (SE):** 0: xHCI will never assert Sleep 1: xHCI may assert Sleep.
2	0b RW	**D3 Hot Enable (D3_HOT_EN):** 0: xHCI will not power gate when Idle 1: xHCI will power gate when idle.
1:0	00b RO	**Reserved**

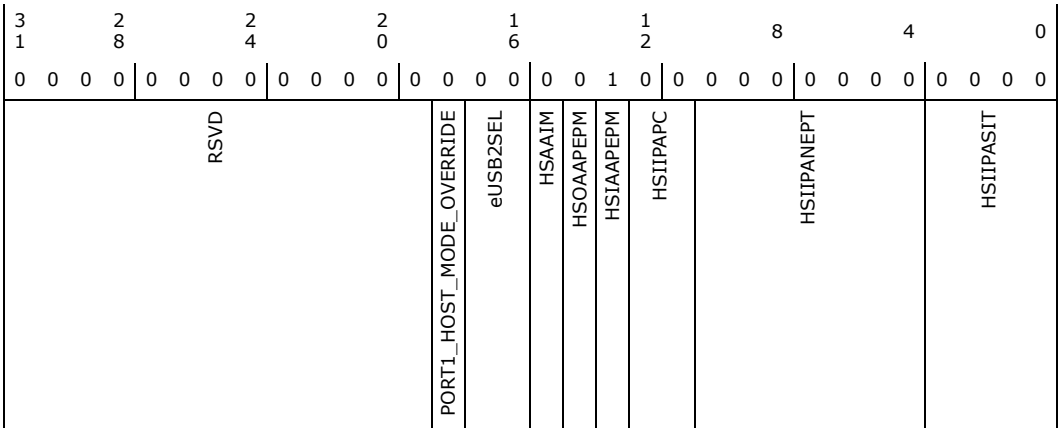
29.8.36 High Speed Configuration 2 (HSCFG2)—Offset A4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 2000h



Bit Range	Default and Access	Field Name (ID): Description
31:19	0h RO	Reserved.
18	0h RW	**PORT1_HOST_MODE_OVERRIDE (PORT1_HOST_MODE_OVERRIDE):** When set, this bit causes the Host_Device mux on port 1 to be forced into the Host mode.
17:16	0h RW	**eUSB2SEL (eUSB2SEL):** The two bits are associate with USB2 ports 1 - bit 16 and 2 - bit 2 0: Port is mapped to USB2 1: Port is mapped to eUSB2
15	0h RW	**HS ASYNC Active IN Mask (HSAAIM):** Determines if the Async Active will mask/ ignore IN EP s. 0 HS ASYNC Active will include IN EP s. 1 HS ASYNC Active will mask/ ignore IN EP s.
14	0h RW	**HS OUT ASYNC Active Polling EP Mask (HSOAAPEPM):** Determines if the Async Active for OUT HS/FS/LS masks/ignores EP s that are polling/PINGing (HS) due to NAK. 0 HS OUT ASYNC Active will include EP s that are polling. 1 HS OUT ASYNC Active will mask/ignore EP s that are polling.
13	1h RW	**HS IN ASYNC Active Polling EP Mask (HSIAAPEPM):** Determines if the Async Active for IN HS/FS/LS masks/ignores EP s that are polling due to NAK. 0 HS IN ASYNC Active will include EP s that are polling. 1 HS IN ASYNC Active will mask/ ignore EP s that are polling.
12:11	0h RW	**HS INTR IN Periodic Active Policy Control (HSIIPAPC):** Controls how the HS INTR IN periodic active is used to generate the global periodic active. This will determine how the smallest service interval among active EP s and number of active EP s are used. 0 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold OR Numb of EP Threshold values meet the requirement. 1 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold AND Numb of EP Threshold values meet the requirement. 2 Always allow HS INTR EP s to be used in the generation of the global Periodic Active indication. 3 Never allow HS INTR EP s to be used in the generation of the global Periodic Active indication
10:4	0h RW	**HS INTR IN Periodic Active Num of EP Threshold (HSIIPANEPT):** Defines the threshold used to determine if Periodic Active may include HS/FS/LS INTR IN EP active indication. If there are more than NumEPThreshold active HS/FS/LS INTR EP s then they may be included as part of the periodic active generation.

Bit Range	Default and Access	Field Name (ID): Description
3:0	0h RW	**HS INTR IN Periodic Active Service Interval Threshold (HSIIPASIT):** Defines the Service Interval threshold used to determine if Periodic Active will include HS/FS/LS INTR IN EP active indication. If there are any active HS/FS/LS INTR EP s with a service interval less than or equal to this threshold then they may be included as part of the periodic active generation.

29.8.37 XHCI USB2 Overcurrent Pin Mapping N (U2OCM)—Offset B0h

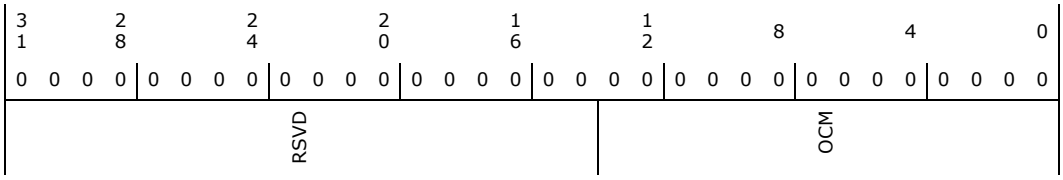
Address Offset: B0-B3h, ... (B0h+(NumOC-1)*4) to (B3h+(NumOC–1)*4)
The RW/L property of this register is controlled by OCCFDONE bit.
Each OC pin can be assigned to one or more of up to 32 Standard USB2 ports.
Each DWord maps one OC pin across up to 32 USB2 ports.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13:0	0h RW/L	**OC Mapping (OCM):** USB2 Port assignment When Set to 1, Bit 0 maps the OC pin N to USB2 std. port 1 Bit 1 maps the OC pin N to USB2 std port 2 ... Bit (NumUSB2std-1) maps the OC pin N to USB2 Std port NumUSB2std ***Note:*** The USB-R port which is the most significant USB2 port does not have an OC pin. Thus the OC assignment for the USB-R port is ignored.

29.8.38 XHCI USB3 Overcurrent Pin Mapping N (U3OCM)—Offset D0h

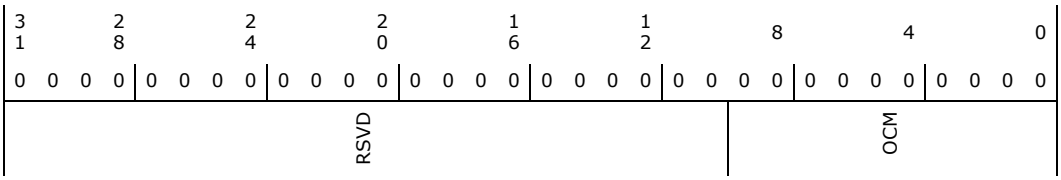
Address Offset: D0-D3h, ... (D0h+(NumOC-1)*4) to (D3h+(NumOC–1)*4)
The RW/L property of this register is controlled by OCCFDONE bit.
Each OC pin can be assigned to one or more of up to 32 Standard USB2 ports.
Each DWord maps one OC pin across up to 32 USB2 ports.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9:0	0h RW/L	**OC Mapping (OCM):** USB3 Port assignment When Set to 1, Bit 0 maps the OC pin N to USB3 std. port 1 Bit 1 maps the OC pin N to USB3 std port 2 ... Bit (NumUSB3std-1) maps the OC pin N to USB3 Std port NumUSB3std

29.9 xHCI Memory Mapped Registers Summary

Table 29-2. Summary of xHCI Memory Mapped Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	0h	Capability Registers Length (CAPLENGTH)—Offset 0h	80h
2h	3h	Host Controller Interface Version Number (HCIVERSION)—Offset 2h	100h
4h	7h	Structural Parameters 1 (HCSPARAMS1)—Offset 4h	18000840h
8h	Bh	Structural Parameters 2 (HCSPARAMS2)—Offset 8h	14200054h
Ch	Fh	Structural Parameters 3 (HCSPARAMS3)—Offset Ch	40001h
10h	13h	Capability Parameters (HCCPARAMS)—Offset 10h	200077C1h
14h	17h	Doorbell Offset (DBOFF)—Offset 14h	3000h
18h	1Bh	Runtime Register Space Offset (RTSOFF)—Offset 18h	2000h
80h	83h	USB Command (USBCMD)—Offset 80h	0h
84h	87h	USB Status (USBSTS)—Offset 84h	1h
88h	8Bh	Page Size (PAGESIZE)—Offset 88h	1h
94h	97h	Device Notification Control (DNCTRL)—Offset 94h	0h
98h	9Bh	Command Ring Low (CRCR_LO)—Offset 98h	0h

Table 29-2. Summary of xHCI Memory Mapped Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
9Ch	9Fh	Command Ring High (CRCR_HI)—Offset 9Ch	0h
B0h	B3h	Device Context Base Address Array Pointer Low (DCBAAP_LO)—Offset B0h	0h

8048h	804Bh	XECP_SUPP_USB3_9 (XECP_SUPP_USB3_9)—Offset 8048h	16C60127h
8094h	9097h	Host Control Scheduler (HOST_CTRL_SCH_REG)—Offset 8094h	00000100h
80A4h	80A7h	Power Management Control (PMCTRL_REG)—Offset 80A4h	002D5090h
80B8	80BB	Super Speed Port Enable (SSPE) —Offset 80B8h	2FFh
846Ch	846Fh	USB Legacy Support Capability (USBLEGSUP)—Offset 846Ch	2201h

Table 29-2. Summary of xHCI Memory Mapped Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
84F4h	84F7h	Port Disable Override Capability Register (PDO_CAPABILITY)—Offset 84F4h	3C6h
84F8h	84FBh	USB2 Port Disable Override (USB2PDO)—Offset 84F8h	0h
84FCh	84FFh	USB3 Port Disable Override (USB3PDO)—Offset 84FCh	0h
8700h	8703h	Debug Capability ID Register (DCID)—Offset 8700h	5100Ah

29.9.1 Capability Registers Length (CAPLENGTH)—Offset 0h

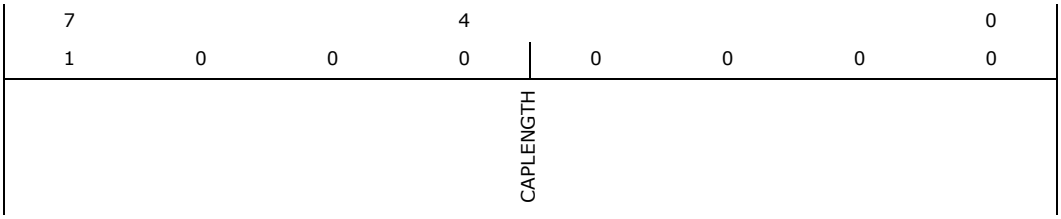
This register is modified and maintained by BIOS.

Access Method

Type: MEM Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 80h



Bit Range	Default and Access	Field Name (ID): Description
7:0	80h RW/L	**Capability Registers Length (CAPLENGTH):** This register is used as an offset to add to the Memory Base Register (D29:F0:10h) to find the beginning of the Operational Register Space. This field is hardwired to 20h indicating that the Operation Registers begin at offset 20h

29.9.2 Host Controller Interface Version Number (HCIVERSION)—Offset 2h

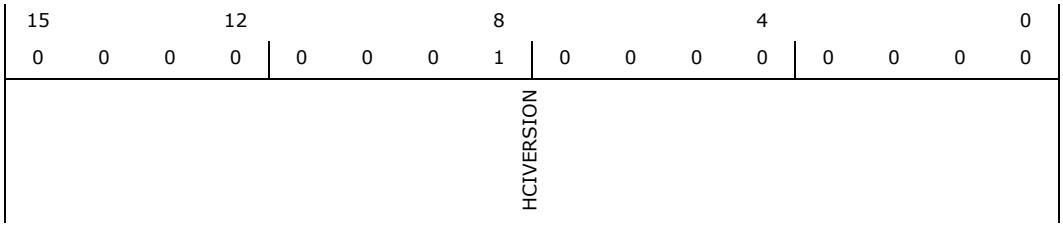
This register is modified and maintained by BIOS.

Access Method

Type: MEM Register
(Size: 16 bits)

Device: 20
Function: 0

Default: 0100h



Bit Range	Default and Access	Field Name (ID): Description
15:0	100h RO	**Host Controller Interface Version Number (HCIVERSION):** This is a two-byte register containing a BCD encoding of the version number of interface that this host controller interface conforms.

29.9.3 Structural Parameters 1 (HCSPARAMS1)—Offset 4h

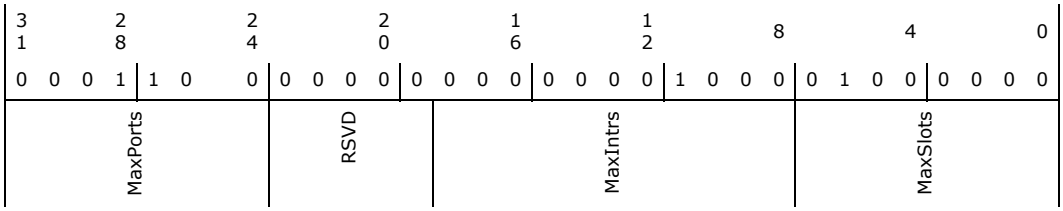
This register is modified and maintained by BIOS.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 18000840h



Bit Range	Default and Access	Field Name (ID): Description
31:24	18h RO	**Number of Ports (MaxPorts):** This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the Operational Register Space.
23:19	0h RO	Reserved.
18:8	8h RW/L	**Number of Interrupters (MaxIntrs):** This field specifies the number of interrupters implemented on this host controller. Each interrupter is allocated to a vector of MSI and controls its generation and moderation.
7:0	40h RW/L	**Number of Device Slots (MaxSlots):** This field specifies the number of Device Context Structures and Doorbell Array entries this host controller can support. Valid values are in the range of 1 to 255.

29.9.4 Structural Parameters 2 (HCSPARAMS2)—Offset 8h

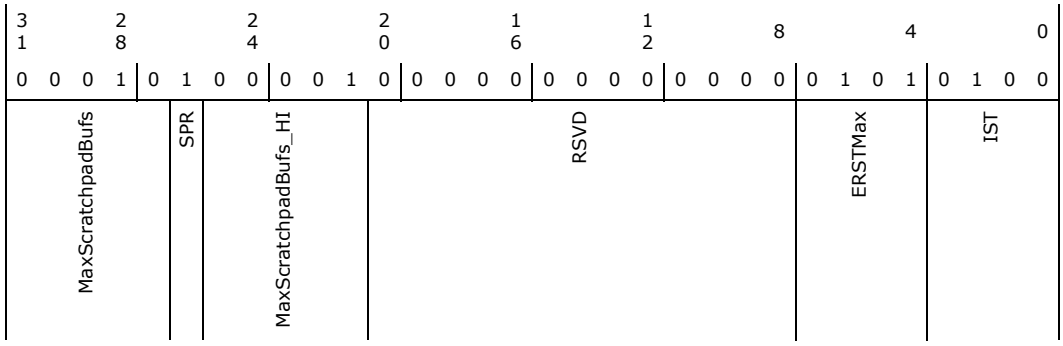
This register is modified and maintained by BIOS.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 14200054h



Bit Range	Default and Access	Field Name (ID): Description
31:27	2h RW/L	**Max Scratchpad Buffers LO (MaxScratchpadBufs):** Indicates the number of Scratchpad Buffers system software shall reserve for the xHC.
26	1h RW/L	**Scratchpad Restore (SPR):** 0 = Indicates the Scratchpad buffer space may be freed and reallocated between power events. 1 = Indicates that the xHC requires the integrity of the Scratchpad buffer space to be maintained across power events.
25:21	1h RW/L	**Max Scratchpad Buffers HI (MaxScratchpadBufs_HI)**

Bit Range	Default and Access	Field Name (ID): Description
20:8	0h RO	Reserved.
7:4	5h RW/L	**Event Ring Segment Table Max (ERSTMax):** This field determines the maximum value supported by the Event Ring Segment Table Base Size registers.
3:0	4h RW/L	**Isochronous Scheduling Threshold (IST):** This field indicates to system software the minimum distance (in time) that it is required to stay ahead of the xHC while adding TRBs, in order to have the xHC process them at the correct time. The value is specified in the number if frames/ microframes. If bit [3] of IST is cleared to 0b, software can add a TRB no later than IST [2:0] microframes before that TRB is scheduled to be executed. If bit [3] of IST is set to 1b, software can add a TRB no later than IST[2:0] frames before that TRB is scheduled to be executed.

29.9.5 Structural Parameters 3 (HCSPARAMS3)—Offset Ch

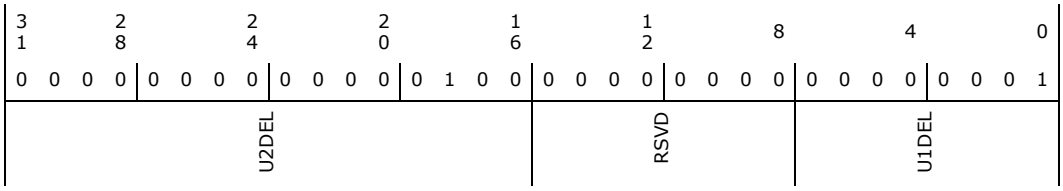
This register is modified and maintained by BIOS.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 40001h



Bit Range	Default and Access	Field Name (ID): Description
31:16	4h RW/L	**U2 Device Exit Latency (U2DEL):** Indicates the worst case latency to transition from U2 to U0. Applies to all root hub ports. The following are permissible values: Value Description 00h Zero 01h Less than 1 µs 02h Less than 2 µs ... 0Bh-FFh Reserved
15:8	0h RO	Reserved.
7:0	1h RW/L	**U1 Device Exit Latency (U1DEL):** Worst case latency to transition a root hub Port Link State (PLS) from U1 to U0. Applies to all root hub ports. The following are permissible values: Value Description 00h Zero 01h Less than 1 µs 02h Less than 2 µs ... 0800h-FFFFh Reserved

29.9.6 Capability Parameters (HCCPARAMS)—Offset 10h

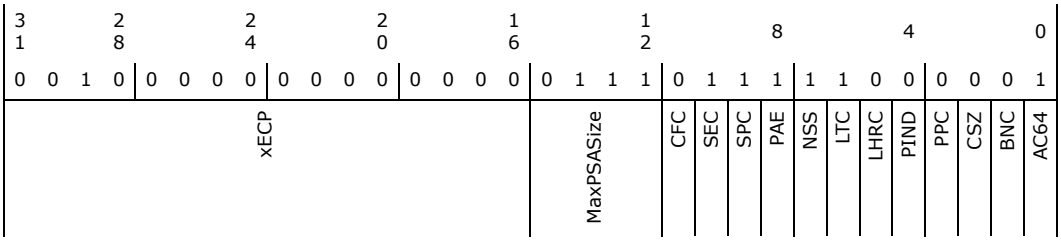
This register is modified and maintained by BIOS.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 200077C1h



Bit Range	Default and Access	Field Name (ID): Description
31:16	2000h RW/L	**xHCI Extended Capabilities Pointer (xECP):** This field indicates the existence of a capabilities list. The value of this field indicates a relative offset, in 32-bit words, from Base to the beginning of the first extended capability.
15:12	7h RW/L	**Maximum Primary Stream Array Size (MaxPSASize):** RW/L. This fields identifies the maximum size Primary Stream Array that the xHC supports. The Primary Stream Array size = 2MaxPSASize+1. Valid MaxPSASize values are 1 to 15.
11	0h RW/L	**Contiguous Frame ID Capability (CFC)**
10	1h RW/L	**Stopped EDLTA Capability (SEC):** This flag indicates that the host controller implementation Stream Context support a Stopped EDLTA field.
9	1h RW/L	**Stopped - Short Packet Capability (SPC):** This flag indicates that the host controller implementation is capable of generating a Stopped-Short Packet Completion Code.
8	1h RW/L	**Parst All Event Data (PAE)**
7	1h RW/L	**No Secondary SID Support (NSS):** Hardwired to '0' indicating Secondary Stream ID decoding is supported.
6	1h RW/L	**Latency Tolerance Messaging Capability (LTC):** 0 = Latency Tolerance Messaging is not supported. 1 = Latency Tolerance Messaging is supported
5	0h RW/L	**Light HC Reset Capability (LHRC):** 0 = Light Host Controller Reset is not supported. 1 = Light Host Controller Reset is supported
4	0h RW/L	**Port Indicators (PIND):** This bit indicates whether the xHC root hub ports support port indicator control. When this bit is a '1', the port status and control registers include a read/writeable field for controlling the state of the port indicator.
3	0h RW/L	**Port Power Control (PPC):** This bit indicates whether the host controller implementation includes port power control. A '1' in this bit indicates the ports have port power switches. A '0' in this bit indicates the port do not have port power switches.

Bit Range	Default and Access	Field Name (ID): Description
2	0h RW/L	**Context Size (CSZ):** If this bit is set to '1', then the xHC uses 64 byte Context data structures. If this bit is cleared to '0', then the xHC uses 32 byte Context data structures.
1	0h RW/L	**BW Negotiation Capability (BNC):** 0 = Not capable of BW Negotiation. 1 = Capable of BW Negotiation.
0	1h RW/L	**64-bit Addressing Capability (AC64):** This bit documents the addressing range capability of the xHC. The value of this flag determines whether the xHC has implemented the high order 32- bits of 64-bit register and data structure pointer fields. Values for this flag have the following interpretation: 0 = Supports 32-bit address memory pointers 1 = Supports 64-bit address memory pointers If 32-bit address memory pointers are implemented, the xHC shall ignore the high order 32- bits of 64-bit data structure pointer fields, and system software shall ignore the high order 32- bits of 64- bit xHC registers.

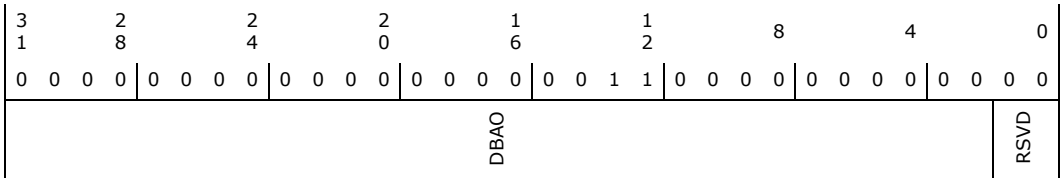
29.9.7 Doorbell Offset (DBOFF)—Offset 14h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 3000h



Bit Range	Default and Access	Field Name (ID): Description
31:2	C00h RO	**Doorbell Array Offset (DBAO):** This field defines the DWord offset of the Doorbell Array base address from the Base (for example, the base address of the xHCI Capability register address space).
1:0	0h RO	Reserved.

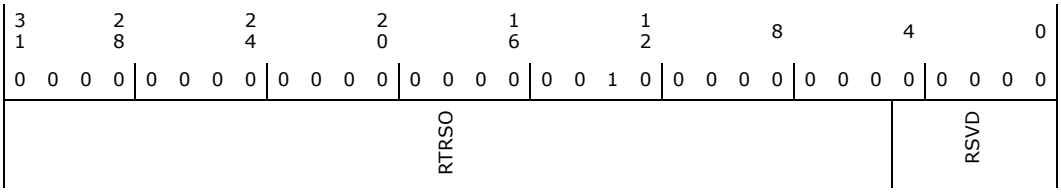
29.9.8 Runtime Register Space Offset (RTSOFF)—Offset 18h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 2000h



Bit Range	Default and Access	Field Name (ID): Description
31:5	100h RO	**Runtime Register Space Offset (RTRSO):** This field defines the 32-byte offset of the xHCI Runtime Registers from the Base. That is, Runtime Register Base Address = Base + Runtime Register Set Offset.
4:0	0h RO	Reserved.

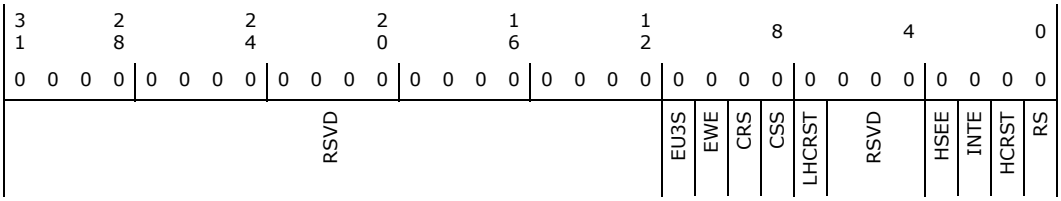
29.9.9 USB Command (USBCMD)—Offset 80h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:12	0h RO	Reserved.
11	0h RW	**Enable U3 MFINDEX Stop (EU3S):** When set to 1b, the xHC may stop the MFINDEX counting action if all Root Hub ports are in the U3, Disconnected, Disabled, or Powered-off state. When cleared to 0b, the xHC may stop the MFINDEX counting action if all Root Hub ports are in the Disconnected, Disabled, or Powered-off state.
10	0h RW	**Enable Wrap Event (EWE):** When set to 1b, the xHC shall generate a MFINDEX Wrap Event every time the MFINDEX register transitions from 03FFFh to 0. When cleared to 0b, no MFINDEX Wrap Events are generated.

Bit Range	Default and Access	Field Name (ID): Description
9	0h RW	**Controller Restore State (CRS):** When set to 1b, MEM_BASE+80h:bit 0= 0b, and MEM_BASE+80h:bit 8 = 1b, the xHC shall perform a Restore State operation and restore its internal state. When set to 1b and MEM_BASE+80h:bit 0= 1b or MEM_BASE+80h:bit 8 = 0b, or when cleared to '0', no Restore State operation shall be performed.
8	0h RW	**Controller Save State (CSS):** When written by software with 1b and MEM_BASE+80h:bit 0=0b, the xHC shall save any internal state that will be restored by a subsequent Restore State operation. When written by software with 1b and MEM_BASE+80h:bit 0= 1b, or written with '0', no Save State operation shall be performed.
7	0h RW	**Light Host Controller Reset (LHCRST):** If the Light HC Reset Capability (LHRC) bit (MEM_BASE=10h:bit 5) is 1b, then setting this bit to 1b allows the driver to reset the xHC without affecting the state of the ports. A system software read of this bit as 0b indicates the Light Host Controller Reset has completed and it is safe for software to re-initialize the xHC. A software read of this bit as a 1b indicates the Light Host Controller Reset has not yet completed.
6:4	0h RO	Reserved.
3	0h RW	**Host System Error Enable (HSEE):** When this bit is set to 1b, and the HSE bit (MEM_BASE+84h:bit 2) is set to 1b, the xHC shall assert out-of-band error signaling to the host. The signaling is acknowledged by software clearing the HSE bit.
2	0h RW	**Interrupter Enable (INTE):** This control bit is used by software to reset the host controller. When software sets this bit to 1b, the Host Controller resets its internal pipelines, timers, counters, state machines, and so forth, to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports. PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values.
1	0h RW	**Host Controller Reset (HCRST):** This control bit is used by software to reset the host controller. When software sets this bit to 1b, the Host Controller resets its internal pipelines, timers, counters, state machines, and so forth, to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports. PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values.
0	0h RW	**Run/Stop (RS):** When set to 1b, the xHC proceeds with execution of the schedule. The xHC continues execution as long as this bit is set to 1b. When this bit is cleared to 0b, the xHC completes the current and any actively pipelined transactions on the USB and then halts. The xHC shall halt within 16 microframes after software clears the Run/ Stop bit. The HCHalted (HCH) bit (MEM_BASE+84h:bit 0) indicates when the xHC has finished its pending pipelined transactions and has entered the stopped state. Software shall not write a '1' to this flag unless the xHC is in the Halted state (that is, HCH in the USBSTS register is '1'); doing so will yield undefined results.

29.9.10 USB Status (USBSTS)—Offset 84h

Offset: MEM_BASE + 84h–87h Attribute: R/WC, RO
Default Value: 00000001h Size: 32 bits
This register indicates pending interrupts and various states of the Host controller. The status resulting from a transaction on the serial bus is not indicated in this register. Seethe Interrupts description in Section 4 of the *xHCI Specification* for additional information concerning interrupt conditions.

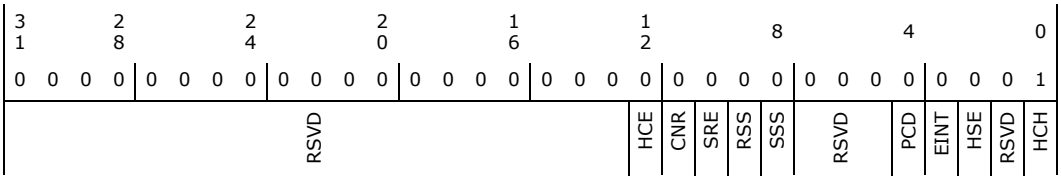
Note: For the writable bits, software must write a 1 to clear bits that are set. Writing a 0 has no effect.

Access Method

Type: MEM Register (Size: 32 bits)

Device: 20
Function: 0

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
31:13	0h RO	Reserved.
12	0h RO	**Host Controller Error (HCE):** This flag shall be set to indicate that an internal error condition has been detected which requires software to reset and re-initialize the xHC. 0 = No internal xHC error conditions exist. 1 = Internal xHC error condition exists.
11	0h RO	**Controller Not Ready (CNR):** 0 = Ready 1 = Not Ready Software shall not write any Doorbell or Operational register of the xHC, other than the USBSTS register, until CNR = 0b. This flag is set by the xHC after a Hardware Reset and cleared when the xHC is ready to begin accepting register writes. This flag shall remain cleared (0b) until the next Chip Hardware Reset.
10	0h RW/C	**Save/Restore Error (SRE):** If an error occurs during a Save or Restore operation this bit shall be set to 1b. This bit shall be cleared to 0b when a Save or Restore operation is initiated or when written with 1b.
9	0h RO	**Restore State Status (RSS):** When the Controller Restore State (CRS) flag in the USB_CMDregister is written with 1b this bit shall be set to 1b and remain set while the xHC restores its internal state. ***Note:*** When the Restore State operation is complete, this bit shall be cleared to 0b.
8	0h RO	**Save State Status (SSS)**
7:5	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
4	0h RW/1C	**Port Change Detect (PCD):** This bit is allowed to be maintained in the Auxiliary power well. Alternatively, it is also acceptable that on a D3 to D0 transition of the xHC, this bit is loaded with the OR of all of the PORTSC change bits (including: Force port resume, overcurrent change, enable/ disable change and connect status change). Regardless of the implementation, when this bit is readable (that is, in the D0 state), it must provide a valid view of the Port Status registers. 0 = No change bit transition from a 0 to 1 or No Force Port Resume bit transition from 0 to 1 as a result of a J-K transition detected on a suspended port. 1 = The Host controller sets this bit to 1 when any port for which the Port Owner bit is set to 0 has a change bit transition from a 0 to 1 or a Force Port Resume bit transition from 0 to 1 as a result of a J-K transition detected on a suspended port.
3	0h RW/1C	**Event Interrupt (EINT):** The xHC sets this bit to 1b when the Interrupt Pending (IP) bit of any Interrupter is transitions from 0b to 1b. Software that uses EINT shall clear it prior to clearing any IP flags. A race condition will occur if software clears the IP flags then clears the EINT flag, and between the operations another IP '0' to '1' transition occurs. In this case the new IP transition will be lost.
2	0h RW/1C	**Host System Error (HSE):** The xHC sets this bit to 1b when a serious error is detected, either internal to the xHC or during a host system access involving the xHC module. Conditions that set this bit to '1' include PCI Parity error, PCI Master Abort, and PCI Target Abort. When this error occurs, the xHC clears the Run/Stop (R/S) bit in the USB_CMD register to prevent further execution of the scheduled TDs. If the HSEE bit in the USB_CMD register is 1b, the xHC shall also assert out-of-band error signaling to the host.
1	0h RO	Reserved.
0	1h RO	**HCHalted (HCH):** This bit is a '0' whenever the Run/Stop (R/S) bit is set to 1b. The xHC sets this bit to 1b after it has stopped executing as a result of the Run/Stop (R/S) bit being cleared to 0b, either by software or by the xHC hardware (for example, internal error). If this bit is set to1b, then SOFs, microSOFs, or Isochronous Timestamp Packets (ITP) shall not be generated by the xHC.

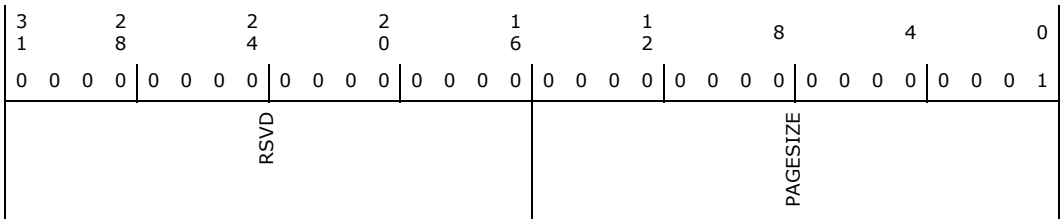
29.9.11 Page Size (PAGESIZE)—Offset 88h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	1h RO	**Page Size (PAGESIZE):** Hardwired to 1h to indicate support for 4 Kbyte page sizes.

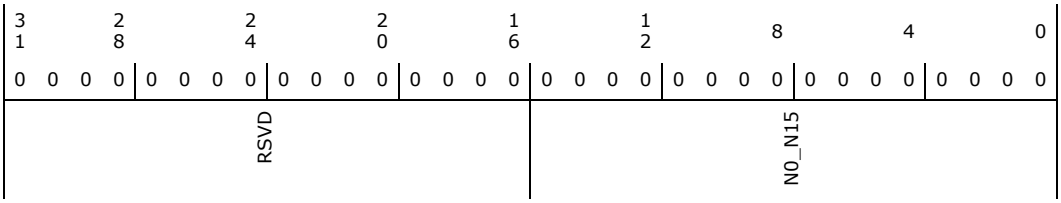
29.9.12 Device Notification Control (DNCTRL)—Offset 94h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW	**Notification Enable (N0_N15):** When a Notification Enable bit is set, a Device Notification Event will be generated when a Device Notification Transaction Packet is received with the matching value in the Notification Type field. For example, setting N1 to '1' enables Device Notification Event generation if a Device Notification TP is received with its Notification Type field set to '1' (FUNCTION_WAKE), and so on

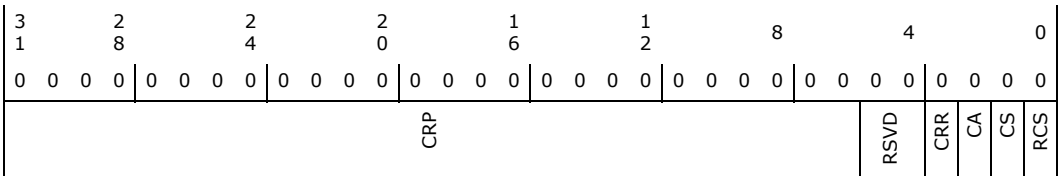
29.9.13 Command Ring Low (CRCR_LO)—Offset 98h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:6	0h RW	**Command Ring Pointer (CRP):** This field defines low order bits of the initial value of the 64-bit Command Ring Dequeue Pointer. ***Notes:*** 1. Writes to this field are ignored when Command Ring Running bit (CRR) = 1b. 2. If the CRCR register is written while the Command Ring is stopped (CRR = 0b), the value of this field shall be used to fetch the first Command TRB the next time the Host Controller Doorbell register is written with the DB Reason field set to Host Controller Command. 3. If the CRCR register is not written while the Command Ring is stopped (CRR = 0b), then the Command Ring shall begin fetching Command TRBs at the current value of the internal xHC Command Ring Dequeue Pointer. 4. Reading this field always returns 0b.

Bit Range	Default and Access	Field Name (ID): Description
5:4	0h RO	Reserved.
3	0h RO	**Command Ring Running (CRR):** This bit is set to 1b if the Run/Stop (R/S) bit is 1b and the Host Controller Doorbell register is written with the DB Reason field set to Host Controller Command. It is cleared to 0b when the Command Ring is stopped after writing a 1b to the Command Stop (CS) or Command Abort (CA) bits, or if the R/S bit is cleared to 0b.
2	0h RW/1S	**Command Abort (CA):** Writing a 1b to this bit shall immediately terminate the currently executing command, stop the Command Ring, and generate a Command Completion Event with the Completion Code set to Command Ring Stopped. The next write to the Host Controller Doorbell with DB Reason field set to Host Controller Command shall restart the Command Ring operation. ***Notes:*** 1. Writes to this flag are ignored by the xHC if Command Ring Running (CRR) = 0b. 2. Reading this bit always returns 0b.
1	0h RW/1S	**Command Stop (CS):** Writing a 1b to this bit shall stop the operation of the Command Ring after the completion of the currently executing command, and generate a Command Completion Event with the Completion Code set to Command Ring Stopped and the Command TRB Pointer set to the current value of the Command Ring Dequeue Pointer. The next write to the Host Controller Doorbell with DB Reason field set to Host Controller Command shall restart the Command Ring operation. ***Notes:*** 1. Writes to this flag are ignored by the xHC if Command Ring Running (CRR) bit = 0b. 2. Reading this bit always returns 0b.
0	0h RW	**Ring Cycle State (RCS):** This bit identifies the value of the xHC Consumer Cycle State (CCS) flag for the TRB referenced by the Command Ring Pointer. ***Notes:*** 1. Writes to this bit are ignored when the Command Ring Running (CRR) bit = 1b. 2. If the CRCR register is written while the Command Ring is stopped (CCR = 0b), then the value of this flag shall be used to fetch the first Command TRB the next time the Host Controller Doorbell register is written with the DB Reason field set to Host Controller Command. 3. If the CRCR register is not written while the Command Ring is stopped (CCR = 0b), then the Command Ring will begin fetching Command TRBs using the current value of the internal Command Ring CCS flag. 4. Reading this flag always returns 0b.

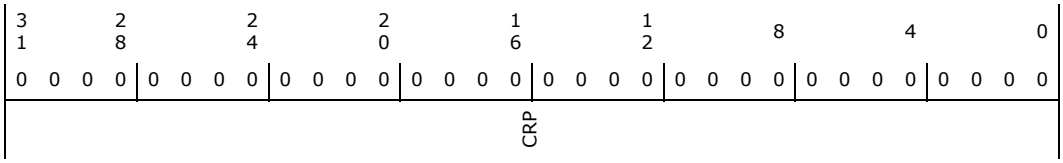
29.9.14 Command Ring High (CRCR_HI)—Offset 9Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Command Ring Pointer (CRP):** Command Ring Pointer—R/W. This field defines high order bits of the initial value of the 64-bit Command Ring Dequeue Pointer. ***Notes:*** 1. Writes to this field are ignored when Command Ring Running bit (CRR) = 1b. 2. If the CRCR register is written while the Command Ring is stopped (CRR = 0b), the value of this field shall be used to fetch the first Command TRB the next time the Host Controller Doorbell register is written with the DB Reason field set to Host Controller Command. 3. If the CRCR register is not written while the Command Ring is stopped (CRR = 0b), then the Command Ring shall begin fetching Command TRBs at the current value of the internal xHC Command Ring Dequeue Pointer. 4. Reading this field always returns 0b.

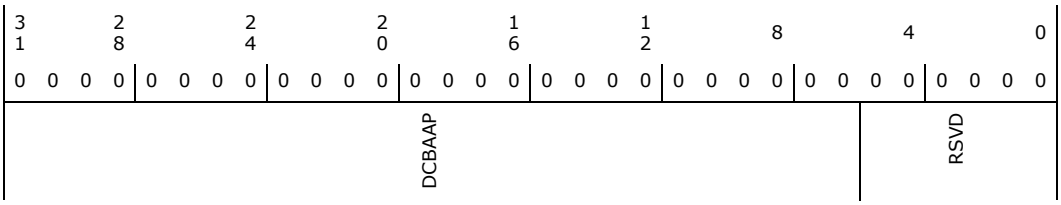
29.9.15 Device Context Base Address Array Pointer Low (DCBAAP_LO)—Offset B0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:6	0h RW	**Device Context Base Address Array Pointer (DCBAAP):** This field defines low order bits of the 64-bit base address of the Device Context Pointer Array table (a table of address pointers that reference Device Context structures for the devices attached to the host.
5:0	0h RO	Reserved.

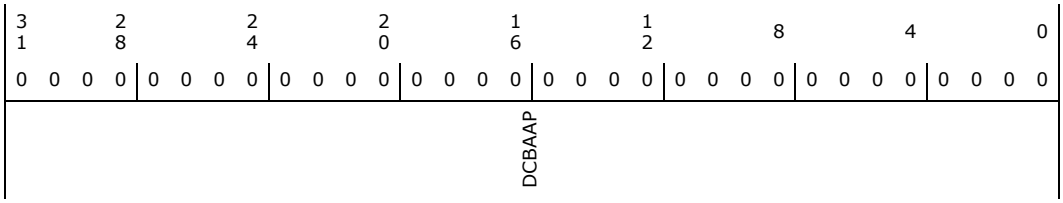
29.9.16 Device Context Base Address Array Pointer High (DCBAAP_HI)—Offset B4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Device Context Base Address Array Pointer (DCBAAP):** This field defines high order bits of the 64-bit base address of the Device Context Pointer Array table (a table of address pointers that reference Device Context structures for the devices attached to the host.)

29.9.17 Port N Status and Control USB2 (PORTSCN)—Offset 480h

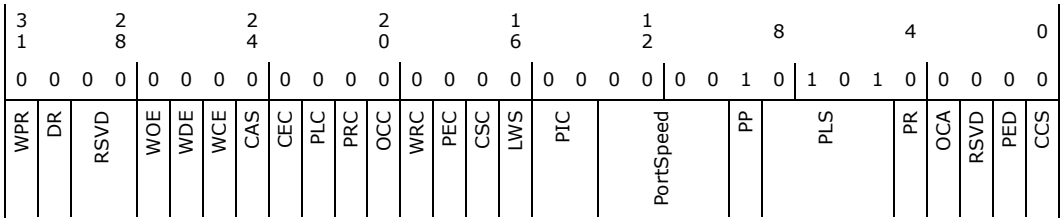
There are NumUSB2 USB2 PORTSC registers at offsets:
480h, 490h, 4A0h,... (480h + (NumUSB2-1)*10h)

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 2A0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/1S	**Warm Port Reset (WPR):** When software sets this bit to 1b, the Warm Reset sequence is
30	0h RW/L	**Device Removable (DR):** This bit indicates if this port has a removable device. 0 = Device is removable. 1 = Device is non-removable.
29:28	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
27	0h RW	**Wake on Over-current Enable (WOE):** 0 = Disable. (Default) 1 = Enable. Writing this bit to a 1b enables the port to be sensitive to over-current conditions as system wake-up events.
26	0h RW	**Wake on Disconnect Enable (WDE):** 0 = Disable. (Default) 1 = Enable. Writing this bit to a 1b enables the port to be sensitive to device disconnects as system wake-up events.
25	0h RW	**Wake on Connect Enable (WCE):** 0 = Disable. (Default) 1 = Enable. Writing this bit to a 1b enables the port to be sensitive to device connects as system wake-up events.
24	0h RO	**Cold Attach Status (CAS):** This bit indicates that far-end terminations were detected in the Disconnected state and the Root Hub Port State Machine was unable to advance to the Enabled state. Software shall clear this bit by writing a 1b to the WPR bit or the xHC shall clear this bit if the CSS bit transitions to 1.
23	0h RW/1C	**Port Config Error Change (CEC):** ***Note:*** This register is sticky.
22	0h RW/1C	**Port Link State Change (PLC):** 0 = No change 1 = Link Status Change This flag is set to '1' due to the following Port Link State (PLS) transitions:
21	0h RW/1C	**Port Reset Change (PRC):** This flag is set to '1' due a '1' to '0' transition of Port Reset (PR). for example, when any reset processing on this port is complete. 0 = No change 1 = Reset Complete
20	0h RW/1C	**Over-current Change (OCC):** The functionality of this bit is not dependent upon the port owner. Software clears this bit by writing a 1 to it. 0 = No change. (Default) 1 = There is a change to Overcurrent Active.
19	0h RW/1C	**Warm Port Reset Change (WRC):** This bit is set when Warm Reset processing on this port completes. 0 = No change. (Default) 1 = Warm reset complete
18	0h RW/1C	**Port Enabled Disabled Change (PEC):** 0 = No change. (Default) 1 = There is a change to PED bit.
17	0h RW/1C	**Connect Status Change (CSC):** R/WC. This flag indicates a change has occurred in the port's Current Connect Status (CCS) or Cold Attach Status (CAS) bits. 0 = No change. (Default) 1 = There is a change to the CCS or CAS bit. The xHC sets this bit to 1b for all changes to the port device connect status, even if system software has not cleared an existing Connect Status Change. For example, the insertion status changes twice before system software has cleared the changed condition, root hub hardware will be "setting" an already-set bit (that is, the bit will remain 1b).
16	0h RW	**Port Link State Write Strobe (LWS):** 0 = When 0b, write data in PLS field is ignored. (Default) 1 = When this bit is set to 1b on a write reference to this register, this flag enables writes to the PLS field. Reads to this bit return '0'.
15:14	0h RW	**Port Indicator Control (PIC):** ***Note:*** This register is sticky.
13:10	0h RW	**Port Speed (PortSpeed):** A device attached to this port operates at a speed defined by the following codes: Value Speed 0001b Full-speed 0010b Low speed 0011b Highspeed All other values reserved. Refer to the eXtensible Host Controller Interface for Universal Serial Bus Specification for additional details.
9	1h RW	**Port Power (PP):** Read-only with a value of 1. This indicates that the port does have power.

Bit Range	Default and Access	Field Name (ID): Description
8:5	5h RW	**Port Link State (PLS):** This field is used to power manage the port and reflects its currentlink state.When the port is in the Enabled state, system software may set the link U-state by writing this field. System software may also write this field to force a Disabled to Disconnected state transition of the port. Write Value Description 0 The link shall transition to a U0 state from any of the U-states. 2 USB 2.0 ports only. The link should transition to the U2 State. 3 The link shall transition to a U3 state from any of the U-states. This action selectively suspends the device connected to this port. While the Port LinkState = U3, the hub does not propagate downstream-directed traffic to this port, but the hub will respond to resume signaling from the port. 5 USB 3.0 ports only. If the port is in the Disabled state (PLS = Disabled, PP= 1), then the link shall transition to a RxDetect state and the port shall transition to the Disconnected state, else ignored. 15 USB 2.0 ports only. If the port is in the U3 state (PLS = U3), then the link shall remain in the U3 state and the port shall transition to the U3Exit substate, else ignored. All other values Ignored Read Value Definition 0 Link is in the U0 State 1 Link is in the U1 State 2 Link is in the U2 State 3 Link is in the U3 State (Device Suspended) 4 Link is in the Disabled State 5 Link is in the RxDetect State 6 Link is in the Inactive State 7 Link is in the Polling State 8 Link is in the Recovery State 9 Link is in the Hot Reset State 10 Link is in the Compliance Mode State 11 Link is in the Test Mode State 12–14 Reserved 15 Link is in the Resume State
4	0h RW/1S	**Port Reset (PR):** When software writes a 1 to this bit (from a 0), the bus reset sequence as 1=port in reset 0=port not in reset
3	0h RW	**Over-current Active (OCA):** 0 = This port does not have an overcurrent condition. (Default) 1 = This port currently has an overcurrent condition. This bit will automatically transition from 1 to 0 when the over current condition is removed. The PCH automatically disables the port when the overcurrent active bit is 1.
2	0h RO	Reserved.
1	0h RW/C	**Port Enabled Disabled (PED):** Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a 1 to this bit. Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by host software. The bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events. 0=disable 1=enable(default)
0	0h RW	**Current Connect Status (CCS):** This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set. 0=no device is present 1=device is present on port.

29.9.18 Port Power Management Status and Control USB2 (PORTPMSCN)—Offset 484h

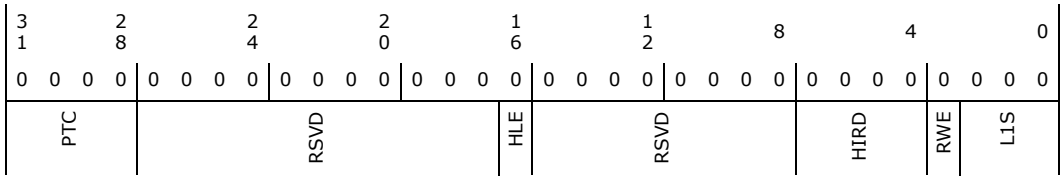
Address Offset: Port 1 484-487h
Default Value: 00000000h
Access: RO; RW; RWS;
Size: 32 bits
There are 6 USB2 PORTPMSC registers at offsets:
484h, 494h, ... (484h + (NumUSB2-1)*10h)

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RW	**Port Test Control (PTC):** When this field is '0', the port is not operating in a test mode. (Default) A non-zero value indicates that the port is operating in test mode and the specific test mode is indicated by the specific value. A non-zero Port Test Control value is only valid to a port that is in the Disabled state. If the port is not in this state, the xHC shall respond with the Port Test Control field set to Port Test Control Error. The encoding of the Test Mode bits for a USB 2.0 port are: Value Test Mode 0h Test mode not enabled 1h Test J_STATE 2h Test K_STATE 3h Test SE0_NAK 4h Test Packet 5h Test FORCE_ENABLE 6h–14h Reserved. 15 Port Test Control Error
27:17	0h RO	Reserved.
16	0h RW	**Hardware LPM Enable (HLE):** 0=disable 1=Enable. When this bit is a 1, hardware controlled LPM shall be enabled for this port. Refer to Section 4 of the *USB 2.0 LPM Specification* for more information.
15:8	0h RO	Reserved.
7:4	0h RW	**Host Initiated Resume Duration (HIRD):** ***Note:*** This register is sticky.
3	0h RW	**Remote Wake Enable (RWE):** The host system sets this flag to enable or disable the device for remote wake from L1. 0=disable 1=enable The value of this flag will temporarily (while in L1) override the current setting of the Remote Wake feature set by the standard Set/ClearFeature() commands defined in Universal Serial Bus Specification, revision 2.0, Chapter 9.
2:0	0h RW	**L1 Status (L1S):** ***Note:*** This register is sticky.

29.9.19 Port N Hardware LPM Control Register (PORTHLPMCN)—Offset 48Ch

There are 9 PORTHLPMC registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh, 50Ch.This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST).The definition for the fields depend on the protocol supported. For USB3 this register is reserved and shall be treated by software as RsvdP. For USB2 the definition is given below. Fields contain parameters necessary for xHC to automatically generate an LPM Token to the downstream device.

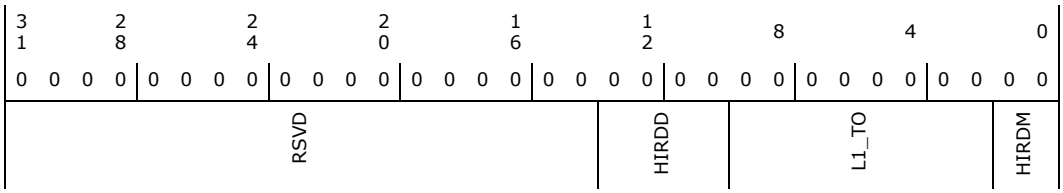
Access Method

Type: MEM Register (Size: 32 bits)

Device: 20

Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13:10	0h RW	**Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume if an exit from L1. The HIRDD value is is encoded as follows: 0h: 50 us (default) 1h: 125 us 2h: 200 us...Fh: 1.175ms The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value.
9:2	0h RW	**L1 Timeout (L1_TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: 00h: 128 us (default) 01h: 256 us....FFh: 65,280us
1:0	0h RW	**Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used. Following are permissible values: 0: Initiate L1 using HIRD only time out (default) 1: Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD 2,3: Reserved ***Note:*** This register is sticky.

29.9.20 Port Status and Control USB3 (PORTSCXUSB3)—Offset 580h

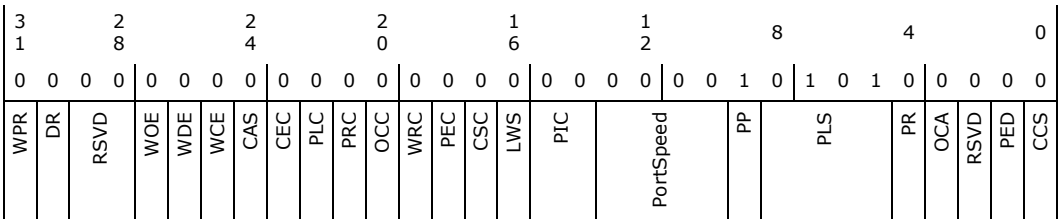
There are USB3 port status and control registers at offsets:
580h, 590h,5A0h,... (580h + (#of USB3 ports -1)*10h)

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 000002A0h



Bit Range	Default and Access	Field Name (ID): Description
31	0b RW/1S	**Warm Port Reset (WPR):** When software sets this bit to 1b, the Warm Reset sequence is enabled.
30	0b RW/L	**Device Removable (DR):** This bit indicates if this port has a removable device. 0 = Device is removable. 1 = Device is non-removable.
29:28	00b RO	Reserved.
27	0b RW	**Wake on Over-current Enable (WOE):** 0 = Disable. (Default) 1 = Enable. Writing this bit to a 1b enables the port to be sensitive to over-current conditions as system wake-up events.
26	0b RW	**Wake on Disconnect Enable (WDE):** 0 = Disable. (Default) 1 = Enable. Writing this bit to a 1b enables the port to be sensitive to device disconnects as system wake-up events.
25	0b RW	**Wake on Connect Enable (WCE):** 0 = Disable. (Default) 1 = Enable. Writing this bit to a 1b enables the port to be sensitive to device connects as system wake-up events.
24	0b RO	**Cold Attach Status (CAS):** This bit indicates that far-end terminations were detected in the Disconnected state and the Root Hub Port State Machine was unable to advance to the Enabled state. Software shall clear this bit by writing a 1b to the WPR bit or the xHC shall clear this bit if the CSS bit transitions to 1.
23	0b RW/1C	**Port Config Error Change (CEC):** ***Note:*** This register is sticky.
22	0b RW/1C	**Port Link State Change (PLC):** 0 = No change 1 = Link Status Change
21	0b RW/1C	**Port Reset Change (PRC):** This flag is set to ‘1’ due a '1' to '0' transition of Port Reset (PR). for example, when any reset processing on this port is complete. 0 = No change 1 = Reset Complete

Bit Range	Default and Access	Field Name (ID): Description
20	0b RW/1C	**Over-current Change (OCC):** The functionality of this bit is not dependent upon the port owner. Software clears this bit by writing a 1 to it. 0 = No change. (Default) 1 = There is a change to Overcurrent Active.
19	0b RW/1C	**Warm Port Reset Change (WRC):** This bit is set when Warm Reset processing on this port completes. 0 = No change. (Default) 1 = Warm reset complete
18	0b RW/1C	**Port Enabled Disabled Change (PEC):** 0 = No change. (Default) 1 = There is a change to PED bit.
17	0b RW/1C	**Connect Status Change (CSC):** R/WC. This flag indicates a change has occurred in the port's Current Connect Status (CCS) or Cold Attach Status (CAS) bits. 0 = No change. (Default) 1 = There is a change to the CCS or CAS bit. The xHC sets this bit to 1b for all changes to the port device connect status, even if system software has not cleared an existing Connect Status Change. For example, the insertion status changes twice before system software has cleared the changed condition, root hub hardware will be "setting" an already-set bit (that is, the bit will remain 1b).
16	0b RW	**Port Link State Write Strobe (LWS):** 0 = When 0b, write data in PLS field is ignored. (Default) 1 = When this bit is set to 1b on a write reference to this register, this flag enables writes to the PLS field. Reads to this bit return '0'.
15:14	00b RW	**Port Indicator Control (PIC):** ***Note:*** This register is sticky.
13:10	0h RW	**Port Speed (PortSpeed):** A device attached to this port operates at a speed defined by the following codes: Value Speed 0100b: Super Speed.
9	1b RW	**Port Power (PP):** Read-only with a value of 1. This indicates that the port does have power.
8:5	5h RW	**Port Link State (PLS):** This field is used to power manage the port and reflects its currentlink state.When the port is in the Enabled state, system software may set the link U-state by writing this field. System software may also write this field to force a Disabled to Disconnected state transition of the port. Write Value Description 0 The link shall transition to a U0 state from any of the U-states. 2 USB 2.0 ports only. The link should transition to the U2 State. 3 The link shall transition to a U3 state from any of the U-states. This action selectively suspends the device connected to this port. While the Port LinkState = U3, the hub does not propagate downstream-directed traffic to this port, but the hub will respond to resume signaling from the port. 5 USB 3.0 ports only. If the port is in the Disabled state (PLS = Disabled, PP= 1), then the link shall transition to a RxDetect state and the port shall transition to the Disconnected state, else ignored. 15 USB 2.0 ports only. If the port is in the U3 state (PLS = U3), then the link shall remain in the U3 state and the port shall transition to the U3Exit substate, else ignored. All other values Ignored Read Value Definition 0 Link is in the U0 State 1 Link is in the U1 State 2 Link is in the U2 State 3 Link is in the U3 State (Device Suspended) 4 Link is in the Disabled State 5 Link is in the RxDetect State 6 Link is in the Inactive State 7 Link is in the Polling State 8 Link is in the Recovery State 9 Link is in the Hot Reset State 10 Link is in the Compliance Mode State 11 Link is in the Test Mode State 12–14 Reserved 15 Link is in the Resume State
4	0b RW/1S	**Port Reset (PR):** When software writes a 1 to this bit (from a 0), the bus reset sequence as 1=port in reset 0=port not in reset

Bit Range	Default and Access	Field Name (ID): Description
3	0b RW	**Over-current Active (OCA):** 0 = This port does not have an overcurrent condition. (Default) 1 = This port currently has an overcurrent condition. This bit will automatically transition from 1 to 0 when the over current condition is removed. The PCH automatically disables the port when the overcurrent active bit is 1.
2	0b RO	Reserved.
1	0h RW/1C	**Port Enabled Disabled (PED):** Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a 1 to this bit. Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by host software. The bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events. 0=disable 1=enable(default)
0	0h RW	**Current Connect Status (CCS):** This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set. 0=no device is present 1=device is present on port.

29.9.21 Port Power Management Status and Control USB3 (PORTPMSCX)—Offset 584h

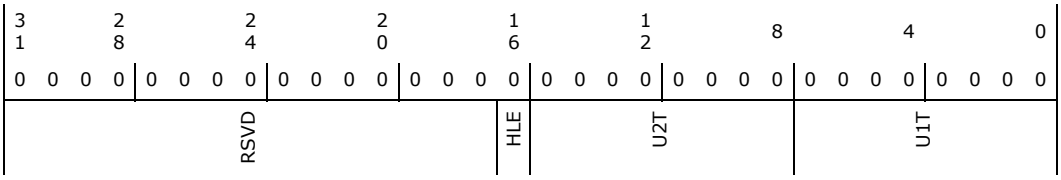
There are 10 USB3 PORTPMSC registers at offsets:
584h, 594h, ... (484h + (# of USB3 ports-1)*10h)

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 00000000h



Bit Range	Default and Access	Field Name (ID): Description
31:17	0000h RO	Reserved.
16	0h RW	**Hardware LPM Enable (HLE):** 0=disable 1=Enable. When this bit is a 1, hardware controlled LPM shall be enabled for this port. Refer to Section 4 of the *USB 2.0 LPM Specification* for more information.
15:8	00h RW/S	**U2 Timeout (U2T)**
7:0	00h RW/S	**U1 Timeout (U1T)**

29.9.22 USB3 Port Link Info (PORTLI)—Offset 588h

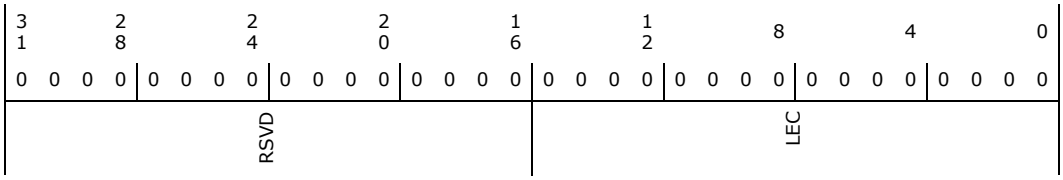
There are 10 USB3 PORTLI registers at offsets:
588h, 598h, ... (584h + (# of USB3 ports-1)*10h)

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 00000000h



Bit Range	Default and Access	Field Name (ID): Description
31:16	00h RO	Reserved.
15:0	0000h RW	**Link Error Count (LEC)** Displays the Link Error Count for the USB3 Port

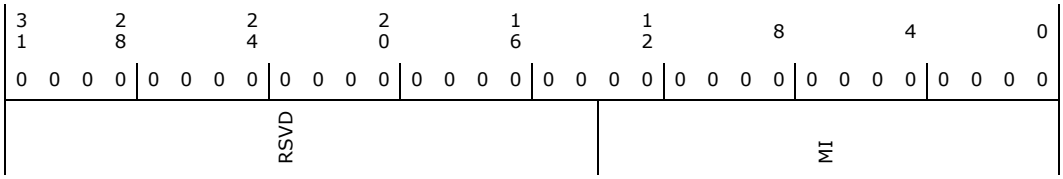
29.9.23 Microframe Index (RTMFINDEX)—Offset 2000h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 00000000h



Bit Range	Default and Access	Field Name (ID): Description
31:14	0h RO	Reserved.
15:0	0h RO	**Microframe Index (MI):** The value in this register increments at the end of each microframe (for example, 125 us). Bits [13:3] may be used to determine the current 1ms frame index.

29.9.24 Interrupt x Management (IMANx) - Offset 2020h

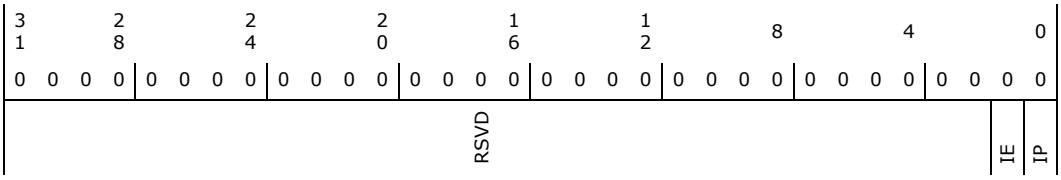
There are 8 IMAN registers at offsets 2020h, 2040h, 2060h ... 2100h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 00000000h



Bit Range	Default and Access	Field Name (ID): Description
31:2	0000000h RO	Reserved.
1	0b RW	Interrupt Enable (IE)
0	0b RW/1C	**Interrupt Pending (IP):** 0 = No interrupt is pending for the interrupter. 1 = An interrupt is pending for this interrupter. This bit is to 1b when IE =1, the IMODI interrupt Moderation Counter field = 0b, the Event Ring associated with the Interrupter is not empty (or for the Primary Interrupter when HCE flag is set to 1b), and EHB = 0. If MSI interrupts are enabled, this flag shall be cleared automatically when the PCI Dword write generated by the interrupt assertion is complete. If PCI pin Interrupts are enabled, this flag shall be cleared by SW.

29.9.25 Interrupter X Moderation (IMODx) - Offset 2024h

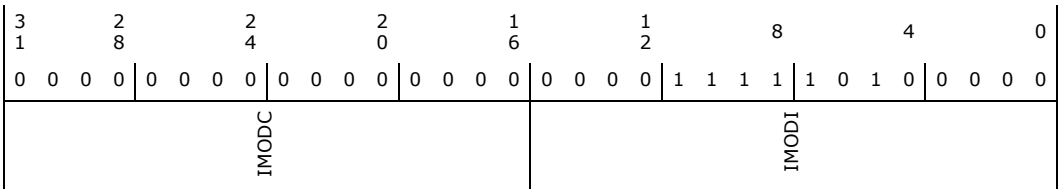
There are 8 IMOD registers at offsets 2024h, 2044h, 2064h ... 2104h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 00000FA0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0000 RW	**Interrupt Moderation Counter (IMODC)**
15:0	0FA0 RW/1C	**Interrupt Moderation Interval (IMODI):**

29.9.26 Event Ring Segment Table Size x (ERSTSZx)—Offset 2028h

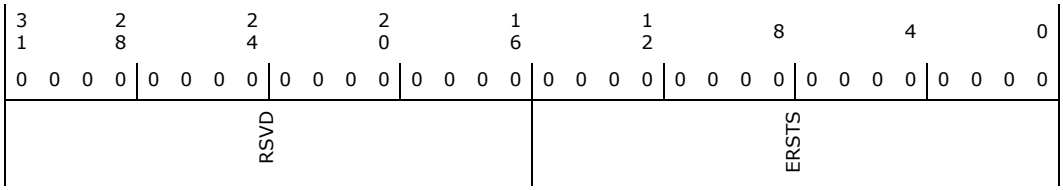
There are 8 ERSTSZ register.x = 1, 2, ..., 8
Address Offset: 2028-202Bh, 2048-204Bh, ..., 2028+(MaxInts-1)*20h-202B+(MaxInts-1)*20h

Access Method

Type: MEM Register (Size: 32 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW	**Event Ring Segment Table Size (ERSTS):** This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register.

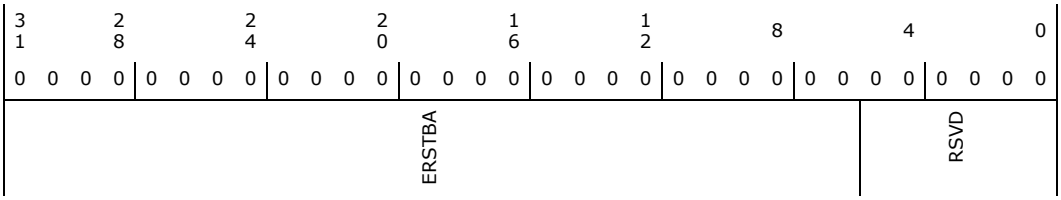
29.9.27 Event Ring Segment Table Base Address Low x (ERSTBA_LOx)—Offset 2030h

There are 8 ERSTBA_LO registersx = 1, 2, ..., 8
Address Offset: 2028-202Bh, 2048-204Bh, ..., 2028+(MaxInts-1)*20h-202B+(MaxInts-1)*20h

Access Method

Type: MEM Register (Size: 32 bits)
Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA):** This field defines the low order bits of the start address of the Event Ring Segment Table. This field shall not be modified if HCHalted (HCH) = 0.
5:0	0h RO	Reserved.

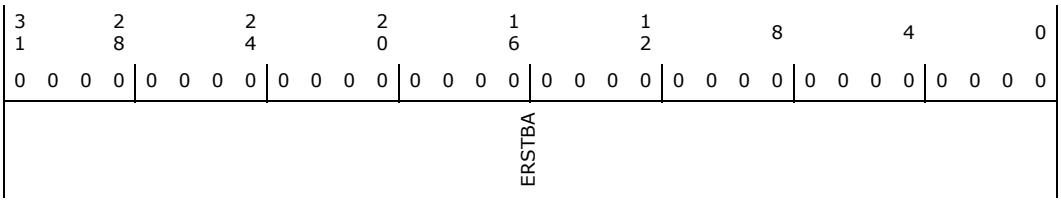
29.9.28 Event Ring Segment Table Base Address High x (ERSTBA_HIx)—Offset 2034h

Address Offset: 2034-2037h, 2054-2057h, ..., 2034+(MaxInts-1)*20h-2037+(MaxInts-1)*20h

Access Method

Type: MEM Register (Size: 32 bits)
Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA):** This field defines the low order bits of the start address of the Event Ring Segment Table. This field shall not be modified if HCHalted (HCH) = 0.

29.9.29 Event Ring Dequeue Pointer Low x (ERDP_LOx)—Offset 2038h

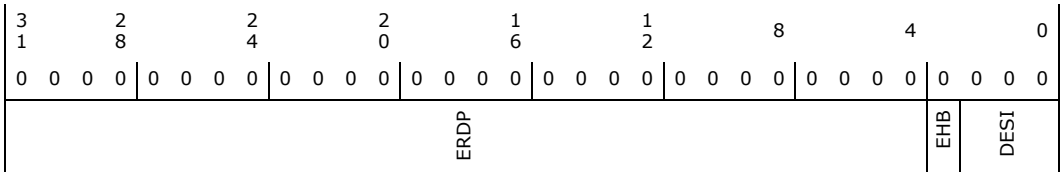
There are 8 ERDP_LO registers.x = 1, 2, ...,8
br] Address Offset: 2038-203Bh, 2058-205Bh, ..., 2038+(MaxInts-1)*20h-203B+(MaxInts-1)*20h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

29.9.30 Event Ring Dequeue Pointer High x (ERDP_HIx)—Offset 203Ch

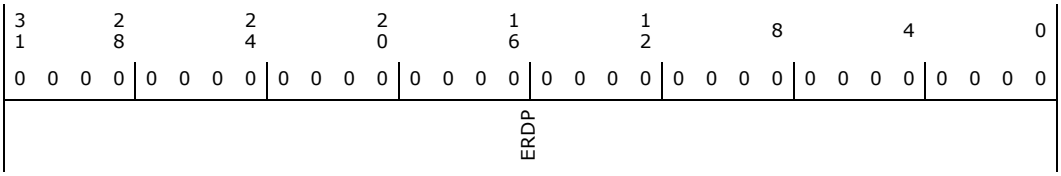
There are 8 ERDP_HI registers.x = 1, 2, ..., 8
Address Offset: 203C-203Fh, 205C-205Fh, ..., 203C+(MaxInts-1)*20h-203F+(MaxInts-1)*20h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

29.9.31 Door Bell x (DBx)—Offset 3000h

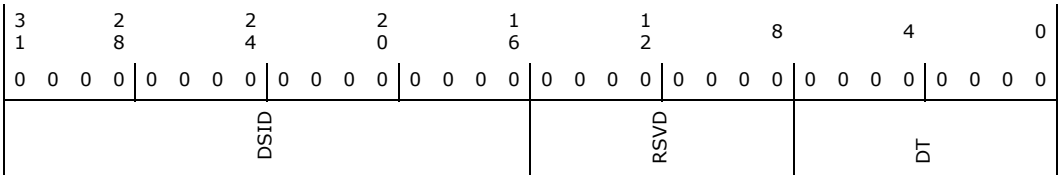
Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.
Address Offset: 3000-3003h, 3004-3007h, ..., 307C-307Fh

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSID)**
15:8	0h RO	Reserved.
7:0	0h RW	**DB Target (DT):** This field defines the target of the doorbell reference. The table below defines the xHC notification that is generated by ringing the doorbell. Doorbell Register 0 is dedicated to Command Ring and decodes this field differently than the other Doorbell Registers. Refer to the xHCI Specification for definitions of the values.

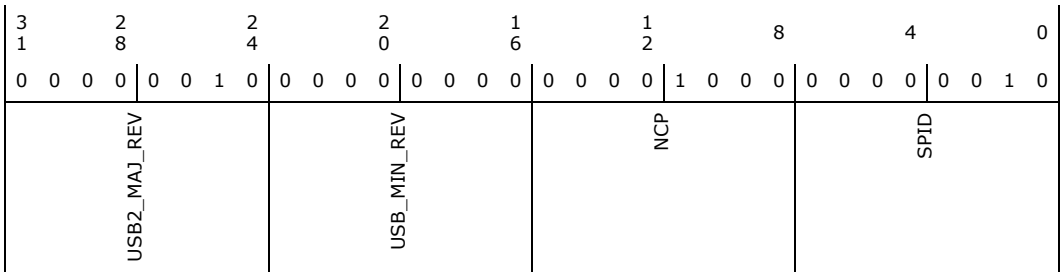
29.9.32 XECP_SUPP_USB2_0 (XECP_SUPP_USB2_0)—Offset 8000h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 2000802h



Bit Range	Default and Access	Field Name (ID): Description
31:24	2h RO	**USB Major Revision: 2.0 (USB2_MAJ_REV):** Major Specification Release Number in Binary-Coded Decimal (i.e., version 3.x is 03h). This field identifies the major release number component of the specification with which the xHC is compliant.
23:16	0h RO	**USB Minor Revision (USB_MIN_REV):** Minor Specification Release Number in Binary-Coded Decimal (i.e., version x.10 is 10h). This field identifies the minor release number component of the specification with which the xHC is compliant.
15:8	8h RO	**Next Capability Pointer (NCP):** This field indicates the location of the next capability with respect to the effective address of this capability. Refer to Table 145 for more information on this field.
7:0	2h RO	**Supported Protocol ID (SPID):** This field identifies the xHCI Extended capability. Refer to Table 146 for a list of the valid xHCI extended capabilities.

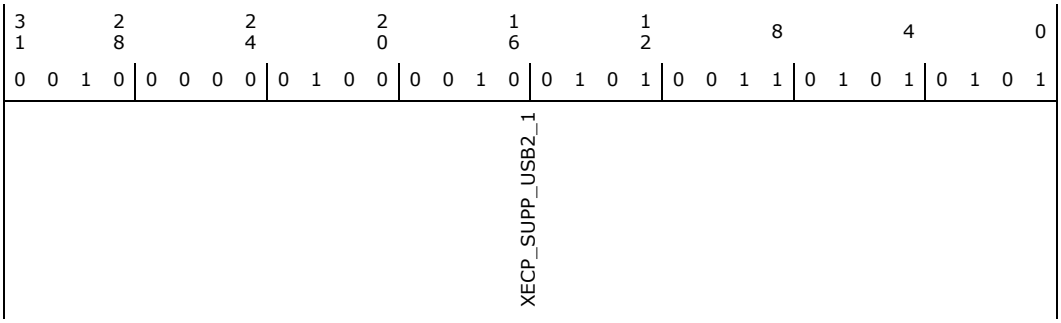
29.9.33 XECP_SUPP_USB2_1 (XECP_SUPP_USB2_1)—Offset 8004h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 20425355h



Bit Range	Default and Access	Field Name (ID): Description
31:0	20425355h RO	**XECP_SUPP_USB2_1 (XECP_SUPP_USB2_1):** This field is a mnemonic name string that references the specification with which the xHC is compliant. Four ASCII characters may be defined. Allowed characters are: alphanumeric, space, and underscore. Alpha characters are case sensitive.

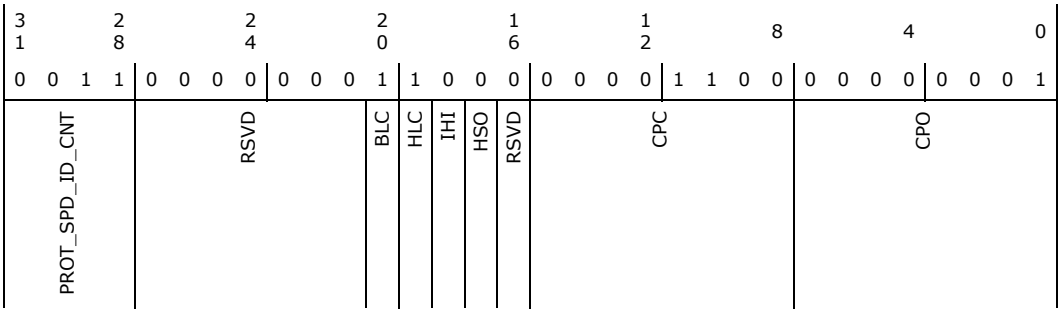
29.9.34 XECP_SUPP_USB2_2 (XECP_SUPP_USB2_2)—Offset 8008h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 30180C01h



Bit Range	Default and Access	Field Name (ID): Description
31:28	3h RO	**Protocol Speed ID Count (PROT_SPD_ID_CNT):** 3 USB 2.0 Speed (High, Full, Low)
27:21	0h RO	Reserved.
20	1h RO	**BESL LPM Capability (BLC):** Bit is set to 1 to indicate that the the ports described by this xHCI Supported Protocol Capability will apply BESL timing to BESL and BESLD fields of the PORTPMSC and PORTHLPMCC registers.
19	1h RO	**Protocol Defined - Hardware LMP Capability (HLC)**
18	0h RO	**Protocol Defined - Integrated Hub Implementation (IHI)**
17	0h RO	**Protocol Defined - High SPeed Only (HSO):** This field indicates the number of Protocol Speed ID (PSI) Dwords that the xHCI Supported Protocol Capability data structure contains. If this field is non-zero, then all speeds supported by the protocol shall be defined using PSI Dwords, i.e., no implied Speed ID mappings apply.
16	0h RO	Reserved.
15:8	Ch RO	**Compatible Port Count (CPC):** This field identifies the number of consecutive Root Hub Ports (starting at the Compatible Port Offset) that support this protocol. Valid values are 1 to MaxPorts.
7:0	1h RO	**Compatible Port Offset (CPO):** This field specifies the starting Port Number of Root Hub Ports that support this protocol. Valid values are '1' to MaxPorts.

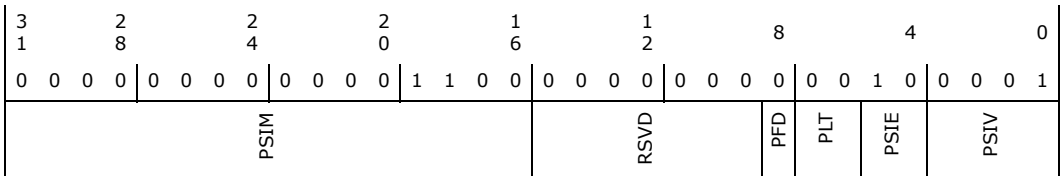
29.9.35 XECP_SUPP_USB2_3 (Full Speed) (XECP_SUPP_USB2_3)—Offset 8010h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: C0021h



Bit Range	Default and Access	Field Name (ID): Description
31:16	Ch RO	**Protocol Speed ID Mantissa (PSIM):** This field defines the mantissa that shall be applied to the PSIE when calculating the maximum bit rate represented by this PSI Dword.
15:9	0h RO	Reserved.
8	0h RO	**PSI Full Duplex (PFD):** If this bit is '1' the link is full-duplex (dual-simplex), and if '0' the link is half-duplex (simplex).

Bit Range	Default and Access	Field Name (ID): Description
7:6	0h RO	**PSI Type (PLT):** This field identifies whether the PSI Dword defines a symmetric or asymmetric bit rate, and if asymmetric, then this field also indicates if this Dword defines the receive or transmit bit rate. Note that the Asymmetric PSI Dwords shall be paired, i.e., an Rx immediately followed by a Tx, and both Dwords shall define the same value for the PSIV. PLT Value Bit Rate Note 0 Symmetric Single PSI Dword 1 Reserved 2 Asymmetric Rx Paired with Asymmetric Tx PSI Dword 3 Asymmetric Tx Immediately follows Rx Asymmetric PSI Dword
5:4	2h RO	**Protocol Speed ID Exponent (PSIE):** This field defines the base 10 exponent times 3, that shall be applied to the Protocol Speed ID Mantissa when calculating the maximum bit rate represented by this PSI Dword. PSIE Value Bit Rate 0 Bits per second 1 Kb/s 2 Mb/s 3 Gb/s
3:0	1h RO	**Protocol Speed ID Value (PSIV):** If a device is attached that operates at the bit rate defined by this PSI Dword, then the value of this field shall be reported in the Port Speed field of PORTSC register (5.4.8) of a compatible port. ***Note:*** The PSIV value of '0' is reserved and shall not be defined by a PSI.

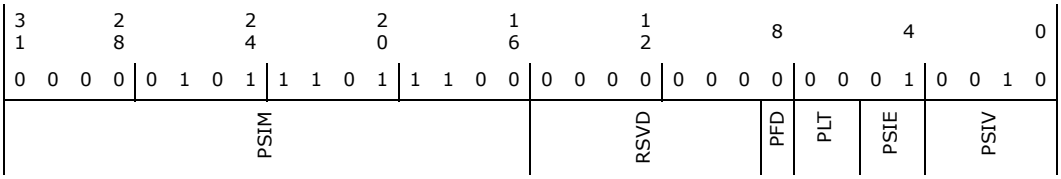
29.9.36 XECP_SUPP_USB2_4 (Low Speed) (XECP_SUPP_USB2_4)—Offset 8014h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 5DC0012h



Bit Range	Default and Access	Field Name (ID): Description
31:16	5DCh RO	**Protocol Speed ID Mantissa (PSIM)**
15:9	0h RO	Reserved.
8	0h RO	**PSI Full Duplex (PFD)**
7:6	0h RO	**PSI Type (PLT)**
5:4	1h RO	**Protocol Speed ID Exponent (PSIE)**
3:0	2h RO	**Protocol Speed ID Value (PSIV)**

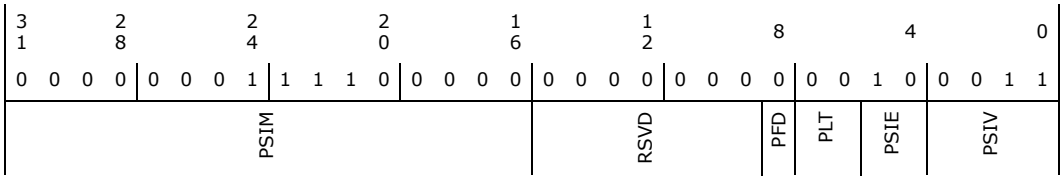
29.9.37 XECP_SUPP_USB2_5 (High Speed) (XECP_SUPP_USB2_5)—Offset 8018h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 1E00023h



Bit Range	Default and Access	Field Name (ID): Description
31:16	1E0h RO	**Protocol Speed ID Mantissa (PSIM)**
15:9	0h RO	Reserved.
8	0h RO	**PSI Full Duplex (PFD)**
7:6	0h RO	**PSI Type (PLT)**
5:4	2h RO	**Protocol Speed ID Exponent (PSIE)**
3:0	3h RO	**Protocol Speed ID Value (PSIV)**

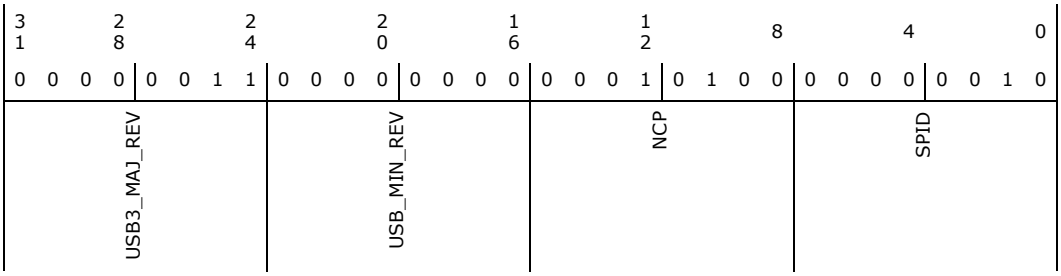
29.9.38 XECP_SUPP_USB3_0 (XECP_SUPP_USB3_0)—Offset 8020h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 3001402h



Bit Range	Default and Access	Field Name (ID): Description
31:24	3h RO	**USB Major Revision: 3.0 (USB3_MAJ_REV)**
23:16	0h RO	**USB Minor Revision (USB_MIN_REV)**
15:8	14h RO	**Next Capability Pointer (NCP)**
7:0	2h RO	**Supported Protocol ID (SPID)**

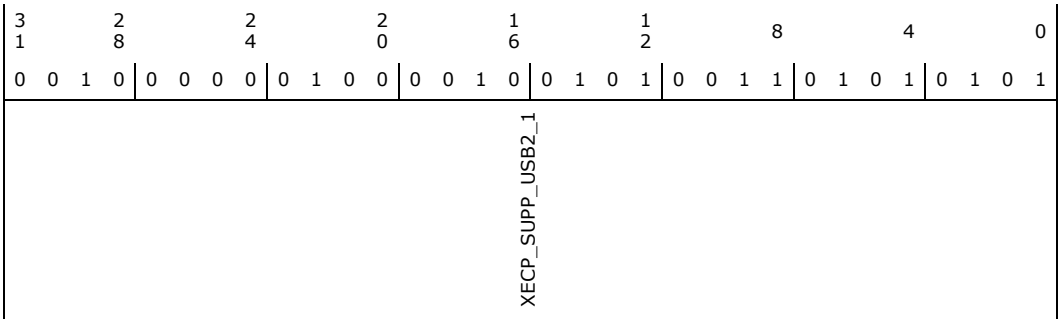
29.9.39 XECP_SUPP_USB3_1 (XECP_SUPP_USB3_1)—Offset 8024h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 20425355h



Bit Range	Default and Access	Field Name (ID): Description
31:0	20425355h RO	**XECP_SUPP_USB2_1 (XECP_SUPP_USB2_1):** Namestring USB

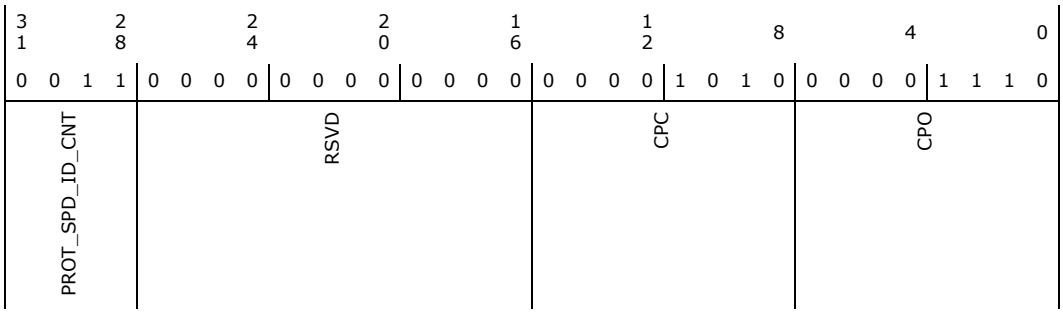
29.9.40 XECP_SUPP_USB3_2 (XECP_SUPP_USB3_2)—Offset 8028h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 30000A0Eh



Bit Range	Default and Access	Field Name (ID): Description
31:28	3h RO	**Protocol Speed ID Count (PROT_SPD_ID_CNT):** 1 USB 3.0 Speed (Supper Speed)
27:16	0h RO	Reserved.
15:8	Ah RO	**Compatible Port Count (CPC)**
7:0	Eh RO	**Compatible Port Offset (CPO)**

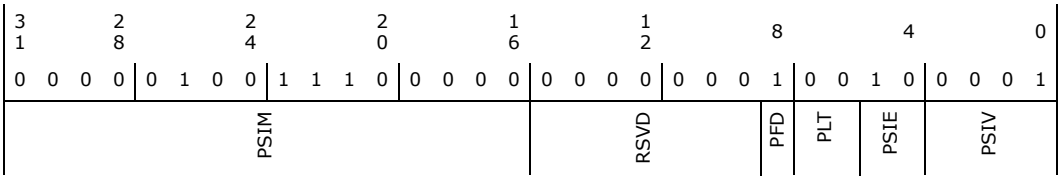
29.9.41 XECP_SUPP_USB3_3 (XECP_SUPP_USB3_3)—Offset 8030h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 4E00121h



Bit Range	Default and Access	Field Name (ID): Description
31:16	4E0h RO	**Protocol Speed ID Mantissa (PSIM)**
15:9	0h RO	Reserved.
8	1h RO	**PSI Full Duplex (PFD)**
7:6	0h RO	**PSI Type (PLT)**
5:4	2h RO	**Protocol Speed ID Exponent (PSIE)**
3:0	1h RO	**Protocol Speed ID Value (PSIV)**

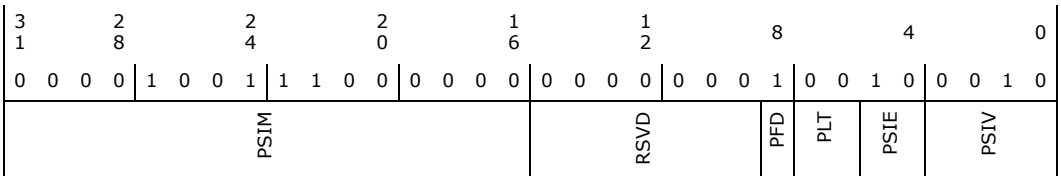
29.9.42 XECP_SUPP_USB3_4 (XECP_SUPP_USB3_4)—Offset 8034h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 9C00122h



Bit Range	Default and Access	Field Name (ID): Description
31:16	9C0h RO	**Protocol Speed ID Mantissa (PSIM)**
15:9	0h RO	Reserved.
8	1h RO	**PSI Full Duplex (PFD)**
7:6	0h RO	**PSI Type (PLT)**
5:4	2h RO	**Protocol Speed ID Exponent (PSIE)**
3:0	2h RO	**Protocol Speed ID Value (PSIV)**

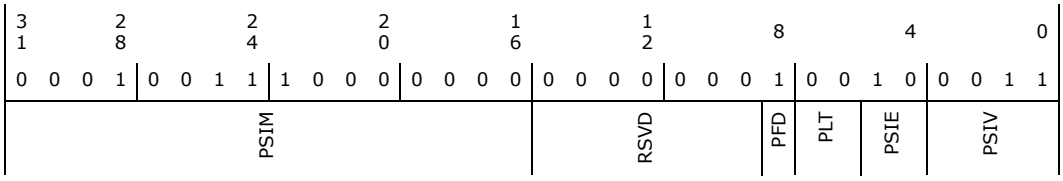
29.9.43 XECP_SUPP_USB3_5 (XECP_SUPP_USB3_5)—Offset 8038h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 13800123h



Bit Range	Default and Access	Field Name (ID): Description
31:16	1380h RO	**Protocol Speed ID Mantissa (PSIM)**
15:9	0h RO	Reserved.
8	1h RO	**PSI Full Duplex (PFD)**
7:6	0h RO	**PSI Type (PLT)**
5:4	2h RO	**Protocol Speed ID Exponent (PSIE)**
3:0	3h RO	**Protocol Speed ID Value (PSIV)**

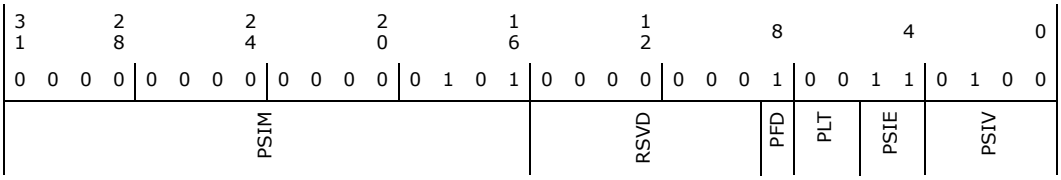
29.9.44 XECP_SUPP_USB3_6 (XECP_SUPP_USB3_6)—Offset 803Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 50134h



Bit Range	Default and Access	Field Name (ID): Description
31:16	5h RO	**Protocol Speed ID Mantissa (PSIM)**
15:9	0h RO	Reserved.
8	1h RO	**PSI Full Duplex (PFD)**
7:6	0h RO	**PSI Type (PLT)**
5:4	3h RO	**Protocol Speed ID Exponent (PSIE)**
3:0	4h RO	**Protocol Speed ID Value (PSIV)**

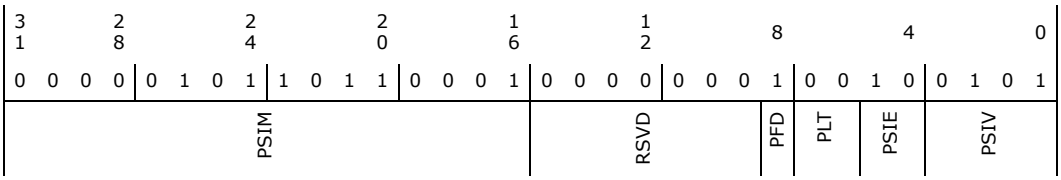
29.9.45 XECP_SUPP_USB3_7 (XECP_SUPP_USB3_7)—Offset 8040h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 5B10125h



Bit Range	Default and Access	Field Name (ID): Description
31:16	5B1h RO	**Protocol Speed ID Mantissa (PSIM)**
15:9	0h RO	Reserved.
8	1h RO	**PSI Full Duplex (PFD)**
7:6	0h RO	**PSI Type (PLT)**
5:4	2h RO	**Protocol Speed ID Exponent (PSIE)**
3:0	5h RO	**Protocol Speed ID Value (PSIV)**

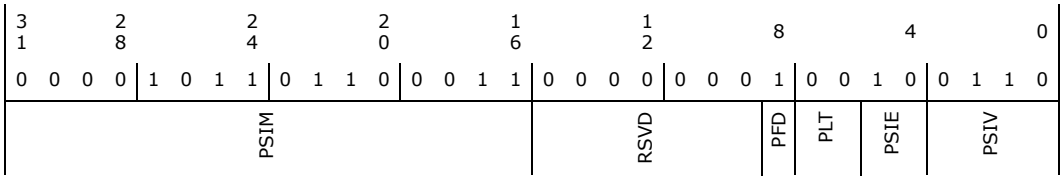
29.9.46 XECP_SUPP_USB3_8 (XECP_SUPP_USB3_8)—Offset 8044h

Access Method

Type: MEM Register (Size: 32 bits)

Device: 20
Function: 0

Default: B630126h



Bit Range	Default and Access	Field Name (ID): Description
31:16	B63h RO	**Protocol Speed ID Mantissa (PSIM)**
15:9	0h RO	Reserved.
8	1h RO	**PSI Full Duplex (PFD)**
7:6	0h RO	**PSI Type (PLT)**
5:4	2h RO	**Protocol Speed ID Exponent (PSIE)**
3:0	6h RO	**Protocol Speed ID Value (PSIV)**

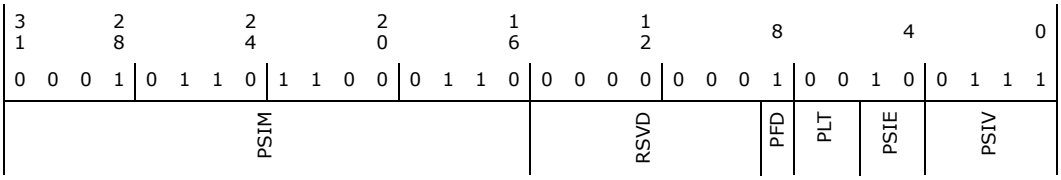
29.9.47 XECP_SUPP_USB3_9 (XECP_SUPP_USB3_9)—Offset 8048h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 16C60127h



Bit Range	Default and Access	Field Name (ID): Description
31:16	16C6h RO	**Protocol Speed ID Mantissa (PSIM)**
15:9	0h RO	Reserved.
8	1h RO	**PSI Full Duplex (PFD)**
7:6	0h RO	**PSI Type (PLT)**
5:4	2h RO	**Protocol Speed ID Exponent (PSIE)**
3:0	7h RO	**Protocol Speed ID Value (PSIV)**

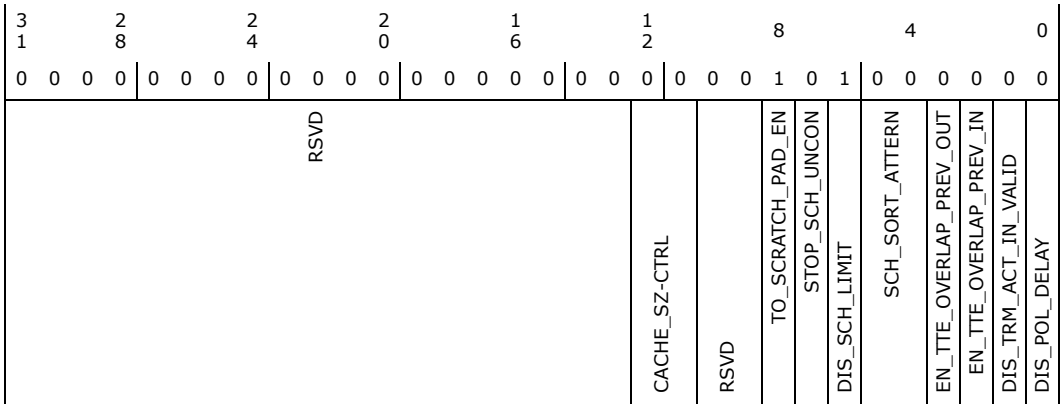
29.9.48 Host Control Scheduler (HOST_CTRL_SCH_REG)—Offset 8094h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 00000100



Bit Range	Default and Access	Field Name (ID): Description
31:13	00000 RO	**Reserved**.
12:11	00b RW	**Cache Size Control Reg (CACHE_SZ_CTRL):** 0: 64 1: 32 2,3: 16
10:9	00b RO	**Reserved**.
8	1b RW	**Turn On Scratch_pad_en (TO_SCRATCH_PAD_EN):** Enables scratch pad function.
7	0b RW	**Scheduler Host Control Reg (STOP_SCH_UNCON)** Enable check to stop scheduling on port that are not connected.
6	0b RW	**Disable Scheduling Limit (DIS_SCH_LIMIT)** Disable 1 pack scheduling limit when ISO pending in present microframe.
5:4	00b RW	**Scheduler Sort Pattern (SCH_SORT_PATTERN)** 00 (default) Search ISO ahead of interrupt within each service interval. 01 - Search USB2-ISO, USB3-ISO, USB2-Interrupt, USB3-Interrupt within each service interval. 10 - Search strictly by interval. 11 - Search all ISO intervals ahead interrupt intervals and within each interval, USB2 ahead of USB3.
3	0b RW	**Enable TTE Overlap Prevention Interrupt Out (EN_TTE_OVERLAP_PREV_OUT)** Enable TTE overlap prevention on interrupt OUT EPs (at cost of possible service interval slip.

Bit Range	Default and Access	Field Name (ID): Description
2	0b RW	**Enable TTE Overlap Prevention Interrupt IN(EN_TTE_OVERLAP_PREV_IN)** Enable TTE overlap prevention on interrupt IN EPs (at cost of possible service interval slip.
1	0b RW	**Disable TRM check (DIS_TRM_ACT_IN_VALID)** Disable TRM active IN EP valid check function.
0	0b RW	**Disable Poll Delay (DIS_POL_DELAY)** Disable poll delay function.

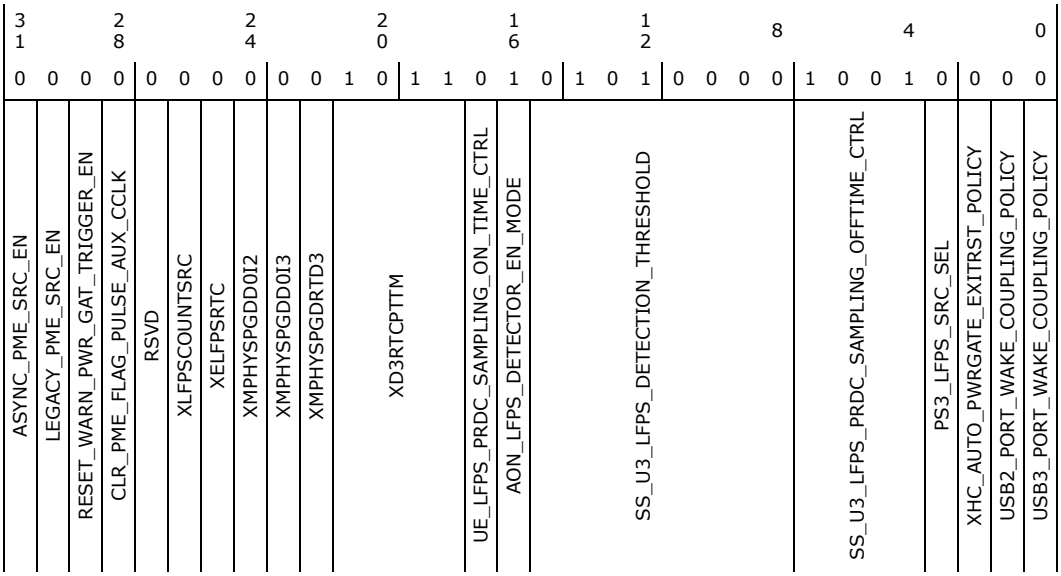
29.9.49 Power Management Control (PMCTRL_REG)—Offset 80A4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 002D5090h



Bit Range	Default and Access	Field Name (ID): Description
31	0b RW	**Async PME Source Enable (ASYNC_PME_SRC_EN)** This field allows the async PME source to be allowed to generate PME. This is specifically required for SOCs that do not allow for any clock other than RTC to be available during RTD3.
30	0b RW	**Legacy PME Source Enable (LEGACY_PME_SRC_EN)** This field allows the legacy PME source to be used in PME generation. The legacy source in reference to the source prior to the RTD3 changes.
29	0b RW	**Reset Warn Power Gate Trigger Disable (RESET_WARN_PWR_GAT_TRIGGER_EN)** This field controls the actions taken for due to reset warn. 0 - Reset Warn will trigger a HW autonomous Power Gate. 1 - Reset Warn will not trigger a HW autonomous Power Gate.

Bit Range	Default and Access	Field Name (ID): Description
28	0b WO	**Internal PME Flag clear (CLR_PME_FLAG_PULSE_AUX_CCLK)** This Write-Only bit can be used to clear the internal PME flag. SW write to 1 will clear the PME flag. SW write to 0 will have no effect and be ignored by the controller. Read always return 0.
27	0b RW	**Reserved**
26	0b	**Source of LFPS OFF Counter (XLFPSCOUNTSRC)** 0: Central RTC Counter for LFPS detection 1: Local Counter for LFPS detection
25	0b RW	**Enable LFPS Filtering on RTC (XELFPSRTC)** 0: Use Oscillator clock for LFPS Filtering during P3. 1: Use RTC Clock for LFPS Filtering during P3.
24	0b RW	**Modphy power gate disable DOI2(XMPHYSPGDD0I2)** ModPHY SUS Well Power Gate Disable for D0I2 0: ModPHY SUS well power gating enabled 1: ModPHY SUS well power gating disabled
23	0b RW	**Modphy power gate disable DOI3 (XMPHYSPGDD0I3)** ModPHY SUS Well Power Gate Disable for D0I3 0: ModPHY SUS well power gating enabled 1: ModPHY SUS well power gating disabled
22	0b RW	**Modphy power gate disable RTD3 (XMPHYSPGDRTD3)** ModPHY SUS Well Power Gate Disable for RTD3 0: ModPHY SUS well power gating enabled 1: ModPHY SUS well power gating disabled
21:18	Bh RW	**D3 RTC Port Timer Tick Multiplier (XD3RTCPTTM)** This register will be the multiplication factor for determining SSIC Wake Detection Frequency and RXDET based on the XD3RTCPTTC value. If XD3RTCPTTC is 9h and this register is Bh, frequency for RXDET and SSIC H8EXIT detection while MODPHY SUS Power gating is enabled would be 99 ms.
17	0b RW	**U3 LFPS Periodic Sampling ON time Control (UE_LFPS_PRDC_SAMPLING_ON_TIME_CTRL);** This field controls the ON time for the LFPS periodic sampling for USB3/SSIC ports. 0: ON time is 2 RTC clocks. 1: ON time is 3 RTC clocks.
16	1b RW	**AON LFPS Detector Enable Mode (AON_LFPS_DETECTOR_EN_MODE)** 1 - Allow the LFSP Detector in AON to own LFPS detection when the port is in PS3 for U2/U3 - not RxD regardless of port ownership. 0 - Allow the LFPS Detector in AON to own the LFPS detection only when the AON owns the port and in U2/U3 - not RxD.
15:8	50h RW	**SS U3 LFPS Detection Threshold (SS_U3_LFPS_DETECTION_THRESHOLD)** This field controls the threshold used to determine when a valid U3 Wake is detected through when using the unfiltered LFPS source. The value on this field will reflect the binary count required to have been detected on the counter being clocked by the unfiltered LFPS source to result in a valid U3 wake detection.
7:4	9h RW	**SS_U3_LFPS_PRDC_SAMPLING_OFFTIME_CTRL (SS_U3_LFPS_PRDC_SAMPLING_OFFTIME_CTRL)** This field controls the OFF time for the LFPS periodic sampling for USB3 Ports 0x0 periodic sampling is disabled. 0x1 OFF time is 1 ms. 0x2 OFF time is 2 ms. 0xF OFF time is 15 ms. The ON Time is determined by the amount of time required to reliably determine if there is a valid LFPS and is HW implementation specific. A speed up mode shall be implemented where this field is in units of us. i.e., 0x1 = 1 us OFF time, 0x2 = 2 us OFF time, etc.
3	0b RW	**PS3 LFPS Source Select (PS3_LFPS_SRC_SEL)** 0: LFPS Source is unfiltered. 1: LFPS Source is filtered (Rx-Elec-Idle). LFPS Source is Rx-Elec-Idle for any non PS3 state.

Bit Range	Default and Access	Field Name (ID): Description
2	0b RW	**XHCI Engine Autonomous Power Gate Exit Reset Policy (XHC_AUTO_PWRGATE_EXITRST_POLICY)** Controls when the xHCI engine is brought out of reset due to a power ungate. 0: Engine is brought out of reset when D3 to D0 is triggered. This allows for a quick power up sequence while leaving the virtual PCIe LTSSM in L23 is power ungate is not due to D3 to D0. 1: Engine is brought out of reset along with the rest of the IP. This is required for PMC save/restore flow.
1	0b RW	**USB2 Port Wake Unit Coupling Policy (USB2_PORT_WAKE_COUPLING_POLICY)** Controls the trigger for USB2 Port Wake Units to initiate Port Level Power Off Preparation. 0: RTD3 triggered 1: - Port Triggered when in L1, L2 or Disabled, Disconnected
0	0b RW	**USB3 Port Wake Unit Coupling Policy (USB3_PORT_WAKE_COUPLING_POLICY)** Controls the trigger for USB3 Port Wake Units to initiate Port Level Power Off Preparation. 0 - RTD3 Triggered 1 - Port Triggered when in PS3 due to RxDetect, U3, U2 or Disabled

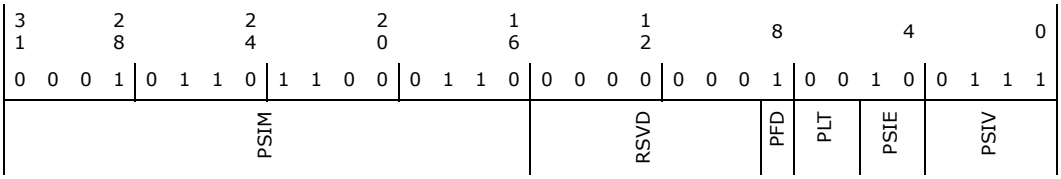
29.9.50 Super Speed Port Enable (SSPE) —Offset 80B8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 16C60127h



Bit Range	Default and Access	Field Name (ID): Description
31:10	0h RO	**Reserved**
9:0	2FFh RW	USB3 Port Enable 1 = Enables PORTSC to see the connects on the port. 0 = Blocks PORTSC from reporting any attach/connects.

29.9.51 USB Legacy Support Capability (USBLEGSUP)—Offset 846Ch

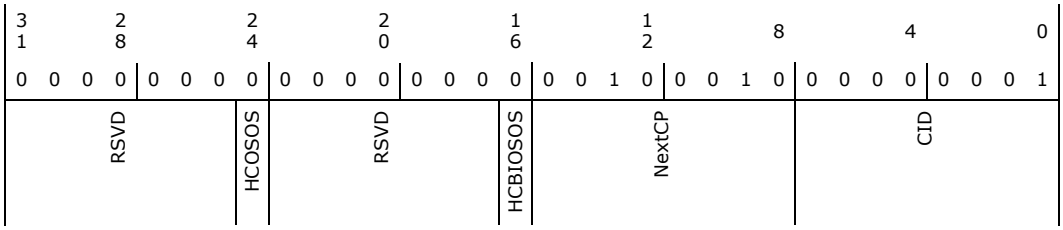
This register is modified and maintained by the BIOS.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 2201h



Bit Range	Default and Access	Field Name (ID): Description
31:25	0h RO	Reserved.
24	0h RW	**HC OS Owned Semaphore (HCOSOS):** Default = '0'. System software sets this bit to request ownership of the xHC. Ownership is obtained when this bit reads as '1' and the HC BIOS Owned Semaphore bit reads as '0'.
23:17	0h RO	Reserved.
16	0h RW	**HC BIOS Owned Semaphore (HCBIOSOS):** Default = '0'. The BIOS sets this bit to establish ownership of the xHC. System BIOS will set this bit to a '0' in response to a request for ownership of the xHC by system software.
15:8	22h RW/S	**Next Capability Pointer (NextCP):** This field indicates the location of the next capability with respect to the effective address of this capability. Refer to Table 145 for more information on this field.
7:0	1h RW/L	**Capability ID (CID):** This field identifies the extended capability. Refer to Table 146 for the value that identifies the capability as Legacy Support. This extended capability requires one additional 32-bit register for control/status information (USBLEGCTLSTS), and this register is located at offset xECP+04h.

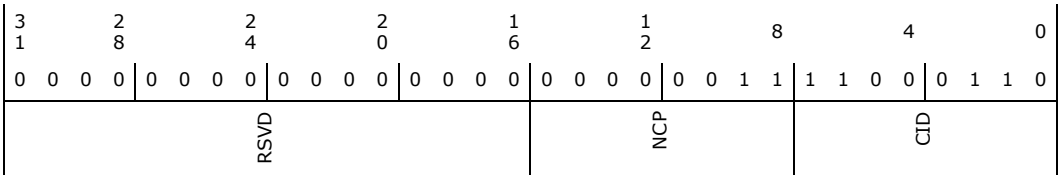
29.9.52 Port Disable Override Capability Register (PDO_CAPABILITY)—Offset 84F4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 3C6h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:8	3h RW/S	**Next Capability Pointer (NCP)**
7:0	C6h RW/S	**Capability ID (CID)**

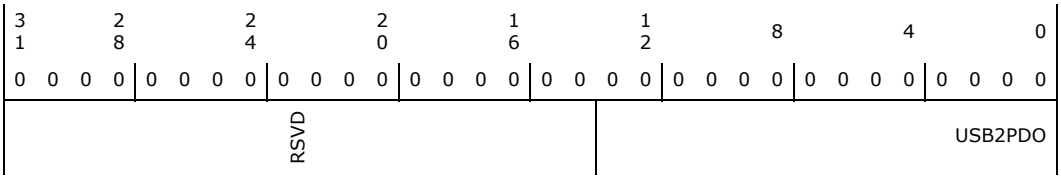
29.9.53 USB2 Port Disable Override (USB2PDO)—Offset 84F8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13:0	0h RW/O	**USB2PDO (USB2PDO):** A '1' in a bit position prevents the corresponding USB2 port from reporting a Device Connection to the XHC. This applies across all USB2 protocol ports. 0 = Allows corresponding USB port to report a device connection to the xHC. 1 = Prevents the corresponding USB port from reporting a device Connection to the xHC. Port to bit mapping is in one-hot encoding, that is bit 0 controls port 1 and so on. Bit 0 = USB 2.0 port 0 ... Bit N = USB 2.0 port N

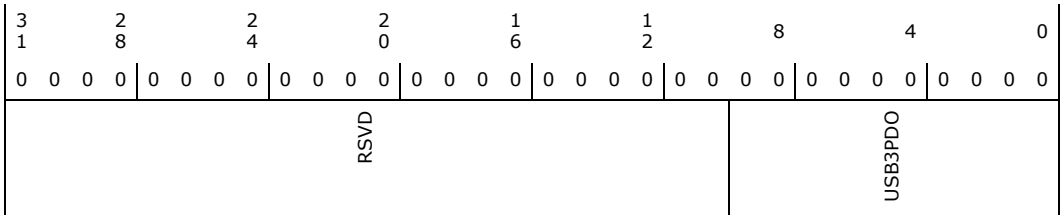
29.9.54 USB3 Port Disable Override (USB3PDO)—Offset 84FCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9:0	0h RW/O	**USB3 Port Disable Override (USB3PDO):** 0 = Allows corresponding USB port to report a Device Connection to the xHC. 1 = Prevents the corresponding USB port from reporting a Device Connection to the xHC. Bit 0 = USB 3.0 Port 1 ... Bit N = USB 3.0 Port N

29.9.55 Debug Capability ID Register (DCID)—Offset 8700h

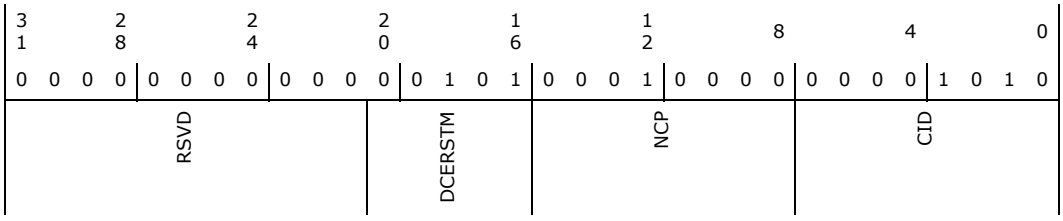
This register is modified and maintained by BIOS.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 5100Ah



Bit Range	Default and Access	Field Name (ID): Description
31:21	0h RO	Reserved.
20:16	5h RW	**Debug Capability Event Ring Segment Table Max (DCERSTM):** ***Note:*** This register is sticky.
15:8	10h RW	**Next Capability Pointer (NCP):** This register is sticky.
7:0	Ah RW	**Capability ID (CID):** This register is sticky.

§

30 Intel® Management Engine Interface (Intel® MEI) (D22:F0, D22:F1, and D22:F4)

30.1 Intel Management Engine Interface Configuration Registers Summary

This section describes the registers for the Intel Management Engine Interface 1 (Intel MEI 1) at Device 22: Function 0.

These registers also apply to the following controllers:

Intel MEI 2 at D22:F1

Intel MEI 3 at D22:F4

Table 30-1. Summary of Intel Management Engine Interface Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Identifiers (HECI1_ID)—Offset 0h	X_8086h
4h	5h	Command (HECI1_CMD)—Offset 4h	0h
6h	7h	Status (HECI1_STS)—Offset 6h	10h
8h	Bh	Revision ID and Class Code (HECI1_RID_CC)—Offset 8h	7800000h
Ch	Ch	Cache Line Size (HECI1_CLS)—Offset Ch	0h
Dh	Dh	Master Latency Timer (HECI1_MLT)—Offset Dh	0h
Eh	Eh	Header Type (HECI1_HTYPE)—Offset Eh	80h
Fh	Fh	Built In Self-Test (HECI1_BIST)—Offset Fh	0h
10h	13h	HECI MMIO Base Address Low (HECI1_MMIO_MBAR_LO)—Offset 10h	4h
14h	17h	HECI MMIO Base Address High (HECI1_MMIO_MBAR_HI)—Offset 14h	0h
2Ch	2Fh	Sub System Identifiers (HECI1_SS)—Offset 2Ch	0h
34h	37h	Capabilities Pointer (HECI1_CAP)—Offset 34h	50h
3Ch	3Dh	Interrupt Information (HECI1_INTR)—Offset 3Ch	100h
3Eh	3Eh	Minimum Grant (HECI1_MGNT)—Offset 3Eh	0h
3Fh	3Fh	Maximum Latency (HECI1_MLAT)—Offset 3Fh	0h
40h	43h	Host Firmware Status Register 1 (HFSTS1)—Offset 40h	0h
48h	4Bh	Host Firmware Status Register 2 (HFSTS2)—Offset 48h	0h
4Ch	4Fh	Host General Status (HECI1_H_GS1)—Offset 4Ch	0h
50h	51h	PCI Power Management Capability ID (HECI1_PID)—Offset 50h	8C01h
52h	53h	PCI Power Management Capabilities (HECI1_PC)—Offset 52h	4003h
54h	55h	PCI Power Management Control and Status (HECI1_PMCS)—Offset 54h	8h
60h	63h	Host Firmware Status Register 3 (HFSTS3)—Offset 60h	0h
64h	67h	Host Firmware Status Register 4 (HFSTS4)—Offset 64h	0h
68h	6Bh	Host Firmware Status Register 5 (HFSTS5)—Offset 68h	0h

Table 30-1. Summary of Intel Management Engine Interface Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
6Ch	6Fh	Host Firmware Status Register 6 (HFSTS6)—Offset 6Ch	0h
70h	73h	Host General Status 2 (HECI1_H_GS2)—Offset 70h	0h
74h	77h	Host General Status 3 (HECI1_H_GS3)—Offset 74h	0h
8Ch	8Dh	Message Signaled Interrupt Identifiers (HECI1_MID)—Offset 8Ch	5h
8Eh	8Fh	Message Signaled Interrupt Message Control (HECI1_MC)—Offset 8Eh	80h
90h	93h	Message Signaled Interrupt Message Address (HECI1_MA)—Offset 90h	0h
94h	97h	Message Signaled Interrupt Upper Address (HECI1_MUA)—Offset 94h	0h
98h	99h	Message Signaled Interrupt Message Data (HECI1_MD)—Offset 98h	0h
A0h	A0h	HECI Interrupt Delivery Mode (HECI1_HIDM)—Offset A0h	0h

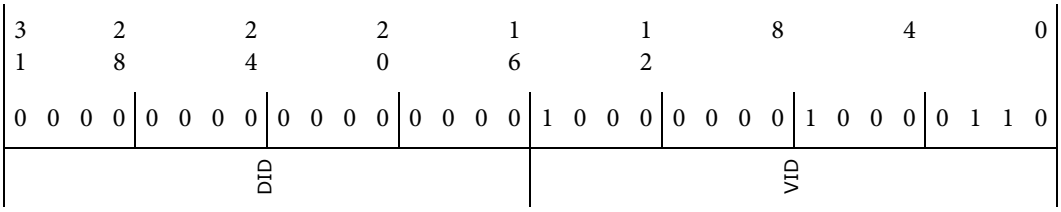
30.1.1 Identifiers (HECI1_ID)—Offset 0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 8086h



Bit Range	Default and Access	Field Name (ID): Description
31:16	-- RO/V	**Device ID (DID):** Indicates what device number assigned by Intel. See the Device and Version ID Table in Volume 1 of the datasheet for the default value.
15:0	8086h RO	**Vendor ID (VID):** 16-bit field which indicates Intel is the vendor.

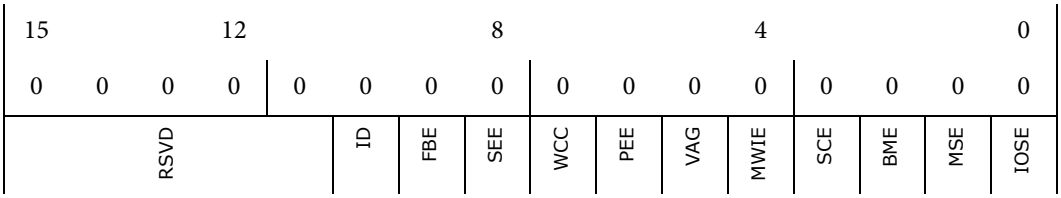
30.1.2 Command (HECI1_CMD)—Offset 4h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:11	0h RO	Reserved.
10	0h RW	**Interrupt Disable (ID)**
9	0h RO	**Fast Back-to-Back Enable (FBE):** Not implemented, hardwired to 0.
8	0h RO	**SERR# Enable (SEE):** Not implemented, hardwired to 0.
7	0h RO	**Wait Cycle Enable (WCC):** Not implemented, hardwired to 0.
6	0h RO	**Parity Error Response Enable (PEE):** Not implemented, hardwired to 0.
5	0h RO	**VGA Palette Snooping Enable (VAG):** Not implemented, hardwired to 0.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Not implemented, hardwired to 0.
3	0h RO	**Special Cycle Enable (SCE):** Not implemented, hardwired to 0.
2	0h RW	**Bus Master Enable (BME):** Controls the HECI host controller's ability to act as a system memory master for data transfers. When this bit is cleared, HECI bus master activity stops and any active DMA engines return to an idle condition.
1	0h RW	**Memory Space Enable (MSE):** Controls access to the HECI host controllers memory mapped register space.
0	0h RO	**I/O Space Enable (IOSE):** Not implemented, hardwired to 0.

30.1.3 Status (HECI1_STS)—Offset 6h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 22
Function: 0

Default: 10h

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
DPE	SSE	RMA	RTA	STA	DEVT		DPD	FBC	RSVD	C66	CL	IS	RSVD		

Bit Range	Default and Access	Field Name (ID): Description
15	0h RO	**Detected Parity Error (DPE)**
14	0h RO	**Signaled System Error (SSE)**
13	0h RO	**Received Master-Abort (RMA)**

Bit Range	Default and Access	Field Name (ID): Description
12	0h RO	**Received Target Abort (RTA):** Not implemented, hardwired to 0.
11	0h RO	**Signaled Target-Abort (STA):** Not implemented, hardwired to 0.
10:9	0h RO	**DEVSEL# Timing (DEVT):** Not implemented, hardwired to 0.
8	0h RO	**Master Data Parity Error Detected (DPD):** Not implemented, hardwired to 0.
7	0h RO	**Fast Back-to-Back Capable (FBC):** Not implemented, hardwired to 0.
6	0h RO	Reserved.
5	0h RO	**66 MHz Capable (C66):** Not implemented, hardwired to 0.
4	1h RO	**Capabilities List (CL):** Indicates the presence of a capabilities list, hardwired to 1.
3	0h RO/V	**Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit. This bit is a 1 when the INTx# is asserted.This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register). Note that this bit is not set by an MSI.
2:0	0h RO	Reserved.

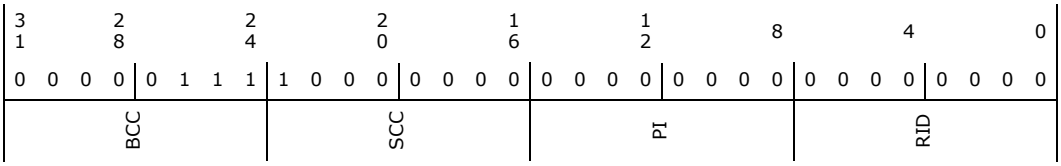
30.1.4 Revision ID and Class Code (HECI1_RID_CC)—Offset 8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 7800000h



Bit Range	Default and Access	Field Name (ID): Description
31:24	7h RO	**Base Class Code (BCC):** Indicates the base class code of the host controller device.
23:16	80h RO	**Sub Class Code (SCC):** Indicates the sub class code of the host controller device.
15:8	0h RO	**Programming Interface (PI):** Indicates the programming interface of the host controller device.
7:0	0h RO/V	**Revision ID (RID):** Indicates stepping of the host controller. Refer to Device and Revision ID table for specific value.

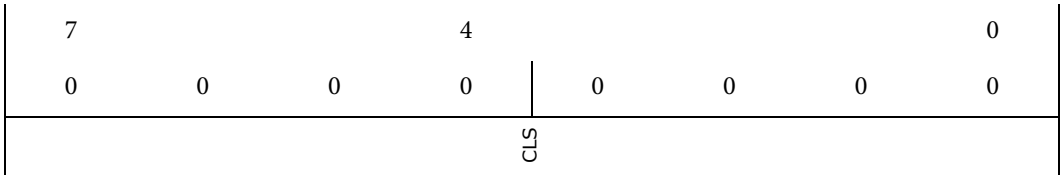
30.1.5 Cache Line Size (HECI1_CLS)—Offset Ch

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Cache Line Size (CLS):** Not implemented, hardwired to 0.

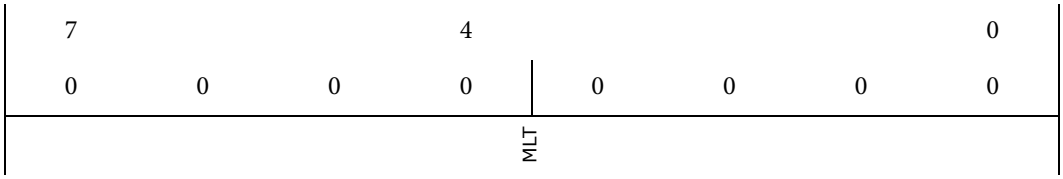
30.1.6 Master Latency Timer (HECI1_MLT)—Offset Dh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Master Latency Timer (MLT):** Not implemented, hardwired to 0.

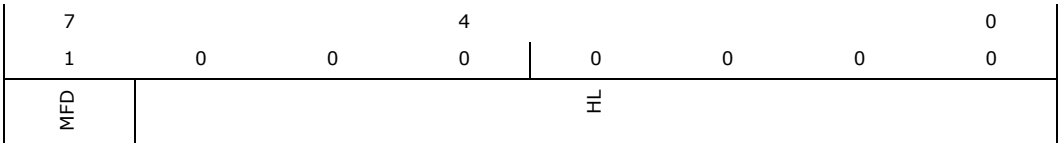
30.1.7 Header Type (HECI1_HTYPE)—Offset Eh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 22
Function: 0

Default: 80h



Bit Range	Default and Access	Field Name (ID): Description
7	1h RO	**Multi-Function Device (MFD):** Indicates the host controller is part of a multi-function device.
6:0	0h RO	**Header Layout (HL):** Indicates that the host controller uses a target device layout.

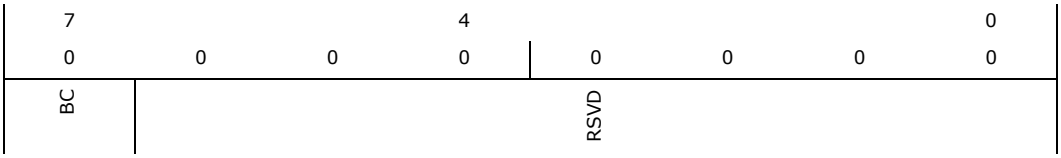
30.1.8 Built In Self-Test (HECI1_BIST)—Offset Fh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7	0h RO	**BIST Capable (BC):** Not implemented, hardwired to 0.
6:0	0h RO	Reserved.

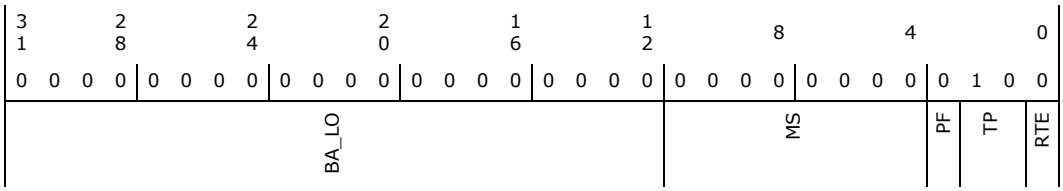
30.1.9 HECI MMIO Base Address Low (HECI1_MMIO_MBAR_LO)—Offset 10h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 4h



Bit Range	Default and Access	Field Name (ID): Description
31:12	0h RW	**Base Address Low (BA_LO):** Lower 32 bits of base address of register memory space.
11:4	0h RO	**Memory Size (MS):** This field is hardwired to 0 to indicate that HECI device requests 4KB of memory space.
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable
2:1	2h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 64-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

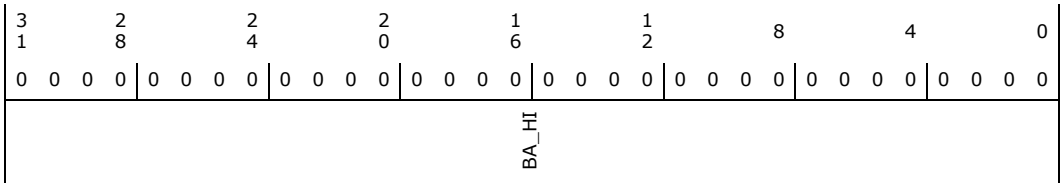
30.1.10 HECI MMIO Base Address High (HECI1_MMIO_MBAR_HI)—Offset 14h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Base Address High (BA_HI):** Upper 32 bits of base address of register memory space.

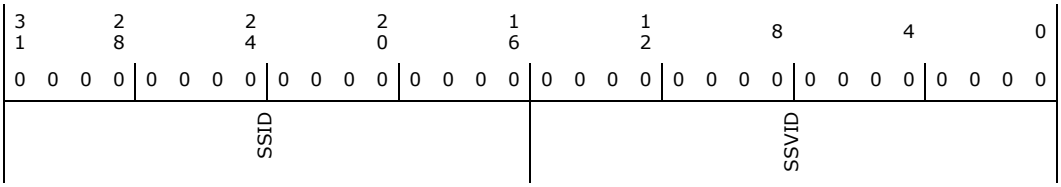
30.1.11 Sub System Identifiers (HECI1_SS)—Offset 2Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** Indicates the sub- system identifier. This field should be programmed by BIOS during boot-up. Once written, this register becomes Read Only.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** Indicates the sub-system vendor identifier. This field should be programmed by BIOS during boot- up. Once written, this register becomes Read Only.

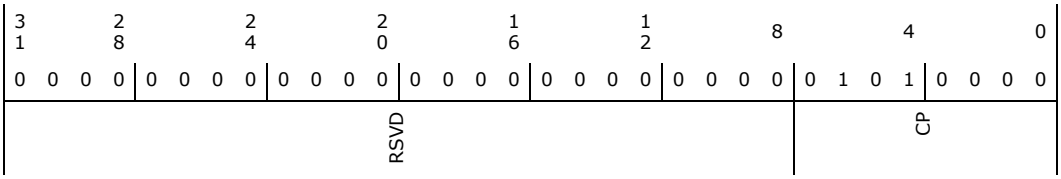
30.1.12 Capabilities Pointer (HECI1_CAP)—Offset 34h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 50h



Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	50h RO	**Capability Pointer (CP):** Indicates the first capability pointer offset. It points to the PCI power management capability offset.

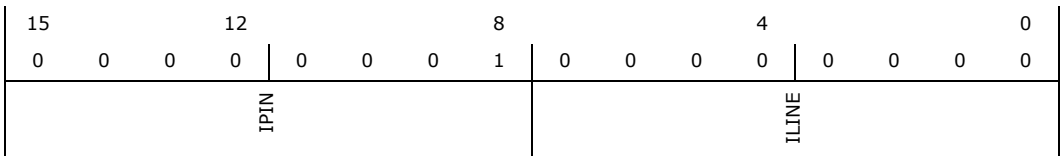
30.1.13 Interrupt Information (HECI1_INTR)—Offset 3Ch

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 22
Function: 0

Default: 100h



Bit Range	Default and Access	Field Name (ID): Description
15:8	1h RO/V	**Interrupt Pin (IPIN):** This field indicates the virtual interrupt pin the host controller uses. A value of 0x1/0x2/0x3/0x4 indicates that this function implements legacy interrupt on INTA/INTB/INTC/INTD, respectively. When legacy interrupt is not used this register should be set to 0x0.
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) theinterrupt is connected to. No hardware action is taken on this field.

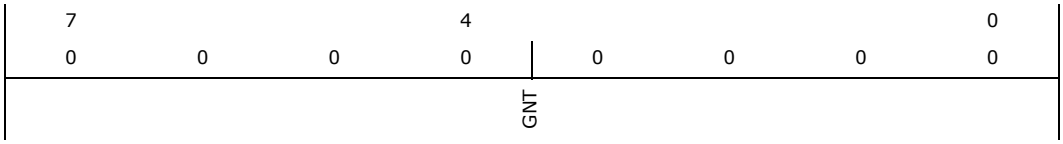
30.1.14 Minimum Grant (HECI1_MGNT)—Offset 3Eh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Grant (GNT):** Not implemented, hardwired to 0.

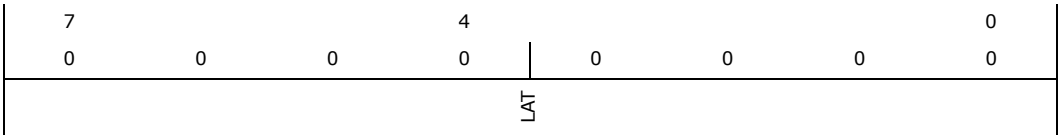
30.1.15 Maximum Latency (HECI1_MLAT)—Offset 3Fh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Latency (LAT):** Not implemented, hardwired to 0.

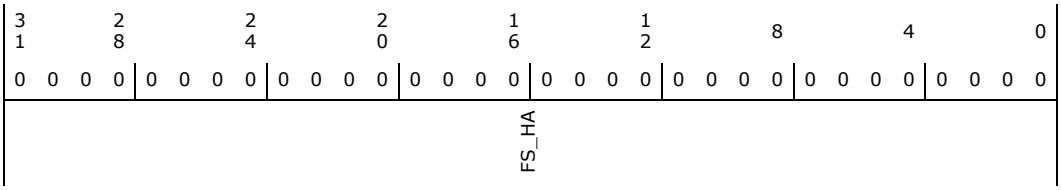
30.1.16 Host Firmware Status Register 1 (HFSTS1)—Offset 40h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**Host Firmware Status (FS_HA):** Indicates current status of the firmware for the controller. This field is the host's read only access to the FS field in the Intel ME Firmware Status register. **This field is reset during CSE partition reset flow.**

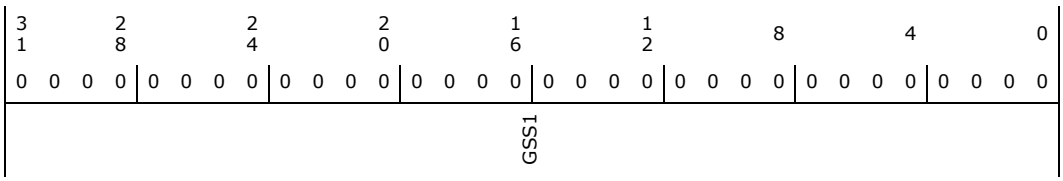
30.1.17 Host Firmware Status Register 2 (HFSTS2)—Offset 48h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**Host Firmware Status (GSS1):** This field is host side shadow of General Status 1 (CSE_GS1) register. **This field is reset during Intel ME partition reset flow.**

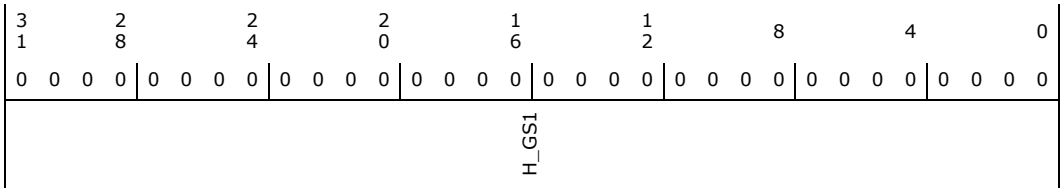
30.1.18 Host General Status (HECI1_H_GS1)—Offset 4Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Host General Status (H_GS1):** General status of Host. This field is not used by hardware.

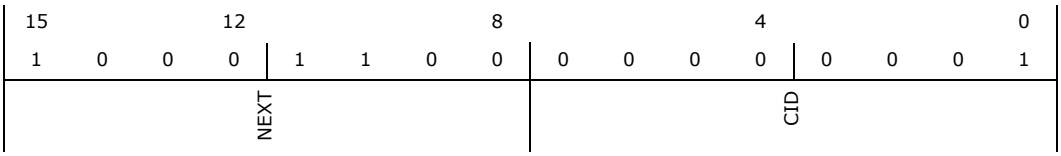
30.1.19 PCI Power Management Capability ID (HECI1_PID)—Offset 50h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 22
Function: 0

Default: 8C01h



Bit Range	Default and Access	Field Name (ID): Description
15:8	8Ch RO	**Next Capability (NEXT):** Indicates the location of the next capability item in the list. This is the Message Signaled Interrupts capability.
7:0	1h RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management.

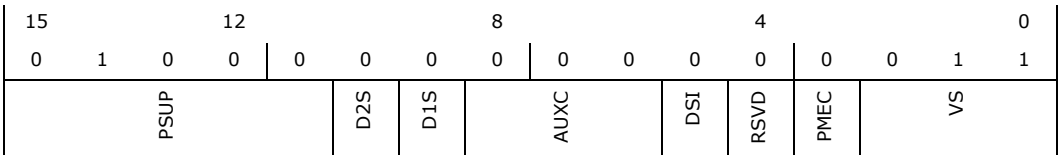
30.1.20 PCI Power Management Capabilities (HECI1_PC)—Offset 52h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 22
Function: 0

Default: 4003h



Bit Range	Default and Access	Field Name (ID): Description
15:11	8h RO	**PME Support (PSUP):** Indicates the states that can generate PME#. The controller can assert PME# from $D3_{HOT}$ only.
10	0h RO	**D2 Support (D2S):** The D2 state is not supported for the host controller.
9	0h RO	**D _Support (D1S):** The D1 state is not supported for the host controller.
8:6	0h RO	**Aux_Current (AUXC):** Reports the maximum Suspend well current required when in the $D3_{COLD}$ state. Value of 0 is reported.
5	0h RO	**Device Specific Initialization (DSI):** Indicates whether device-specific initialization is required.
4	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
3	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

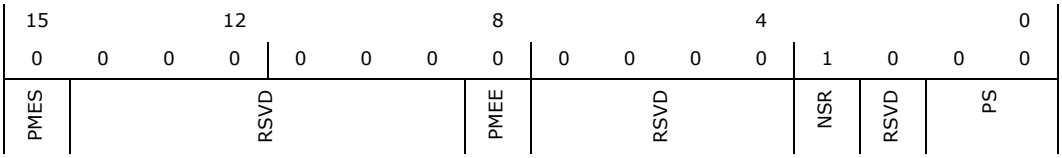
30.1.21 PCI Power Management Control and Status (HECI1_PMCS)—Offset 54h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 22
Function: 0

Default: 8h



Bit Range	Default and Access	Field Name (ID): Description
15	0h RW/1C/V	**PME Status (PMES):** The PME Status bit can be set to '1' by the FW. This bit is cleared by host CPU writing a '1' to it. FW cannot clear this bit. Host CPU writes with value '0' have no effect on this bit.
14:9	0h RO	Reserved.
8	0h RW	**PME Enable (PMEE):** When set, PME_assert and PME_deassert messages are sent over Sideband to PMC based on the PMES bit. When reset these messages may not be sent.
7:4	0h RO	Reserved.
3	1h RO	**No Soft Reset (NSR):** This bit indicates that when the controller is transitioning from $D3_{HOT}$ to D0 due to power state command, it does not perform and internal reset.
2	0h RO	Reserved.
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the controller and to set a new power state. The values are: 00 - D0 state 11 - $D3_{HOT}$ state. The D1 and D2 states are not supported for this controller. If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs. When in the $D3_{HOT}$ state, the HBA's configuration space is available, but the registers memory space is not. Additionally, interrupts are blocked.

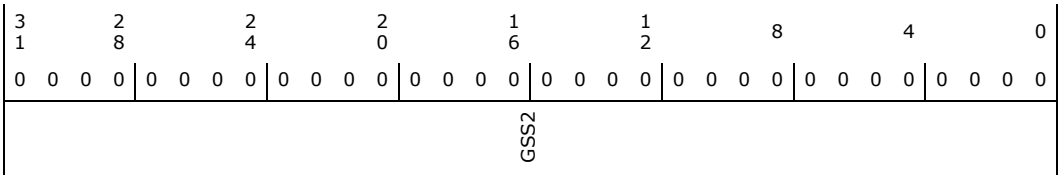
30.1.22 Host Firmware Status Register 3 (HFSTS3)—Offset 60h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**Host Firmware Status (GSS2):** This field is host side shadow of Intel ME General Status 2 (CSE_GS2). **This field is reset during Intel ME partition reset flow.**

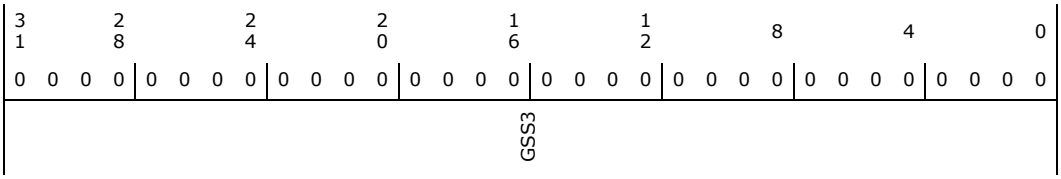
30.1.23 Host Firmware Status Register 4 (HFSTS4)—Offset 64h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**Host Firmware Status (GSS3):** This field is host side shadow of CSE General Status 3 (CSE_GS3). **This field is reset during Intel ME partition reset flow.**

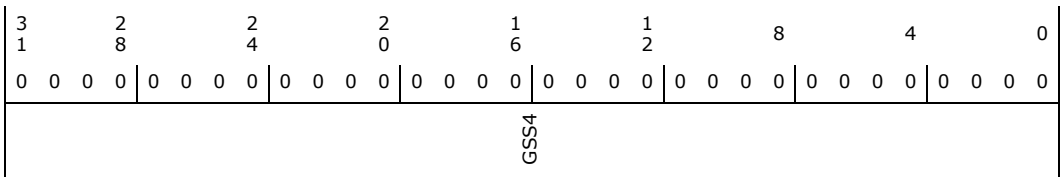
30.1.24 Host Firmware Status Register 5 (HFSTS5)—Offset 68h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**Host Firmware Status (GSS4):** This field is host side shadow of Intel ME General Status 4 (CSE_GS4). **This field is reset during Intel ME partition reset flow.**

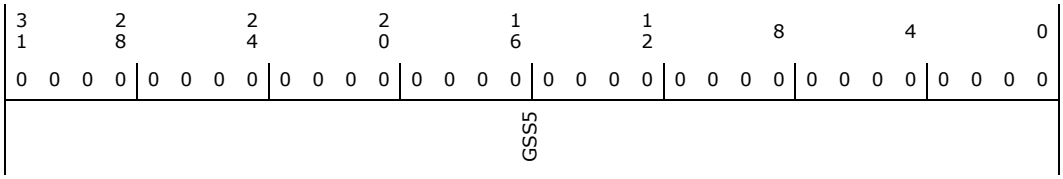
30.1.25 Host Firmware Status Register 6 (HFSTS6)—Offset 6Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**Host Firmware Status (GSS5):** This field is host side shadow of Intel ME General Status 5 (CSE_GS5). **This field is reset during Intel ME partition reset flow.**

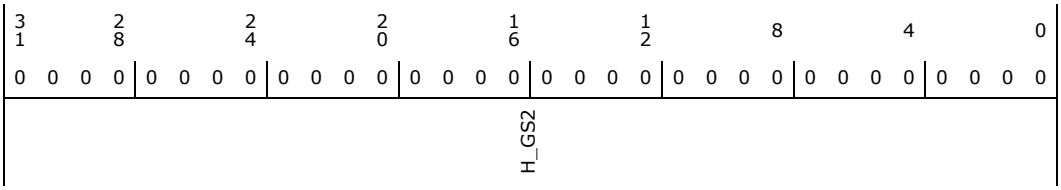
30.1.26 Host General Status 2 (HECI1_H_GS2)—Offset 70h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Host General Status 2 (H_GS2):** General status of Host. This field is not used by hardware.

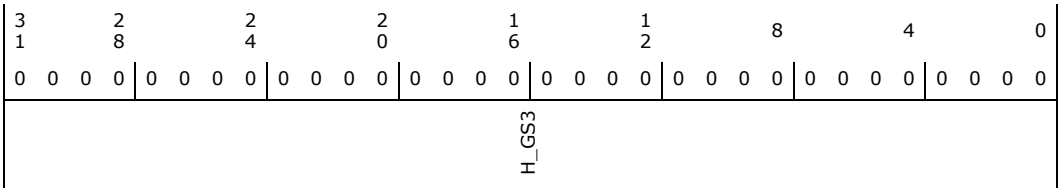
30.1.27 Host General Status 3 (HECI1_H_GS3)—Offset 74h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Host General Status 3 (H_GS3):** General status of Host. This field is not used by hardware.

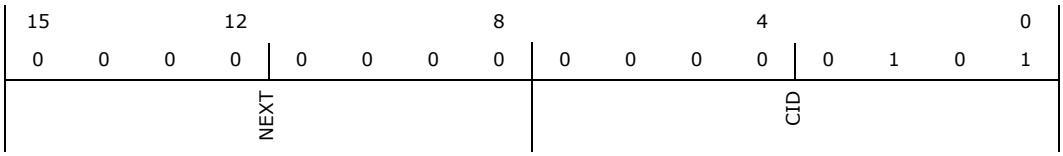
30.1.28 Message Signaled Interrupt Identifiers (HECI1_MID)—Offset 8Ch

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 22
Function: 0

Default: 5h



Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RO	**Next Pointer (NEXT):** Indicates the next item in the list. This can be other capability pointers (such as PCI-X or PCI- Express) or it can be the last item in the list.
7:0	5h RO	**Capability ID (CID):** Indicates MSI.

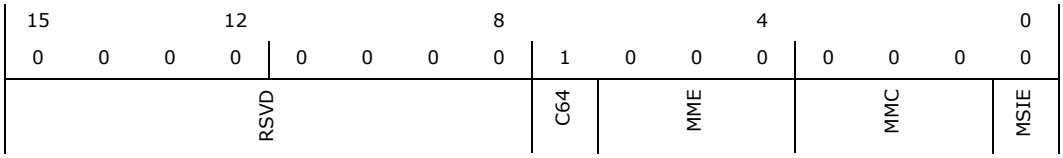
30.1.29 Message Signaled Interrupt Message Control (HECI1_MC)—Offset 8Eh

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 22
Function: 0

Default: 80h



Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7	1h RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages.
6:4	0h RO	**Multiple Message Enable (MME):** Not implemented, hardwired to 0.
3:1	0h RO	**Multiple Message Capable (MMC):** Not implemented, hardwired to 0.
0	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and INTx virtual wires are not used to generate interrupts.

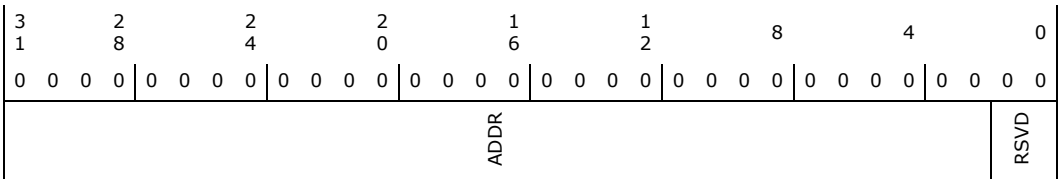
30.1.30 Message Signaled Interrupt Message Address (HECI1_MA)—Offset 90h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**Address (ADDR):** Lower 32 bits of the system specified message address, always DW aligned.
1:0	0h RO	Reserved.

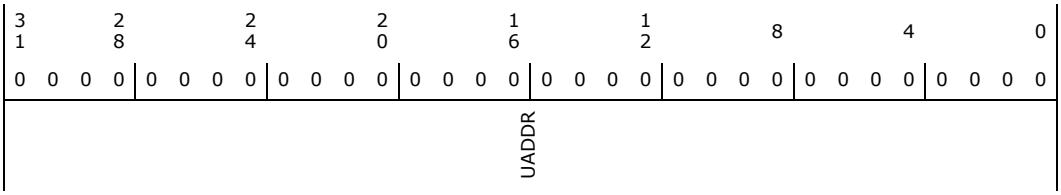
30.1.31 Message Signaled Interrupt Upper Address (HECI1_MUA)—Offset 94h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Upper Address (UADDR):** Upper 32 bits of the system specified message address. This register is optional and only implemented if MC.C64=1.

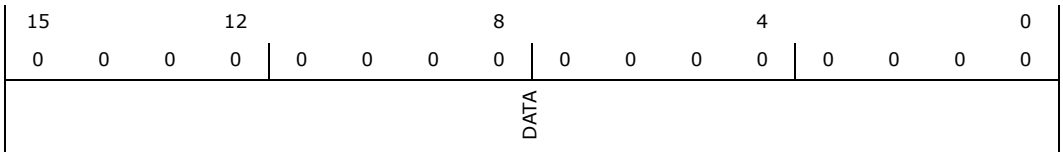
30.1.32 Message Signaled Interrupt Message Data (HECI1_MD)—Offset 98h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:0	0h RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled.

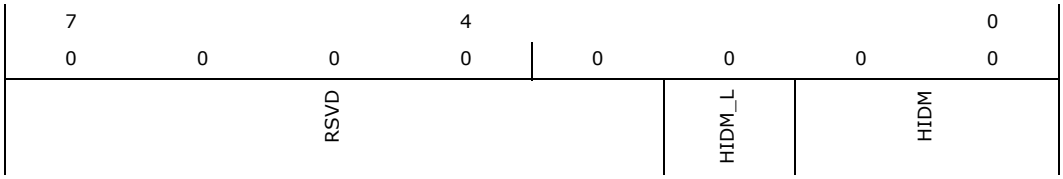
30.1.33 HECI Interrupt Delivery Mode (HECI1_HIDM)—Offset A0h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:3	0h RO	Reserved.
2	0h RW/1S	**HIDM Lock (HIDM_L):** Writing 1 to this bit locks the HIDM field.
1:0	0h RW/L	**HECI Interrupt Delivery Mode (HIDM):** These bits control what type of interrupt the controller will send when Intel ME FW writes to set the CSE_IG bit. They are interpreted as follows: 00 - Generate Legacy or MSI interrupt; 01 - Generate SCI; 10 - Generate SMI; This field may be locked by writing 1 to HIDM_L bit.

30.2 Intel MEI MMIO Registers Summary

Table 30-2. Summary of Intel MEI MMIO Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
800h	803h	D0i3 Control (HECI1_D0I3C)—Offset 800h	0h

30.2.1 D0i3 Control (HECI1_D0I3C)—Offset 800h

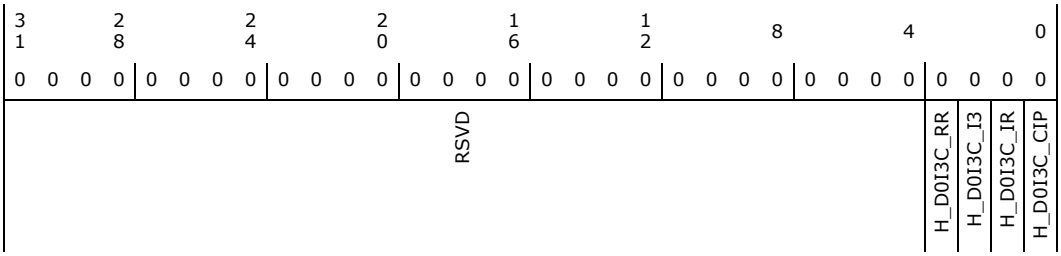
This register allows host to configure the power mode using D0i0/D0i3 support.

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3	0h RO	**Restore Required (H_D0I3C_RR):** SW sets this bit to 1 in order to move the interface into the D0i3 state. Clearing this bit will return the interface into the fully active D0 state (D0i0).
2	0h RW	**D0i3 (H_D0I3C_I3):** SW sets this bit to 1 in order to move the IP into the D0i3 state. Clearing this bit will return the IP into the fully active D0 state (D0i0). When this bit changes state, mIA may be interrupted (see H_PCI_CSR.D0I3C_IS register's description)
1	0h RW	**Interrupt Request (H_D0I3C_IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this bit on each write to this register.
0	0h RO/V	**Command-in-Progress (H_D0I3C_CIP):** HW sets this bit on a 0->1 or 1->0 transition of D0i3 bit (bit [2]). While set, the other bits in this register are not valid and it is illegal for SW to write to any of them. While clear, all other bits in this register are valid and SW may write to them. If Interrupt Request (bit [1]) was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to HW. SW writes to this bit have no effect. This bit is auto-cleared by HW one cycle after it is set.

§

31 IDE Redirect (IDE-R) (D22:F2)

31.1 IDE Redirect PCI Configuration (D22:F2) Registers Summary

Table 31-1. Summary of IDE Redirect PCI Configuration (D22:F2) Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Device ID and Vendor ID (IDE_HOST_DID_VID)—Offset 0h	X_8086h
4h	7h	Status and Command (IDE_HOST_STS_CMD)—Offset 4h	B00000h
8h	Bh	Class Code and Revision ID (IDE_HOST_CC_RID)—Offset 8h	10185xxh
Ch	Fh	BIST, Header Type, Latency Timer, and Cache Line Size (IDE_HOST_BIST_HTYPE_LT_CLS)—Offset Ch	800000h
10h	13h	IDE Primary Command Block IO BAR (IDE_HOST_PCMDIOBAR)—Offset 10h	1h
14h	17h	IDE Primary Control Block IO BAR (IDE_HOST_PCTLIOBAR)—Offset 14h	1h
18h	1Bh	IDE Secondary Command Block IO BAR (IDE_HOST_SCMDIOBAR)—Offset 18h	1h
1Ch	1Fh	IDE Secondary Control Block IO BAR (IDE_HOST_SCTLIOBAR)—Offset 1Ch	1h
20h	23h	IDE Bus Master Block IO BAR (IDE_HOST_BMIOBAR)—Offset 20h	1h
2Ch	2Fh	Subsystem ID and Subsystem Vendor ID (IDE_HOST_SID_SVID)—Offset 2Ch	8086h
34h	37h	Capabilities List Pointer (IDE_HOST_CAPP)—Offset 34h	40h
3Ch	3Fh	Maximum Latency, Minimum Grant, Interrupt Pin and Interrupt Line (IDE_HOST_MAXL_MING_INTP_INTL)—Offset 3Ch	0h
40h	43h	MSI Message Control, Next Pointer and Capability ID (IDE_HOST_MSIMC_MSINP_MSICID)—Offset 40h	805005h
44h	47h	MSI Message Address (IDE_HOST_MSIMA)—Offset 44h	0h
48h	4Bh	MSI Message Upper Address (IDE_HOST_MSIMUA)—Offset 48h	0h
4Ch	4Fh	MSI Message Data (IDE_HOST_MSIMD)—Offset 4Ch	0h
50h	53h	Power Management Capabilities, Next Pointer and Capability ID (IDE_HOST_PMCAP_PMNP_PMCID)—Offset 50h	230001h
54h	57h	Power Management Data, Control/Status Register Bridge Support Extensions, Control and Status (IDE_HOST_PMD_PMCSRBSE_PMCSR)—Offset 54h	8h

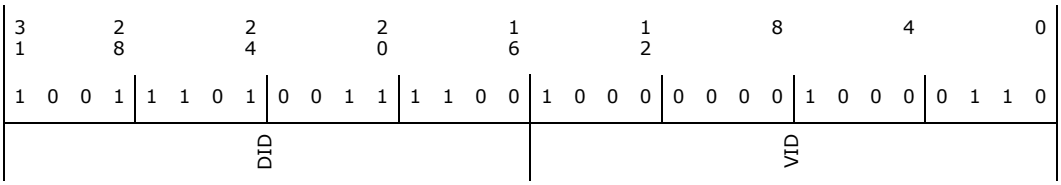
31.1.1 Device ID and Vendor ID (IDE_HOST_DID_VID)—Offset 0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 2

Default: xxxx8086h



Bit Range	Default and Access	Field Name (ID): Description
31:16	-- RO/V	**Device ID (DID):** This field identifies the particular device. See the Device and Version ID Table in Volume 1 for the default value.
15:0	8086h RO	**Vendor ID (VID):** This field identifies the manufacturer of the device. The value of 0x8086 indicates Intel.

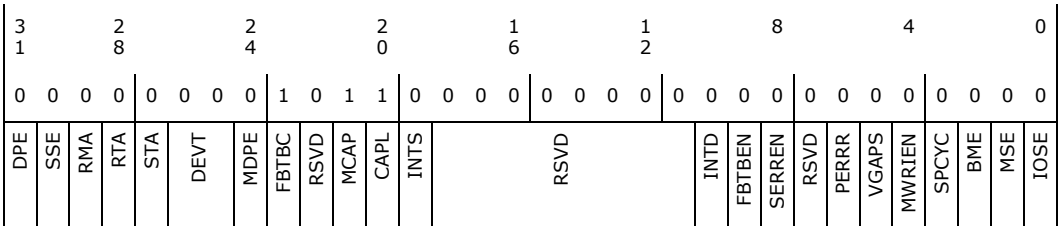
31.1.2 Status and Command (IDE_HOST_STS_CMD)—Offset 4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 2

Default: B00000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	**Detected Parity Error (DPE):** Not implemented. Hardwired to 0.
30	0h RO	**Signaled System Error (SSE):** Not implemented. Hardwired to 0.
29	0h RW/1C/V	**Received Master Abort (RMA):** This bit must be set by a master device whenever its transaction (except for Special Cycle) is completed with Unsupported Request Completion Status (a.k.a. Master-Abort). All master devices must implement this bit.
28	0h RW/1C/V	**Received Target Abort (RTA):** This bit must be set by a master device whenever its transaction is completed with Completer Abort Completion Status (a.k.a. Target-Abort). All master devices must implement this bit.

Bit Range	Default and Access	Field Name (ID): Description
27	0h RW/1C/V	**Signaled Target Abort (STA):** This bit must be set by a target device whenever it completes a Posted or Non-Posted transaction with a Completer Abort (a.k.a. Target-Abort) error. Devices that will never signal Completer Abort (a.k.a. Target-Abort) do not need to implement this bit.
26:25	0h RO	**Devsel Timing (DEVT):** These bits encode the timing of DEVSEL#. There are three allowable timings for assertion of DEVSEL# as described below: 00b: fast; 01b: medium; 10b: slow; 11b: reserved. These bits are read-only and must indicate the slowest time that a device asserts DEVSEL# for any bus command except Configuration Read and Configuration Write. Hardwired to 00b.
24	0h RO	**Master Data Parity Error (MDPE):** Not implemented. Hardwired to 0.
23	1h RO	**Fast Back to Back Capable (FBTBC):** This bit indicates whether or not the target is capable of accepting fast back-to-back transactions when the transactions are not to the same agent. This bit can be set to 1 if the device can accept these transactions and must be set to 0 otherwise. Hardwired to 1.
22	0h RO	Reserved.
21	1h RO	**66 MHz Capable (MCAP):** This bit indicates whether or not this device is capable of running at 66 MHz. A value of 0 indicates 33 MHz. A value of 1 indicates that the device is 66 MHz capable. Hardwired to 1.
20	1h RO	**Capabilities List (CAPL):** This optional read-only bit indicates whether or not this device implements the pointer for a New Capabilities linked list at offset 34h. A value of zero indicates that no New Capabilities linked list is available. A value of one indicates that the value read at offset 34h is a pointer in Configuration Space to a linked list of new capabilities.
19	0h RO	**Interrupt Status (INTS):** This read-only bit reflects the state of the interrupt in the device/function. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. Read-only and hardwired to 0 for a device that does NOT support pin-based interrupt.
18:11	0h RO	Reserved.
10	0h RW	**Interrupt Disable (INTD):** This bit disables the device/function from asserting INTx#. A value of 0 enables the assertion of its INTx# signal. A value of 1 disables the assertion of its INTx# signal. This bit's state after RST# is 0.
9	0h RO	**Fast Back to Back Enable (FBTBEN):** Not implemented. Hardwired to 0.
8	0h RO	**System Error Enable (SERREN):** Not implemented. Hardwired to 0.
7	0h RO	Reserved.
6	0h RO	**Parity Error Response (PERRR):** Not implemented. Hardwired to 0.
5	0h RO	**VGA Palette Snoop (VGAPS):** Not implemented. Hardwired to 0.
4	0h RO	**Memory Write and Invalidate Enable (MWRIEN):** Not implemented. Hardwired to 0.
3	0h RO	**Special Cycles (SPCYC):** Not implemented. Hardwired to 0.
2	0h RW	**Bus Master Enable (BME):** This bit controls the PCI device's ability to act as a master for data transfers. This bit does not impact the generation of completions for split transaction commands.

Bit Range	Default and Access	Field Name (ID): Description
1	0h RO	**Memory Space Enable (MSE):** Read-only and hardwired to 0 because IDE does NOT support Memory Space accesses.
0	0h RW	**IO Space Enable (IOSE):** Controls a device's response to I/O Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to I/O Space accesses. State after RST# is 0.

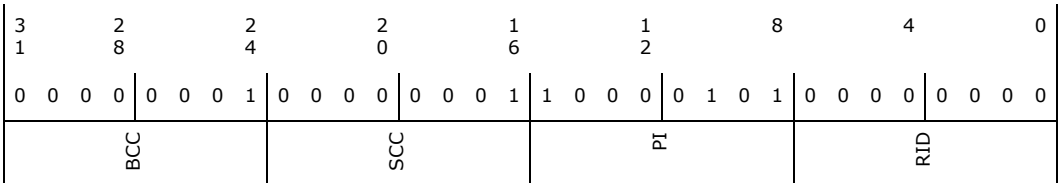
31.1.3 Class Code and Revision ID (IDE_HOST_CC_RID)—Offset 8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 2

Default: 10185xxh



Bit Range	Default and Access	Field Name (ID): Description
31:24	1h RO	**Base Class Code (BCC):** Identifies the Base Class Code of an external IDE controller device driver.
23:16	1h RO	**Sub-Class Code (SCC):** Identifies the Sub-Class Code of an external IDE controller device driver.
15:8	85h RO	**Programming Interface (PI):** Identifies the Programming Interface of an IDE controller device driver.
7:0	-- RO/V	**Revision ID (RID):** This register specifies a device specific revision identifier. Refer to Device and Revision ID table in Vol1 for specific value.

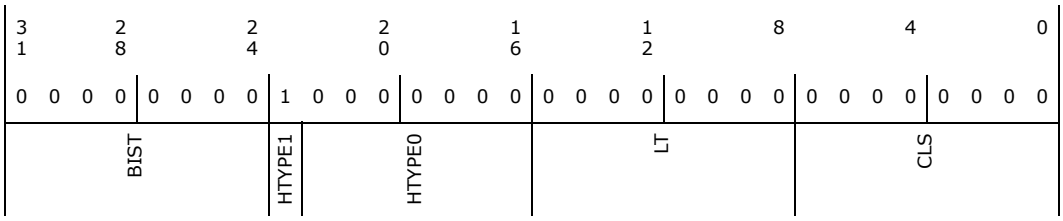
31.1.4 BIST, Header Type, Latency Timer, and Cache Line Size (IDE_HOST_BIST_HTYPE_LT_CLS)—Offset Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 2

Default: 800000h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	**Built In Self Test (BIST):** Not implemented. Hardwired to 0.
23	1h RO/V	**Header Type 1 (HTYPE1):** This bit identifies whether or not the device contains multiple functions. - If the bit is 0, then the device is single function. - If the bit is 1, then the device has multiple functions.
22:16	0h RO	**Header Type 0 (HTYPE0):** Hardwired to 0 to identify the non-bridge Configuration Space Header.
15:8	0h RO	**Latency Timer (LT):** Not implemented. Hardwired to 0.
7:0	0h RO	**Cache Line Size (CLS):** Not implemented. Hardwired to 0.

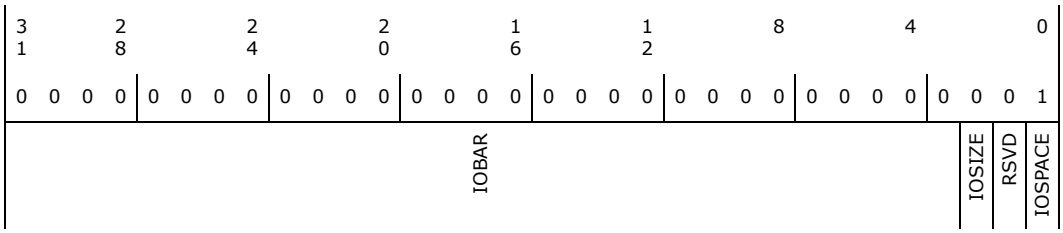
31.1.5 IDE Primary Command Block IO BAR (IDE_HOST_PCMDIOBAR)—Offset 10h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 2

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
31:3	0h RW	**IO BAR (IOBAR):** Software programs this space with the base address of the device's I/O region
2	0h RO	**IO Size (IOSIZE):** Hardwired to 0 to indicate 8B of I/O space
1	0h RO	Reserved.
0	1h RO	**IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an I/O BAR.

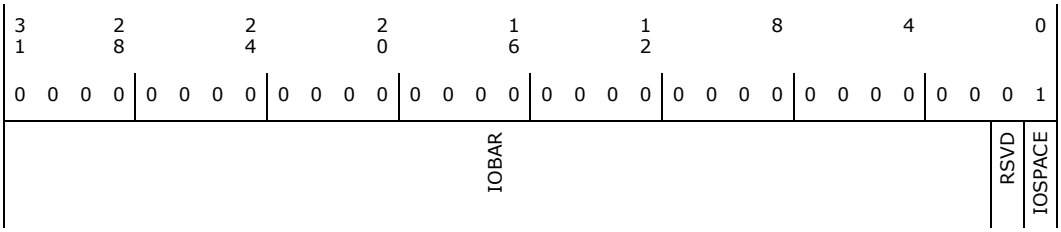
31.1.6 IDE Primary Control Block IO BAR (IDE_HOST_PCTLIOBAR)—Offset 14h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 2

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**IO BAR (IOBAR):** Software programs this space with the base address of the device's I/O region
1	0h RO	Reserved.
0	1h RO	**IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an I/O BAR.

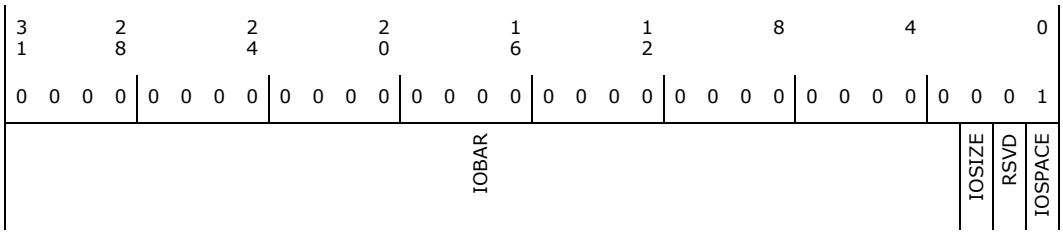
31.1.7 IDE Secondary Command Block IO BAR (IDE_HOST_SCMDIOBAR)—Offset 18h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 2

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
31:3	0h RW	**IO BAR (IOBAR):** Software programs this space with the base address of the device's I/O region
2	0h RO	**IO Size (IOSIZE):** Hardwired to 0 to indicate 8B of I/O space
1	0h RO	Reserved.
0	1h RO	**IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an I/O BAR.

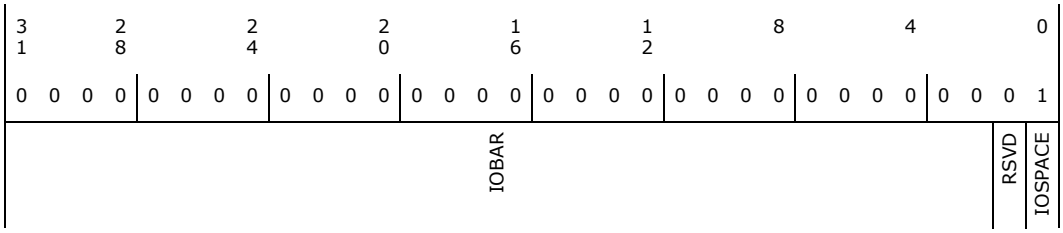
31.1.8 IDE Secondary Control Block IO BAR (IDE_HOST_SCTLIOBAR)—Offset 1Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 2

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**IO BAR (IOBAR):** Software programs this space with the base address of the device's I/O region

Bit Range	Default and Access	Field Name (ID): Description
1	0h RO	Reserved.
0	1h RO	**IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an I/O BAR.

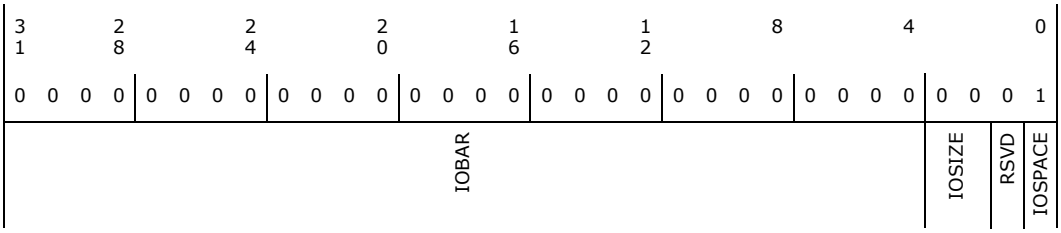
31.1.9 IDE Bus Master Block IO BAR (IDE_HOST_BMIOBAR)—Offset 20h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 2

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
31:4	0h RW	**IO BAR (IOBAR):** Software programs this space with the base address of the device's I/O region
3:2	0h RO	**IO Size (IOSIZE):** Hardwired to 0 to indicate 16B of I/O space
1	0h RO	Reserved.
0	1h RO	**IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an I/O BAR.

31.1.10 Subsystem ID and Subsystem Vendor ID (IDE_HOST_SID_SVID)—Offset 2Ch

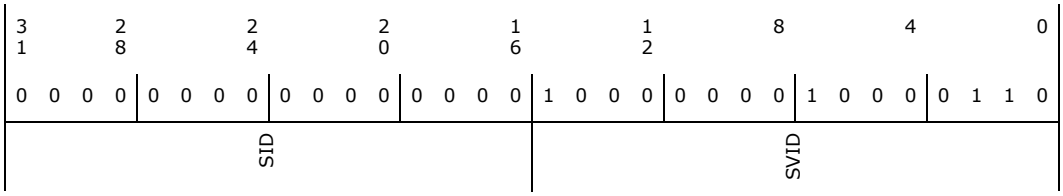
These registers are used to uniquely identify the add-in card or subsystem where the PCI device resides. They provide a mechanism for add-in card vendors to distinguish their add-in cards from one another even though the add-in cards may have the same PCI controller on them (and, therefore, the same Vendor ID and Device ID).

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 2

Default: 8086h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SID):** Value of this field is vendor-specific. This is written by BIOS. No hardware action will be taken on this value.
15:0	8086h RW/O	**Subsystem Vendor ID (SVID):** This field identifies the vendor of the add-in card or subsystem. This is written by BIOS. No hardware action will be taken on this value.

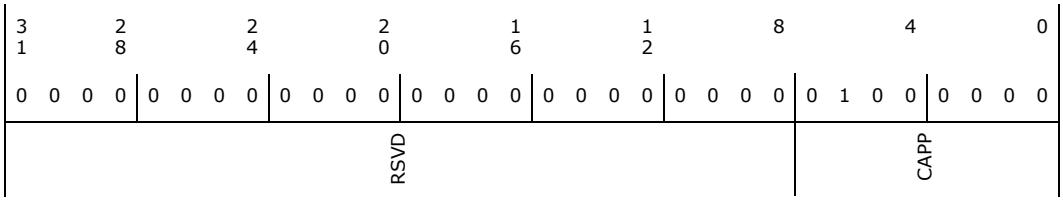
31.1.11 Capabilities List Pointer (IDE_HOST_CAPP)—Offset 34h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 2

Default: 40h



Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	40h RO	**Capabilities Pointer (CAPP):** Indicates the pointer for the first entry in the capabilities list which is the MSI Capability.

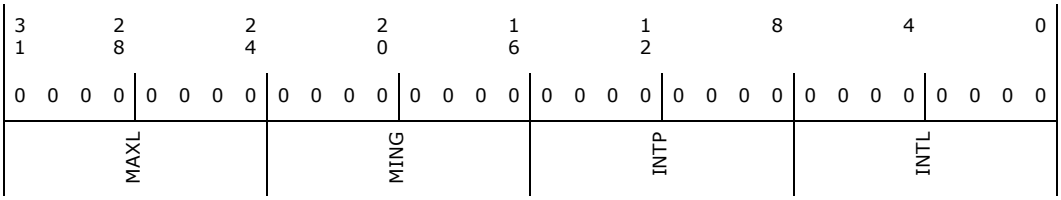
31.1.12 Maximum Latency, Minimum Grant, Interrupt Pin and Interrupt Line (IDE_HOST_MAXL_MING_INTP_INTL)—Offset 3Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	**Maximum Latency (MAXL):** Not implemented. Hardwired to 0.
23:16	0h RO	**Minimum Grant (MING):** Not implemented. Hardwired to 0.
15:8	0h RO/V	**Interrupt Pin (INTP):** This register specifies which interrupt pin IDE uses in PCI interrupt mode. Value Decoding 00h The function does NOT use an interrupt pin. 01h INTA 02h INTB 03h INTC 04h INTD 05h - FFh Reserved.
7:0	0h RW	**Interrupt Line (INTL):** The value written in this register indicates which input of the system interrupt controller, the device's interrupt pin is connected to. This value is used by the operating system and the device driver, and has no affect on the hardware

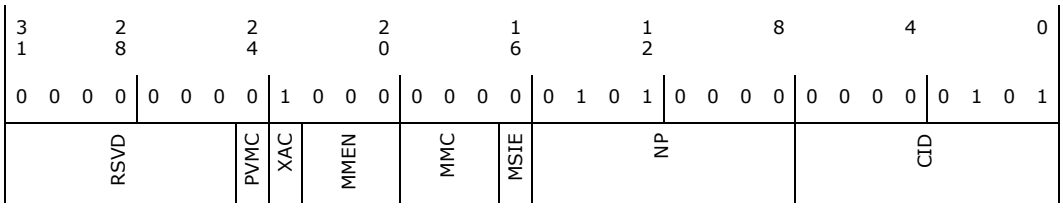
31.1.13 MSI Message Control, Next Pointer and Capability ID (IDE_HOST_MSIMC_MSINP_MSICID)—Offset 40h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 2

Default: 805005h



Bit Range	Default and Access	Field Name (ID): Description
31:25	0h RO	Reserved.
24	0h RO	**Per Vector Masking Capable (PVMC):** Not implemented. Hardwired to 0 to indicate the function does NOT support MSI per-vector masking.
23	1h RO	**64 bit address capable (XAC):** Hardwired to 1 to indicate the function is capable of sending a 64-bit message address.
22:20	0h RW	**Multiple Message Enable (MMEN):** Encoded number of interrupt vectors allocated by SW. This field is RW for software compatibility, but only one interrupt vector is ever sent by the function.
19:17	0h RO	**Multiple Message Capable (MMC):** Encoded number of interrupt vectors requested by a device. Hardwired to 0 to indicate one requested interrupt vector.
16	0h RW	**MSI Enable (MSIE):** If set, MSI interrupt delivery is enabled whereas pin-based interrupt delivery SHALL be disabled. If cleared, prior to returning the configuration write (that clears this field) completion, the function must send any pending MSI(s).
15:8	50h RO	**Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list. Hardwired to 50h to point to the PM Capability list
7:0	5h RO	**Capability ID (CID):** Hardwired to 05h to indicate the linked list item as the MSI Capability registers

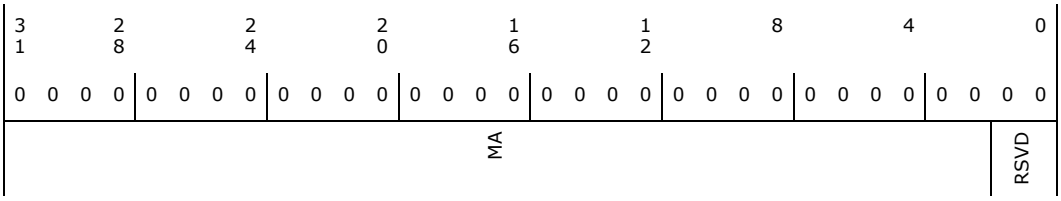
31.1.14 MSI Message Address (IDE_HOST_MSIMA)—Offset 44h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**Message Address (MA):** 32-bit DW-aligned MSI message address.
1:0	0h RO	Reserved.

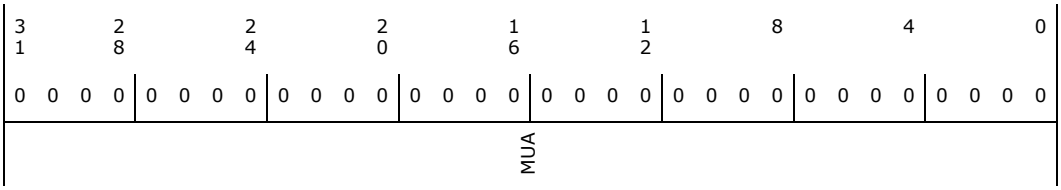
31.1.15 MSI Message Upper Address (IDE_HOST_MSIMUA)—Offset 48h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Message Upper Address (MUA):** Upper 32-bit of a 64-bit DW-aligned MSI message address.

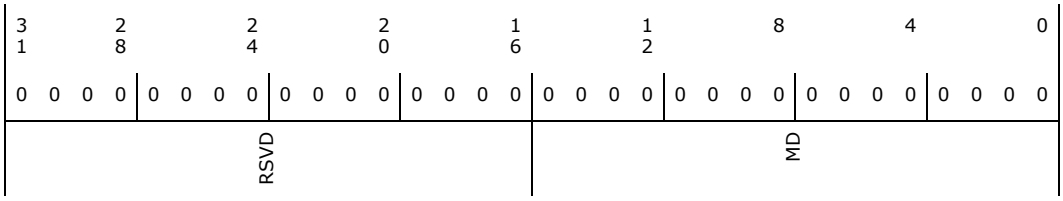
31.1.16 MSI Message Data (IDE_HOST_MSIMD)—Offset 4Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW	**Message Data (MD):** MSI Message Data

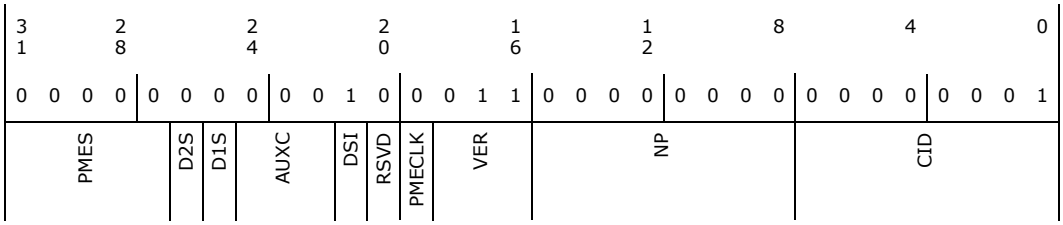
31.1.17 Power Management Capabilities, Next Pointer and Capability ID (IDE_HOST_PMCAP_PMNP_PMCID)—Offset 50h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 2

Default: 230001h



Bit Range	Default and Access	Field Name (ID): Description
31:27	0h RO	**PME Support (PMES):** This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. bit(27) X XXX1b - PME# can be asserted from D0 bit(28) X XX1Xb - PME# can be asserted from D1 bit(29) X X1XXb - PME# can be asserted from D2 bit(30) X 1XXXb - PME# can be asserted from $D3_{HOT}$ bit(31) 1 XXXXb - PME# can be asserted from $D3_{COLD}$
26	0h RO	**D2 Support (D2S):** Hardwired to 0 to indicate that this device does not support D2

Bit Range	Default and Access	Field Name (ID): Description
25	0h RO	**D1 Support (D1S):** Hardwired to 0 to indicate that this device does not support D1
24:22	0h RO	**Aux Current (AUXC):** Not implemented. Hardwired to 0.
21	1h RO	**Device Specific Initialization (DSI):** indicates whether special initialization of this function is required (beyond the standard PCI configuration header) before the generic class device driver is able to use it. A 1 indicates that the function requires a device specific initialization sequence following transition to the D0 uninitialized state. Hardwired to 1 to indicate Device Specific Initialization is required.
20	0h RO	Reserved.
19	0h RO	**PME Clock (PMECLK):** Not implemented. Hardwired to 0.
18:16	3h RO	**Version (VER):** Hardwired to value of 011b indicates that this function complies with Rev. 1.2 of *PCI Power Management Interface Specification*
15:8	0h RO	**Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list. Hardwired to 0 to indicate no more linked list item.
7:0	1h RO	**Capability ID (CID):** Hardwired to 01h to indicate the linked list item as the PCI Power Management registers

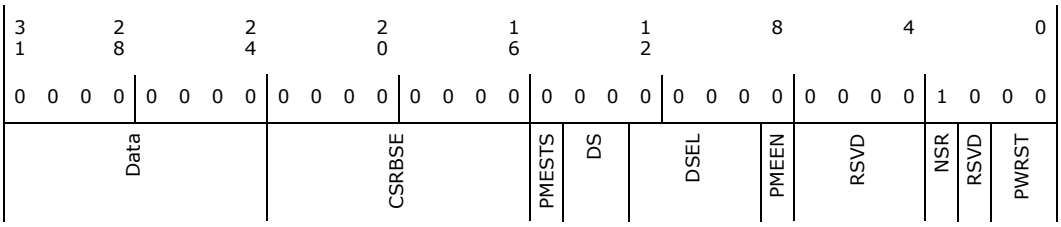
31.1.18 Power Management Data, Control/Status Register Bridge Support Extensions, Control and Status (IDE_HOST_PMD_PMCSRBSE_PMCSR)—Offset 54h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 2

Default: 8h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	**Data (Data):** Not implemented. Hardwired to 0.
23:16	0h RO	**Control/Status Register Bridge Support Extensions (CSRBSE):** Not implemented. Hardwired to 0.
15	0h RO	**PME Status (PMESTS):** Not implemented. Hardwired to 0.
14:13	0h RO	**Data Scale (DS):** Not implemented. Hardwired to 0.

Bit Range	Default and Access	Field Name (ID): Description
12:9	0h RO	**Data Select (DSEL):** Not implemented. Hardwired to 0.
8	0h RO	**PME Enable (PMEEN):** Not implemented. Hardwired to 0.
7:4	0h RO	Reserved.
3	1h RO	**No Soft Reset (NSR):** When set to 1, this bit indicates that devices transitioning from $D3_{HOT}$ to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the $D3_{HOT}$ to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits.
2	0h RO	Reserved.
1:0	0h RW	**Power State (PWRST):** This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state. The definition of the field values is given below: 00b - D0 01b - D1 10b - D2 11b - $D3_{HOT}$ If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs.

§

32 Keyboard and Text (KT) (D22:F3)

32.1 Serial Port for Remote Keyboard and Text (KT) (D22:F3) Registers Summary

Table 32-1. Summary of Serial Port for Remote Keyboard and Text (KT) (D22:F3) Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Device ID and Vendor ID (KT_HOST_DID_VID)—Offset 0h	X_8086h
4h	7h	Status and Command (KT_HOST_STS_CMD)—Offset 4h	B00000h
8h	Bh	Class Code and Revision ID (KT_HOST_CC_RID)—Offset 8h	70002XXh
Ch	Fh	BIST, Header Type, Latency Timer, and Cache Line Size (KT_HOST_BIST_HTYPE_LT_CLS)—Offset Ch	800000h
10h	13h	KT IO BAR (KT_HOST_IOBAR)—Offset 10h	1h
14h	17h	KT Memory BAR (KT_HOST_MEMBAR)—Offset 14h	0h
28h	2Bh	Cardbus CIS Pointer (KT_HOST_CCP)—Offset 28h	0h
2Ch	2Fh	Subsystem ID and Subsystem Vendor ID (KT_HOST_SID_SVID)—Offset 2Ch	8086h
30h	33h	Expansion ROM Base Address (KT_HOST_XRBAR)—Offset 30h	0h
34h	37h	Capabilities List Pointer (KT_HOST_CAPP)—Offset 34h	40h
3Ch	3Fh	Maximum Latency, Minimum Grant, Interrupt Pin and Interrupt Line (KT_HOST_MAXL_MING_INTP_INTL)—Offset 3Ch	0h
40h	43h	MSI Message Control, Next Pointer and Capability ID (KT_HOST_MSIMC_MSINP_MSICID)—Offset 40h	805005h
44h	47h	MSI Message Address (KT_HOST_MSIMA)—Offset 44h	0h
48h	4Bh	MSI Message Upper Address (KT_HOST_MSIMUA)—Offset 48h	0h
4Ch	4Fh	MSI Message Data (KT_HOST_MSIMD)—Offset 4Ch	0h
50h	53h	Power Management Capabilities, Next Pointer and Capability ID (KT_HOST_PMCAP_PMNP_PMCID)—Offset 50h	230001h
54h	57h	Power Management Data, Control/Status Register Bridge Support Extensions, Control and Status (KT_HOST_PMD_PMCSRBSE_PMCSR)—Offset 54h	8h

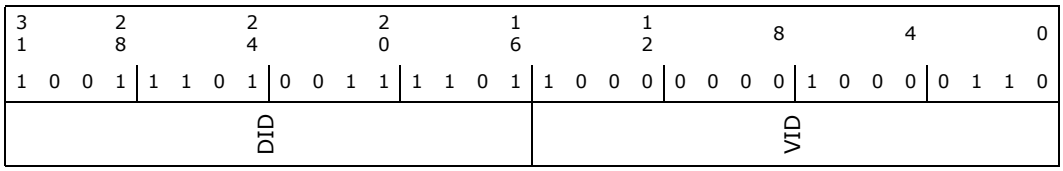
32.1.1 Device ID and Vendor ID (KT_HOST_DID_VID)—Offset 0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 3

Default: X_8086h



Bit Range	Default and Access	Field Name (ID): Description
31:16	---- RO/V	**Device ID (DID):** This field identifies the particular device. See the Device and Version ID Table in Volume 1 for the default value.
15:0	8086h RO	**Vendor ID (VID):** This field identifies the manufacturer of the device. The value of 0x8086 indicates Intel.

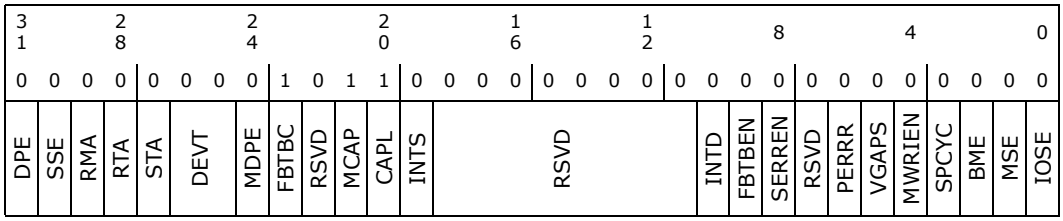
32.1.2 Status and Command (KT_HOST_STS_CMD)—Offset 4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 3

Default: B00000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	**Detected Parity Error (DPE):** Not implemented. Hardwired to 0.
30	0h RO	**Signaled System Error (SSE):** Not implemented. Hardwired to 0.
29	0h RW/1C/V	**Received Master Abort (RMA):** This bit must be set by a master device whenever its transaction (except for Special Cycle) is completed with Unsupported Request Completion Status (a.k.a. Master-Abort). All master devices must implement this bit.
28	0h RW/1C/V	**Received Target Abort (RTA):** This bit must be set by a master device whenever its transaction is completed with Completer Abort Completion Status (a.k.a. Target-Abort). All master devices must implement this bit.

Bit Range	Default and Access	Field Name (ID): Description
27	0h RW/1C/V	**Signaled Target Abort (STA):** This bit must be set by a target device whenever it completes a Posted or Non-Posted transaction with a Completer Abort (a.k.a. Target-Abort) error. Devices that will never signal Completer Abort (a.k.a. Target-Abort) do not need to implement this bit.
26:25	0h RO	**Devsel Timing (DEVT):** These bits encode the timing of DEVSEL#. There are three allowable timings for assertion of DEVSEL# as described below: 00b: fast; 01b: medium; 10b: slow; 11b: reserved. These bits are read-only and must indicate the slowest time that a device asserts DEVSEL# for any bus command except Configuration Read and Configuration Write. Hardwired to 00b.
24	0h RO	**Master Data Parity Error (MDPE):** Not implemented. Hardwired to 0.
23	1h RO	**Fast Back to Back Capable (FBTBC):** This bit indicates whether or not the target is capable of accepting fast back-to-back transactions when the transactions are not to the same agent. This bit can be set to 1 if the device can accept these transactions and must be set to 0 otherwise. Hardwired to 1.
22	0h RO	Reserved.
21	1h RO	**66 MHz Capable (MCAP):** This bit indicates whether or not this device is capable of running at 66 MHz. A value of 0 indicates 33 MHz. A value of 1 indicates that the device is 66 MHz capable. Hardwired to 1.
20	1h RO	**Capabilities List (CAPL):** This optional read-only bit indicates whether or not this device implements the pointer for a New Capabilities linked list at offset 34h. A value of zero indicates that no New Capabilities linked list is available. A value of one indicates that the value read at offset 34h is a pointer in Configuration Space to a linked list of new capabilities.
19	0h RO	**Interrupt Status (INTS):** This read-only bit reflects the state of the interrupt in the device/function. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. Read-only and hardwired to 0 for a device that does NOT support pin-based interrupt.
18:11	0h RO	Reserved.
10	0h RW	**Interrupt Disable (INTD):** This bit disables the device/function from asserting INTx#. A value of 0 enables the assertion of its INTx# signal. A value of 1 disables the assertion of its INTx# signal. This bit's state after RST# is 0.
9	0h RO	**Fast Back to Back Enable (FBTBEN):** Not implemented. Hardwired to 0.
8	0h RO	**System Error Enable (SERREN):** Not implemented. Hardwired to 0.
7	0h RO	Reserved.
6	0h RO	**Parity Error Response (PERRR):** Not implemented. Hardwired to 0.
5	0h RO	**VGA Palette Snoop (VGAPS):** Not implemented. Hardwired to 0.
4	0h RO	**Memory Write and Invalidate Enable (MWRIEN):** Not implemented. Hardwired to 0.
3	0h RO	**Special Cycles (SPCYC):** Not implemented. Hardwired to 0.

Bit Range	Default and Access	Field Name (ID): Description
2	0h RW	**Bus Master Enable (BME):** Controls the ability of a PCI device to issue Memory and I/O Read/Write Requests, and the ability of a PCI bridge to forward Memory and I/O Read/Write Requests in the Upstream direction. Devices: When this bit is Set, the PCI device function is allowed to issue Memory or I/O Requests. When this bit is Clear, the PCI device function is not allowed to issue any Memory or I/O Requests. Note that as MSI/MSI-X interrupt Messages are in-band memory writes, setting the Bus Master Enable bit to 0b disables MSI/MSI-X interrupt Messages as well. Requests other than Memory or I/O Requests are not controlled by this bit. Default value of this bit is 0b. This bit is hardwired to 0b if a PCI device function does not generate Memory or I/O Requests. Bridges: This bit controls forwarding of Memory or I/O Requests by a bridge in the Upstream direction. When this bit is 0b, Memory and I/O Requests received at the Downstream side of a bridge must be handled as Unsupported Requests (UR), and for Non-Posted Requests a Completion with UR completion status must be returned. This bit does not affect forwarding of Completions in either the Upstream or Downstream direction. The forwarding of Requests other than Memory or I/O Requests is not controlled by this bit. Default value of this bit is 0b.
1	0h RW	**Memory Space Enable (MSE):** Controls a device's response to Memory Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to Memory Space accesses. State after RST# is 0.
0	0h RW	**IO Space Enable (IOSE):** Controls a device's response to I/O Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to I/O Space accesses. State after RST# is 0.

32.1.3 Class Code and Revision ID (KT_HOST_CC_RID)—Offset 8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 3

Default: 70002xxh

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
BCC								SCC								PI								RID							

Bit Range	Default and Access	Field Name (ID): Description
31:24	7h RO	**Base Class Code (BCC):** Identifies the Base Class Code of an external 16550-compatible serial controller device driver.
23:16	0h RO	**Sub-Class Code (SCC):** Identifies the Sub-Class Code of an external 16550-compatible serial controller device driver.
15:8	2h RO	**Programming Interface (PI):** Identifies the Programming Interface of an external 16550-compatible serial controller device driver.
7:0	---- RO/V	**Revision ID (RID):** Indicates stepping of the host controller. Refer to Device and Revision ID table in Vol1 for specific value.

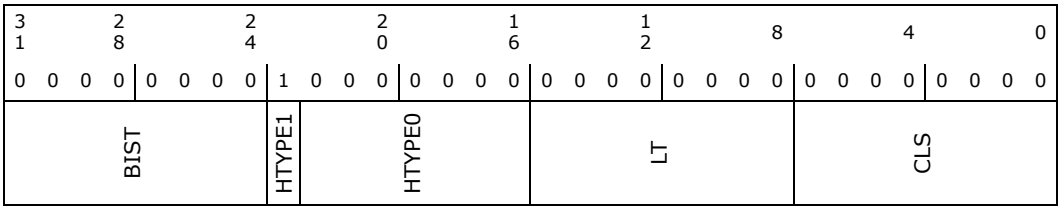
32.1.4 BIST, Header Type, Latency Timer, and Cache Line Size (KT_HOST_BIST_HTYPE_LT_CLS)—Offset Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 3

Default: 800000h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	**Built In Self Test (BIST):** Not implemented. Hardwired to 0.
23	1h RO/V	**Header Type 1 (HTYPE1):** This bit identifies whether or not the device contains multiple functions. - If the bit is 0, then the device is single function. - If the bit is 1, then the device has multiple functions.
22:16	0h RO	**Header Type 0 (HTYPE0):** This field identifies the layout of the second part of the predefined header (beginning at byte 10h in Configuration Space). - The encoding 00h specifies the non-bridge Configuration Space Header. - The encoding 01h specifies the PCI-to-PCI bridge Configuration Space Header. - The encoding 02h specifies the CardBus bridge Configuration Space Header. - All other encodings are reserved. Hardwired to 0 to identify the non-bridge Configuration Space Header.
15:8	0h RO	**Latency Timer (LT):** Not implemented. Hardwired to 0.
7:0	0h RO	**Cache Line Size (CLS):** Not implemented. Hardwired to 0.

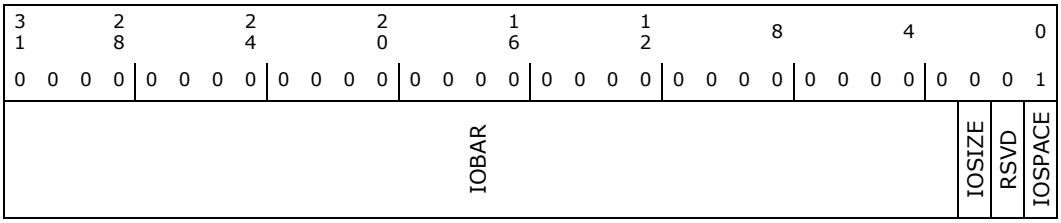
32.1.5 KT IO BAR (KT_HOST_IOBAR)—Offset 10h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 3

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
31:3	0h RW	**IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region
2	0h RO	**IO Size (IOSIZE):** Hardwired to 0 to indicate 8B of I/O space
1	0h RO	Reserved.
0	1h RO	**IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an I/O BAR.

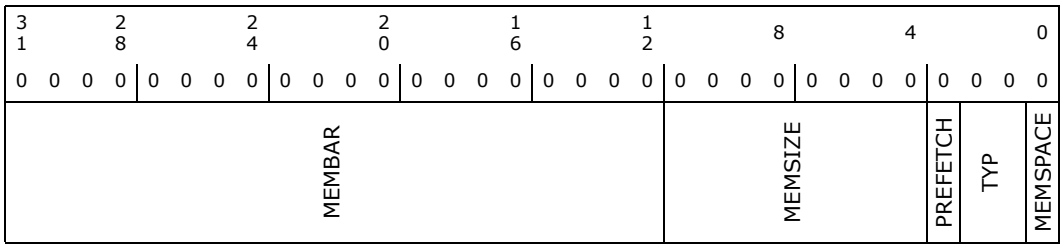
32.1.6 KT Memory BAR (KT_HOST_MEMBAR)—Offset 14h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:12	0h RW	**Memory BAR (MEMBAR):** Software programs this register with the base address of the device's memory region
11:4	0h RO	**Memory Size (MEMSIZE):** Hardwired to 0 to indicate 4KB of memory space
3	0h RO	**Prefetchable (PREFETCH):** A device can mark a range as prefetchable if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables. Hardwired to 0 to indicate the device's memory space as non-prefetchable.
2:1	0h RO	**Type (TYP):** Hardwired to 0 to indicate that Base register is 32 bits wide and mapping can be done anywhere in the 32-bit Memory Space.
0	0h RO	**Memory Space Indicator (MEMSPACE):** Hardwired to 0 to identify a Memory BAR.

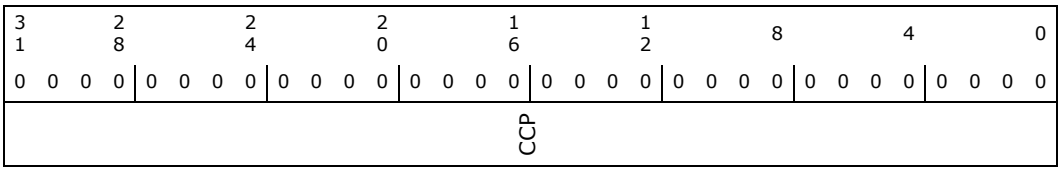
32.1.7 Cardbus CIS Pointer (KT_HOST_CCP)—Offset 28h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO	**Cardbus CIS Pointer (CCP):** Not implemented. Hardwired to 0.

32.1.8 Subsystem ID and Subsystem Vendor ID (KT_HOST_SID_SVID)—Offset 2Ch

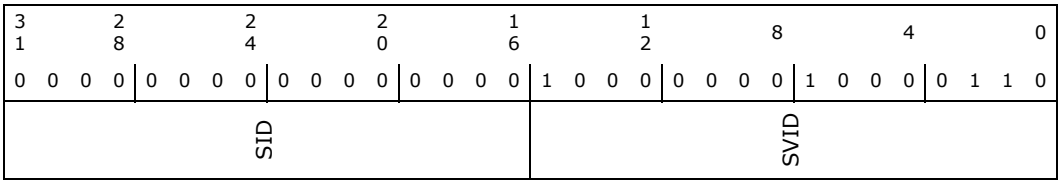
These registers are used to uniquely identify the add-in card or subsystem where the PCI device resides. They provide a mechanism for add-in card vendors to distinguish their add-in cards from one another even though the add-in cards may have the same PCI controller on them (and, therefore, the same Vendor ID and Device ID).

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 3

Default: 8086h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SID):** Value of this field is vendor-specific. This is written by BIOS. No hardware action will be taken on this value. **Implementation Note:** The Write-once lock must be implemented per field. SID should have its own lock.
15:0	8086h RW/O	**Subsystem Vendor ID (SVID):** This field identifies the vendor of the add-in card or subsystem. This is written by BIOS. No hardware action will be taken on this value. **Implementation Note:** The Write-once lock must be implemented per field. SVID should have its own lock.

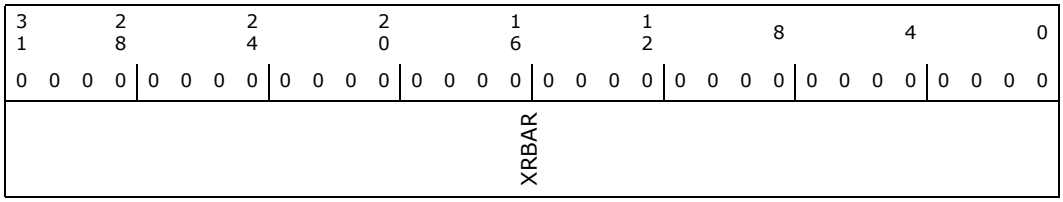
32.1.9 Expansion ROM Base Address (KT_HOST_XRBAR)—Offset 30h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO	**Expansion ROM Base Address (XRBAR):** Not implemented. Hardwired to 0.

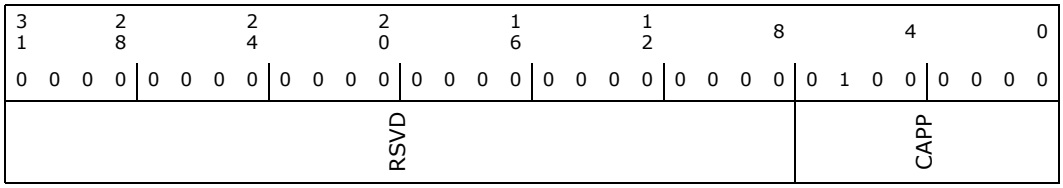
32.1.10 Capabilities List Pointer (KT_HOST_CAPP)—Offset 34h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 3

Default: 40h



Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	40h RO	**Capabilities Pointer (CAPP):** Indicates the pointer for the first entry in the capabilities list which is the MSI Capability.

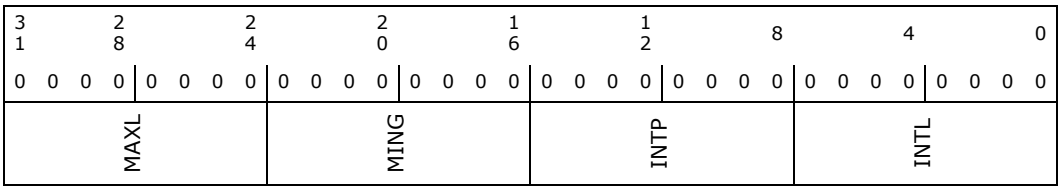
32.1.11 Maximum Latency, Minimum Grant, Interrupt Pin and Interrupt Line (KT_HOST_MAXL_MING_INTP_INTL)—Offset 3Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	**Maximum Latency (MAXL):** Not implemented. Hardwired to 0.
23:16	0h RO	**Minimum Grant (MING):** Not implemented. Hardwired to 0.
15:8	0h RO/V	**Interrupt Pin (INTP):** This register specifies which interrupt pin KT uses in PCI interrupt mode. Value Decoding 00h The function does NOT use an interrupt pin. 01h INTA 02h INTB 03h INTC 04h INTD 05h - FFh Reserved. ***Note:*** This field shadows the KTHIPINR.IPIN field in the PTIO Host private CR space which is configured by BIOS over IOSF SB.
7:0	0h RW	**Interrupt Line (INTL):** This register is used to communicate interrupt line routing information. POST software will write the routing information into this register as it initializes and configures the system. The value in this register tells which input of the system interrupt controller(s) the device's interrupt pin is connected to. The device itself does not use this value, rather it is used by device drivers and operating systems. Device drivers and operating systems can use this information to determine priority and vector information. Values in this register are system architecture specific.

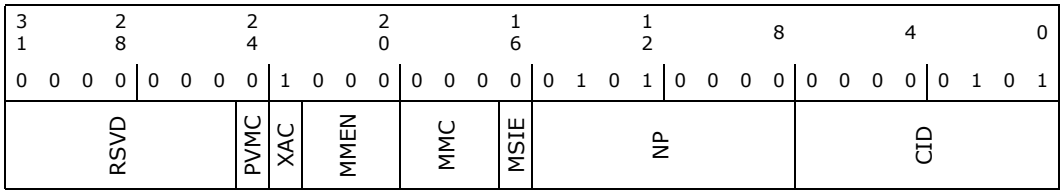
32.1.12 MSI Message Control, Next Pointer and Capability ID (KT_HOST_MSIMC_MSINP_MSICID)—Offset 40h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 3

Default: 805005h



Bit Range	Default and Access	Field Name (ID): Description
31:25	0h RO	Reserved.
24	0h RO	**Per Vector Masking Capable (PVMC):** Not implemented. Hardwired to 0 to indicate the function does NOT support MSI per-vector masking.
23	1h RO	**64 bit address capable (XAC):** Hardwired to 1 to indicate the function is capable of sending a 64-bit message address.
22:20	0h RW	**Multiple Message Enable (MMEN):** Encoded number of interrupt vectors allocated by SW. This field is RW for software compatibility, but only one interrupt vector is ever sent by the function.
19:17	0h RO	**Multiple Message Capable (MMC):** Encoded number of interrupt vectors requested by a device. Hardwired to 0 to indicate one requested interrupt vector.
16	0h RW	**MSI Enable (MSIE):** If set, MSI interrupt delivery is enabled whereas pin-based interrupt delivery SHALL be disabled. If cleared, prior to returning the configuration write (that clears this field) completion, the function must send any pending MSI(s).
15:8	50h RO	**Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list. Hardwired to 50h to point to the PM Capability list
7:0	5h RO	**Capability ID (CID):** Hardwired to 05h to indicate the linked list item as the MSI Capability registers

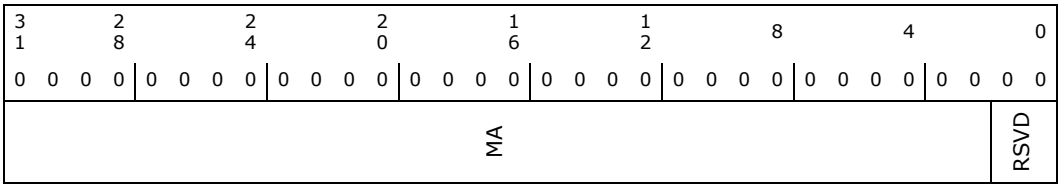
32.1.13 MSI Message Address (KT_HOST_MSIMA)—Offset 44h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**Message Address (MA):** 32-bit DW-aligned MSI message address.
1:0	0h RO	Reserved.

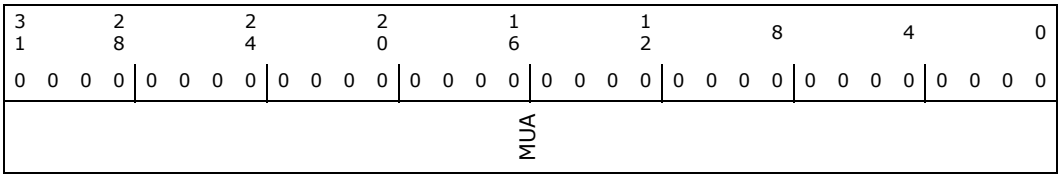
32.1.14 MSI Message Upper Address (KT_HOST_MSIMUA)—Offset 48h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Message Upper Address (MUA):** Upper 32-bit of a 64-bit DW-aligned MSI message address.

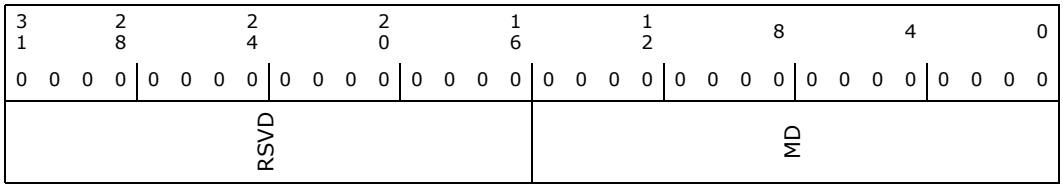
32.1.15 MSI Message Data (KT_HOST_MSIMD)—Offset 4Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW	**Message Data (MD):** MSI Message Data

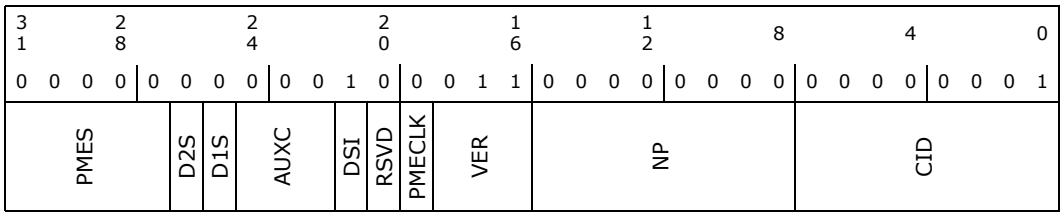
32.1.16 Power Management Capabilities, Next Pointer and Capability ID (KT_HOST_PMCAP_PMNP_PMCID)—Offset 50h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 3

Default: 230001h



Bit Range	Default and Access	Field Name (ID): Description
31:27	0h RO	**PME Support (PMES):** This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. bit(27) X XXX1b - PME# can be asserted from D0 bit(28) X XX1Xb - PME# can be asserted from D1 bit(29) X X1XXb - PME# can be asserted from D2 bit(30) X 1XXXb - PME# can be asserted from D3HOT bit(31) 1 XXXXb - PME# can be asserted from $D3_{COLD}$
26	0h RO	**D2 Support (D2S):** Hardwired to 0 to indicate that this device does not support D2
25	0h RO	**D1 Support (D1S):** Hardwired to 0 to indicate that this device does not support D1
24:22	0h RO	**Aux Current (AUXC):** Not implemented. Hardwired to 0.
21	1h RO	**Device Specific Initialization (DSI):** indicates whether special initialization of this function is required (beyond the standard PCI configuration header) before the generic class device driver is able to use it. A 1 indicates that the function requires a device specific initialization sequence following transition to the D0 uninitialized state. Hardwired to 1 to indicate Device Specific Initialization is required.
20	0h RO	Reserved.
19	0h RO	**PME Clock (PMECLK):** Not implemented. Hardwired to 0.
18:16	3h RO	**Version (VER):** Hardwired to value of 011b indicates that this function complies with Rev 1.2 of the *PCI Power Management Interface Specification*
15:8	0h RO	**Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list. Hardwired to 0 to indicate no more linked list item.
7:0	1h RO	**Capability ID (CID):** Hardwired to 01h to indicate the linked list item as the PCI Power Management registers

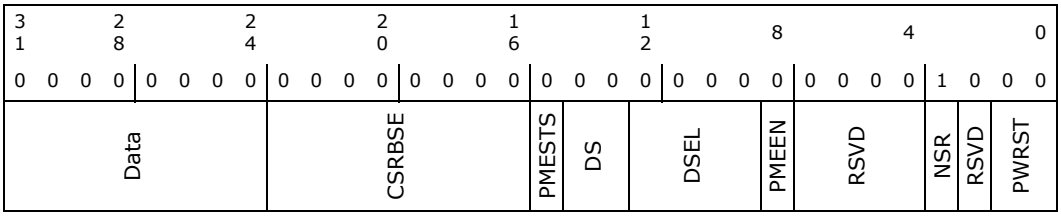
32.1.17 Power Management Data, Control/Status Register Bridge Support Extensions, Control and Status (KT_HOST_PMD_PMCSRBSE_PMCSR)—Offset 54h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 3

Default: 8h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	**Data (Data):** Not implemented. Hardwired to 0.
23:16	0h RO	**Control/Status Register Bridge Support Extensions (CSRBSE):** Not implemented. Hardwired to 0.
15	0h RO	**PME Status (PMESTS):** This bit is set when the function would normally assert the PME signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the function to stop asserting a PME (if enabled). Writing a 0 has no effect. If the function supports PME from $D3_{COLD}$, then this bit is sticky and must be explicitly cleared by the operating system each time the operating system is initially loaded. Not implemented. Hardwired to 0.
14:13	0h RO	**Data Scale (DS):** Not implemented. Hardwired to 0.
12:9	0h RO	**Data Select (DSEL):** Not implemented. Hardwired to 0.
8	0h RO	**PME Enable (PMEEN):** A 1 enables the function to assert PME. When 0, PME assertion is disabled. This bit defaults to 0 if the function does not support PME generation from $D3_{COLD}$. If the function supports PME from $D3_{COLD}$ then this bit is sticky and must be explicitly cleared by the operating system each time it is initially loaded. Not implemented. Hardwired to 0.
7:4	0h RO	Reserved.
3	1h RO	**No Soft Reset (NSR):** When set to 1, this bit indicates that devices transitioning from $D3_{HOT}$ to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the $D3_{HOT}$ to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits.
2	0h RO	Reserved.
1:0	0h RW	**Power State (PWRST):** This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state. The definition of the field values is given below: 00b - D0 01b - D1 10b - D2 11b - $D3_{HOT}$ If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs.

32.2 Keyboard and Text (KT) Additional Configuration Registers Summary

Table 32-2. Summary of Keyboard and Text (KT) Additional Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
54h	57h	Power Management Control and Status (KT_CSXE_PMD_PMCSRBSE_PMCSR)—Offset 54h	8h

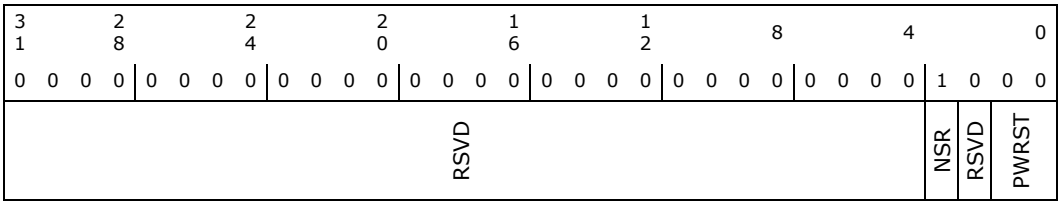
32.2.1 Power Management Control and Status (KT_CSXE_PMD_PMCSRBSE_PMCSR)—Offset 54h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 13
Function: 1

Default: 8h



Bit Range	Default and Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3	1h RO	**No Soft Reset (NSR):** When set to 1, this bit indicates that devices transitioning from $D3_{HOT}$ to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the $D3_{HOT}$ to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits.
2	0h RO	Reserved.
1:0	0h RW	**Power State (PWRST):** This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state. The definition of the field values is given below: 00b - D0 01b - D1 10b - D2 11b - $D3_{HOT}$ If software attempts to write an unsupported, optional state to this field, the write operation will complete normally on the bus; however, the data is discarded and no state change occurs.

33 Innovation Engine (IE)

33.1 Acronyms

Acronyms	Description
IE	Innovation Engine
Intel® ME	Intel® Management Engine
DRNG	Digital Random Number Generator
ITH	Intel Trace Hub

33.2 References

None.

33.3 Overview

The PCH integrates a small embedded core referred to as the Innovation Engine. The IE promotes customer innovation. The IE is a small, 32-bit Intel® Architecture core. It can be enabled by system builders and OEM's to run signed firmware created by the system builder or a third party software vendor. The IE can operate independently or cooperatively with the Intel® Management Engine (Intel® ME), which also resides in the PCH. This subsystem is connected to the rest of the system via an internal fabric, and has its own system address space, exposing some of its interfaces to the host.

33.4 Signal Description

Name	Type	Description
GPP_C3_SML0CLK_IE	I/OD	**IE System Management Link [0] Clock**; Muxed with Intel ME SML0.
GPP_C4_SML0DATA_IE	I/OD	**IE System Management Link [0] Data**; Muxed with Intel ME SML0.
GPP_C5_SML0ALERT_IE_N	I/OD	**IE System Management Link [0] Alert**; Muxed with Intel ME SML0.
GPP_D13_SML0BCLK_IE	I/OD	**IE 2nd instance of Intel ME's SML0CLK used for Comms Hub**; Muxed with Intel ME SML0B.
GPP_D14_SML0BDATA_IE	I/OD	**IE 2nd instance of Intel ME's SML0DATA used for Comms Hub**; Muxed with Intel ME SML0B.
GPP_D16_SML0BALERT_IE_N	I/OD	**IE 2nd instance of Intel ME's SML0ALERTB used for Comms Hub**; Muxed with Intel ME SML0B.
GPP_C6_SML1CLK_IE	I/OD	**IE System Management Link [1] Clock**; Muxed with Intel ME SML1.
GPP_C7_SML1DATA_IE	I/OD	**IE System Management Link [1] Data**; Muxed with Intel ME SML1.
GPP_B23_MEIE_SML1ALRT_N_PHOT_N	I/OD	**IE SML1ALERTB: System Management Link [1] Alert**; Muxed with Intel ME SML1.
GPP_H10_SML2CLK_IE	I/OD	**IE System Management Link [2] Clock**; Muxed with Intel ME SML2.
GPP_H11_SML2DATA_IE	I/OD	**IE System Management Link [2] Data**; Muxed with Intel ME SML2.
GPP_H12_SML2ALERT_N_IE_N	I/OD	**IE System Management Link [2] Alert**; Muxed with Intel ME SML2.
GPP_H13_SML3CLK_IE	I/OD	**IE System Management Link [3] Clock**; Muxed with Intel ME SML3.
GPP_H14_SML3DATA_IE	I/OD	**IE System Management Link [3] Data**; Muxed with Intel ME SML3.

Name	Type	Description
GPP_H15_SML3ALERT_N_IE_N	I/OD	**IE System Management Link [3] Alert**; Muxed with Intel ME SML3.
GPP_H16_SML4CLK_IE	I/OD	**IE System Management Link [4] Clock**; Muxed with Intel ME SML4.
GPP_H17_SML4DATA_IE	I/OD	**IE System Management Link [4] Data**; Muxed with Intel ME SML4.
GPP_H18_SML4ALERT_N_IE_N	I/OD	**IE System Management Link [4] Alert**; Muxed with Intel ME SML4.
GPP_G0_FANTACH0_FANTACH0IE	I	**IE Tachometer pulse input signal 0**; It is used to measure fan speed via the fan's SENSE signal.
GPP_G1_FANTACH1_FANTACH1IE	I	**IE Tachometer pulse input signal 1**; It is used to measure fan speed via the fan's SENSE signal.
GPP_G2_FANTACH2_FANTACH2IE	I	**IE Tachometer pulse input signal 2**; It is used to measure fan speed via the fan's SENSE signal.
GPP_G3_FANTACH3_FANTACH3IE	I	**IE Tachometer pulse input signal 3**; It is used to measure fan speed via the fan's SENSE signal.
GPP_G4_FANTACH4_FANTACH4IE	I	**IE Tachometer pulse input signal 4**; It is used to measure fan speed via the fan's SENSE signal.
GPP_G5_FANTACH5_FANTACH5IE	I	**IE Tachometer pulse input signal 5**; It is used to measure fan speed via the fan's SENSE signal.
GPP_G6_FANTACH6_FANTACH6IE	I	**IE Tachometer pulse input signal 6**; It is used to measure fan speed via the fan's SENSE signal.
GPP_G7_FANTACH7_FANTACH7IE	I	**IE Tachometer pulse input signal 7**; It is used to measure fan speed via the fan's SENSE signal.
GPP_G8_FANPWM0_FANPWM0IE	OD	**IE Pulse Width Modulated duty cycle output signal 0;** It is used for fan speed control.
GPP_G9_FANPWM1_FAMPWM1IE	OD	**IE Pulse Width Modulated duty cycle output signal 1;** It is used for fan speed control.
GPP_G10_FANPWM2_FANPWM2IE	OD	**IE Pulse Width Modulated duty cycle output signal 2;** It is used for fan speed control.
GPP_G11_FANPWM3_FANPMW3IE	OD	**IE Pulse Width Modulated duty cycle output signal 3;** It is used for fan speed control.
GPP_D22_IE_UART_TX	O	**IE High Speed UART Transmit Data**
GPP_D21_IE_UART_RX	I	**IE High Speed UART Receive Data**

33.5 Integrated Pull-Ups and Pull-Downs

Signal	Resistor Type	Value	Notes
GPP_C5_SML0ALERT_IE_N	Pull-Down		1
GPP_B23_MEIE_SML1ALRT_N_PHOT_N	Pull-Down		1
GPP_H12_SML2ALERT_N_IE_N	Pull-Down		1
GPP_G0_FANTACH0_FANTACH0IE	Pull-Up		
GPP_G1_FANTACH1_FANTACH1IE	Pull-Up		
GPP_G2_FANTACH2_FANTACH2IE	Pull-Up		
GPP_G3_FANTACH3_FANTACH3IE	Pull-Up		
GPP_G4_FANTACH4_FANTACH4IE	Pull-Up		
GPP_G5_FANTACH5_FANTACH5IE	Pull-Up		
GPP_G6_FANTACH6_FANTACH6IE	Pull-Up		
GPP_G7_FANTACH7_FANTACH7IE	Pull-Up		

Notes:
1. The internal pull-down is only applied during the strap sampling window and is then disabled.
2. Internal pull-ups and pull-downs are only valid once all the voltages are valid.

33.6 I/O Signal Planes and States

Signal Name	Power Plane	During Reset	Immediately After Reset	S3/S4/S5	Deep Sx
GPP_C3_SML0CLK_IE	Primary	Z	Z	Z	OFF

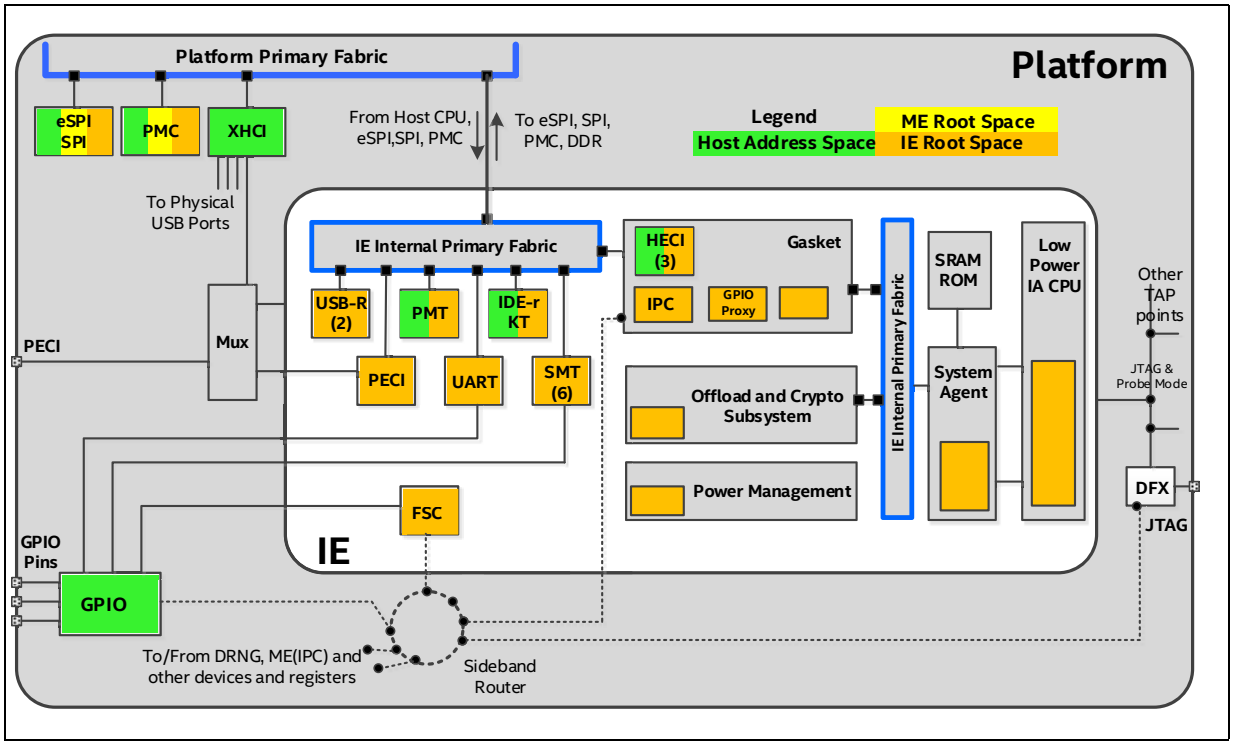
GPP_G7_FANTACH7_FANTACH7IE	Primary	Z	Z	Z	OFF
GPP_G8_FANPWM0_FANPWM0IE	Primary	Z	Z	Z	OFF
GPP_G9_FANPWM1_FAMPWM1IE	Primary	Z	Z	Z	OFF
GPP_G10_FANPWM2_FANPWM2IE	Primary	Z	Z	Z	OFF
GPP_G11_FANPWM3_FANPMW3IE	Primary	Z	Z	Z	OFF

33.7 Functional Description

The IE sub-system includes a very small, low power 32-bit IA core plus a system agent, ROM/SRAM and I/O. The IE is designed for Original Equipment Manufacturers and system builders to develop product differentiating features built on Intel Architecture.

33.7.1 Block Diagram

Figure 33-1. IE Block Diagram



IE has the following main blocks:

- Low Power IA CPU
- System Agent
- SRAM/ROM
- Offload and Crypto Subsystem
- Gasket
- Converged Manageability

IE is integrated to the PCH via internal primary and sideband fabric connections to PCH primary fabric and sideband router as shown in the figure above.

Other main interfaces (signals) include:

- IA CPU JTAG and Probe mode interface to PCH DFx
- SMT/FSC/UART interface to GPIO
- PECI interface to PECI pin
- UTMI interface to XHCI controller

33.7.2 IE Devices

Refer to Table 33-1 for IE host root space device list.

Table 33-1. IE Host Root Space Devices

Host Visible Functions B:D:F		
Device	**B:D:F**	**Comments**
HECI1	M:16:0	
HECI2	M:16:1	
PTIO:IDER	M:16:2	
PTIO:KT	M:16:3	
HECI3	M:16:4	
PMT	M:16:5	

In addition to host root space devices, IE implements several IE root space PCI functions which have PCI configure header and are enumerate-able to the IE FW. IE also implements several fixed address (a.k.a ACPI) IE root space devices and some PCI-like devices on sideband fabric. IE FW directly interfaces with these devices. IE root space device's Device/Function number and Device ID are listed in Table 33-2. HECI1, HECI2, HECI3, PTIO:IDER, PTIO:KT and PMT are dual root space devices.

Table 33-2. IE Root Space Devices (Sheet 1 of 2)

IE Root Space Device	Device Type	IE Root Space Device BDF	IE Root Space Device ID	Comment
Gasket				
HECI1*	ACPI	D2:F0	0xFFF0	
HECI2*	ACPI	D1:F1	0xFFF1	
HECI3*	ACPI	D1:F11	0xFFFB	
GPIO Proxy	ACPI	D1:F7	0xFFF7	
CM Devices

SMT5	PCI	D10:F4	0x0124	
SMT6	PCI	D10:F5	0x0125	
PECI	PCI	D12:F0	0x0104	
PTIO:IDER*	PCI	D13:F0	0x0105	
PTIO:KT*	PCI	D13:F1	0x0106	
PMT*	PCI	D14:F0	0x0107	
UART	PCI	D15:F0	0x0108	
Outside IE				
SPI	PCI	D25:F0	0x0204	Intel ME Root Space SPI flash has a different DID of 0x0201.

Table 33-2. IE Root Space Devices (Sheet 2 of 2)

IE Root Space Device	Device Type	IE Root Space Device BDF	IE Root Space Device ID	Comment
eSPI	PCI	D25:F1	0x0202	
PMC	PCI	D26:F0	0x0203	
DRNG	Sideband Fabric	NA	NA	
ITH	Sideband Fabric	NA	NA	
Note: * These are dual root-space devices.				

33.7.3 IE Features

The IE features are listed in Table 33-3.

Table 33-3. IE Features

Feature	Comment
Access to System Memory	Yes
HECI	Yes (x3)
GPIO Proxy	Yes
Application / Kernel Timer	Yes
IPC	Intel ME
USB-r	Yes
SMT	Yes (x6)
PECI	Yes
IDE-r	Yes
KT	Yes
PMT	Yes
UART	Yes
Hotham	Yes
FSC	Yes
DMA-AES (AES-128, AES-256)	2
DMA-Hash (SHA-1, SHA256)	1
DMA-RC4	1
GPDMA	1
Firmware Tracing via ITH	Yes
JTAG interface	Yes
Chassis compliant power gating	Yes
Sx Support	Yes
Clock gating	Yes
Dynamic clock throttling	Yes
Partition Reset	Yes
The number of Internal primary fabric channels	3
Sideband fabric	Yes

Refer to IE development guide for detail operation of each feature, and device programming model.

33.7.4 IE Power Management

This section summarizes the IE Power Management functionality in the PCH. From the PCI configuration (IE root space) perspective, this chapter contains function 0 representing the interface for the Power Management Controller and some other IE Power Management registers.

Summary of differences between IE and Intel ME PM space.

- IE does not have access to RTC configure registers control.
- IE can not control the sleep pins for sleep stretching.
- IE does not have access to the power state control register.
- IE does not have control of the configuration of timeouts for the PCH
  - PROC_PWRGD to CPURST time out value
  - PROC_PWRGD stuck low timeout
  - Host_Prim_Rst entry time
- Does not have access to the integrated 1 GbE LAN control registers. The definitions still exist in the register bits but the fields have been set to reserve.

33.7.4.1 PROC_PWRGD Support of IE

The IE is capable of delaying the wake Host platform wake sequence. In order to avoid violating the PEROC_PWRGD-to-RST# specification, this is done by delaying the rising edge of the PROC_PWRGD pin. Additionally, the PROC_PWRGD pin must be driven low in all of the cases in which the traditional SLP_S3# pin was driven low. This prevents the PCH from violating the CPU's max PROC_PWRGD-to-CPURST# de-assertion specification in the event that the IE overrides the SLP_S3# pin high. For example, in the boundary case that a reset-with power-cycle event occurs immediately after reset-without-power-cycle is started. In that case, the PCH may proceed with a long reset sequence in which the reset logic attempts to power-cycle the platform. However, the IE is overriding the SLP_Sx# signals high. Therefore, the processor would not see its PROC_PWRGD pin de-assert while its reset input is asserted for seconds without this new functional change. Adding SLP_S3# to the conditions that de-assert PROC_PWRGD is also important for the case of a short residency in an S3/4/5 state. If the platform power discharges slowly, it is possible that a platform could keep PCH_PWROK and SYS_PWROK asserted for extended periods of time thereby either violating the PROC_PWRGD-to-RST# specification or preventing the IE from delaying the wake from S3.

The PCH contains Hardware Watchdog timers to protect against Firmware hangs or other failures that can cause the PROC_PWRGD-related specs to be violated at the processor.

33.7.4.2 IE Reset Handling

The IE platform is capable of operating through a Intel ME and a host partitioned reset and vice versa. There are also cases where either platform can cause a “Global Reset” condition that forces a reset on all platforms.

33.8 Registers

Table 33-1 lists host visible IE devices. Host software accesses these IE devices register through their bus, device, and function number in the host space. For the register detail, refer to the IE developers guide included in Section 33.2.

33.8.1 IE HECI Devices In Host Space (D16:F0, D16:F1, D16:F4)

There are three host visible IE HECI devices for host software access to communicate with IE firmware. The device ID of IE HECI devices are listed in Chapter 2.

Refer to the Intel ME HECI Interface Chapter for the three IE HECI devices register description in host space. They are identical to Intel ME HECI devices except the device number is 16.

§

34 Fan Control

34.1 Acronyms

Acronyms	Description
PWM	Pulse Width Modulation
FSC	Fan Speed Controller

34.2 References

None.

34.3 Overview

The Fan Speed Controller is used to control the fans in the system.

34.4 Signal Description

Name	Type	Description
FAN_TACH_0 / GPP_G0	I	Tachometer pulse input signal
FAN_TACH_1 / GPP_G1	I	Tachometer pulse input signal
FAN_TACH_2 / GPP_G2	I	Tachometer pulse input signal
FAN_TACH_3 / GPP_G3	I	Tachometer pulse input signal
FAN_TACH_4 / GPP_G4	I	Tachometer pulse input signal
FAN_TACH_5 / GPP_G5	I	Tachometer pulse input signal
FAN_TACH_6 / GPP_G6	I	Tachometer pulse input signal
FAN_TACH_7 / GPP_G7	I	Tachometer pulse input signal
FAN_PWM_0 / GPP_G8	OD	Pulse Width Modulated duty cycle output
FAN_PWM_1 / GPP_G9	OD	Pulse Width Modulated duty cycle output
FAN_PWM_2 / GPP_G10	OD	Pulse Width Modulated duty cycle output
FAN_PWM_3 / GPP_G11	OD	Pulse Width Modulated duty cycle output

34.5 Integrated Pull-ups and Pull-downs

Signal	Resistor Type	Value	Notes
FAN_TACH_[7:0]	Internal Pull-up	14K - 26K	
Note: 1. The internal pull-down is only applied during the strap sampling window and is then disabled.			

34.6 I/O Signal Planes and States

Signal Name	Power Plane	During Reset	Immediately after Reset	S3/S4/S5	Deep Sx
FAN_TACH_[7:0]	Primary	Undriven	Undriven	Undriven	Off
FAN_PWM_[3:0]	Primary	Undriven	Undriven	Undriven	Off

34.7 Functional Description

The Fan Speed Controller (FSC) is used to control fans in the system. FSC drives four pulse width modulated signals to control the speed of the fans. FSC samples eight tachometer inputs to measure the speed of the fans. FSC also has an interface to the on-die thermal sensor to know the current temperature.

PWM signal is driven as open-drain. An external pull-up resistor should be implemented to provide the rising edge of the PWM output signal. The PWM output is driven low during reset, which represents 0% duty cycle to the majority of fans.

Note that if a PWM output is programmed to inverted polarity for a particular fan, then the low voltage driven during reset represents 100% duty cycle to the fan.

35.3 Overview

The Intel® C620 Series Chipset adds new features above the standard PCH functions that we share with client for the purpose of providing extra support for the workstation and enterprise customers. Higher level enabling/control of these new features are done via the MS Unit. This section describes what encompasses the MS Unit. These functions are part of the base feature set of the Intel® C620 Series Chipset and are available with every SKU. The EVA functions are all accessible via DMI.

35.4 Functional Description

The MS Unit is a Multifunction device (device 17), consisting of MROM0 (Function 0), MROM 1(Function 1) and SSATA (Function 5).

The SSATA controller is a replication of the SATA controller. All the features and functions are the same with the exception that the SSATA controller has six ports while the SATA controller has eight. The register PCIe and Register description of the SSATA controller is in the SATA/SSATA chapter since they are the same.

MROM1 provides the configuration control of the IE via PCIe configuration registers. It provides the standard DID, VID< PCISTS, PCICMD, CC, RID, CLK, MLT and HDR registers from 00h to 0Fh The Expansion ROM base address is defined at address 30h. The maximum size of the ROM bar is 16 MB.

MROM0 is the base function for the MS Unit at function 0. The PCI configuration registers describe the expansion ROM region for the Intel ME. MROM0 also provides control and enables various EVA functions. The MS Unit Device Function Hide Control register provides the ability to hide SSATA and MROM1 from BIOS and the OS. MROM0 is never hidden. MROM0 provides the control for the ADR Timer. Through the ADR Timer Control register, the ADR timer can be enabled or disabled, and the value of the timer is programmed. The length of the time is combination of the ADR timer value and multiplier value. The ADR timer is programmed in steps of 25, 50 or 100 us, and then a multiplier of 1-96 is then applied to the timer value to give the final timeout.

Inside the logic of the MS Unit is the mux control of the PECI and USBr signals between IE and Intel ME. Both the Intel ME and IE have PECI control functions and interfaces to the XHCI host controller for USB redirection. The MS unit does the physical muxing of those signals. As it is muxing, it's not possible for the IE and Intel ME to both be able to control PECI and the USB redirection.

35.5 MROM0 Configuration Registers Summary

Table 35-1. Summary of xHCI Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	1h	Vendor ID (VID)—Offset 0h	8086h
2h	3h	Device ID (DID)—Offset 2h	(TBA)h
4h	5h	Command (CMD)—Offset 4h	0h
6h	7h	Device Status (STS)—Offset 6h	000h
8h	8h	Revision ID (RID)—Offset 8h	0h
9h	9h	Programming Interface (PI)—Offset 9h	30h
Ah	Ah	Sub Class Code (SCC)—Offset Ah	3h
Bh	Bh	Base Class Code (BCC)—Offset Bh	Ch
Dh	Dh	Master Latency Timer (MLT)—Offset Dh	0h
Eh	Eh	Header Type (HT)—Offset Eh	0h
2Ch	2Dh	Subsystem Vendor ID (SSVID)—Offset 2Ch	0h
2Eh	2Fh	Subsystem ID (SSID)—Offset 2Eh	0h
30h	33h	Expansion ROM Base Address Register (EROMBAR)—Offset 30h	70h
34	34	Capabilities Pointer (CAP_PTR) - Offset 30h	80h
3Ch	3Ch	Interrupt Line (ILINE)—Offset 3Ch	0h
3Dh	3Dh	Interrupt Pin (IPIN)—Offset 3Dh	0h
80h	81h	Power Management Capability List Register ID (PMCAPLST) - Offset 80h	01h
82h	83h	Power Management Capabilities (PM_CAP) - offset 82h	C0E2h
84h	85h	Power Management Control/Status (PM_CS) Offset 84h	0h
D4h	D7h	Device Function Hide Control Register (MSDEVFUNCHIDE) - Offset D4h	0h
DCh	DFh	Soft Strap Public Register (SSPUB) - Offset DCh	0h
E0h	E3h	Private Block Control Register (PRIBLKCTL) - Offset E0h	0h
E4	E7	Device Clock Gate Control Register (DEVCLKGCTL) - offset E4h	0h
E8	E9	Personality Lock Key Control Register (PLKCTL) - Offset E8h	0h
180	183	ADR Timer Control Register (ADRTIMERCTRL) - Offset 180h	10000000h

35.5.1 Vendor ID (VID)—Offset 0h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 0

Default: 8086h

15			12				8				4				0
1	0	0	0	0	0	0	0	1	0	0	0	0	1	1	0
VID															

Bit Range	Default and Access	Field Name (ID): Description
15:0	8086h RO	**Vendor ID (VID)**

35.5.2 Device ID (DID)—Offset 2h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: 8C31h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DID															

Bit Range	Default and Access	Field Name (ID): Description
15:0	TBAV	**Device ID (DID):** See Global Device ID table in Chap. 2 for value

35.5.3 Command (CMD)—Offset 4h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 0

Default: 0h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD					ID	FBE	SERR	WCC	PER	VPS	MWI	SCE	BME	MSE	IOSE

Bit Range	Default and Access	Field Name (ID): Description
15:11	0h RO	Reserved.
10	0h RO	**Interrupt Disable (ID):** MROM does not have an interrupt to disable, so this bit is hardwired to 0.
9	0h RO	**Fast Back to Back Enable (FBE)**
8	0h RW	**SERR# Enable (SERR):** When set to 1, the XHC is capable of generating (internally) SERR#. See section on error handling.
7	0h RO	**Wait Cycle Control (WCC)**
6	0h RW	**Parity Error Response (PER):** This bit controls the setting of the master data parity error bit in the status register in response to a parity error received.
5	0h RO	**VGA Palette Snoop (VPS)**
4	0h RO	**Memory Write Invalidate (MWI)**
3	0h RO	**Special Cycle Enable (SCE)**
2	0h RW	**Bus Master Enable (BME):** This bit controls the ability of the function to issue memory and I/O read or write requests.
1	0h RW	**Memory Space Enable (MSE):** This bit controls the response to memory space accesses. When 0b, the function will handle memory transactions targeting it as an Unsupported request (UR). For Type 1 configuration space headers, this bit controls the primary side response to memory space accesses targeting the secondary side. When this bis is 0b, every memory transaction targeting a secondary interface is handled as an Unsupported Request (UR).
0	0h RO	**I/O Space Enable (IOSE):** Reserved as 0. Read-Only.

35.5.4 Device Status (STS)—Offset 6h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 0

Default: 290h

15			12				8				4				0
0	0	0	0	0	0	1	0	1	0	0	1	0	0	0	0
DPE	SSE	RMA	RTA	STA	DEVT		MDPED	FBBC	UDF	MC	CL	IS	RSVD		

Bit Range	Default and Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE):** This bit is set by the Intel PCH whenever a parity error is seen on the internal interface, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a 1 to this bit location.
14	0h RW/1C	**Signaled System Error (SSE):** This bit is set by the Intel PCH whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. See error handling section for complete list of conditions handled. Software clears this bit by writing a 1 to this bit location.
13	0h RW/1C	**Received Master-Abort Status (RMA):** This bit is set when the requester receives a completion with a UR completion status. Software clears this bit by writing a 1 to this bit location.
12	0h RW/1C	**Received Target Abort Status (RTA):** This bit is set upon receiving a CA completion status. Software clears this bit by writing a 1 to this bit location.
11	0h RW/1C	**Signaled Target-Abort Status (STA):** This bit is used to indicate when the function generates a completion packet with Completer Abort (CA) status.
10:9	1h RO	**DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion. Read-Only.
8	0h RW/1C	**Master Data Parity Error Detected (MDPED):** This bit is set by the Intel PCH whenever a data parity error is detected in a read completion packet on the internal interface and bit 6 of the Command register is set to 1. Software clears this bit by writing a 1 to this bit location.
7	0h RO	**Fast Back-to-Back Capable (FBBC):** Reserved as 0 Read-Only.
6	0h RO	**User Definable Features (UDF):** Reserved as 0. Read-Only.
5	0h RO	**66 MHz Capable (MC):** Reserved as 0. Read-Only.
4	1h RO	**Capabilities List (CL):** Hardwired to 1 indicating that offset 34h contains a valid capabilities pointer.
3	0h RO/V	**Interrupt Status (IS):** Interrupts are not supported so this bit always returns "0" when read.
2:0	0h RO	Reserved.

35.5.5 Revision ID (RID)—Offset 8h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 0

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
RID							

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO/V	**Revision ID (RID):** RIDs are identified in the datasheet specification updates.

35.5.6 Programming Interface (PI)—Offset 9h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 0

Default: 30h

7			4				0
0	0	1	1	0	0	0	0
PI							

Bit Range	Default and Access	Field Name (ID): Description
7:0	00h RO	**Programming Interface (PI):** Default value of 00h.

35.5.7 Sub Class Code (SCC)—Offset Ah

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 0

Default: 3h

7			4				0
0	0	0	0	0	0	0	0
SCC							

Bit Range	Default and Access	Field Name (ID): Description
7:0	00h RO	**Sub Class Code (SCC):** default value of 00h

35.5.8 Base Class Code (BCC)—Offset Bh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 0

Default: Ch

7			4				0
0	0	0	0	1	1	0	0
BCC							

Bit Range	Default and Access	Field Name (ID): Description
7:0	FFh RO	**Base Class Code (BCC):** A value of FFh indicates that this does not fit into any defined class.

35.5.9 Cachleline Size Register (CLS)—Offset Ch

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 0

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
CLS							

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**Cacheline Size Register (CLR):** This register has no meaning for MROM.

35.5.10 Master Latency Timer (MLT)—Offset Dh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 0

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
MLT							

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Master Latency Timer (MLT):** The bits will be fixed at 0 as this register has no meaning for MROM.

35.5.11 Header Type (HT)—Offset Eh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 0

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
MFB	CL						

Bit Range	Default and Access	Field Name (ID): Description
7	0h RO	**Multi-Function Bit (MFB):** Defaults to 0, but if after reset MROM1 or SSATA is enabled then this bit will become a “1”.
6:0	0h RO	**Configuration layout (CL):** Hardwired to 0 to indicate a standard PCI configuration layout.

Bit Range	Default and Access	Field Name (ID): Description
63:16	0h RW	**Base Address (BA):** Bits (63:16) correspond to memory address signals (63:16), respectively. This gives 64 KB of relocatable memory space aligned to 64 KB boundaries.
15:4	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
3	0h RO	**Prefetchable (Prefetchable):** This bit is hardwired to 0 indicating that this range should not be prefetched.
2:1	2h RO	**Type (Type):** If this field is hardwired to 00 it indicates that this range can be mapped anywhere within 32-bit address space. If this field is hardwired to 10 it indicates that this range can be mapped anywhere within 64-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** This bit is hardwired to 0 indicating that the base address field in this register maps to memory space

35.5.12 Subsystem Vendor ID (SSVID)—Offset 2Ch

This register is modified and maintained by BIOS.

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 0

Default: 8086h

15			12				8				4				0
1	0	0	0	1	0	0	0	1	0	0	0	0	1	1	0
SSVID															

Bit Range	Default and Access	Field Name (ID): Description
15:0	8086h RW/L	**Subsystem Vendor ID (SSVID):** This field identifies Intel as the manufacturer of the device.

35.5.13 Subsystem ID (SSID)—Offset 2Eh

This register is modified and maintained by BIOS

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 0

Default: 0h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
SSID															

Bit Range	Default and Access	Field Name (ID): Description
15:0	0h RW/L	**Subsystem ID (SSID):**

35.5.14 Expansion ROM Base Address Register (EROMBAR)—Offset 30h

Access Method

Type: CFG Register (Size: 32bits)

Device: 17
Function: 0

Default: XXh

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	0	1
RBAUB								RBAB23	RBAB22	RBAB21	RBAB20	RBAB19	RBAB18	RBAB17	RBAB16	RBAB15	RSVD														ERE

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RW-LV	**ROM Base Address Upper Bits (RBAUB):** The ROM base address includes both RBAUB and RBAB (23:15) bits below. The RBAUB bits correspond to bits 31:24 0f the ROM base address value.
23	0h RW-LV	**ROM Base Address Bit 23(RBAB23):** Bit 23 becomes RO and locked with ROM is 16M, size = 0h. All MSIZE bits are RW if MROMCTL[size]>=9h, indicating 32K, unless otherwise locked as described.
22	0h RW-LV	**ROM Base Address Bit 22(RBAB22):** Bit 22 becomes RO and locked with ROM is 8M or larger, size <= 1h. All MSIZE bits are RW if MROMCTL[size]>=9h, indicating 32K, unless otherwise locked as described
21	0h RW-LV	**ROM Base Address Bit 21(RBAB21):** Bit 21 becomes RO and locked with ROM is 4M or larger, size <= 2h. All MSIZE bits are RW if MROMCTL[size]>=9h, indicating 32K, unless otherwise locked as described
20	0h RW-LV	**ROM Base Address Bit 20(RBAB20):** Bit 20 becomes RO and locked with ROM is 2M or larger, size <= 3h. All MSIZE bits are RW if MROMCTL[size]>=9h, indicating 32K, unless otherwise locked as described
19	0h RW-LV	**ROM Base Address Bit 19(RBAB19):** Bit 19 becomes RO and locked with ROM is 1M, size <= 4h. All MSIZE bits are RW if MROMCTL[size]>=9h, indicating 32K, unless otherwise locked as described
18	0h RW-LV	**ROM Base Address Bit 18(RBAB18):** Bit 18 becomes RO and locked with ROM is 512K or larger, size< = 5h. All MSIZE bits are RW if MROMCTL[size]>=9h, indicating 32K, unless otherwise locked as described
17	0h RW-LV	**ROM Base Address Bit 17(RBAB17):** Bit 17 becomes RO and locked with ROM is 256K or larger, size <= 6h. All MSIZE bits are RW if MROMCTL[size]>=9h, indicating 32K, unless otherwise locked as described
16	0h RW-LV	**ROM Base Address Bit 16(RBAB16):** Bit 16 becomes RO and locked with ROM is 128K or larger, size <= 7h. All MSIZE bits are RW if MROMCTL[size]>=9h, indicating 32K, unless otherwise locked as described

Bit Range	Default and Access	Field Name (ID): Description
15	0h RW-LV	**ROM Base Address Bit 15(RBAB15):** Bit 15 becomes RO and locked with ROM is 64K or larger, size <= 8h. All MSIZE bits are RW if MROMCTL[size]>=9h, indicating 32K, unless otherwise locked as described
14:1	0;RO	Reserved
0	0h RW-LV	**Expansion ROM Enable (ERE):** 0b: ROM Disabled 1b: Expansion ROM enabled Not writable if MROMCTL[EMROM] = 0 or PRIBLKCTL{ERBD] =1 as described above. If ERE = 1b, but PCICMD[MSE] = 0b, then this address region will no be enabled, as PCICMD[MSE] takes precedence. Both bits need to be 1 in order to enabled address decoding. BIOS must disable ROMBAR to prevent further MROM access prior to the transition to OS. This register can be locked down by PRIBLKCTL[ERBD]=1

35.5.15 Capabilities Pointer (CAP_PTR)—Offset 34h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 0

Default: 80h

7			4				0
1	0	0	0	0	0	0	0
CAP_PTR							

Bit Range	Default and Access	Field Name (ID): Description
7:0	80h RO	**Capabilities Pointer (CAP_PTR):** This register points to the starting offset of the capabilities ranges.

35.5.16 Interrupt Line (ILINE)—Offset 3Ch

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 0

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
ILINE							

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Line (ILINE):** This data is not used by the Intel PCH. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to. A value of 0xFF defines no connection. BIOS should write FFh to this field

35.5.17 Interrupt Pin (IPIN)—Offset 3Dh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
IPIN							

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW/L	**Interrupt pin (IPIN):** Bits 7:0 reflect the Interrupt Pin assigned to the host controller by the platform (and are hardwired).

35.5.18 Power Management Capability List Register ID (PMCAPLST)—Offset 80h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 0

Default: 1h

15			12				8				4				0
0	0	0	0	0	0	0	0	0I	0	0	0	0	0	0	1
NP								CPID							

Bit Range	Default and Access	Field Name (ID): Description
7:0	1h RO	**PCI Power Management Capability ID (PM_CID):** A value of 01h indicates that this is a PCI Power Management capabilities field.
15:8	00h RW-L	**Next Pointer (NP):** Contains the offset of the next item in the capabilities list. A null value is used to indicate that this is the last capability.

35.5.19 Power Management Capabilities (PM_CAP)—Offset 82h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 0

Default: 0000h

15			12				8				4				0
1	1	0	0	0	0	0	1	1	1	0	0	0	0	1	0
PME_Support					D2_Support	D1_Support	Aux_Current			DSI	RSVD	PMEClock	Version		

Bit Range	Default and Access	Field Name (ID): Description
15:11	00h RO	**PME_Support (PME_Support):** This 5-bit field indicates the power states in which the function may assert PME#. A value of 00h implies that this device does not generate PME events.
10	0h RO	**D2_Support (D2_Support):** The D2 state is not supported.
9	0h RO	**D1_Support (D1_Support):** The D1 state is not supported.
8:6	0h RO	**Aux_Current (Aux_Current):** Auxiliary power is not supported.
5	0h Ro	**DSI (DSI):** The Intel PCH reports 0, indicating that no device-specific initialization is required.
4	0h RO	Reserved.
3	0h RW/L	**PME Clock (PMEClock):** The Intel PCH reports 0, indicating that no PCI clock is required to generate PME#.
2:0	3h RW/L	**Version (Version):** Complies with Revision 1.2 of the PCI Power Management Specification.

35.5.20 Power Management Control/Status (PM_CS)—Offset 84h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 0

Default: 8h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
PME_Status	Data_Scale		Data_Select				PME_En	RSVD				NSR	RSVD	PowerState	

Bit Range	Default and Access	Field Name (ID): Description
15	0h RW/1C	**PME_Status (PME_Status):** This bit is set when the function would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded.
14:13	0h RO	**Data_Scale (Data_Scale):** Not supported so hardwired to 00.
12:9	0h RO	**Data_Select (Data_Select):** Not supported so hardwired to 00.
8	0h RW	**PME_En (PME_En):** A 1 enables the function to generate an internal PME signal when PME_Status is 1. This bit must be explicitly cleared by the operating system each time it is initially loaded.
7:4	0h RO	Reserved.
3	1h RO	**No Soft Reset (NSR):** This bit indicates that devices transitioning from $D3_{HOT}$ to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the $D3_{HOT}$ to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits.
2	0h RO	Reserved.
1:0	0h RW	**PowerState (PowerState):** This 2-bit field is used both to determine the current power state and to set a new power state. The definition of the field values are: 00b - D0 state 11b - $D3_{HOT}$ state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs.

35.5.21 Device Function Hide Control Register (MSDEVFUNCHIDE)—Offset D4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 0

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
LOCK	RSVD																								SSATA	RSVD			MROM1	RSVD	

Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/l	**LOCK (Addr):** locked =1b, unlocked = 0b. This bit locks the device function hide register. Once this bit is set to 1b, it can not be unlocked. Writing a 0b has no effect. This gets reset to 0b on a power cycle.
30:6	0h RO	Reserved.
5	0b RW/L	**Function 5 sSATA (SSATA):** 0b = enabled for use by BIOS/OS, 1b = hidden from BIOS/OS.
4:2	0h RO	Reserved.
1	1b RW/L	**Function 1 MROM1(MROM1**) 0b = enabled for use by BIOS/OS, 1b = hidden from BIOS/OS. By default MROM1 is hidden from BIOS and the OS
0	0 RO	**Function 0 MROM0 (MROM0):** MROM0 is never hidden

35.5.22 Soft Strap Public Register (SSPUB)—Offset DCh

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 0

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD																														DISSSATA	DISMROM1

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	**RSVD**
1	0h RO	Disable SSATA (DISSSATA): reflects the status of soft straps to enable or disable the SSATA. 0 = SSATA enabled. 1 = SSATA disabled
0	0b RO	Disab.e MROM1 (DISMROM1): reflects the status of soft straps to enable or disable the MROM1. 0 = MROM1enabled. 1 = MROM1disabled

35.5.23 Private Block Control Register (PRIBLKCTL)—Offset E0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 0

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
ERBD	RSVD																														DNEERB

Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	**Expansion ROM BAR Disable (ERBD):** This bit is self locking. Once set to one can not be cleared by writing a "0" to it. Setting this to "1" makes all bits in the EROMBAR register RO
30:1	0h RW	These bits are reserved and must remain "0"
0	0b RO	**Do Not Enable Expansion ROM Bar (DNEERB);** This is a read-only bit that reflects the state of a fuse bit. The fuse does not directly control anything but is used as a signal for BIOS and FW to enable the expansion ROM BAR or not.

35.5.24 Device Clock Gate Control Register (DEVCLKGCTL)—Offset E4h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 0

Default: 0010h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
ICGE	RSVD							ICT							

Bit Range	Default and Access	Field Name (ID): Description
15	0h Rw	**Idle Clock Gate Enable (ICGE):** When set this bit enables the IP block to enter clock gating mode, where the clocks are turned off to save power.
14:8	0h RW	These bits are reserved and must remain "0".
7:0	0b Rw	**Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle for before the clock disable process begins. 01h = 1 clock and FFh = 255. The minimum number recommended is 16 (default).

35.5.25 Personality Lock Key Control Register (PLKCTL) —Offset E8h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 0

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD															CL

Bit Range	Default and Access	Field Name (ID): Description
15:1	0h RW	These bits are reserved and must remain "0".
0	0b Rw-L	**Capability Lock (CL):** Lock bit for all RW-L bits in all registers for this function. 0b= unlocked 1b = locked. Once a "1" is written to this bit it is only reset to 0 with a global reset.

35.5.26 ADR Timer Control Register (ADRTIMERCTRL)—Offset 180h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 0

Default: 10000000h

31			28				24				20				16				12				8				4				0
0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
ADR_TMR			RSVD				ADR_MUL				RSVD																					

Bit Range	Default and Access	Field Name (ID): Description
31:30	00b RW-L	**ADR Timer (ADR_TMR)**: The value programmed into this field is part of the equation for determining how long a global reset included in the ADR flow will be delayed before triggering a reset. The time must be long enough to along the even to be communicated to the CPU via PM Sync and for the CPU to complete it's required steps. The actual time is a combination of the time determined by this register multiplied by the value in the ADR timer multiplier (bits 27:24 of this same register). The lock key bit is located in the Personality Lock Key Control Register (PLKCTL) 00: 25 uS 01: 50 uS 10: 100 uS 11: 0 uS (off)
29:28	01b RSVD	**RSVD**
27:24	0h, RW-L	**ADR Timer Multiplier (ADR_MULT):** This field contains 9 encoded values, that when used as multiplies with ADR_TMR produce the final length of time that a global reset is held off for in the ADR flow. 0000: 1 0001: 8 0010: 24 0011: 40 0100: 56 0110: 72 0111: 80 1000: 88 1001: 96 1010 - 1111: Reserved, defaults to a multiplier of 96
23:0	0h RV	**RSVD**

35.6 MROM1 Configuration Registers Summary

Table 35-2. Summary of MROM1 Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	1h	Vendor ID (VID)—Offset 0h	8086h
2h	3h	Device ID (DID)—Offset 2h	(TBA)h
4h	5h	Command (CMD)—Offset 4h	0h
6h	7h	Device Status (STS)—Offset 6h	000h
8h	8h	Revision ID (RID)—Offset 8h	0h
9h	9h	Programming Interface (PI)—Offset 9h	30h
Ah	Ah	Sub Class Code (SCC)—Offset Ah	3h
Bh	Bh	Base Class Code (BCC)—Offset Bh	Ch
Dh	Dh	Master Latency Timer (MLT)—Offset Dh	0h
Eh	Eh	Header Type (HT)—Offset Eh	0h
2Ch	2Dh	Subsystem Vendor ID (SSVID)—Offset 2Ch	0h
2Eh	2Fh	Subsystem ID (SSID)—Offset 2Eh	0h
30h	33	Expansion ROM Base Address Register (EROMBAR)—Offset 30h	0h
34h	34h	Capabilities Pointer (CAP_PTR) Offset 34h	80h

Table 35-2. Summary of MROM1 Configuration Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
3Ch	3Ch	Interrupt Line (ILINE)—Offset 3Ch	0h
3Dh	3Dh	Interrupt Pin (IPIN)—Offset 3Dh	0h
80h	81h	Power management Capability List Register ID (PMCAPLST) - Offset 80h	0h
82	83h	Power Management Capabilities (PM_CAP) - Offset 82h	0h
84h	87h	Power Management Control/Status (PM_CS) Offset 84h	0008h
E0	E3	Private Block Control Register (PRIBLKCTL) - Offset E0h	0h
E4	E5	Device Clock Gate Control Register (DEVCLKGCTL) - Offset E4h	0h
E8h	E9h	Personality Lock Key control Register (PLKCTL) - Offset E8h	0h

35.6.1 Vendor ID (VID)—Offset 0h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 1

Default: 8086h

15			12				8				4				0
1	0	0	0	0	0	0	0	1	0	0	0	0	1	1	0
VID															

Bit Range	Default and Access	Field Name (ID): Description
15:0	8086h RO	**Vendor ID (VID)**

35.6.2 Device ID (DID)—Offset 2h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 1

Default: h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DID															

Bit Range	Default and Access	Field Name (ID): Description
15:0	TBAV	**Device ID (DID):** See Global Device ID table in Chapter 2 for value.

35.6.3 Command (CMD)—Offset 4h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 1

Default: 0h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD					ID	FBE	SERR	WCC	PER	VPS	MWI	SCE	BME	MSE	IOSE

Bit Range	Default and Access	Field Name (ID): Description
15:11	0h RO	Reserved.
10	0h RO	**Interrupt Disable (ID):** MROM does not have an interrupt to disable, so this bit is hardwired to 0.
9	0h RO	**Fast Back to Back Enable (FBE)**
8	0h RW	**SERR# Enable (SERR):** When set to 1, the XHC is capable of generating (internally) SERR#. See section on error handling.
7	0h RO	**Wait Cycle Control (WCC)**
6	0h RW	**Parity Error Response (PER):** This bit controls the setting of the master data parity error bit in the status register in response to a parity error received.
5	0h RO	**VGA Palette Snoop (VPS)**
4	0h RO	**Memory Write Invalidate (MWI)**
3	0h RO	**Special Cycle Enable (SCE)**
2	0h RW	**Bus Master Enable (BME):** This bit controls the ability of the function to issue memory and I/O read or write requests.
1	0h RW	**Memory Space Enable (MSE):** This bit controls the response to memory space accesses. When 0b, the function will handle memory transactions targeting it as an Unsupported request (UR). For Type 1 configuration space headers, this bit controls the primary side response to memory space accesses targeting the secondary side. When this bis is 0b, every memory transaction targeting a secondary interface is handled as an Unsupported Request (UR).
0	0h RO	**I/O Space Enable (IOSE):** Reserved as 0. Read-Only.

35.6.4 Device Status (STS)—Offset 6h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 1

Default: 290h

15			12				8				4				0
0	0	0	0	0	0	1	0	1	0	0	1	0	0	0	0
DPE	SSE	RMA	RTA	STA	DEVT		MDPED	FBBC	UDF	MC	CL	IS	RSVD		

Bit Range	Default and Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE):** This bit is set by the Intel PCH whenever a parity error is seen on the internal interface, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a 1 to this bit location.
14	0h RW/1C	**Signaled System Error (SSE):** This bit is set by the Intel PCH whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. See error handling section for complete list of conditions handled. Software clears this bit by writing a 1 to this bit location.
13	0h RW/1C	**Received Master-Abort Status (RMA):** This bit is set when the requester receives a completion with a UR completion status. Software clears this bit by writing a 1 to this bit location.
12	0h RW/1C	**Received Target Abort Status (RTA):** This bit is set upon receiving a CA completion status. Software clears this bit by writing a 1 to this bit location.
11	0h RW/1C	**Signaled Target-Abort Status (STA):** This bit is used to indicate when the function generates a completion packet with Completer Abort (CA) status.
10:9	1h RO	**DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion. Read-Only.
8	0h RW/1C	**Master Data Parity Error Detected (MDPED):** This bit is set by the Intel PCH whenever a data parity error is detected in a read completion packet on the internal interface and bit 6 of the Command register is set to 1. Software clears this bit by writing a 1 to this bit location.
7	0h RO	**Fast Back-to-Back Capable (FBBC):** Reserved as 0 Read-Only.
6	0h RO	**User Definable Features (UDF):** Reserved as 0. Read-Only.
5	0h RO	**66 MHz Capable (MC):** Reserved as 0. Read-Only.
4	1h RO	**Capabilities List (CL):** Hardwired to 1 indicating that offset 34h contains a valid capabilities pointer.
3	0h RO/V	**Interrupt Status (IS):** Interrupts are not supported so this bit always returns "0" when read.
2:0	0h RO	Reserved.

35.6.5 Revision ID (RID)—Offset 8h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 1

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
RID							

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO/V	**Revision ID (RID):** RIDs are identified in the datasheet specification updates.

35.6.6 Programming Interface (PI)—Offset 9h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 1

Default: 30h

7			4				0
0	0	1	1	0	0	0	0
PI							

Bit Range	Default and Access	Field Name (ID): Description
7:0	00h RO	**Programming Interface (PI):** Default value of 00h.

35.6.7 Sub Class Code (SCC)—Offset Ah

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 1

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
SCC							

Bit Range	Default and Access	Field Name (ID): Description
7:0	00h RO	**Sub Class Code (SCC):** Default value of 00h

35.6.8 Base Class Code (BCC)—Offset Bh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 1

Default: Ch

7			4				0
0	0	0	0	1	1	0	0
BCC							

Bit Range	Default and Access	Field Name (ID): Description
7:0	FFh RO	**Base Class Code (BCC):** A value of FFh indicates that this does not fit into any defined class.

35.6.9 Cachleline Size Register (CLS)—Offset Ch

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 1

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
CLS							

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**Cacheline Size Register (CLR):** This register has no meaning for MROM.

35.6.10 Master Latency Timer (MLT)—Offset Dh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 1

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
MLT							

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Master Latency Timer (MLT):** The bits will be fixed at 0 as this register has no meaning for MROM.

35.6.11 Header Type (HT)—Offset Eh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 1

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
MFB	CL						

Bit Range	Default and Access	Field Name (ID): Description
7	0h RO	**Multi-Function Bit (MFB):** Defaults to 0, but if after reset MROM1 or SSATA is enabled then this bit will become a “1”.
6:0	0h RO	**Configuration layout (CL):** Hardwired to 0 to indicate a standard PCI configuration layout.

Bit Range	Default and Access	Field Name (ID): Description
63:16	0h RW	**Base Address (BA):** Bits [63:16] correspond to memory address signals [63:16], respectively. This gives 64 KB of relocatable memory space aligned to 64 KB boundaries.
15:4	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
3	0h RO	**Prefetchable (Prefetchable):** This bit is hardwired to 0 indicating that this range should not be prefetched.
2:1	2h RO	**Type (Type):** If this field is hardwired to 00 it indicates that this range can be mapped anywhere within 32-bit address space. If this field is hardwired to 10 it indicates that this range can be mapped anywhere within 64-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** This bit is hardwired to 0 indicating that the base address field in this register maps to memory space

35.6.12 Subsystem Vendor ID (SSVID)—Offset 2Ch

This register is modified and maintained by BIOS

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 1

Default: 8086h

15			12				8				4				0
1	0	0	0	1	0	0	0	1	0	0	0	0	1	1	0
SSVID															

Bit Range	Default and Access	Field Name (ID): Description
15:0	8086h RW/L	**Subsystem Vendor ID (SSVID):** This field identifies Intel as the manufacturer of the device.

35.6.13 Subsystem ID (SSID)—Offset 2Eh

This register is modified and maintained by BIOS.

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 1

Default: 0h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
SSID															

Bit Range	Default and Access	Field Name (ID): Description
15:0	0h RW/L	**Subsystem ID (SSID):**

35.6.14 Expansion ROM Base Address Register (EROMBAR)—Offset 30h

Access Method

Type: CFG Register
(Size: 32bits)

Device: 17
Function: 1

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RBAUB								RBAB23	RBAB22	RBAB21	RBAB20	RBAB19	RBAB18	RBAB17	RBAB16	RBAB15	RSVD														ERE

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RW-LV	**ROM Base Address Upper Bits (RBAUB):** The ROM base address includes both RBAUB and RBAB (23:15) bits below. The RBAUB bits correspond to bits 31:24 0f the ROM base address value.
23	0h RW-LV	**ROM Base Address Bit 23(RBAB23):** Bit 23 becomes RO and locked with ROM is 16M, size = 0h. All MSIZE bits are RW if MROMCTL[size]>=9h, indicating 32K, unless otherwise locked as described.
22	0h RW-LV	**ROM Base Address Bit 22(RBAB22):** Bit 22 becomes RO and locked with ROM is 8M or larger, size <= 1h. All MSIZE bits are RW if MROMCTL[size]>=9h, indicating 32K, unless otherwise locked as described.
21	0h RW-LV	**ROM Base Address Bit 21(RBAB21):** Bit 21 becomes RO and locked with ROM is 4M or larger, size <= 2h. All MSIZE bits are RW if MROMCTL[size]>=9h, indicating 32K, unless otherwise locked as described.
20	0h RW-LV	**ROM Base Address Bit 20(RBAB20):** Bit 20 becomes RO and locked with ROM is 2M or larger, size <= 3h. All MSIZE bits are RW if MROMCTL[size]>=9h, indicating 32K, unless otherwise locked as described.
19	0h RW-LV	**ROM Base Address Bit 19(RBAB19):** Bit 19 becomes RO and locked with ROM is 1M, size <= 4h. All MSIZE bits are RW if MROMCTL[size]>=9h, indicating 32K, unless otherwise locked as described.
18	0h RW-LV	**ROM Base Address Bit 18(RBAB18):** Bit 18 becomes RO and locked with ROM is 512K or larger, size< = 5h. All MSIZE bits are RW if MROMCTL[size]>=9h, indicating 32K, unless otherwise locked as described.
17	0h RW-LV	**ROM Base Address Bit 17(RBAB17):** Bit 17 becomes RO and locked with ROM is 256K or larger, size <= 6h. All MSIZE bits are RW if MROMCTL[size]>=9h, indicating 32K, unless otherwise locked as described.
16	0h RW-LV	**ROM Base Address Bit 16(RBAB16):** Bit 16 becomes RO and locked with ROM is 128K or larger, size <= 7h. All MSIZE bits are RW if MROMCTL[size]>=9h, indicating 32K, unless otherwise locked as described.

Bit Range	Default and Access	Field Name (ID): Description
15	0h RW-LV	**ROM Base Address Bit 15(RBAB15):** Bit 15 becomes RO and locked with ROM is 64K or larger, size <= 8h. All MSIZE bits are RW if MROMCTL[size]>=9h, indicating 32K, unless otherwise locked as described.
14:1	0;RO	Reserved
0	0h RW-LV	**Expansion ROM Enable (ERE):** 0b: ROM Disabled 1b: Expansion ROM enabled Not writable if MROMCTL[EMROM] = 0 or PRIBLKCTL{ERBD] =1 as described above. If ERE = 1b, but PCICMD[MSE] = 0b, then this address region will no be enabled, as PCICMD[MSE] takes precedence. Both bits need to be 1 in order to enabled address decoding. BIOS must disable ROMBAR to prevent further MROM access prior to the transition to OS. This register can be locked down by PRIBLKCTL[ERBD]=1.

35.6.15 Capabilities Pointer (CAP_PTR)—Offset 34h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 1

Default: 80h

7			4				0
1	0	0	0	0	0	0	0
CAP_PTR							

Bit Range	Default and Access	Field Name (ID): Description
7:0	80h RO	**Capabilities Pointer (CAP_PTR):** This register points to the starting offset of the capabilities ranges.

35.6.16 Interrupt Line (ILINE)—Offset 3Ch

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 1

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
ILINE							

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Line (ILINE):** This data is not used by the Intel PCH. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to. A value of 0xFF defines no connection. BIOS should write FFh to this field.

35.6.17 Interrupt Pin (IPIN)—Offset 3Dh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 17
Function: 1

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
IPIN							

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW/L	**Interrupt pin (IPIN):** Bits [7:0] reflect the Interrupt Pin assigned to the host controller by the platform (and are hardwired).

35.6.18 Power Management Capability List Register ID (PMCAPLST)—Offset 80h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 1

Default: 1h

15			12				8				4				0
0	0	0	0	0	0	0	0	0I	0	0	0	0	0	0	1
NP								CPID							

Bit Range	Default and Access	Field Name (ID): Description
7:0	1h RO	**PCI Power Management Capability ID (PM_CID):** A value of 01h indicates that this is a PCI Power Management capabilities field.
15:8	00h RW-L	**Next Pointer (NP):** Contains the offset of the next item in the capabilities list. A null value is used to indicate that this is the last capability.

35.6.19 Power Management Capabilities (PM_CAP)—Offset 82h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 1

Default: 3h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
PME_Support					D2_Support	D1_Support	Aux_Current			DSI	RSVD	PMEClock	Version		

Bit Range	Default and Access	Field Name (ID): Description
15:11	00h RO	**PME_Support (PME_Support):** This 5-bit field indicates the power states in which the function may assert PME#. A value of 00h implies that this device does not generate PME events.
10	0h RO	**D2_Support (D2_Support):** The D2 state is not supported.
9	0h RO	**D1_Support (D1_Support):** The D1 state is not supported.
8:6	0h RO	**Aux_Current (Aux_Current):** Auxiliary power is not supported.
5	0h Ro	**DSI (DSI):** The Intel PCH reports 0, indicating that no device-specific initialization is required.
4	0h RO	Reserved.
3	0h RW/L	**PME Clock (PMEClock):** The Intel PCH reports 0, indicating that no PCI clock is required to generate PME#.
2:0	3h RW/L	**Version (Version):** Complies with Revision 1.2 of the PCI Power Management Specification.

35.6.20 Power Management Control/Status (PM_CS)—Offset 84h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 1

Default: 8h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
PME_Status	Data_Scale		Data_Select				PME_En	RSVD				NSR	RSVD	PowerState	

Bit Range	Default and Access	Field Name (ID): Description
15	0h RW/1C	**PME_Status (PME_Status):** This bit is set when the function would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded.
14:13	0h RO	**Data_Scale (Data_Scale):** Not supported so hardwired to 00.
12:9	0h RO	**Data_Select (Data_Select):** Not supported so hardwired to 00.
8	0h RW	**PME_En (PME_En):** A 1 enables the function to generate an internal PME signal when PME_Status is 1. This bit must be explicitly cleared by the operating system each time it is initially loaded.
7:4	0h RO	Reserved.
3	1h RO	**No Soft Reset (NSR):** this bit indicates that devices transitioning from $D3_{HOT}$ to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the $D3_{HOT}$ to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits.
2	0h RO	Reserved.
1:0	0h RW	**PowerState (PowerState):** This 2-bit field is used both to determine the current power state and to set a new power state. The definition of the field values are: 00b - D0 state 11b - $D3_{HOT}$ state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs.

35.6.21 Private Block Control Register (PRIBLKCTL)—Offset E0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 17
Function: 1

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
ERBD	RSVD																														DNEERB

Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	**Expansion ROM BAR Disable (ERBD):** This bit is self locking. Once set to one can not be cleared by writing a "0" to it. Setting this to "1" makes all bits in the EROMBAR register RO
30:1	0h RW	These bits are reserved and must remain "0".
0	0b RO	**Do Not Enable Expansion ROM Bar (DNEERB);** This is a read-only bit that reflects the state of a fuse bit. The fuse does not directly control anything but is used as a signal for BIOS and FW to enable the expansion ROM BAR or not.

35.6.22 Device Clock Gate Control Register (DEVCLKGCTL)—Offset E4h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 1

Default: 0h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
ICGE	RSVD							ICT							

Bit Range	Default and Access	Field Name (ID): Description
15	0h Rw	**Idle Clock Gate Enable (ICGE):** When set this bit enables the IP block to enter clock gating mode, where the clocks are turned off to save power
14:8	0h RW	These bits are reserved and must remain "0".
7:0	0b Rw	**Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle for before the clock disable process begins. 01h = 1 clock and FFh = 255. The minimum number recommended is 16 (default)

35.6.23 Personality Lock Key Control Register (PLKCTL) —Offset E8h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 17
Function: 1

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	10	0	0	0	0	0	0	0
RSVD															CL

Bit Range	Default and Access	Field Name (ID): Description
15:1	0h RW	These bits are reserved and must remain "0".
0	0b Rw-L	**Capability Lock (CL):** Lock bit for all RW-L bits in all registers for this function. 0b= unlocked 1b = locked. Once a "1" is written to this bit it is only reset to 0 with a global reset.

§

36 Additional Configuration Registers

36.1 FIA Configuration PCR Registers Summary

These registers are within the PCH Private Configuration Space which is accessible through the PCH Sideband Interface. They can be accessed via (SBREG_BAR + PortID + Register Offset).

Table 36-1. Summary of FIA Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Common Control (CC)—Offset 0h	0h
100h	103h	Device Reference Clock Request Mapping 1 (DRCRM1)—Offset 100h	76543210h
104h	107h	Device Reference Clock Request Mapping 2 (DRCRM2)—Offset 104h	FEDCBA98h
108h	10Bh	Device Reference Clock Request Mapping 3 (DRCRM3)—Offset 108h	F000FFFFh
224	227	PCIe Uplink and Downlink Strap Configuration (PCIEUDLSTRPCFG)	0h
250h	253h	Lane Owner Status 1 (LOS1)—Offset 250h	0h
254h	257h	Lane Owner Status 2 (LOS2)—Offset 254h	0h
258h	25Bh	Lane Owner Status 3 (LOS3)—Offset 258h	0h
25Ch	25Fh	Lane Owner Status 4 (LOS4)—Offset 25Ch	0h

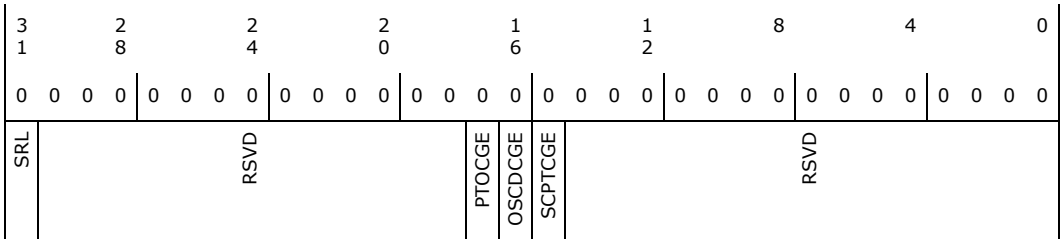
36.1.1 Common Control (CC)—Offset 0h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/O	**Secured Register Lock (SRL):** When this bit is set, all the secured registers will be locked and will be Read-Only.
30:18	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
17	0h RW	**Partition/Trunk Oscillator Clock Gating Enable (PTOCGE):** When set, the oscillator and side clock will be dynamically clock gated when the conditions to clock gate are met. When clear, the oscillator and side clock will never be dynamically clock gated.
16	0h RW	**Oscillator/Side Clock Dynamic Clock Gating Enable (OSCDCGE):** When set, the oscillator and side clock will be dynamically clock gated when the conditions to clock gate are met. When clear, the oscillator and side clock will never be dynamically clock gated.
15	0h RW	**Side Clock Partition/Trunk Clock Gating Enable (SCPTCGE):** When set, the Side Clock will be clock gated at the partition/trunk level when the conditions to clock gate are met. When clear, the Side Clock will never be clock gated at the partition/trunk level.
14:0	0h RO	Reserved.

36.1.2 Device Reference Clock Request Mapping 1 (DRCRM1)—Offset 100h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 76543210h

31			28				24				20				16				12				8				4				0
0	1	1	1	0	1	1	0	0	1	0	1	0	1	0	0	0	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
P8CKRQM				P7CKRQM				P6CKRQM				P5CKRQM				P4CKRQM				P3CKRQM				P2CKRQM				P1CKRQM				

Bit Range	Default and Access	Field Name (ID): Description
31:28	7h RW/L	**PCI Express Port 7 CLKREQ Mapping (P7CKRQM):** Same description as bit [3:0], except that this field applies to PCIe Port 8.
27:24	6h RW/L	**PCI Express Port 6 CLKREQ Mapping (P6CKRQM):** Same description as bit [3:0], except that this field applies to PCIe Port 7.
23:20	5h RW/L	**PCI Express Port 5 CLKREQ Mapping (P5CKRQM):** Same description as bit [3:0], except that this field applies to PCIe Port 6.
19:16	4h RW/L	**PCIe Express Port 4 CLKREQ Mapping (P4CKRQM):** Same description as bit [3:0], except that this field applies to PCIe Port 5.
15:12	3h RW/L	**PCI Express Port 3 CLKREQ Mapping (P3CKRQM):** Same description as bit [3:0], except that this field applies to PCIe Port 4.

Bit Range	Default and Access	Field Name (ID): Description
11:8	2h RW/L	**PCI Express Port 2 CLKREQ Mapping (P2CKRQM):** Same description as bit [3:0], except that this field applies to PCIe Port 3.
7:4	1h RW/L	**PCI Express Port 1 CLKREQ Mapping (P1CKRQM):** Same description as bit [3:0], except that this field applies to PCIe Port 2.
3:0	0h RW/L	**PCI Express Port 0 CLKREQ Mapping (P0CKRQM):** The mapping of PCI Express Port 0 to the corresponding CLKREQ# pin is configured by this field. 0000b: Port 0 maps to CLKREQ0# pin. 0001b: Port 0 maps to CLKREQ1# pin. 0010b: Port 0 maps to CLKREQ2# pin. 0011b: Port 0 maps to CLKREQ3# pin. 0100b: Port 0 maps to CLKREQ4# pin. 0101b: Express Port 0 maps to CLKREQ5# pin. ....[br 1111b: Port 0 maps to CLKREQ15# pin. Software must never map multiple Express Ports to the same CLKREQ# pin. The hardware behavior is undefined if this ever happens. ***Notes:*** This field must be configured prior to enabling any power management features. This register bit is Read-Only when the CC.SRL bit is set. Register Attribute: Static.

36.1.3 Device Reference Clock Request Mapping 2 (DRCRM2)—Offset 104h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: FEDCBA98h

31			28				24				20				16				12				8				4				0
1	1	1	1	1	1	1	0	1	1	0	1	1	1	0	0	1	0	1	1	1	0	1	0	1	0	0	1	1	0	0	0
P16CKRQM				P15CKRQM				P14CKRQM				P13CKRQM				P12CKRQM				P11CKRQM				P10CKRQM				P9CKRQM			

Bit Range	Default and Access	Field Name (ID): Description
31:28	Fh RW/L	**PCI Express Port 15 CLKREQ Mapping (P15CKRQM):** Same description as bit [3:0], except that this field applies to PCIe Port 16.
27:24	Eh RW/L	**Express Port 14 CLKREQ Mapping (P14CKRQM):** Same description as bit [3:0], except that this field applies to PCIe Port 15.
23:20	Dh RW/L	**PCI Express Port 13 CLKREQ Mapping (P13CKRQM):** Same description as bit [3:0], except that this field applies to PCIe Port 14.
19:16	Ch RW/L	**PCI Express Port 12 CLKREQ Mapping (P12CKRQM):** Same description as bit [3:0], except that this field applies to PCIe Port 13.
15:12	Bh RW/L	**PCI Express Port 11 CLKREQ Mapping (P11CKRQM):** Same description as bit [3:0], except that this field applies to PCIe Port 12.

Bit Range	Default and Access	Field Name (ID): Description
11:8	Ah RW/L	**PCI Express Port 10 CLKREQ Mapping (P10CKRQM):** Same description as bit [3:0], except that this field applies to PCIe Port 11.
7:4	9h RW/L	**PCI Express Port 9 CLKREQ Mapping (P9CKRQM):** Same description as bit [3:0], except that this field applies to PCIe Port 10.
3:0	8h RW/L	**PCI Express Port 8 CLKREQ Mapping (P8CKRQM):** The mapping of PCI Express Port 9 to the corresponding CLKREQ# pin is configured by this field. 0000b: Port 8 maps to CLKREQ0# pin. 0001b: Port 8 maps to CLKREQ1# pin. 0010b: Port 8 maps to CLKREQ2# pin. 0011b: Port 8 maps to CLKREQ3# pin. 0100b: Port 8 maps to CLKREQ4# pin. 0101b: Express Port 1 maps to CLKREQ5# pin. ....[br 1111b: Port 8 maps to CLKREQ15# pin. Software must never map multiple Express Ports to the same CLKREQ# pin. The hardware behavior is undefined if this ever happens. ***Notes:*** This field must be configured prior to enabling any power management features. This register bit is Read-Only when the CC.SRL bit is set. Register Attribute: Static.

36.1.4 Device Reference Clock Request Mapping 3 (DRCRM3)—Offset 108h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: F000FFFFh

31			28				24				20				16				12				8				4				0
1	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
GBEPCKRQM				RSVD												P20CKRQM				P19CKRQM				P18CKRQM				P17CKRQM				

Bit Range	Default and Access	Field Name (ID): Description
31:28	Fh RW/L	**GbE Port CLKREQ Mapping (GBEPCKRQM):** The mapping of GbE port to the corresponding CLKREQ# pin is configured by this field. 0000b: GbE port maps to CLKREQ0# pin. 0001b: GbE port maps to CLKREQ1# pin. 0010b: GbE port maps to CLKREQ2# pin. 0011b: GbE port maps to CLKREQ3# pin. 0100b: GbE port maps to CLKREQ4# pin. 0101b: GbE port maps to CLKREQ5# pin. ..... 1111b: GbE port maps to CLKREQ15# pin. Software must never map multiple Express Ports to the same CLKREQ# pin. The hardware behavior is undefined if this ever happens. ***Notes:*** This field must be configured prior to enabling any power management features. This register bit is Read-Only when the CC.SRL bit is set. Register Attribute: Static.
27:16	0h RO	Reserved.
15:12	Fh RW/L	**PCI Express Port 19 CLKREQ Mapping (P19CKRQM):** Same description as bit [3:0], except that this field applies to PCIe Port 20.
11:8	Fh RW/L	**PCI Express Port 18 CLKREQ Mapping (P18CKRQM):** Same description as bit [3:0], except that this field applies to PCIe Port 19.
7:4	Fh RW/L	**PCI Express Port 17 CLKREQ Mapping (P17CKRQM):** Same description as bit [3:0], except that this field applies to PCIe Port 18.
3:0	Fh RW/L	**PCI Express Port 16 CLKREQ Mapping (P16CKRQM):** The mapping of PCI Express Port 16 to the corresponding CLKREQ# pin is configured by this field. 0000b: Port 16 maps to CLKREQ0# pin. 0001b: Port 16 maps to CLKREQ1# pin. 0010b: Port 16 maps to CLKREQ2# pin. 0011b: Port 16 maps to CLKREQ3# pin. 0100b: Port 16 maps to CLKREQ4# pin. 0101b: Express Port 16 maps to CLKREQ5# pin. ....[br 1111b: Port 16 maps to CLKREQ15# pin. Software must never map multiple Express Ports to the same CLKREQ# pin. The hardware behavior is undefined if this ever happens. ***Note:*** This field must be configured prior to enabling any power management features. This register bit is Read-Only when the CC.SRL bit is set. Register Attribute: Static.

36.1.5 PCIe Uplink and Downlink Strap Configuration (PCIEUDLSTRPCFG)—Offset 224h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVDd																															pcieuds

Bit Range	Default and Access	Field Name (ID): Description
31:1	00000000h RO	**RSVD:**
0	RO/S	**PCIe Uplink and Downlink Strap (PCIEUDS):** 0: Statically assigned Lanes 25:18 to PCIe Downlink 1: Statically assigned Lanes 25:18 to PCIe Uplink

36.1.6 Lane Owner Status 1 (LOS1)—Offset 250h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
L7O				L6O				L5O				L4O				L3O				L2O				L1O				L0O			

Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RO/V	**Lane 7 Owner (L7O):** Same description as bits [3:0].
27:24	0h RO/V	**Lane 6 Owner (L6O):** Same description as bits [3:0].
23:20	0h RO/V	**Lane 5 Owner (L5O):** Same description as bits [3:0].
19:16	0h RO/V	**Lane 4 Owner (L4O):** Same description as bits [3:0].

Bit Range	Default and Access	Field Name (ID): Description
15:12	0h RO/V	**Lane 3 Owner (L3O):** Same description as bits [3:0].
11:8	0h RO/V	**Lane 2 Owner (L2O):** Same description as bits [3:0].
7:4	0h RO/V	**Lane 1 Owner (L1O):** Same description as bits [3:0].
3:0	0h RO/V	**Lane 0 Owner (L0O):** Lane 0 Owner (L0O): This register indicates the lane owner for Lane 0. 0000: PCIe/DMI. 0001: USB3. 0010: SATA. 0011: GbE. Others: Reserved.

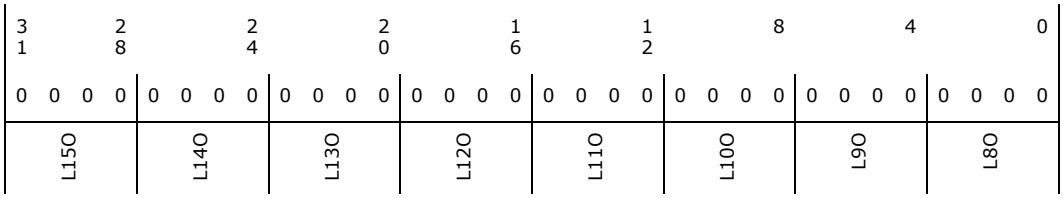
36.1.7 Lane Owner Status 2 (LOS2)—Offset 254h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RO/V	**Lane 15 Owner (L15O):** Same description as bits [3:0].
27:24	0h RO/V	**Lane 14 Owner (L14O):** Same description as bits [3:0].
23:20	0h RO/V	**Lane 13 Owner (L13O):** Same description as bits [3:0].
19:16	0h RO/V	**Lane 12 Owner (L12O):** Same description as bits [3:0].
15:12	0h RO/V	**Lane 11 Owner (L11O):** Same description as bits [3:0].
11:8	0h RO/V	**Lane 10 Owner (L10O):** Same description as bits [3:0].
7:4	0h RO/V	**Lane 9 Owner (L9O):** Same description as bits [3:0].

Bit Range	Default and Access	Field Name (ID): Description
3:0	0h RO/V	**Lane 8 Owner (L8O):** Lane 8 Owner (L8O): This register indicates the lane owner for Lane 0. 0000: PCIe/DMI. 0001: USB3. 0010: SATA. 0011: GbE. Others: Reserved.

36.1.8 Lane Owner Status 3 (LOS3)—Offset 258h

Size:32 bits
FIA Private Configuration Register: Offset 258h: LOS3 - Lane Owner Status 3

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	0h RO	Reserved.
19:16	0h RO	Reserved.
15:12	0h RO	Reserved.
11:8	0h RO	Reserved.
7:4	0h RO/V	**Lane 25 Owner (L25O):** Same description as bits [3:0].
3:0	0h RO/V	**Lane 24 Owner (L24O):** Lane 24 Owner (L24O): This register indicates the lane owner for Lane 0. 0000: PCIe/DMI/PCIe Uplink 0001: USB3. 0010: SATA. 0011: GbE. Others: Reserved.

36.2 DMI Configuration Registers Summary

Table 36-2. Summary of DMI Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
2014h	2017h	Virtual Channel 0 Resource Control (V0CTL)—Offset 2014h	80000010h
2018h	201Bh	Virtual Channel 0 Resource Status (V0STS)—Offset 2018h	0h
2020h	2023h	Virtual Channel 1 Resource Control (V1CTL)—Offset 2020h	0h
2024h	2027h	Virtual Channel 1 Resource Status (V1STS)—Offset 2024h	0h
2040h	2043h	ME Virtual Channel (VCm) Resource Control (VMCTL)—Offset 2040h	0h
2046h	2049h	ME Virtual Channel (VCm) Resource Status (VMSTS)—Offset 2046h	0h
2084h	2087h	Uncorrectable Error Status (UES)—Offset 2084h	0h

Table 36-2. Summary of DMI Configuration Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
2088h	208Bh	Uncorrectable Error Mask (UEM)—Offset 2088h	0h
208Ch	208Fh	Uncorrectable Error Severity (UEV)—Offset 208Ch	0h
2090h	2093h	Correctable Error Status (CES)—Offset 2090h	0h
2094h	2097h	Correctable Error Mask (CEM)—Offset 2094h	2000h
20ACh	20AFh	Root Error Command (REC)—Offset 20ACh	0h
20B0h	20B3h	Root Error Status (RES)—Offset 20B0h	0h
20B4h	20B7h	Error Source Identification (ESID)—Offset 20B4h	0h
21A4h	21A7h	Link Capabilities (LCAP)—Offset 21A4h	12C40h
21A8h	21ABh	Link Control and Link Status (LCTL_LSTS)—Offset 21A8h	410000h
21ACh	21AFh	Link Capabilities 2 (LCAP2)—Offset 21ACh	0h
21B0h	21B3h	Link Control 2 and Link Status 2 (LCTL2_LSTS2)—Offset 21B0h	1h
2234h	2237h	DMI Control Register (DMIC)—Offset 2234h	0h
223Ch	223Fh	IOSF Primary Control And Status (IPCS_IOSFSBCS)—Offset 223Ch	0h
2304h	2307h	DMI Port Link Control (DMILINKC)—Offset 2304h	0h
2310h	2313h	DMI Configuration (DMICFG)—Offset 2310h	0h
2320h	2323h	DMI PLL Shutdown (DMIPLLDOWN)—Offset 2320h	0h
2334h	2337h	DMI Power Management Control (DMIPMCTL)—Offset 2334h	0h
2338h	233Bh	DMI Additional Link Control (DMIALC)—Offset 2338h	0h
2340h	2343h	DMI NFTS (DMINFTS)—Offset 2340h	0h
2730h	2733h	LPC Generic I/O Range 1 (LPCLGIR1)—Offset 2730h	0h
2734h	2737h	LPC Generic I/O Range 2 (LPCLGIR2)—Offset 2734h	0h
2738h	273Bh	LPC Generic I/O Range 3 (LPCLGIR3)—Offset 2738h	0h
273Ch	273Fh	LPC Generic I/O Range 4 (LPCLGIR4)—Offset 273Ch	0h

Bit Range	Default and Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RO/V	**VC Negotiation Pending (NP):** When set, indicates the virtual channel is still being negotiated with ingress ports.
16:0	0h RO	Reserved.

36.2.7 Uncorrectable Error Status (UES)—Offset 2084h

These registers are reset by core PWROK

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD															RO	UC	CA	CT	FCPE	PT	RSVD							DLPE	RSVD			TE

Bit Range	Default and Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RWC/P	**Receiver Overflow Status (RO):** Indicates a receiver overflow occurred.
16	0h RO	**Unexpected Completion Status (UC):** Reserved, not supported.
15	0h RWC/P	**Completer Abort Status (CA):** Indicates a completer abort was received.
14	0h RO	**Completion Timeout Status (CT):** Reserved, not supported.
13	0h RO	**Flow Control Protocol Error Status (FCPE):** Reserved, not supported.
12	0h RWC/P	**Poisoned TLP Status (PT):** Indicates a poisoned TLP was received.
11:5	0h RO	Reserved.
4	0h RWC/P	**Data Link Protocol Error Status (DLPE):** Indicates a data link protocol error occurred.
3:1	0h RO	Reserved.
0	0h RO	**Training Error Status (TE):** Not supported.

36.2.8 Uncorrectable Error Mask (UEM)—Offset 2088h

When set, the corresponding error in the UES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled.
These registers are reset by core PWROK.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD											URE	EE	MT	RO	UC	CM	CT	FCPE	PT	RSVD								DLPE	RSVD			TE

Bit Range	Default and Access	Field Name (ID): Description
31:21	0h RO	Reserved.
20	0h RW/P	**Unsupported Request Error Mask (URE):** Mask for uncorrectable errors.
19	0h RO	**ECRC Error Mask (EE):** ECRC is not supported.
18	0h RW/P	**Malformed TLP Mask (MT):** Mask for malformed TLPs.
17	0h RW/P	**Receiver Overflow Mask (RO):** Mask for receiver overflows.
16	0h RO	**Unexpected Completion Mask (UC):** Reserved, Not supported.
15	0h RW/P	**Completer Abort Mask (CM):** Mask for completer abort.
14	0h RO	**Completion Timeout Mask (CT):** Reserved, not supported.
13	0h RO	**Flow Control Protocol Error Mask (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Mask (PT):** Mask for poisoned TLPs.
11:5	0h RO	Reserved.
4	0h RW/P	**Data Link Protocol Error Mask (DLPE):** Mask for data link protocol errors.
3:1	0h RO	Reserved.
0	0h RO	**Training Error Mask (TE):** Not supported.

36.2.9 Uncorrectable Error Severity (UEV)—Offset 208Ch

These registers are reset by core PWROK

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD											URE	EE	MT	RO	UC	CA	CT	FCPE	PT	RSVD								DLPE	RSVD			TE

Bit Range	Default and Access	Field Name (ID): Description
31:21	0h RO	Reserved.
20	0h RW/P	**Unsupported Request Error Severity (URE):** Severity for unsupported request reception.
19	0h RO	**ECRC Error Severity (EE):** Not Supported.
18	0h RW/P	**Malformed TLP Severity (MT):** Severity for malformed TLP reception.
17	0h RW/P	**Receiver Overflow Severity (RO):** Severity for receiver overflow occurrences.
16	0h RO	**Unexpected Completion Severity (UC):** Reserved, Not supported.
15	0h RW/P	**Completer Abort Severity (CA):** Severity for completer.
14	0h RO	**Completion Timeout Severity (CT):** Reserved, Not supported.
13	0h RO	**Flow Control Protocol Error Severity (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Severity (PT):** Severity for poisoned TLP reception.
11:5	0h RO	Reserved.
4	0h RW/P	**Data Link Protocol Error Severity (DLPE):** Severity for data link protocol errors.
3:1	0h RO	Reserved.
0	0h RW/P	**Training Error Severity (TE):** TE not supported. This bit is RW for ease of implementation.

36.2.10 Correctable Error Status (CES)—Offset 2090h

These registers are reset by core PWROK.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD																		ANFES	RTT	RSVD			RNR	BD	BT	RSVD					RE	

Bit Range	Default and Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13	0h RWC/P	**Advisory Non-Fatal Error Status (ANFES):** When set, indicates that a Advisory Non-Fatal Error occurred.
12	0h RWC/P	**Replay Timer Timeout Status (RTT):** Indicates the replay timer timed out.
11:9	0h RO	Reserved.
8	0h RWC/P	**Replay Number Rollover Status (RNR):** Indicates the replay number rolled over.
7	0h RWC/P	**Bad DLLP Status (BD):** Indicates a bad DLLP was received.
6	0h RWC/P	**Bad TLP Status (BT):** Indicates a bad TLP was received.
5:1	0h RO	Reserved.
0	0h RWC/P	**Receiver Error Status (RE):** Indicates a receiver error occurred.

36.2.11 Correctable Error Mask (CEM)—Offset 2094h

When set, the corresponding error in the CES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled.
These registers are reset by core PWROK.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 2000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD																		ANFEM	RTT	RSVD			RNR	BD	BT	RSVD					RE

Bit Range	Default and Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13	1h RW/P	**Advisory Non-Fatal Error Mask (ANFEM):** When set, masks Advisory Non-Fatal errors from (a) signaling ERR_COR to the device control register and (b) updating the Uncorrectable Error Status register. This register is set by default to enable compatibility with software that does not comprehend Role-Based Error Reporting.
12	0h RW/P	**Replay Timer Timeout Mask (RTT):** Mask for replay timer timeout.
11:9	0h RO	Reserved.
8	0h RW/P	**Replay Number Rollover Mask (RNR):** Mask for replay number rollover.
7	0h RW/P	**Bad DLLP Mask (BD):** Mask for bad DLLP reception.
6	0h RW/P	**Bad TLP Mask (BT):** Mask for bad TLP reception.
5:1	0h RO	Reserved.
0	0h RW/P	**Receiver Error Mask (RE):** Mask for receiver errors.

36.2.12 Root Error Command (REC)—Offset 20ACh

In an exposed AER capability, this register allows errors to generate interrupts. For this implementation, and for RCRBs in general, interrupts cannot be generated, so this register is reserved.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DPDP	UTPB	RSVD																													

Bit Range	Default and Access	Field Name (ID): Description
31	0h RW	**Drop Poisoned Downstream Packets (DPDP):** When set to a '1': if downstream packet on DMI is received with the EP bit set, this packet and all subsequent packets with data received on DMI for any VC will have their Unsupported Transaction (UT) field set causing them to be forwarded to the Error Handler. When cleared to a '0', downstream packets from DMI with the EP bit set are forwarded onto the downstream backbone normally.
30	0h RW	**Unsupported Transaction Policy Bit (UTPB):** When set to 1, the Unsupported Transactions detected on DMI will not set the UES.URE bit. This subsequently ensures that SERR will never be signaled in response to Unsupported Transactions regardless of UEV.URE. When set to 0, the Unsupported Transactions detected on DMI will set the UES.URE bit.
29:0	0h RO	Reserved.

36.2.13 Root Error Status (RES)—Offset 20B0h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD																													ENR	RSVD	CR

Bit Range	Default and Access	Field Name (ID): Description
31:3	0h RO	Reserved.
2	0h RWC	**ERR_FATAL/NONFATAL Received (ENR):** Set when either a fatal or a non-fatal error message is received or an internal fatal error is detected (all internal uncorrectable errors are fatal).
1	0h RO	Reserved.
0	0h RWC	**ERR_COR Received (CR):** Set when a correctable error message is received or an internal correctable error is detected.

36.2.14 Error Source Identification (ESID)—Offset 20B4h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

RSVD																													TLS			

Bit Range	Default and Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3:0	1h RW/F	**Target Link Speed (TLS):** This field sets an upper limit on Link operational speed by restricting the values advertised by the upstream component in its training sequences. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. If a value is written to this field that does not correspond to a supported speed, as indicated by the Supported Link Speeds Vector, the result is undefined. The default value of this field is 2.5 GT/s for survivability reason. ***Note:*** This register field could be used by REUT software to limit the link speed to 2.5 GT/s or 5 GT/s data rate. Register Attribute: Dynamic.

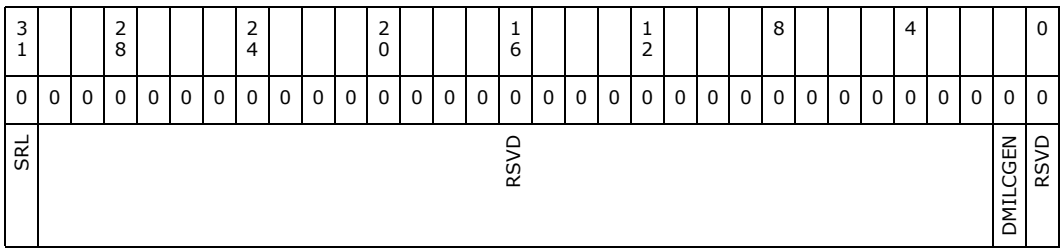
36.2.19 DMI Control Register (DMIC)—Offset 2234h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RWO	**Secured Register Lock (SRL):** When this bit is set, all the secured registers will be locked and will be Read-Only. The following fields are locked by DMIC.SRL: V0CTL.ETVM and V0CTL.TVM. V1CTL.ETVM and V1CTL.TVM.
30:2	0h RO	Reserved.
1	0h RW	**DMI Link Dynamic Clock Gate Enable (DMILCGEN):** When set, this bit enables dynamic clock gating on the DMI Link clock domain logic. When cleared, dynamic clock gating on the DMI Link clock domain is disabled.
0	0h RO	Reserved.

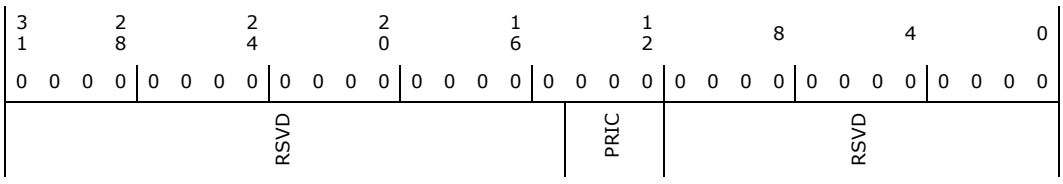
36.2.20 IOSF Primary Control And Status (IPCS_IOSFSBCS)—Offset 223Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:15	0h RO	Reserved.
14:12	0h RW	**IOSF Primary ISM Idle Counter (PRIC):** BIOS may need to program this register field.
11:0	0h RO	Reserved.

36.2.21 DMI Port Link Control (DMILINKC)—Offset 2304h

The BIOS may need to program this register.

36.2.22 DMI Configuration (DMICFG)—Offset 2310h

The BIOS may need to program this register.

36.2.23 DMI PLL Shutdown (DMIPLLDOWN)—Offset 2320h

The BIOS may need to program this register.

36.2.24 DMI Power Management Control (DMIPMCTL)—Offset 2334h

The BIOS may need to program this register.

36.2.25 DMI Additional Link Control (DMIALC)—Offset 2338h

The BIOS may need to program this register.

36.2.26 DMI NFTS (DMINFTS)—Offset 2340h

The BIOS may need to program this register.

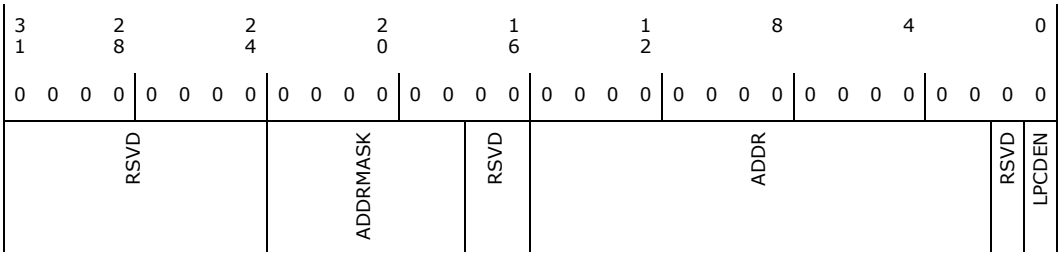
36.2.27 LPC Generic I/O Range 1 (LPCLGIR1)—Offset 2730h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:18	0h RW/L	**Address [7:2] Mask (ADDRMASK):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
17:16	0h RO	Reserved.
15:2	0h RW/L	**Address [15:2] (ADDR):** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
1	0h RO	Reserved.
0	0h RW/L	**LPC Decode Enable (LPCDEN):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.

36.2.28 LPC Generic I/O Range 2 (LPCLGIR2)—Offset 2734h

Same description as LPCLGIR1 register.

36.2.29 LPC Generic I/O Range 3 (LPCLGIR3)—Offset 2738h

Same description as LPCLGIR1 register.

36.2.30 LPC Generic I/O Range 4 (LPCLGIR4)—Offset 273Ch

Same description as LPCLGIR1 register.

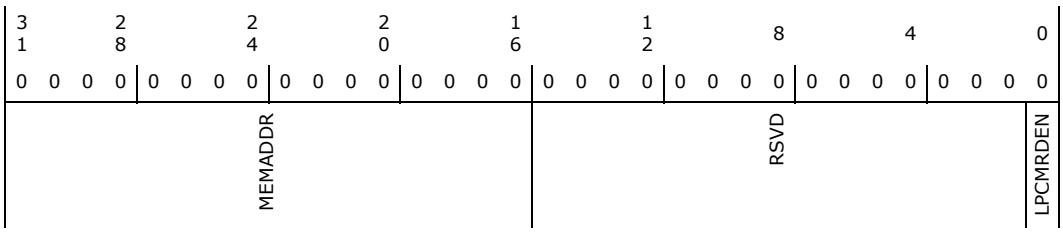
36.2.31 LPC Generic Memory Range (LPCGMR)—Offset 2740h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW/L	**Memory Address (MEMADDR):** This field specifies a 64KB memory block anywhere in the 4GB memory space that will be decoded to LPC as standard LPC Memory Cycle if enabled. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
15:1	0h RO	Reserved.
0	0h RW/L	**LPC Memory Range Decode Enable (LPCMRDEN):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.

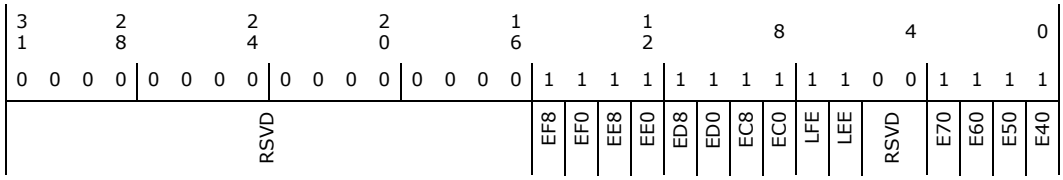
36.2.32 LPC BIOS Decode Enable (LPCBDE)—Offset 2744h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: FFCFh



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	1h RO	**F8-FF Enable (EF8):** Enables decoding of 512K of the following BIOS range: Data space: FFF80000h – FFFFFFFFh Feature space: FFB80000h – FFBFFFFFh Register Attribute: Static.
14	1h RW/L	**F0-F8 Enable (EF0):** Enables decoding of 512K of the following BIOS range: Data space: FFF00000h – FFF7FFFFh Feature space: FFB00000h – FFB7FFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
13	1h RW/L	**E8-EF Enable (EE8):** Enables decoding of 512K of the following BIOS range: Data space: FFE80000h – FFEFFFFFh Feature space: FFA80000h – FFAFFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
12	1h RW/L	**E0-E8 Enable (EE0):** Enables decoding of 512K of the following BIOS range: Data space: FFE00000h – FFE7FFFFh Feature Space: FFA00000h – FFA7FFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
11	1h RW/L	**D8-DF Enable (ED8):** Enables decoding of 512K of the following BIOS range: Data space: FFD80000h – FFDFFFFFh Feature space: FF980000h – FF9FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.

Bit Range	Default and Access	Field Name (ID): Description
10	1h RW/L	**D0-D7 Enable (ED0):** Enables decoding of 512K of the following BIOS range: Data space: FFD00000h – FFD7FFFFh Feature space: FF900000h – FF97FFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
9	1h RW/L	**C8-CF Enable (EC8):** Enables decoding of 512K of the following BIOS range: Data space: FFC80000h – FFCFFFFFh Feature space: FF880000h – FF8FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
8	1h RW/L	**C0-C7 Enable (EC0):** Enables decoding of 512K of the following BIOS range: Data space: FFC00000h – FFC7FFFFh Feature space: FF800000h – FF87FFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
7	1h RW/L	**Legacy F Segment Enable (LFE):** This enables the decoding of the legacy 64KB range at F0000h – FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
6	1h RW/L	**Legacy E Segment Enable (LEE):** This enables the decoding of the legacy 64KB range at E0000h – EFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
5:4	0h RO	Reserved.
3	1h RW/L	**70-7F Enable (E70):** Enables decoding of 1MB of the following BIOS range: Data space: FF700000h – FF7FFFFFh Feature space: FF300000h – FF3FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
2	1h RW/L	**60-6F Enable (E60):** Enables decoding of 1MB of the following BIOS range: Data space: FF600000h – FF6FFFFFh Feature Space: FF200000h – FF2FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
1	1h RW/L	**50-5F Enable (E50):** Enables decoding of 1MB of the following BIOS range: Data space: FF500000h – FF5FFFFFh Feature Space: FF100000h – FF1FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
0	1h RW/L	**40-4F Enable (E40):** Enables decoding of 1MB of the following BIOS range: Data space: FF400000h – FF4FFFFFh Feature space: FF000000h – FF0FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.

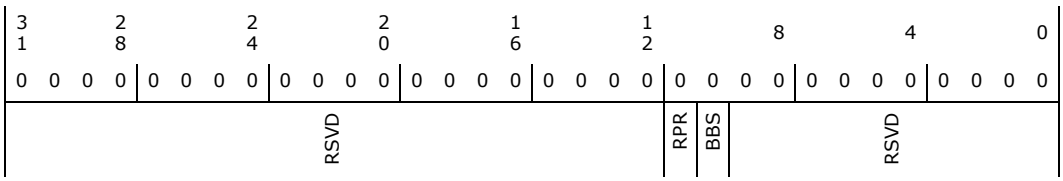
36.2.33 General Control and Status (GCS)—Offset 274Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:12	0h RO	Reserved.
11	0h RW/L	**Reserved Page Route (RPR):** Determines where to send the reserved page registers. These addresses are sent to PCIe Root Port or LPC/eSPI for the purpose of generating POST codes. The I/O addresses modified by this field are: 80h - 8Fh. When cleared, DMI will not perform source decode on the I/O ranges specified above. The cycles hitting these ranges will end up in P2SB which will then forward the cycle to LPC or eSPI through IOSF Sideband. When set, access to the I/O ranges specified above will be forwarded to PCIe Root Port with the destination ID specified in GCS.RPRDID using DMI source decode. The aliases for these registers, at 90h, 94h, 95h, 96h, 98h, 9Ch, 9Dh, and 9Eh, are never source decoded by DMI. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
10	0h RW/L/S	**Boot BIOS Strap (BBS):** This field determines the destination of accesses to the BIOS memory range. Bits Description 0 SPI 1 LPC/eSPI When SPI or LPC/eSPI is selected, the range that is decoded is further qualified by other configuration bits described in the respective sections. The value in this field can be overwritten by software as long as the BIOS Interface Lock-Down (bit 0) and DMIC.SRL are not set. Register Attribute: Static.
9:0	0h RO	Reserved.

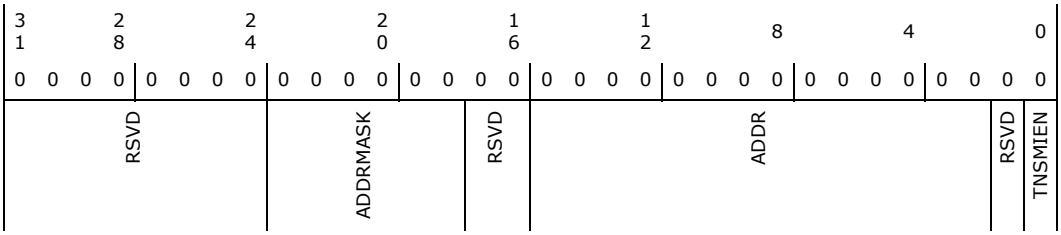
36.2.34 I/O Trap Register 1 low (IOT1_LOW)—Offset 2750h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:18	0h RW	**Address Mask (ADDRMASK):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for traps on address ranges up to 256 bytes in size.
17:16	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
15:2	0h RW	**Address (ADDR):** DWord-aligned address.
1	0h RO	Reserved.
0	0h RW	**Trap and SMI# Enable (TNSMIEN):** When this bit is set to "1?, then the trapping logic specified in this register is enabled.

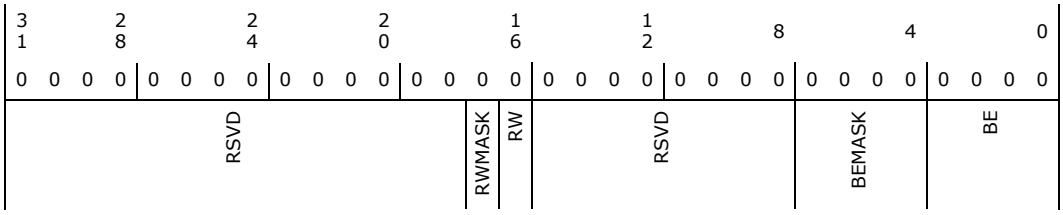
36.2.35 I/O Trap Register 1 high (IOT1_HIGH)—Offset 2754h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RW	**Read/Write Mask (RWMASK):** When this bit is 1, the trapping logic will operate on both read and write cycles. When this bit is 0, the cycle must match the type specified in bit 16.
16	0h RW	**Read/Write (RW):** 1 = Read 0 = Write The value in this field does not matter if bit 17 is set.
15:8	0h RO	Reserved.
7:4	0h RW	**Byte Enable Mask (BEMASK):** A 1 in any bit position indicates that any value in the corresponding byte enable bit in a received cycle will be treated as a match. The corresponding bit in the Byte Enables field, below, is ignored.
3:0	0h RW	**Byte Enables (BE):** Active-high, DWord-aligned byte enables.

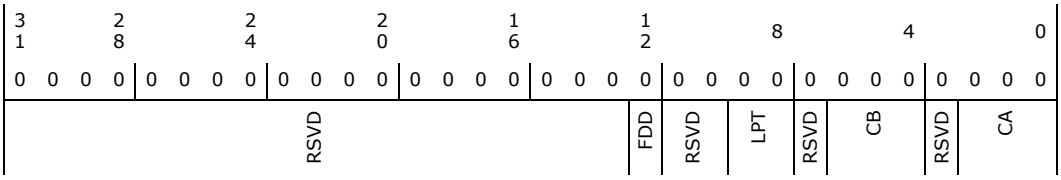
36.2.36 LPC I/O Decode Range (LPCIOD)—Offset 2770h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:13	0h RO	Reserved.
12	0h RW/L	**FDD Range (FDD)**
11:10	0h RO	Reserved.
9:8	0h RW/L	**LPT Range (LPT):** The following table describes which range to decode for the LPT Port. Bits Decode Range 00 378h - 37Fh and 778h – 77Fh 01 278h – 27Fh (port 279h is read only) and 678h – 67Fh 10 3BCh – 3BEh and 7BCh – 7BEh 11 Reserved This register is Read-Only if the DMIC.SRL field is set.
7	0h RO	Reserved.
6:4	0h RW/L	**ComB Range (CB):** The following table describes which range to decode for the COMB Port. Bits Decode Range 000 3F8h – 3FFh (COM1) 001 2F8h – 2FFh (COM2) 010 220h – 227h 011 228h – 22Fh 100 238h – 23Fh 101 2E8h – 2EFh (COM 4) 110 338h – 33Fh 111 3E8h – 3EFh (COM 3) This register is Read-Only if the DMIC.SRL field is set.
3	0h RO	Reserved.
2:0	0h RW/L	**ComA Range (CA):** The following table describes which range to decode for the COMA Port. Bits Decode Range 000 3F8h – 3FFh (COM1) 001 2F8h – 2FFh (COM2) 010 220h – 227h 011 228h – 22Fh 100 238h – 23Fh 101 2E8h – 2EFh (COM 4) 110 338h – 33Fh 111 3E8h – 3EFh (COM 3) This register is Read-Only if the DMIC.SRL field is set.

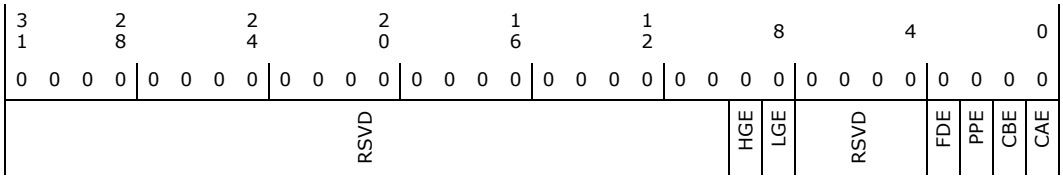
36.2.37 LPC I/O Enable (LPCIOE)—Offset 2774h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9	0h RW/L	**High Gameport Enable (HGE):** Enables decoding of the I/O locations 208h to 20Fh to LPC. This register is Read-Only if the DMIC.SRL field is set.
8	0h RW/L	**Low Gameport Enable (LGE):** Enables decoding of the I/O locations 200h to 207h to LPC. This register is Read-Only if the DMIC.SRL field is set.
7:4	0h RO	Reserved.
3	0h RW/L	**Floppy Drive Enable (FDE):** Enables decoding of the FDD range to LPC. Range is selected by LIOD.FDE. This register is Read-Only if the DMIC.SRL field is set.
2	0h RW/L	**Parallel Port Enable (PPE):** Enables decoding of the LPT range to LPC. Range is selected by LIOD.LPT. This register is Read-Only if the DMIC.SRL field is set.
1	0h RW/L	**Com Port B Enable (CBE):** Enables decoding of the COMB range to LPC. Range is selected by LIOD.CB. This register is Read-Only if the DMIC.SRL field is set.
0	0h RW/L	**Com Port A Enable (CAE):** Enables decoding of the COMA range to LPC. Range is selected by LIOD.CA. This register is Read-Only if the DMIC.SRL field is set.

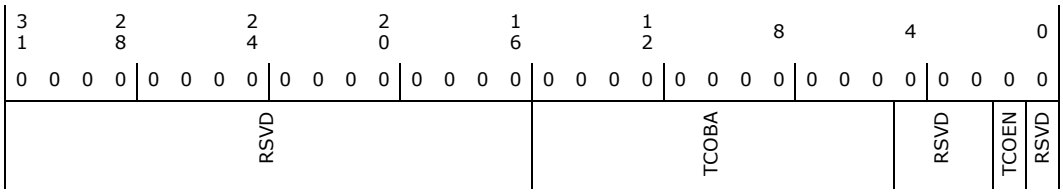
36.2.38 TCO Base Address (TCOBASE)—Offset 2778h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:5	0h RW/L	**TCO Base Address (TCOBA):** Provides the 32 bytes of I/O space for TCO logic, that can be map anywhere in the 64k I/O space on 32-byte boundaries. This register is Read-Only if the DMIC.SRL field is set.
4:2	0h RO	Reserved.
1	0h RW/L	**TCO Enable (TCOEN):** When set, decode of the I/O range specified by the TCO base address. This register is Read-Only if the DMIC.SRL field is set.
0	0h RO	Reserved.

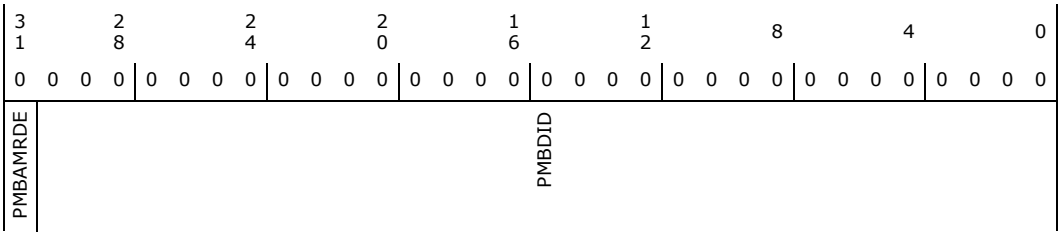
36.2.39 PM Base Control (PMBASEC)—Offset 27B0h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/L	**PM Base Address Memory Range Decode Enable (PMBAMRDE):** When enabled, memory cycles that falls within the PMBASEADDR.PMBAMRB and PMBASEADDR.PMBAMRL range inclusive will be forwarded using source decode to the destination ID specified in PMBASEC.PMBDID field. This register is Read-Only if the DMIC.SRL field is set.
30:0	0h RW/L	**PM Base Destination ID (PMBDID):** The destination ID to be used to forward the cycle decoded to hit the PM Base Address range. BIOS must program the bits which are not used to zeros. Hardware will ignore the unused bits. This register is Read-Only if the DMIC.SRL field is set.

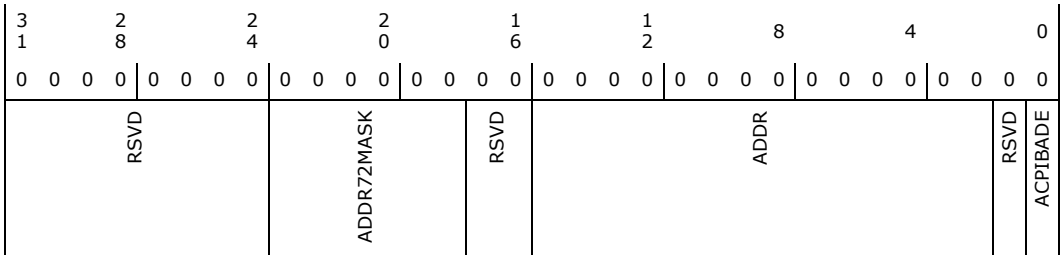
36.2.40 ACPI Base Address (ACPIBA)—Offset 27B4h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:18	0h RW/L	**Address[7:2] Mask (ADDR72MASK):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size. This register is Read-Only if the DMIC.SRL field is set.
17:16	0h RO	Reserved.
15:2	0h RW/L	**Address[15:2] (ADDR):** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level. This register is Read-Only if the DMIC.SRL field is set.
1	0h RO	Reserved.
0	0h RW/L	**ACPI Base Address Decode Enable (ACPIBADE):** When this bit is set to 1, then the range specified in this register is enabled for decoding to the destination ID specified in ACPIBDID register. This register is Read-Only if the DMIC.SRL field is set.

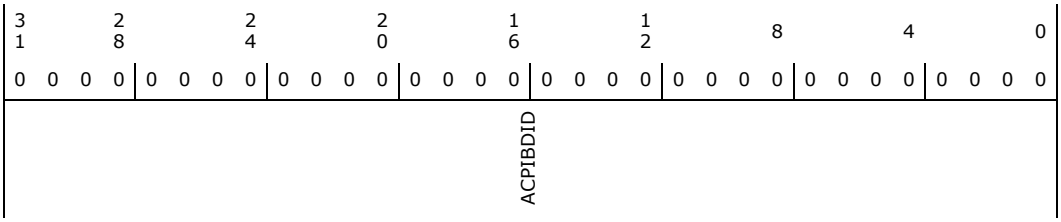
36.2.41 ACPI Base Destination ID (ACPIBDID)—Offset 27B8h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/L	**ACPI Base Destination ID (ACPIBDID):** The destination ID to be used to forward the cycle decoded to hit the ACPI Base Address range. BIOS must program the bits which are not used to zeros. Hardware will ignore the unused bits. This register is Read-Only if the DMIC.SRL field is set.

36.3 DCI Configuration Registers Summary

These registers are within the PCH Private Configuration Space which is accessible through the PCH Sideband Interface. They can be accessed via (SBREG_BAR + PortID + Register Offset).

Table 36-3. Summary of DCI Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
4h	7h	DCI Control Register (ECTRL) - Offset 4h	0h

36.3.1 DCI Control Register (ECTRL)—Offset 4h

These registers are within the PCH Private Configuration Space which is accessible through the PCH Sideband Interface. They can be accessed via (SBREG_BAR + PortID + Register Offset).

Table 36-4. Summary of DCI PCR Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
4h	7h	DCI Control Register (ECTRL)—Offset 4h	0h

Access Method

Bit Range	Default and Access	Field Name (ID): Description
31:13	0h RW	**SATA PCI BAR (AddrBase)**
12:0	0h RO	Reserved.

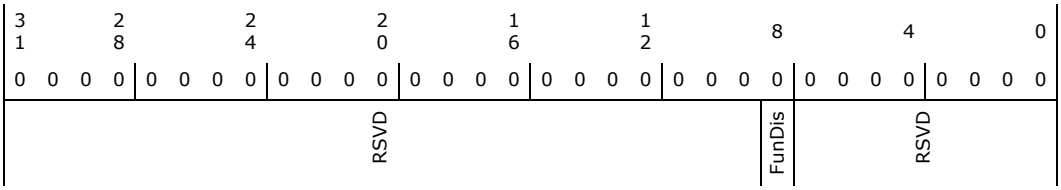
36.4.12 D17:F5 Function Disable (PSF_1_AGNT_T0_SHDW_PCIEN_PTIO_RS0_D17_F5)—Offset C1Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8	0h	**sSATA FunDis:** When set, transactions targeting this PCI function will not be positively decoded, and cfgWr transactions to this function will not be carried out.
7:0	0h RO	Reserved.

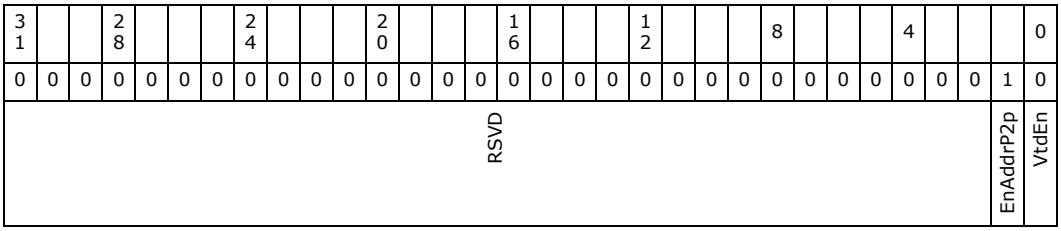
36.4.13 Rootspace Configuration (PSF_1_ROOTSPACE_CONFIG_RS0)—Offset 4014h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 2h



Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1	1h	**EnAddrP2p:** If set, address-based p2p transactions are allowed for this root space.
0	0h RW	**Vtd Enable (VtdEn):** If set Intel Virtualization Technology for Directed I/O is enabled for this root space. This bit should reflect the system-wide VT-D setting, and is typically maintained by BIOS.

36.4.14 Multicast Control Register (PSF_1_PSF_MC_CONTROL_MCAST0_RS0_EOI)—Offset 4054h

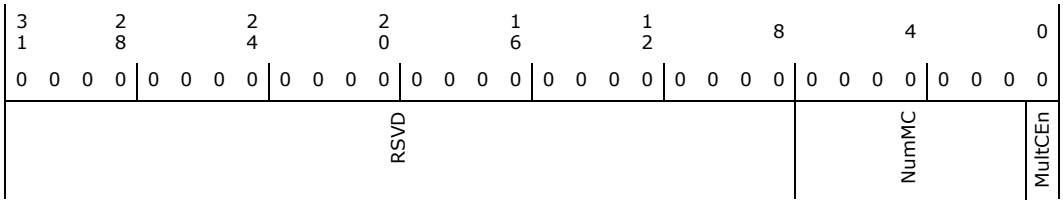
This register contains information for the PSF to be able to do a multicast operation on each root-space for incoming IOSF messages that requires Broadcast from Root Complex. The only multicast messages supported on PSF are EOI and MCTP messages. There will be a copy of this register for EOI and MCTP, and for each root-space.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:1	0h	**Multicast (NumMC):** Number of multicast Agents on this root-space on the PSF segment.
0	0h	**Multicast Enable (MultCEn):** Multicast Enable. If set Multicast transactions are supported on this root-space.

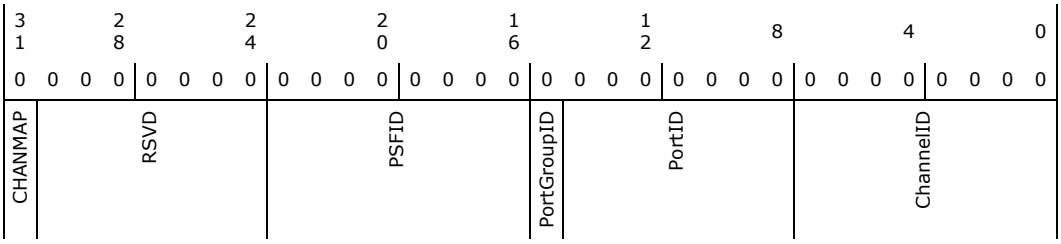
36.4.15 Destination ID (PSF_1_PSF_MC_AGENT_MCAST0_RS0_TGT0_EOI)—Offset 406Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h	**Channel ID Map (CHANMAP):** If this bit is set, the ChannelID field is ignored and is looked up in the CHANMAP register set that belongs to PortGroupID:PortID
30:24	0h RO	Reserved.
23:16	0h	**PSF ID (PSFID):** Default value=0x0,
15	0h	**Port Group ID (PortGroupID):** Default value=0
14:8	0h	**Port ID (PortID):** Default value=0x0, Since 1'b0 indicates source-decode, the port ID needs to be larger than 0
7:0	0h	**Channel ID (ChannelID):** Default value=0x0,

36.5 PSF2 PCR Registers Summary

These registers are within the PCH Private Configuration Space which is accessible through the PCH Sideband Interface. They can be accessed via (SBREG_BAR + PortID + Register Offset).

Table 36-6. Summary of PSF2 PCR registers

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h	**CfgDis:** If set, the PCI configuration space of this device is switched off, and hidden from the OS.

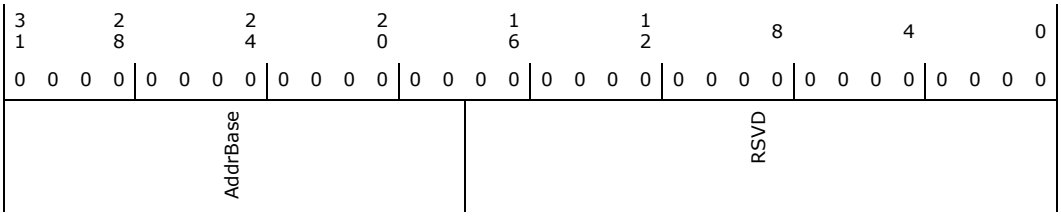
36.6.11 D20:F4 Intel Trace Hub PCI Base Address (PSF_3_AGNT_T0_SHDW_BAR0_NPK_RS0_D20_F4)—Offset 800h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:18	0h RW	**Trace Hub PCI BAR (AddrBase)**
17:0	0h RO	Reserved.

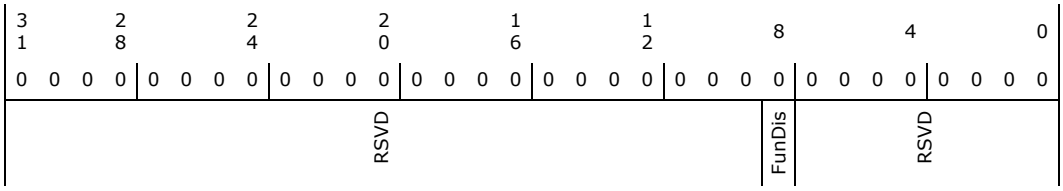
36.6.12 D20:F4 Function Disable (PSF_3_AGNT_T0_SHDW_PCIEN_NPK_RS0_D20_F4)—Offset 81Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8	0h	**Intel Trace Hub FunDis:** When set, transactions targeting this PCI function will not be positively decoded, and cfgWr transactions to this function will not be carried out.
7:0	0h RO	Reserved.

36.6.13 D20:F4 Intel Trace Hub PCI Configuration Disable (PSF_3_AGNT_T0_SHDW_CFG_DIS_NPK_RS0_D20_F4)—Offset 838h

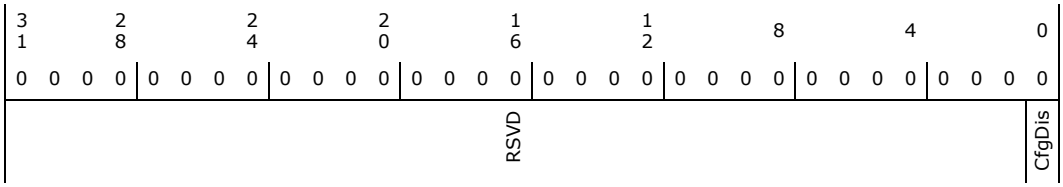
If set, this bit disables the shadowed PCI configuration header of the device. When a PCI configuration header is disabled, cfgWr transactions are no longer shadowed, and whatever the current contents of the address resources (BAR[0..1]) and requester ID (B:D:F) becomes the fixed location of the device in the address space. With its PCI configuration header disabled, the device effectively becomes an ACPI device, with fixed address ranges and requester ID.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h	**CfgDis:** Default value=0x0, If set, the PCI configuration space of this device is switched off, and hidden from the OS. This bit is writable through IOSF SB interface only.

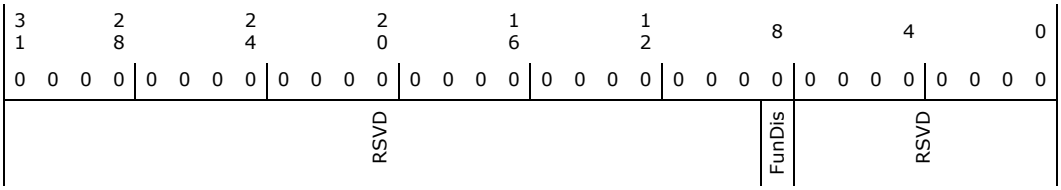
36.6.14 D31:F0 Function Disable (PSF_3_AGNT_T0_SHDW_PCIEN_LPC_RS0_D31_F0)—Offset A1Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8	0h	**LPC FunDis:** When set, transactions targeting this PCI function will not be positively decoded, and cfgWr transactions to this function will not be carried out.
7:0	0h RO	Reserved.

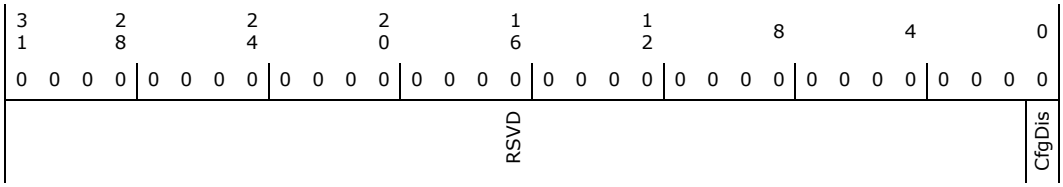
36.6.15 D31:F0 PCI Configuration Disable (PSF_3_AGNT_T0_SHDW_CFG_DIS_LPC_RS0_D31_F0)—Offset A38h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h	**CfgDis:** Default value=0x0, If set, the PCI configuration space of this device is switched off, and hidden from the OS. This bit is writable through IOSF SB interface only.

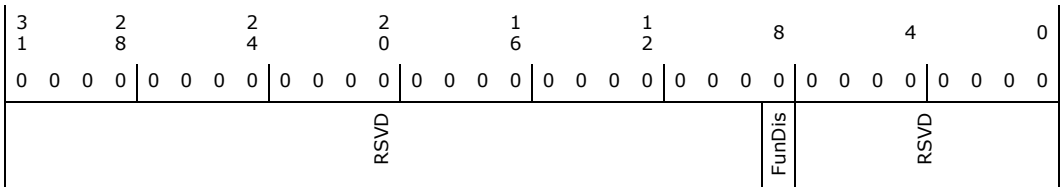
36.6.16 D31:F4 Function Disable (PSF_3_AGNT_T0_SHDW_PCIEN_SMB_RS0_D31_F4)—Offset B1Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8	0h	**SMBus FunDis:** When set, transactions targeting this PCI function will not be positively decoded, and cfgWr transactions to this function will not be carried out.
7:0	0h RO	Reserved.

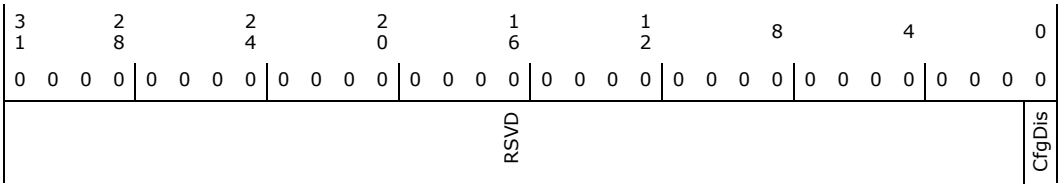
36.6.17 D31:F4 PCI Configuration Disable (PSF_3_AGNT_T0_SHDW_CFG_DIS_SMB_RS0_D31_F4)—Offset B38h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h	**CfgDis:** Default value=0x0, If set, the PCI configuration space of this device is switched off, and hidden from the OS. This bit is writable through IOSF SB interface only.

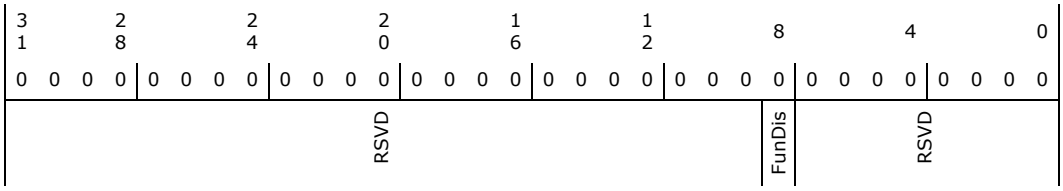
36.6.18 D31:F5 Function Disable (PSF_3_AGNT_T0_SHDW_PCIEN_SPI_RS0_D31_F5)—Offset 131Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8	0h	**SPI FunDis:** When set, transactions targeting this PCI function will not be positively decoded, and cfgWr transactions to this function will not be carried out.
7:0	0h RO	Reserved.

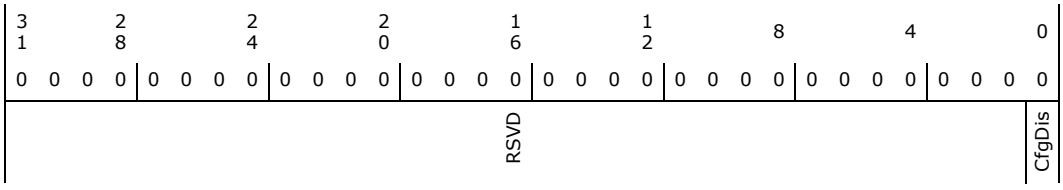
36.6.19 D31:F5 PCI Configuration Disable (PSF_3_AGNT_T0_SHDW_CFG_DIS_SPI_RS0_D31_F5)—Offset 1338h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h	**CfgDis:** Default value=0x0, If set, the PCI configuration space of this device is switched off, and hidden from the OS. This bit is writable through IOSF SB interface only.

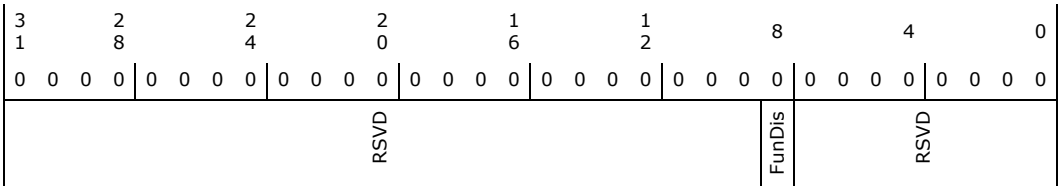
36.6.20 D31:F0 Function Disable (PSF_3_AGNT_T0_SHDW_PCIEN_SPI_RS0_D31_F0)—Offset 141Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8	0h	**eSPI FunDis:** When set, transactions targeting this PCI function will not be positively decoded, and cfgWr transactions to this function will not be carried out.
7:0	0h RO	Reserved.

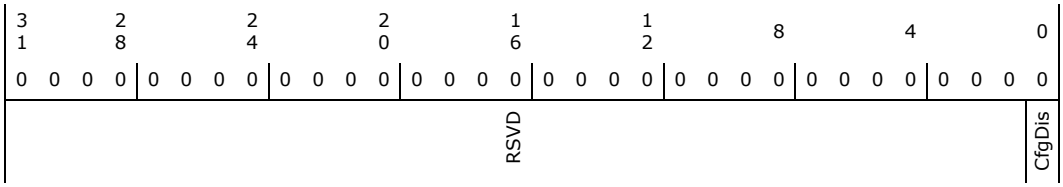
36.6.21 D31:F0 PCI Configuration Disable (PSF_3_AGNT_T0_SHDW_CFG_DIS_SPI_RS0_D31_F0)—Offset 1438h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h	**CfgDis:** Default value=0x0, If set, the PCI configuration space of this device is switched off, and hidden from the OS. This bit is writable through IOSF SB interface only.

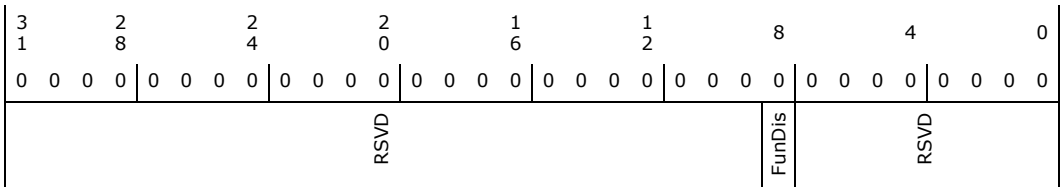
36.6.22 D31:F6 PCI Function Disable (PSF_3_AGNT_T0_SHDW_PCIEN_GBE_RS0_D31_F6)—Offset 161Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8	0h RO	**GbE Function Disable (FunDis):** When set, transactions targeting this PCI function will not be positively decoded, and cfgWr transactions to this function will not be carried out. SW can not write to this bit and disable the 1GbE device. It must be disabled via Soft Strap.
7:0	0h RO	Reserved.

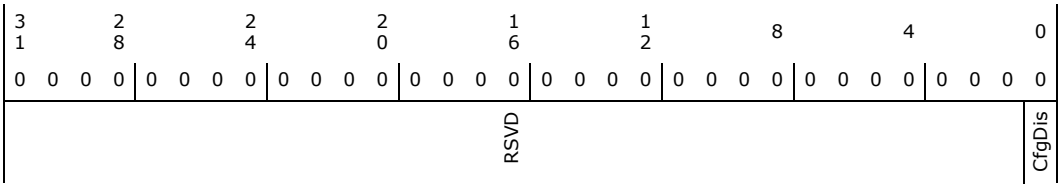
36.6.23 D31:F6 PCI Configuration Disable (PSF_3_AGNT_T0_SHDW_CFG_DIS_SPI_RS0_D31_F6)—Offset 1638h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h	**CfgDis:** Default value=0x0, If set, the PCI configuration space of this device is switched off, and hidden from the OS. This bit is writable through IOSF SB interface only.

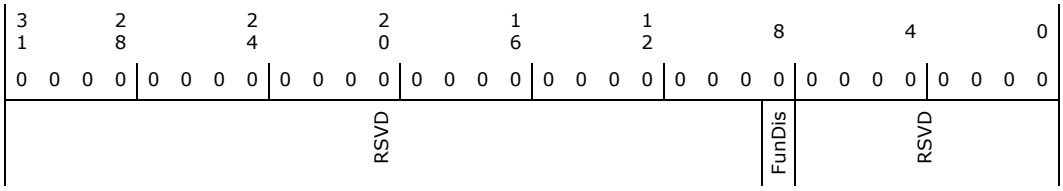
36.6.24 D31:F3 PCI Function Disable (PSF_3_AGNT_T0_SHDW_PCIEN_AUD_RS0_D31_F3)—Offset 181Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8	0h	**Audio Disable (FunDis):** When set, transactions targeting this PCI function will not be positively decoded, and cfgWr transactions to this function will not be carried out.
7:0	0h RO	Reserved.

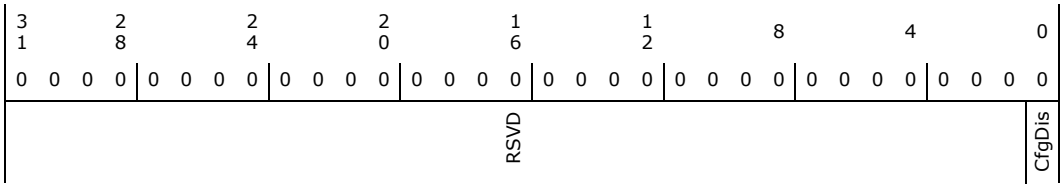
36.6.25 D31:F3 PCI Configuration Disable (PSF_3_AGNT_T0_SHDW_CFG_DIS_AUD_RS0_D31_F3)—Offset 1838h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h	**CfgDis:** Default value=0x0, If set, the PCI configuration space of this device is switched off, and hidden from the OS. This bit is writable through IOSF SB interface only.

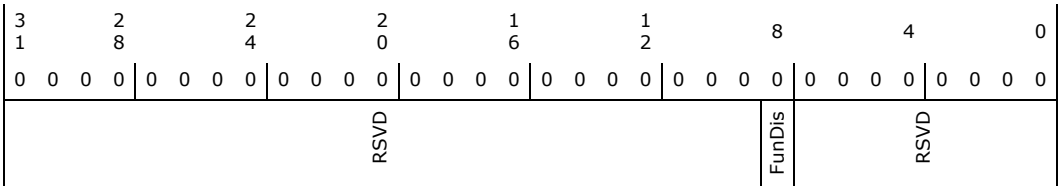
36.6.26 D17:F0 PCI Function Disable (PSF_3_AGNT_T0_SHDW_PCIEN_MSU_RS0_D17_F0)—Offset 191Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8	0h	**MROM0 Disable (FunDis):** When set, transactions targeting this PCI function will not be positively decoded, and cfgWr transactions to this function will not be carried out.
7:0	0h RO	Reserved.

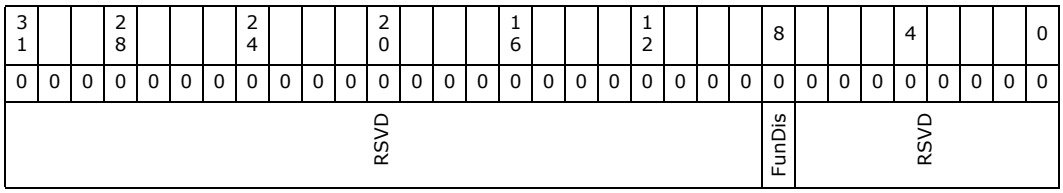
36.6.27 D17:F1 PCI Function Disable (PSF_3_AGNT_T0_SHDW_PCIEN_MSU_RS0_D17_F1)—Offset 1A1Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8	0h	**MROM1 Disable (FunDis):** When set, transactions targeting this PCI function will not be positively decoded, and cfgWr transactions to this function will not be carried out.
7:0	0h RO	Reserved.

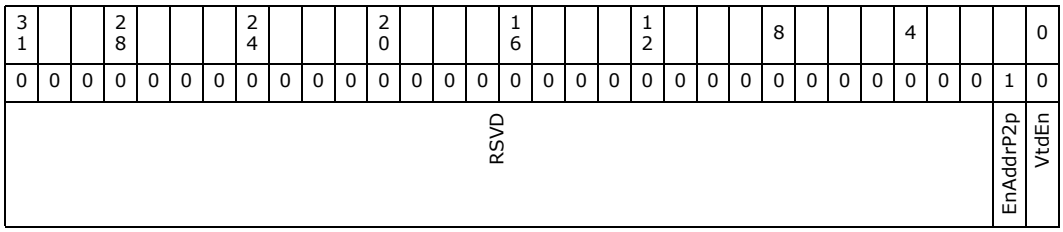
36.6.28 Root Space Config (PSF_3_ROOTSPACE_CONFIG_RS0)—Offset 4014h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 2h



Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1	1h	**Address Enable (EnAddrP2p):** Default value=0x1, If set, address-based p2p transactions are allowed for this root space.
0	0h	**VTd Enable (VtdEn):** Default value=0x0, If set Intel Virtualization Technology for Directed I/O is enabled for this root space. This bit should reflect the system-wide VT-D setting, and is typically maintained by BIOS

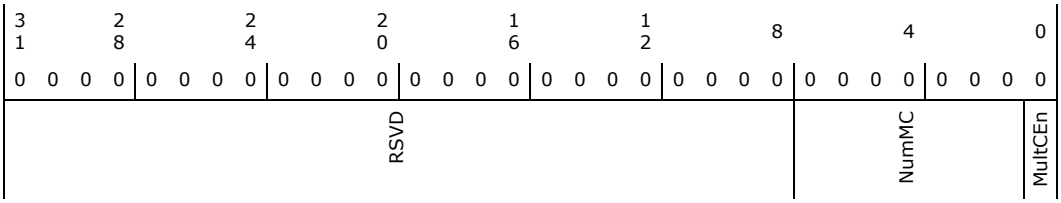
36.6.29 Multicast Control (PSF_3_PSF_MC_CONTROL_MCAST0_RS0_EOI)—Offset 4058h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:1	0h	**Multicast Agent (NumMC):** Number of multicast Agents on this root-space on the PSF segment.
0	0h	**Multicast Enable (MultCEn):** Multicast Enable. If set Multicast transactions are supported on this root-space, and can be received on any PSF port.

36.6.30 Destination ID (PSF_3_PSF_MC_AGENT_MCAST0_RS0_TGT0_EOI)—Offset 4064h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
CHANMAP	RSVD							PSFID								PortGroupID	PortID							ChannelID							

Bit Range	Default and Access	Field Name (ID): Description
31	0h	**Channel ID Map (CHANMAP):** If this bit is set, the ChannelID field is ignored and looked up in the CHANMAP register set that belongs to PortGroupID:PortID
30:24	0h RO	Reserved.
23:16	0h	**PSF ID (PSFID):** Default value=0x0,
15	0h	**Port Group ID (PortGroupID):** Default value=0x0
14:8	0h	**Port ID (PortID):** Since 1'b0 indicates source-decode, the port ID needs to be larger than 0
7:0	0h	**Channel ID (ChannelID):** Default value=0x0,

36.7 PSF4 PCR Registers Summary

These registers are within the PCH Private Configuration Space which is accessible through the PCH Sideband Interface. They can be accessed via (SBREG_BAR + PortID + Register Offset).

Table 36-8. Summary of PSF4 PCR registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
4014h	4017h	PSF_4_ROOTSPACE_CONFIG_RS0)—Offset 4014h	00000002h

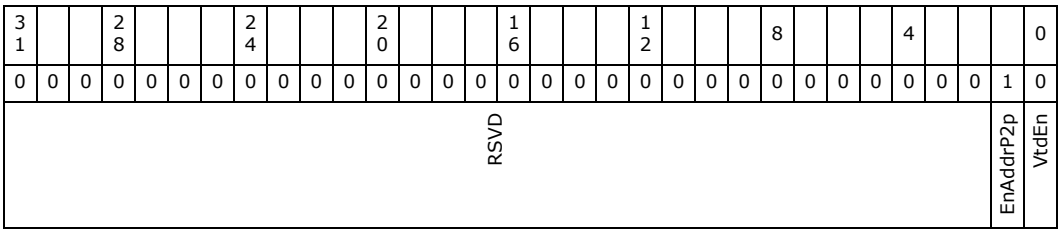
36.7.1 Rootspace Configuration (PSF_4_ROOTSPACE_CONFIG_RS0)—Offset 4014h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 2h



Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1	1h	**Address Enable (EnAddrP2p):** Default value=0x1, If set, address-based p2p transactions are allowed for this root space.
0	0h	**VTd Enable (VtdEn):** Default value=0x0, If set Intel Virtualization Technology for Directed I/O is enabled for this root space. This bit should reflect the system-wide VT-D setting, and is typically maintained by BIOS

36.8 I/O Trap Registers Summary

These registers are within the PCH Private Configuration Space which is accessible through the PCH Sideband Interface. They can be accessed via (SBREG_BAR + PortID + Register Offset).

Table 36-9. Summary of I/O Trap Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
1E00h	1E03h	Trap Status Register (TRPSTS)—Offset 1E00h	0h
1E10h	1E13h	Trapped Cycle Register (TRPCYC1)—Offset 1E10h	0h
1E18h	1E1Bh	Trapped Write Data Register (TRPWRDATA1)—Offset 1E18h	0h
1E80h	1E83h	I/O Trap Registers 1 (IOTRP1_1)—Offset 1E80h	0h
1E84h	1E87h	I/O Trap Registers 1 (IOTRP1_2)—Offset 1E84h	0h
1E88h	1E8Bh	I/O Trap Registers 2 (IOTRP2_1)—Offset 1E88h	0h
1E8Ch	1E8Fh	I/O Trap Registers 2 (IOTRP2_2)—Offset 1E8Ch	0h
1E90h	1E93h	I/O Trap Registers 3 (IOTRP3_1)—Offset 1E90h	0h
1E94h	1E97h	I/O Trap Registers 3 (IOTRP3_2)—Offset 1E94h	0h
1E98h	1E9Bh	I/O Trap Registers 4 (IOTRP4_1)—Offset 1E98h	0h
1E9Ch	1E9Fh	I/O Trap Registers 4 (IOTRP4_2)—Offset 1E9Ch	0h

36.8.1 Trap Status Register (TRPSTS)—Offset 1E00h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD																												SMISTAT			

Bit Range	Default and Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3:0	0h RWC	**Cycle Trap SMI# Status (SMISTAT):** These bits are set by hardware when the corresponding Cycle Trap register is enabled and a matching cycle is received (and trapped). These bits are OR'ed together to create a single status bit in the Power Management register space.Note that the SMI# and trapping must be enabled in order to set these bits. This is because, in order to do the cycle comparison, packets must be delayed by several clocks from the DMI pins to the internal receiver. This delay is only enabled when at least one of the trap ranges is enabled. These bits are set before the completion is generated for the trapped cycle, thereby guaranteeing that the processor can enter the SMI# handler when the instruction completes. Each status bit is cleared by writing a '1' to the corresponding bit location in this register.

36.8.2 Trapped Cycle Register (TRPCYC1)—Offset 1E10h

This register saves information about the I/O Cycle that was trapped and generated the SMI# for software to read.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD							TRPRWR	RSVD				TRPBE				TRPADDR													RSVD			

Bit Range	Default and Access	Field Name (ID): Description
31:25	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
24	0h RO/V	**Read-Write (TRPRWR):** 1 = Read, 0 = Write
23:20	0h RO	Reserved.
19:16	0h RO/V	**Active-High Byte Enables (TRPBE):** This is the DWord-aligned byte enables associated with the trapped cycle. A 1 in any bit location indicates that the corresponding byte is enabled in the cycle.
15:2	0h RO/V	**IO Address (TRPADDR):** This is the DWord-aligned address of the trapped cycle.
1:0	0h RO	Reserved.

36.8.3 Trapped Write Data Register (TRPWRDATA1)—Offset 1E18h

This register saves the data from I/O write cycles that are trapped for software to read.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
TRPDATA																															

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**Data (TRPDATA):** DWord of I/O write data. This field is undefined after trapping a read cycle.

36.8.4 I/O Trap Registers 1 (IOTRP1_1)—Offset 1E80h

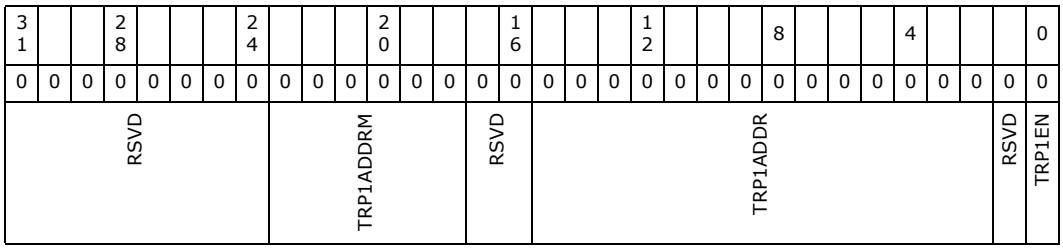
These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:18	0h RW	**Address Mask (TRP1ADDRM):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for traps on address ranges up to 256 bytes in size.
17:16	0h RO	Reserved.
15:2	0h RW	**Address (TRP1ADDR):** DWord-aligned address
1	0h RO	Reserved.
0	0h RW	**Trap and SMI Enable (TRP1EN):** When this bit is set to 1, then the trapping logic specified in this register is enabled.

36.8.5 I/O Trap Registers 1 (IOTRP1_2)—Offset 1E84h

These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD															TRP1RWM	TRP1RW	RSVD								TRP1BEM				TRP1BE			

Bit Range	Default and Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RW	**Read-Write Mask (TRP1RWM):** When this bit is '1', the trapping logic will operate on both read and write cycles. When this bit is '0', the cycle must match the type specified in bit 48.
16	0h RW	**Read/Write (TRP1RW):** 1 = Read, 0 = Write, the value in this field does not matter if bit 49 is set.
15:8	0h RO	Reserved.
7:4	0h RW	**Byte Enable Mask (TRP1BEM):** A '1' in any bit position indicates that any value in the corresponding byte enable bit in a received cycle will be treated as a match. The corresponding bit in the Byte Enables field, below, is ignored.
3:0	0h RW	**Byte Enables (TRP1BE):** Active-high, DWord-aligned byte enables

36.8.6 I/O Trap Registers 2 (IOTRP2_1)—Offset 1E88h

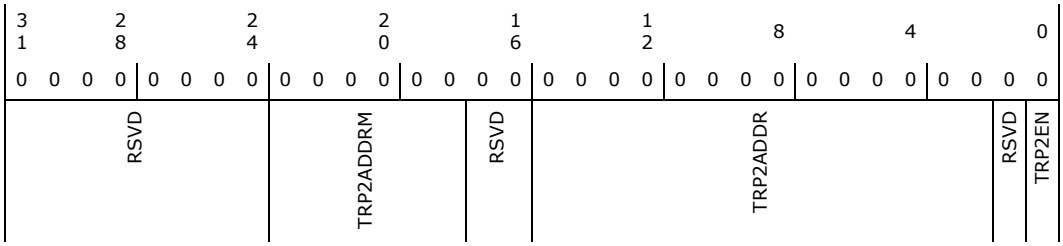
These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:18	0h RW	**Address Mask (TRP2ADDRM):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for traps on address ranges up to 256 bytes in size.
17:16	0h RO	Reserved.
15:2	0h RW	**Address (TRP2ADDR):** DWord-aligned address
1	0h RO	Reserved.
0	0h RW	**Trap and SMI Enable (TRP2EN):** When this bit is set to 1, then the trapping logic specified in this register is enabled.

36.8.7 I/O Trap Registers 2 (IOTRP2_2)—Offset 1E8Ch

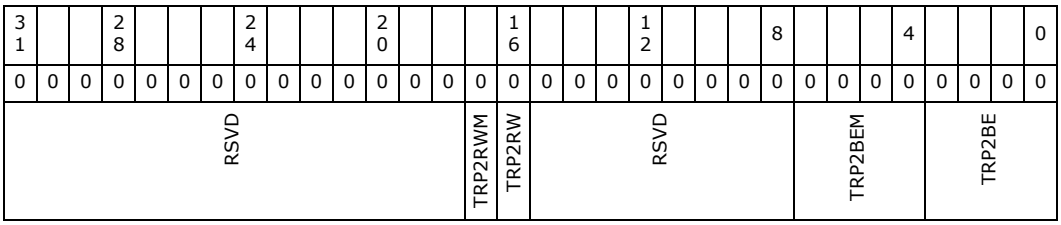
These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RW	**Read-Write Mask (TRP2RWM):** When this bit is '1', the trapping logic will operate on both read and write cycles. When this bit is '0', the cycle must match the type specified in bit 48.
16	0h RW	**Read/Write (TRP2RW):** 1 = Read, 0 = Write, the value in this field does not matter if bit 49 is set.
15:8	0h RO	Reserved.
7:4	0h RW	**Byte Enable Mask (TRP2BEM):** A '1' in any bit position indicates that any value in the corresponding byte enable bit in a received cycle will be treated as a match. The corresponding bit in the Byte Enables field, below, is ignored.
3:0	0h RW	**Byte Enables (TRP2BE):** Active-high, DWord-aligned byte enables

36.8.8 I/O Trap Registers 3 (IOTRP3_1)—Offset 1E90h

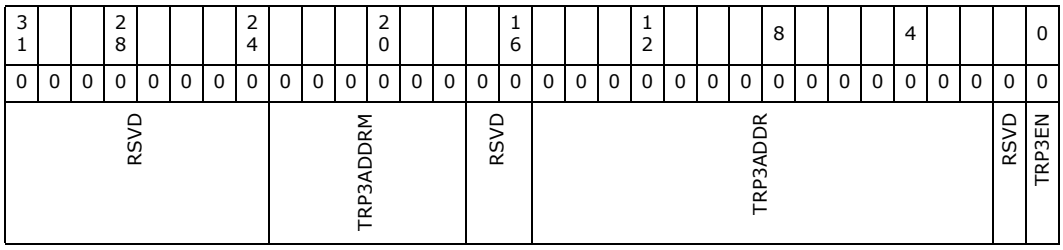
These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:18	0h RW	**Address Mask (TRP3ADDRM):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for traps on address ranges up to 256 bytes in size.
17:16	0h RO	Reserved.
15:2	0h RW	**Address (TRP3ADDR):** DWord-aligned address
1	0h RO	Reserved.
0	0h RW	**Trap and SMI Enable (TRP3EN):** When this bit is set to 1, then the trapping logic specified in this register is enabled.

36.8.9 I/O Trap Registers 3 (IOTRP3_2)—Offset 1E94h

These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD															TRP3RWM	TRP3RW	RSVD								TRP3BEM				TRP3BE			

Bit Range	Default and Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RW	**Read-Write Mask (TRP3RWM):** When this bit is '1', the trapping logic will operate on both read and write cycles. When this bit is '0', the cycle must match the type specified in bit 48.
16	0h RW	**Read/Write (TRP3RW):** 1 = Read, 0 = Write, the value in this field does not matter if bit 49 is set.
15:8	0h RO	Reserved.
7:4	0h RW	**Byte Enable Mask (TRP3BEM):** A '1' in any bit position indicates that any value in the corresponding byte enable bit in a received cycle will be treated as a match. The corresponding bit in the Byte Enables field, below, is ignored.
3:0	0h RW	**Byte Enables (TRP3BE):** Active-high, DWord-aligned byte enables

36.8.10 I/O Trap Registers 4 (IOTRP4_1)—Offset 1E98h

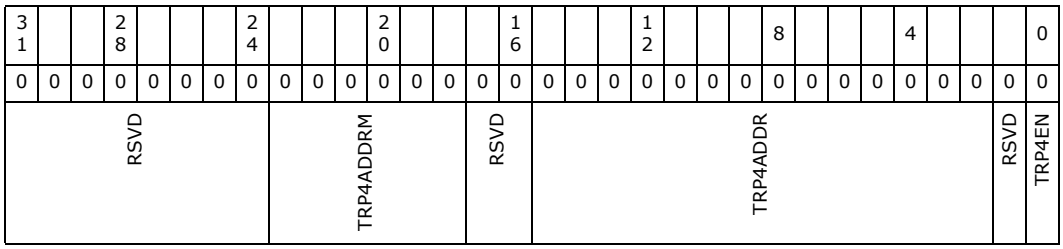
These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:18	0h RW	**Address Mask (TRP4ADDRM):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for traps on address ranges up to 256 bytes in size.
17:16	0h RO	Reserved.
15:2	0h RW	**Reserved (TRP4ADDR):** DWord-aligned address
1	0h RO	Reserved.
0	0h RW	**Trap and SMI Enable (TRP4EN):** When this bit is set to 1, then the trapping logic specified in this register is enabled.

36.8.11 I/O Trap Registers 4 (IOTRP4_2)—Offset 1E9Ch

These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD															TRP4RWM	TRP4RW	RSVD								TRP4BEM				TRP4BE			

Bit Range	Default and Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RW	**Read-Write Mask (TRP4RWM):** When this bit is '1', the trapping logic will operate on both read and write cycles. When this bit is '0', the cycle must match the type specified in bit 48.
16	0h RW	**Read/Write (TRP4RW):** 1 = Read, 0 = Write, the value in this field does not matter if bit 49 is set.
15:8	0h RO	Reserved.
7:4	0h RW	**Byte Enable Mask (TRP4BEM):** A '1' in any bit position indicates that any value in the corresponding byte enable bit in a received cycle will be treated as a match. The corresponding bit in the Byte Enables field, below, is ignored.
3:0	0h RW	**Byte Enables (TRP4BE):** Active-high, DWord-aligned byte enables

36.9 P2SB Bridge

36.9.1 Overview

The PCH incorporates a wide variety of devices and functions. The registers within these devices are mainly accessed through the primary interface, such as PCI configuration space and IO/MMIO space. Some devices also have registers that are distributed within the PCH Private Configuration Space at individual endpoints (Target Port IDs) which are only accessible through the PCH Sideband Interface.

These PCH Private Configuration Space Registers can be addressed via SBREG_BAR or through SBI Index Data pair programming.

Table 36-10. Private Configuration Space Register Target Port IDs (Sheet 1 of 2)

PCH Device/Function Type	Target Port ID
PCIe Uplink controller (mux x8)	0x06

Table 36-10. Private Configuration Space Register Target Port IDs (Sheet 2 of 2)

PCH Device/Function Type	Target Port ID
PCIe Uplink controller	0x07
sSATA	0x0F
General Purpose I/O (GPIO) Community 5	0x11
HSIO Strap Configuration	0x89
General Purpose I/O (GPIO) Community 4	0xAB
General Purpose I/O (GPIO) Community 3	0xAC
General Purpose I/O (GPIO) Community 2	0xAD
General Purpose I/O (GPIO) Community 1	0xAE
General Purpose I/O (GPIO) Community 0	0xAF
DCI	0xB8
PSF1- Function Disable	0xBA
PSF2- Function Disable	0xBB
PSF3- Function Disable	0xBC
PSF4- Function Disable	0xBD
ISH Controller	0xBF
Real Time Clock (RTC)	0xC3
Processor Interface, 8254 Timer, HPET, APIC	0xC4
SMBus	0xC6
LPC	0xC7
USB2.0	0xCA
FIA Configuration	0x13
HDA	0xD7
SATA	0xD9
Integrated Clock Controller (ICC)	0xDC
PCIe Controller #1 (SPA)	0xE0
PCIe Controller #2 (SPB)	0xE1
PCIe Controller #3 (SPC)	0xE2
PCIe Controller #4 (SPD)	0xE3
PCIe Controller #5 (SPE)	0xE4
xHCI	0xE6
MODPHY1 (HSIO Lanes #0 - 9)	0xE9
MODPHY2 (HSIO Lanes)	0xA9
MODPHY4 (Uplink for PCIe Gen2)	0xEB
MODPHY5 (Uplink for PCIe Gen3)	0x10
eSPI / SPI	0xEE
DMI Configuration	0xEF

36.9.2 P2SB Configuration Registers Summary

Table 36-11. Summary of Internal Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	PCI Identifier (PCIID)—Offset 0h	X_8086h
4h	5h	PCI Command (PCICMD)—Offset 4h	4h
8h	8h	Revision ID (PCIRID)—Offset 8h	0h
9h	Ch	Class Code (PCICC)—Offset 9h	58000h
Eh	Eh	PCI Header Type (PCIHTYPE)—Offset Eh	0h
10h	13h	Sideband Register Access BAR (SBREG_BAR)—Offset 10h	4h
14h	17h	Sideband Register BAR High DWORD (SBREG_BARH)—Offset 14h	0h
2Ch	2Fh	PCI Subsystem Identifiers (PCIHSS)—Offset 2Ch	0h
50h	51h	VLW Bus:Device:Function (VBDF)—Offset 50h	F8h
52h	53h	ERROR Bus:Device:Function (EBDF)—Offset 52h	F8h
54h	57h	Routing Configuration (RCFG)—Offset 54h	C700h
60h	60h	High Performance Event Timer Configuration (HPTC)—Offset 60h	0h
64h	65h	IOxAPIC Configuration (IOAC)—Offset 64h	0h
6Ch	6Dh	IOxAPIC Bus:Device:Function (IBDF)—Offset 6Ch	F8h
70h	71h	HPET Bus:Device:Function (HBDF)—Offset 70h	F8h
80h	83h	Sideband Register posted 0 (SBREGPOSTED0)—Offset 80h	0h
84h	87h	Sideband Register posted 1 (SBREGPOSTED1)—Offset 84h	0h
88h	8Bh	Sideband Register posted 2 (SBREGPOSTED2)—Offset 88h	0h
8Ch	8Fh	Sideband Register posted 3 (SBREGPOSTED3)—Offset 8Ch	0h
90h	93h	Sideband Register posted 4 (SBREGPOSTED4)—Offset 90h	0h
94h	97h	Sideband Register posted 5 (SBREGPOSTED5)—Offset 94h	0h
98h	9Bh	Sideband Register posted 6 (SBREGPOSTED6)—Offset 98h	0h
9Ch	9Fh	Sideband Register posted 7 (SBREGPOSTED7)—Offset 9Ch	0h
A0h	A3h	Display Bus:Device:Function (DISPBDF)—Offset A0h	60010h
A4h	A5h	ICC Register Offsets (ICCOS)—Offset A4h	0h
B0h	B3h	Endpoint Mask 0 (EPMASK0)—Offset B0h	0h
B4h	B7h	Endpoint Mask 1 (EPMASK1)—Offset B4h	0h
B8h	BBh	Endpoint Mask 2 (EPMASK2)—Offset B8h	0h
BCh	BFh	Endpoint Mask 3 (EPMASK3)—Offset BCh	0h
C0h	C3h	Endpoint Mask 4 (EPMASK4)—Offset C0h	0h
C4h	C7h	Endpoint Mask 5 (EPMASK5)—Offset C4h	0h
C8h	CBh	Endpoint Mask 6 (EPMASK6)—Offset C8h	0h
CCh	CFh	Endpoint Mask 7 (EPMASK7)—Offset CCh	0h
D0h	D3h	SBI Address (SBIADDR)—Offset D0h	0h
D4h	D7h	SBI Data (SBIDATA)—Offset D4h	0h
D8h	D9h	SBI Status (SBISTAT)—Offset D8h	0h
DAh	DBh	SBI Routing Identification (SBIRID)—Offset DAh	0h
DCh	DFh	SBI Extended Address (SBIEXTADDR)—Offset DCh	0h
E0h	E4h	P2SB Control (P2SBC) - Offset E0h	0h

Table 36-11. Summary of Internal Configuration Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
E4h	E4h	Power Control Enable (PCE)—Offset E4h	1h

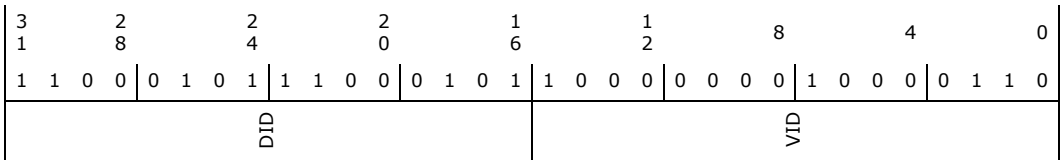
36.9.3 PCI Identifier (PCIID)—Offset 0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: C5C58086h



Bit Range	Default and Access	Field Name (ID): Description
31:16	-- RO	**Device Identification (DID):** Indicates the Device ID of the controller. See the Device and Version ID Table in Volume 1 of the datasheet for the default value.
15:0	8086h RO	**Vendor Identification (VID):** Indicates Intel.

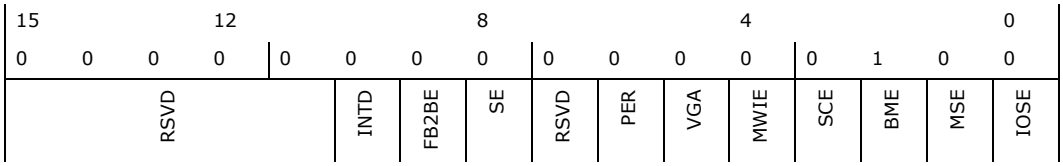
36.9.4 PCI Command (PCICMD)—Offset 4h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 1

Default: 4h



Bit Range	Default and Access	Field Name (ID): Description
15:11	0h RO	Reserved.
10	0h RO	**Interrupt Disable (INTD):** P2SB does not issue any interrupts on its own behalf
9	0h RO	**Fast Back to Back Enable (FB2BE):** Not applicable

Bit Range	Default and Access	Field Name (ID): Description
8	0h RO	**SERR# Enable (SE):** P2SB does not issue SERR# on its own behalf.
7	0h RO	Reserved.
6	0h RO	**Parity Error Response (PER):** No support for parity error detection.
5	0h RO	**VGA Palette Snoop (VGA):** Not applicable.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Not applicable.
3	0h RO	**Special Cycle Enable (SCE):** Not applicable.
2	1h RO	**Bus Master Enable (BME):** Bus mastering cannot be disabled as this device acts as a proxy for non-PCI devices.
1	0h RW	**Memory Space Enable (MSE):** Will control the P2SB acceptance of PCI MMIO BARs only. Other legacy regions are unaffected by this bit.
0	0h RW	**I/O Space Enable (IOSE):** Legacy regions are unaffected by this bit.

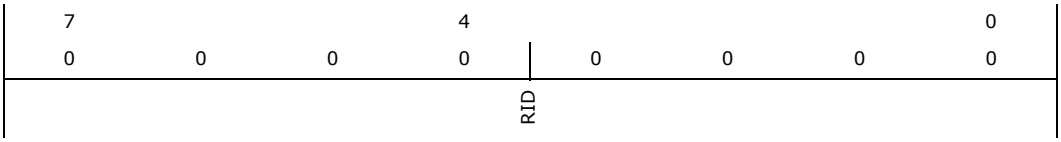
36.9.5 Revision ID (PCIRID)—Offset 8h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Revision ID (RID):** Indicates stepping of the host controller. Refer to Device and Revision ID table in Vol1 of the datasheet for specific value.

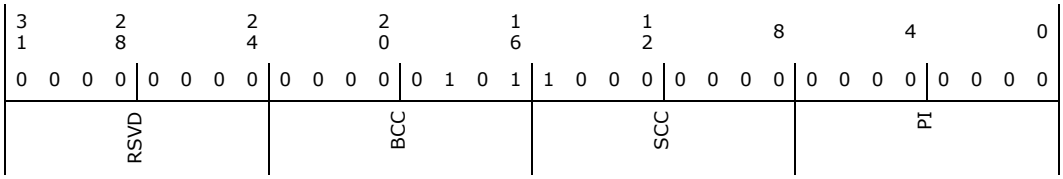
36.9.6 Class Code (PCICC)—Offset 9h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 58000h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:16	5h RO	**Base Class Code (BCC):** Indicates a memory controller device class.
15:8	80h RO	**Sub-Class Code (SCC):** Indicates an unspecified other memory controller.
7:0	0h RO	**Programming Interface (PI):** No programming interface.

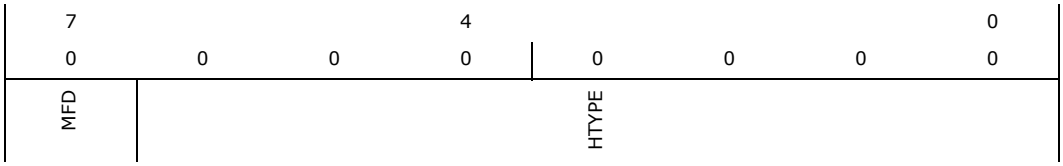
36.9.7 PCI Header Type (PCIHTYPE)—Offset Eh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7	0h RO	**Multi-Function Device (MFD):** Indicates that this is part of a multi-function device.
6:0	0h RO	**Header Type (HTYPE):** Indicates a generic device header.

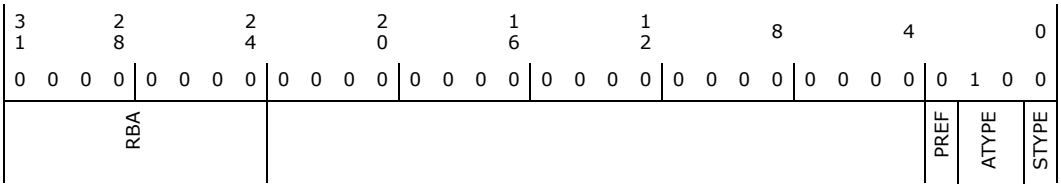
36.9.8 Sideband Register Access BAR (SBREG_BAR)—Offset 10h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 4h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RW	**Register Base Address (RBA):** Lower DWORD of the base address for the sideband register access BAR.
23:4	0h RO	**:** Hardwired to 0 to request a BAR of 16MB
3	0h RO	**Prefetchable (PREF):** Indicates this is not prefetchable.
2:1	2h RO	**Address Type (ATYPE):** Indicates that this can be placed anywhere in 64b space.
0	0h RO	**Space Type (STYPE):** Indicates memory space

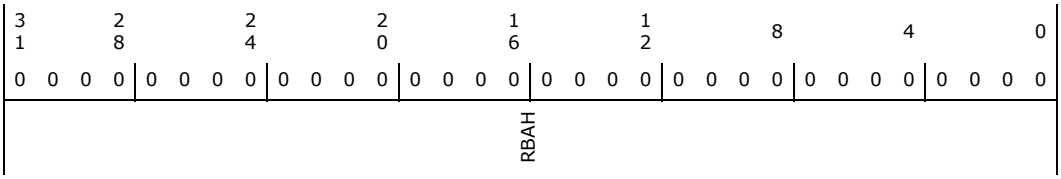
36.9.9 Sideband Register BAR High DWORD (SBREG_BARH)—Offset 14h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Register Base Address (RBAH):** Upper DWORD of the base address for the sideband register access BAR.

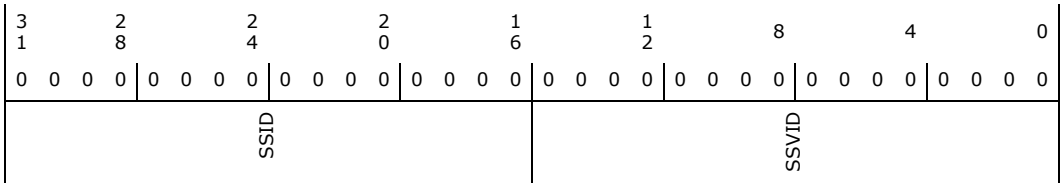
36.9.10 PCI Subsystem Identifiers (PCIHSS)—Offset 2Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** Written by BIOS. Not used by hardware.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** Written by BIOS. Not used by hardware.

36.9.11 VLW Bus:Device:Function (VBDF)—Offset 50h

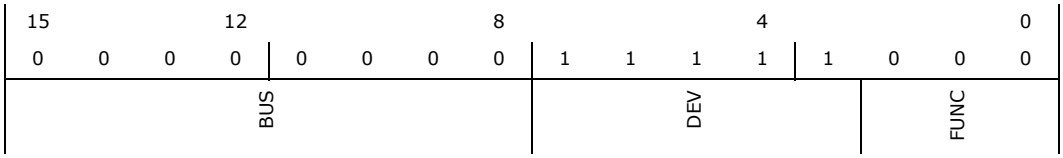
This register specifies the bus:device:function ID that will be used for its Requester ID. This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if unique bus:device:function number is required.

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 1

Default: F8h



Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RW	**Bus Number (BUS)**
7:3	1Fh RW	**Device Number (DEV)**
2:0	0h RW	**Function Number (FUNC)**

36.9.12 ERROR Bus:Device:Function (EBDF)—Offset 52h

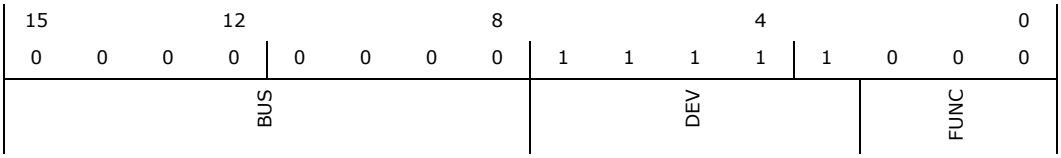
This register specifies the bus:device:function ID that the Error Signaling messages will use for its Requester ID. This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if unique bus:device:function number is required.

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 1

Default: F8h



Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RW	**Bus Number (BUS)**
7:3	1Fh RW	**Device Number (DEV)**
2:0	0h RW	**Function Number (FUNC)**

36.9.13 Routing Configuration (RCFG)—Offset 54h

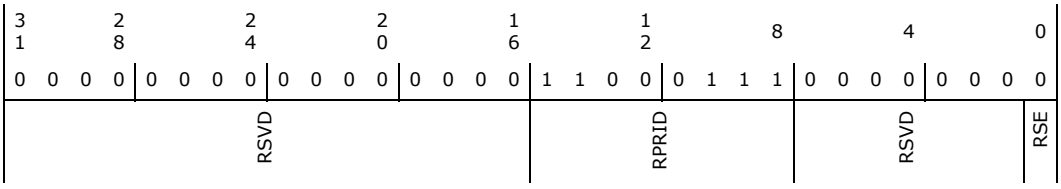
This register contains information used for routing transactions between primary and sideband interfaces.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: C700h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
15:8	C7h RW	**Reserved Page Register Destination ID (RPRID):** Specifies the IOSF-SB destination ID for sending Reserved Page Register cycles (e.g., Port 80h). By default this will load to the ID of the LPC or eSPI device depending on which has been strapped active in the system.
7:1	0h RO	Reserved.
0	0h RW	**RTC Shadow Enable (RSE):** When set, all I/O writes to the RTC will be also sent to the PMC. This allows cases where the battery backed storage is in an external PMIC.

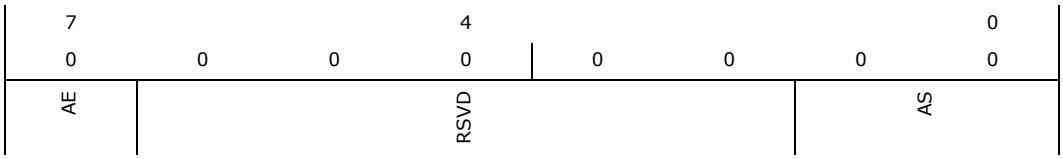
36.9.14 High Performance Event Timer Configuration (HPTC)—Offset 60h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7	0h RW	**Address Enable (AE):** When set, the P2SB will decode the High Performance Timer memory address range selected by bits [1:0] below.
6:2	0h RO	Reserved.
1:0	0h RW	**Address Select (AS):** This 2-bit field selects 1 of 4 possible memory address ranges for the High Performance Timer functionality. The encodings are: 00 : FED0_0000h - FED0_03FFFh 01 : FED0_1000h - FED0_13FFFh 10 : FED0_2000h - FED0_23FFFh 11 : FED0_3000h - FED0_33FFFh

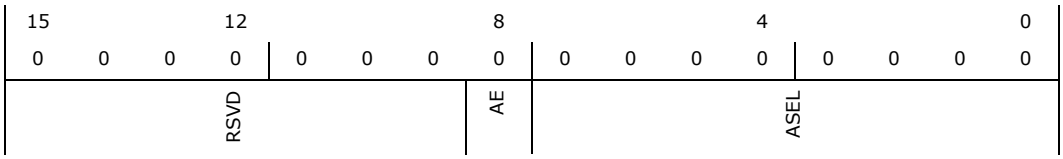
36.9.15 IOxAPIC Configuration (IOAC)—Offset 64h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:9	0h RO	Reserved.
8	0h RW	**Address Enable (AE):** When set, the P2SB will decode the IOxAPIC memory address range selected by bits 7:0 below.
7:0	0h RW	**APIC Range Select (ASEL):** These bits define address bits 19:12 for the IOxAPIC range. The default value of 00h enables compatibility with prior products as an initial value. This value must not be changed unless the IOxAPIC Enable bit is cleared.

36.9.16 IOxAPIC Bus:Device:Function (IBDF)—Offset 6Ch

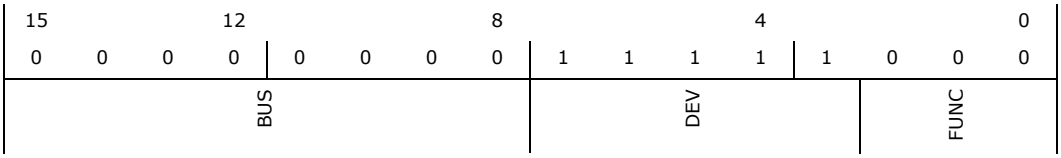
This register specifies the bus:device:function ID that the IOxAPIC will use in the following: As the Requester ID when initiating Interrupt Messages to the CPU As the Completer ID when responding to the reads targeting the IOxAPICs Memory-Mapped I/O registers This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if unique bus:device:function number is required for the internal IOxAPIC.

Access Method

Type: CFG Register (Size: 16 bits)

Device: 31
Function: 1

Default: F8h



Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RW	**Bus Number (BUS)**
7:3	1Fh RW	**Device Number (DEV)**
2:0	0h RW	**Function Number (FUNC)**

36.9.17 HPET Bus:Device:Function (HBDF)—Offset 70h

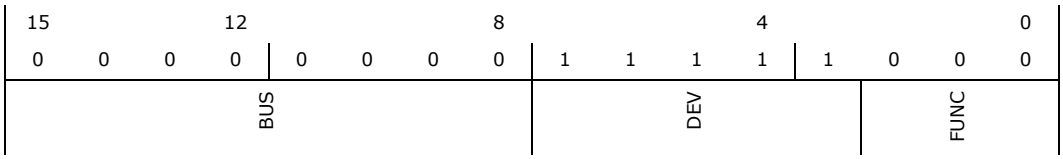
This register specifies the bus:device:function ID that the HPET device will use in the following: As the Requester ID when initiating Interrupt Messages to the CPU As the Completer ID when responding to the reads targeting the corresponding HPETs Memory-Mapped I/O registers This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if unique bus:device:function number is required for the corresponding HPET.

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 1

Default: F8h



Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RW	**Bus Number (BUS)**
7:3	1Fh RW	**Device Number (DEV)**
2:0	0h RW	**Function Number (FUNC)**

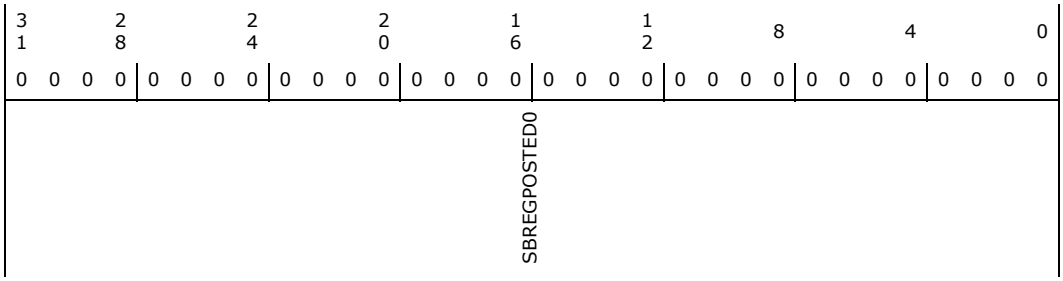
36.9.18 Sideband Register Posted 0 (SBREGPOSTED0)—Offset 80h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register posted 0 (SBREGPOSTED0):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 31-0.

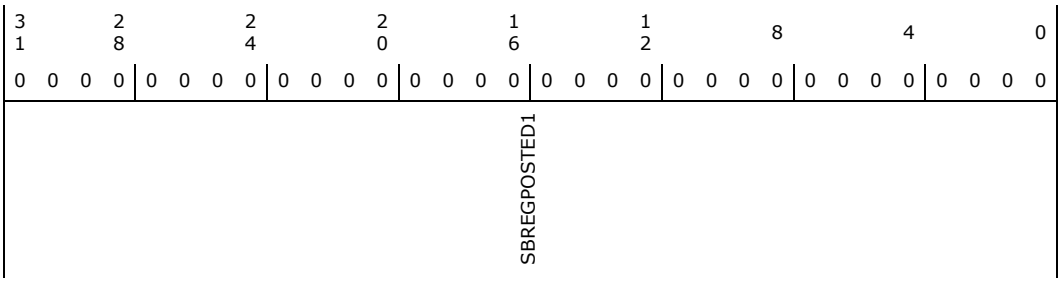
36.9.19 Sideband Register Posted 1 (SBREGPOSTED1)—Offset 84h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register posted 1 (SBREGPOSTED1):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 63-32.

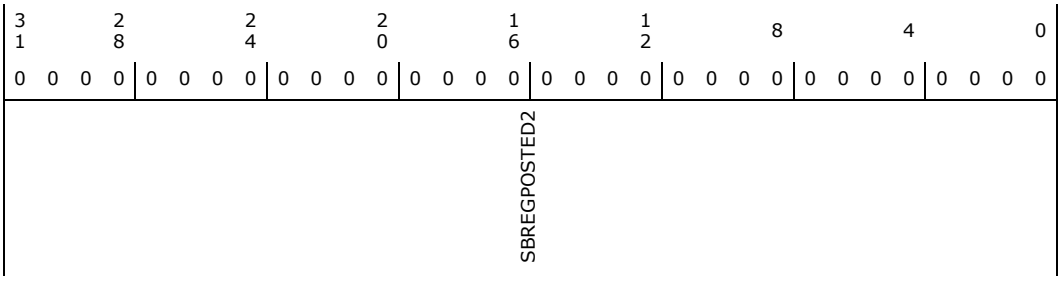
36.9.20 Sideband Register Posted 2 (SBREGPOSTED2)—Offset 88h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register posted 0 (SBREGPOSTED2):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 95-64.

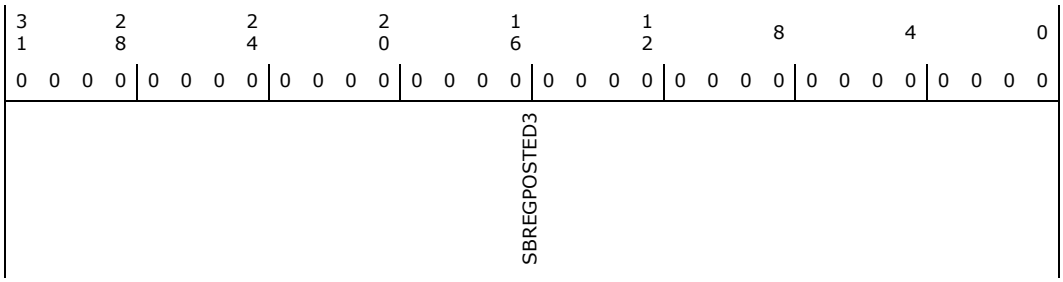
36.9.21 Sideband Register Posted 3 (SBREGPOSTED3)—Offset 8Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register posted 3 (SBREGPOSTED3):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 127-96.

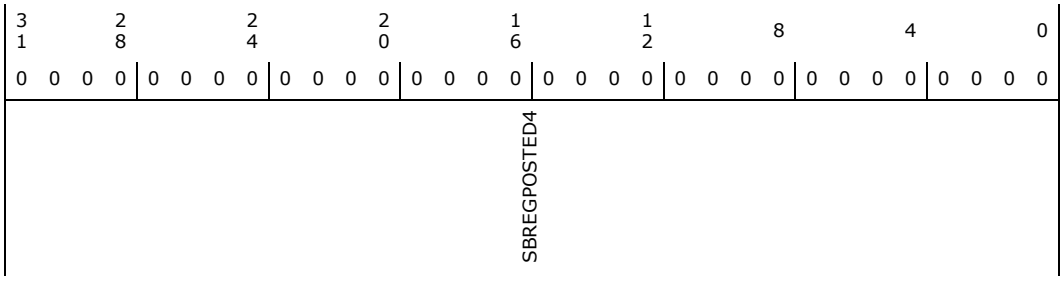
36.9.22 Sideband Register Posted 4 (SBREGPOSTED4)—Offset 90h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register posted 4 (SBREGPOSTED4):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 159-128.

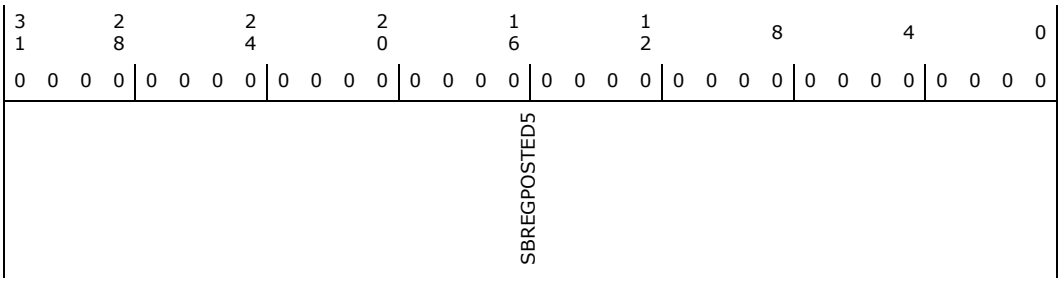
36.9.23 Sideband Register Posted 5 (SBREGPOSTED5)—Offset 94h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register posted 5 (SBREGPOSTED5):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 191-160.

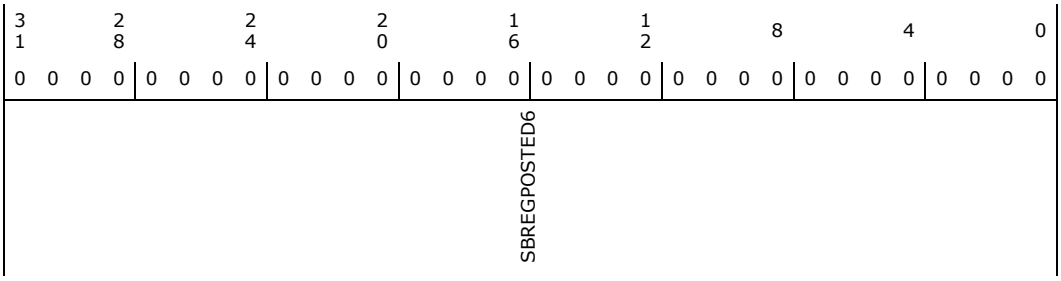
36.9.24 Sideband Register Posted 6 (SBREGPOSTED6)—Offset 98h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register posted 6 (SBREGPOSTED6):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 223-192.

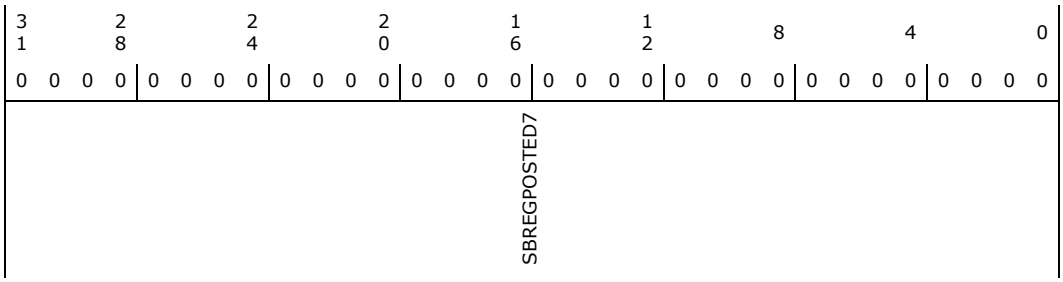
36.9.25 Sideband Register Posted 7 (SBREGPOSTED7)—Offset 9Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register posted 7 (SBREGPOSTED7):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 255-224.

36.9.26 Display Bus:Device:Function (DISPBDF)—Offset A0h

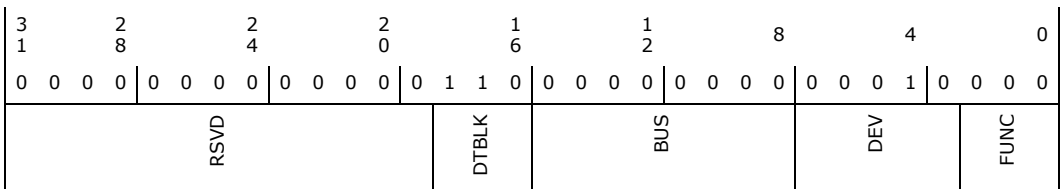
This register specifies the bus:device:function ID that the Display initiated upstream RAVDMs will use for its Requester ID. This will also be used for the claiming these Route-by-ID RAVDMs downstream.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 60010h



Bit Range	Default and Access	Field Name (ID): Description
31:19	0h RO	Reserved.
18:16	6h RW	**Display Target Block (DTBLK):** This register contains the Target BLK field that will be used when sending RAVDM messages to the CPU Complex North Display.
15:8	0h RW	**Bus Number (BUS):** The bus number of the Display in the CPU Complex.
7:3	2h RW	**Device Number (DEV):** The bus number of the Display in the CPU Complex.
2:0	0h RW	**Function Number (FUNC):** The function number of the Display in the CPU Complex

36.9.27 ICC Register Offsets (ICCOS)—Offset A4h

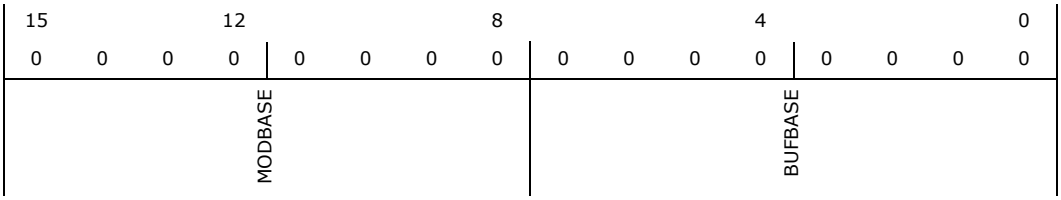
This register contains the offsets to be used when sending RAVDMs to the Integrated Clock Controller. Each of the two spaces decoded for the ICC have a separate base address that will be used when sending those transactions on IOSF-SB to the ICC.

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RW	**Modulator Control Address Offset (MODBASE):** This specifies the upper 8b for the 16b address that will be used for sending RAVDM access that target the Modulator Control range of the ICC (FFF00h - FFFFFh).
7:0	0h RW	**Buffer Address Offset (BUFBASE):** This specifies the upper 8b for the 16b address that will be used for sending RAVDM access that target the Buffer range of the ICC (FFE00h - FFEFFh).

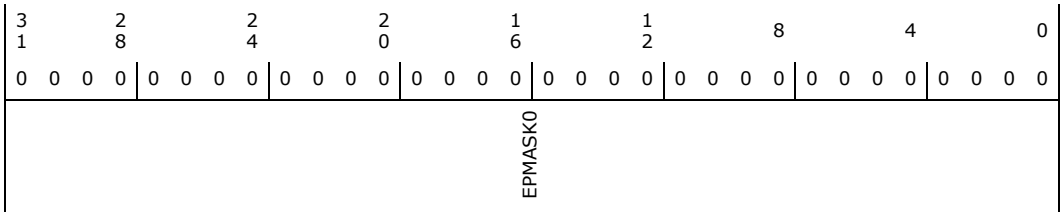
36.9.28 Endpoint Mask 0 (EPMASK0)—Offset B0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/L	**Endpoint Mask 0 (EPMASK0):** One hot masks for disabling IOSF-SB endpoint IDs 31-0.

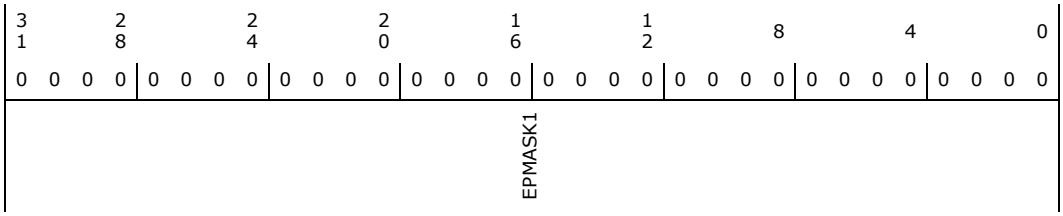
36.9.29 Endpoint Mask 1 (EPMASK1)—Offset B4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/L	**Endpoint Mask 1 (EPMASK1):** One hot masks for disabling IOSF-SB endpoint IDs 63-32.

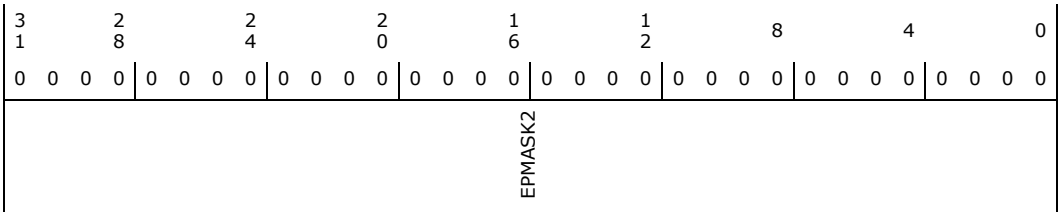
36.9.30 Endpoint Mask 2 (EPMASK2)—Offset B8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/L	**Endpoint Mask 2 (EPMASK2):** One hot masks for disabling IOSF-SB endpoint IDs 95-64

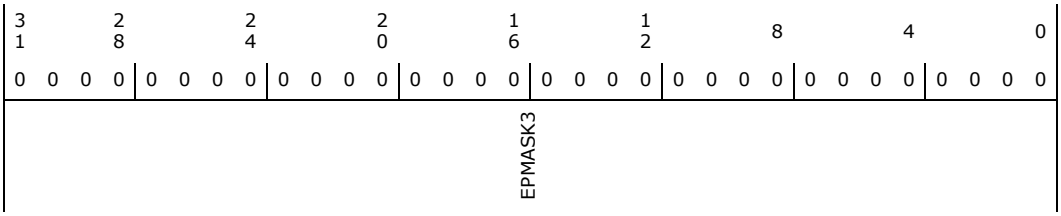
36.9.31 Endpoint Mask 3 (EPMASK3)—Offset BCh

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/L	**Endpoint Mask 3 (EPMASK3):** One hot masks for disabling IOSF-SB endpoint IDs 127-96

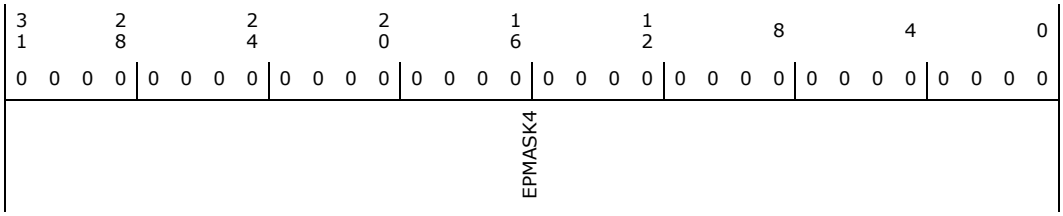
36.9.32 Endpoint Mask 4 (EPMASK4)—Offset C0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/L	**Endpoint Mask 4 (EPMASK4):** One hot masks for disabling IOSF-SB endpoint IDs 128-159

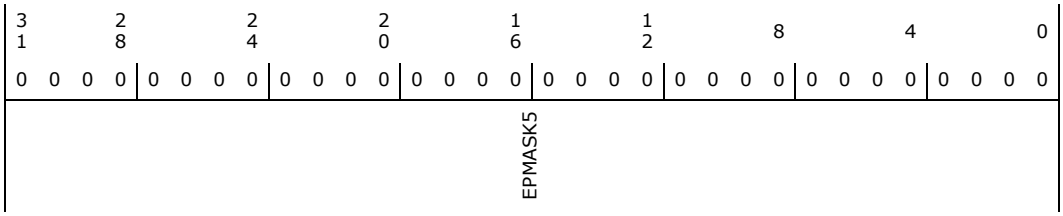
36.9.33 Endpoint Mask 5 (EPMASK5)—Offset C4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/L	**Endpoint Mask 5 (EPMASK5):** One hot masks for disabling IOSF-SB endpoint IDs 191-160

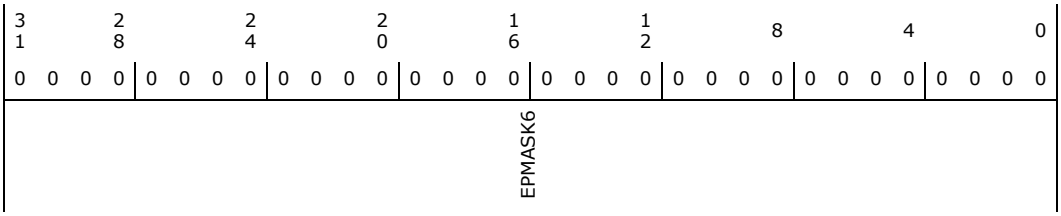
36.9.34 Endpoint Mask 6 (EPMASK6)—Offset C8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/L	**Endpoint Mask 6 (EPMASK6):** One hot masks for disabling IOSF-SB endpoint IDs 223-192

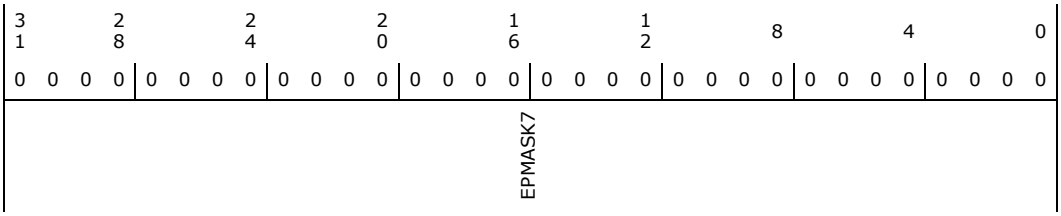
36.9.35 Endpoint Mask 7 (EPMASK7)—Offset CCh

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/L	**Endpoint Mask 7 (EPMASK7):** One hot masks for disabling IOSF-SB endpoint IDs 255-224

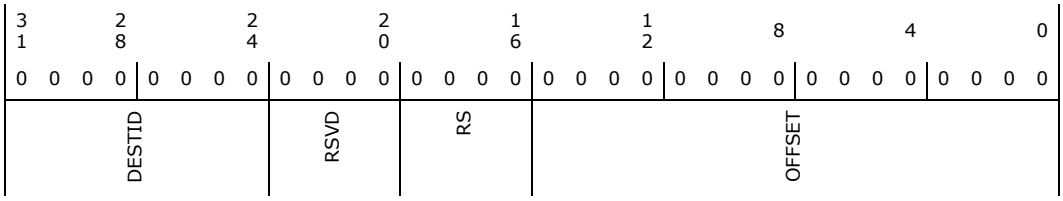
36.9.36 SBI Address (SBIADDR)—Offset D0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RW	**Destination Port ID (DESTID):** The content of this register field is sent in the IOSF Sideband Message Register Access dest field.
23:20	0h RO	Reserved.
19:16	0h RW	**Root Space (RS):** Destination IOSF-SB Root Space. ***Note:*** This register may only be written during manufacturing test. P2SB will only accept writes to this register from transactions with a SAI equal to the SBI_RS_ACCESS_SAI parameter. This should be assigned to the SAI used by the functional test module (typically TAM) that will perform this register write on IOSF-P.
15:0	0h RW	**Address Offset (OFFSET):** Register address offset. The content of this register field is sent in the IOSF Sideband Message Register Access address(15:0) field.

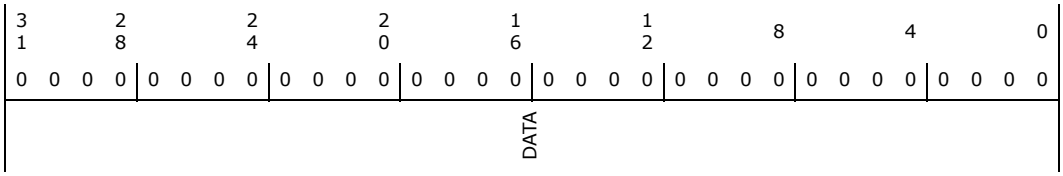
36.9.37 SBI Data (SBIDATA)—Offset D4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Data (DATA):** The content of this register field is sent on the IOSF sideband Message Register Access data(31:0) field.

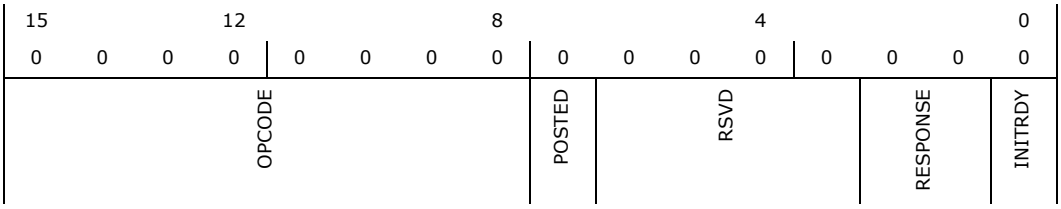
36.9.38 SBI Status (SBISTAT)—Offset D8h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RW	**Opcode (OPCODE):** This is the Opcode sent in the IOSF sideband message.
7	0h RW	**Posted (POSTED):** When set to 1, the message will be send as a posted message instead of non-posted. This should only be used if the receiver is known to support posted operations for the specified operation.
6:3	0h RO	Reserved.
2:1	0h RO/V	**Response Status (RESPONSE):** 00 - Successful 01 - Unsuccessful / Not Supported 10 - Powered Down 11 - Multi-cast Mixed This register reflects the response status for the previously completed transaction. The value of this register is only meaningful if SBISTAT.INITRDY is zero.
0	0h RW/V/L	**Initiate/ Ready# (INITRDY):** 0: The IOSF sideband interface is ready for a new transaction 1: The IOSF sideband interface is busy with the previous transaction. A write to set this register bit to 1 will trigger an IOSF sideband message on the private IOSF sideband interface. The message will be formed based on the values programmed in the Sideband Message Interface Register Access registers. Software needs to ensure that the interface is not busy (SBISTAT.INITRDY is clear) before writing to this register.

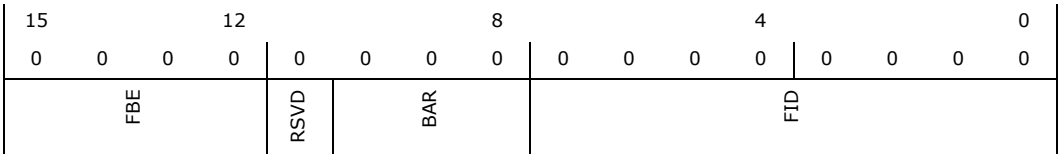
36.9.39 SBI Routing Identification (SBIRID)—Offset DAh

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:12	0h RW	**First Byte Enable (FBE):** The content of this field is sent in the IOSF Sideband Register Access FBE field.
11	0h RO	Reserved.
10:8	0h RW	**Base Address Register (BAR):** The contents of this field are sent in the IOSF Sideband Register Access BAR field. This should be zero performing a Memory Mapped operation to a PCI compliant device.
7:0	0h RW	**Function ID (FID):** The contents of this field are sent in the IOSF Sideband Register access FID field. This field should generally remain at zero unless specifically required by a particular application.

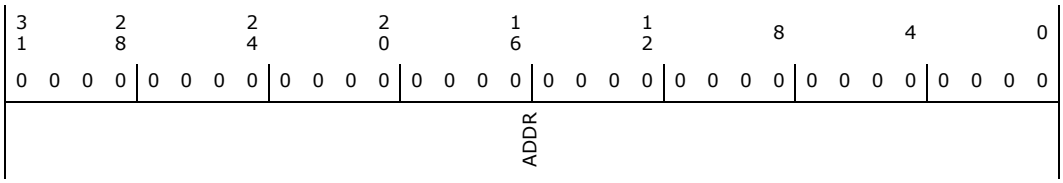
36.9.40 SBI Extended Address (SBIEXTADDR)—Offset DCh

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Extended Address (ADDR):** The content of this register field is sent on the IOSF sideband Message Register Access address(48:32) field. This must be set to all 0 if 16b addressing is desired.

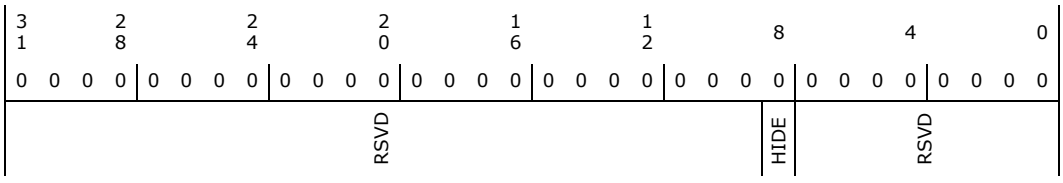
36.9.41 P2SB Control (P2SBC) —Offset E0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 1

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RSVD)**
8	0b RW	**Device Hide(HIDE):** When this bit is set, the P2SB will return 1s on any PCI Configuration Read on IOSF-P. All other transactions, including PCI Configuration writes, are unaffected by this. This does not affect reads performed on the IOSF-SB interface.
7:0	0h RO	**Reserved (RSVD)**

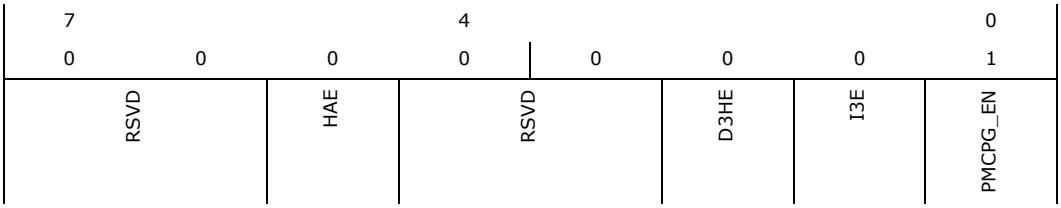
36.9.42 Power Control Enable (PCE)—Offset E4h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 1

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
7:6	0h RO	Reserved.
5	0h RW	**Hardware Autonomous Enable (HAE):** When set, the P2SB will automatically engage power gating when it has reached its idle condition.
4:3	0h RO	Reserved.
2	0h RO	**D3-Hot Enable (D3HE):** No support for $D3_{HOT}$ power gating.
1	0h RO	**I3 Enable (I3E):** No support for S0i3 power gating.
0	1h RW	**PMC Power Gating Enable (PMCPG_EN):** When set to 1, the P2SB will engage power gating if it is idle and the pmc_p2sb_sw_pg_req_b signal is asserted.

36.10 PHY Tuning Registers

This section provides a reference for the tuning registers for the USB2 PHYs and the HSIO PHYs. The HSIO PHYs encompass PCIe* 1/2/3, SATA 1.5/3.0/6.0 Gbps, and USB3. The actual values to be programmed into these registers are not in this document. **A separate document, the *Intel® C620 Series Chipset HSIO Tuning Guide*, will provide the details on what the registers do and values to be programmed into them**. The PhyTune Compliance tool will access these registers, too.

36.10.1 USB 2.0 Additional Electrical Control Registers

The following "USB 2.0 Additional Registers" are distributed within the PCH Private Configuration Space which is accessible through the PCH Sideband Interface using the following Target Port (Destination Port) Identification:

— Target Port (Destination Port) Identification = 0xCA

Note: For complete details on how to use the PCH Sideband Interface to access these PCH Private Configuration Registers reference the latest *Intel® C620 Series Chipset Platform Controller Hub BIOS Specification*.

36.10.2 USB2 PER PORT 1 Electrical Control Register(USB2PP1)

Offset Address:

Port 1: CA4100h
Port 2: CA4200h
Port x: CA4x00h

BIOS Reference Code Platform Configuration PCH Policy Details:

- File = PchPolicyCommon.h Release or Greater
- USB2 HSIO Structures
  - — Bit[14] = PERPORTTXPEHALF
  - — Bits[13:11] = PERPORTPETXISET
  - — Bits[10:8] = PERPORTTXISET

Note: These registers are located in the suspend well.

Bit	Description
31:15	Reserved
14	**Per Port Half Bit Pre-emphasis - R/W** Configuration bit (per port) to select between half-bit or full-bit implementation — 1 - select half-bit pre-emphasis — 0 - select full-bit pre-emphasis ***Note:*** Refer to Section 36.2.3 to configure these bits.
13:11	**Per Port HS Pre-emphasis bias - R/W** ***Note:*** Refer to Section 36.2.3 to configure these bits.
10:8	**Per Port HS TX Bias - R/W** ***Note:*** Refer to Section 36.2.3 to configure these bits.
7:0	Reserved

36.10.3 USB2 PER PORT 2 Electrical Control Register (USB2PP2)

Offset Address:

Port 1: CA4126h
Port 2: CA4226h
Port x: CA4x26h

BIOS Reference Code Platform Configuration PCH Policy Details:

- File = PchPolicyCommon.h Release or Greater
- USB2 HSIO Structure
  - — Bits[24:23] = IUSBTXEMPHASISEN

Note: These registers are located in the suspend well.

Bit	Description
31:25	Reserved
24:23	**Per Port HS TX Emphasis - R/W** Enables the HS Tx Emphasis for the respective port ***Note:*** Refer to Section 36.2.3 to configure these bits.
22:0	Reserved

36.10.4 High Speed I/O (HSIO) Modular Physical Layer (ModPHY)

The Intel® C620 Series Chipset Platform Controller Hub ModPHY architecture handles the HSIO Physical Layer Data Receiver (RX) and Data Transmitter (TX) protocol and electrical signaling requirements where its modular capabilities allow the HSIO lanes to be statically mapped to different controllers using the Flexible I/O technology. It also contains the Internal Clock Phase Lock Loop (PLL) Registers; which apply to the USB3Gen2PCIe PLL.

The Flexible I/O technology allows the HSIO lanes to be configured for connection to the PCIe* Gen 1/2/3, SATA 1.5/3.0/6.0 Gb/s, or USB 3.0 controllers. The ModPHY architecture in conjunction with the Flexible I/O technology enables customers to optimize the allocation of HSIO interfaces to better meet the I/O needs of their system.

Table 36-12. Intel® C620 Series Chipset PCH SBREG_BAR and SBI Address Offset Details (Sheet 1 of 2)

§

37 Debug Registers

37.1 Introduction

The following registers are accessed with the Debug tool provided through SPS FW and C scripts. They may or may not be described in other sections of this document or other documents, but are combined here in one chapter for decode reference. As they are accessed through the SPS interface, the location of these registers is not visible so there's no field for location.

37.2 Register Summary

Table 37-1. Summary of Debug Registers

Register Name (ID)—	Default Value
IP_STS	00h
Link_STS	00h
PREP_STS	00h
IE_STS	00h
HOST_PR_CAUSE_0	00h
HOST_PR_CAUSE_1	00h
HOST_PR_CAUSE_2	00h
HOST_RSTOUT	00h
SUS_SIG_MON_0	F8h
SUS_SIG_MON_1	03h
SUS_SIG_MON_2	40h
SUS_SIG_MON_3	00h
INIT_PWR_OK	00h
PMC Soft Strap 1	06h
PMC Soft Strap 2	10h
PMC Soft Strap 3	80h
PMC Soft Strap 11	0Ah
PMC Soft Strap 12	40h
GLBLRST_CAUSE_3	00h
FW_GLBLRST_CAUSE_0	00h
FW_GLBLRST_CAUSE_1	00h
GLBLRST_CAUSE_0	00h
GLBLRST_CAUSE_1	00h
GLBLRST_CAUSE_2	00h
CORE_SIG_MON_0	9Eh
CORE_SIG_MON_1	00h
MR_GENCTLA	00h
MR_GENCTLC	00h
STATE_TRANS_DATA	00h

Table 37-1. Summary of Debug Registers (Continued)

Register Name (ID)—	Default Value
SLPOUT	00h
SLPOUT2	00h
DSW_WAKE_STS	00h
DSW_PM_FUSE_MON_0	18h

37.2.1 IP_STS

7			4				0
0	0	0	0	0	0	0	0
RSVD						SBI_BP_RP_ALL1_STS	IP_READY_ALL1_STS

Bit Range	Default Value	Field Name (ID): Description
7:2	00h	**Reserved**
1	0b	**SBI BootPrep/ResetPrep All 1 Status (SBI_BP_RP_ALL1_STS)** This bit is set to '1' when all the enabled bits in the SBI_BP_RP_ACK_STS_* registers are '1'. The corresponding enables are in the IP_STS_MASK_* set of registers.
0	0b	**IP_READY All 1 Status (IP_READY_ALL1_STS)** This bit is set to '1' when all the enabled bits in the IP_READY_STS_* registers are '1'. The corresponding enables are in the IP_STS_MASK_* set of registers.

37.2.2 Link_STS

7			4	3			0
0	0	0	0	0	0	0	0
RSVD			DO_RESETB_IN_STS	RESET_DON_IN_STS	DMI_L23_STS	EVA_23_STS	SP_23_STS

Bit Range	Default Value	Field Name (ID): Description
7-5	000b	**Reserved**
4	0b	**DO_RESET_IN# status (DO_RESETB_IN_STS)** This bit is set to ‘1’ by hardware with the DO_RESET_IN# pin transitions from ‘1’ to ‘0’.

Bit Range	Default Value	Field Name (ID): Description
3	0b	**Reset Done In Status (RESET_DONE_IN_STS)** This bit is set to ‘1’ by hardware when the RESET_DON_IN pin transitions from ‘0’ to ‘1’.
2	0b	**DMI L2/L3 Status (DMI_L23_STS)** This bit is set to '1' by hardware when DMI is indicating that the link is in the L2/L3 power state (level event).
1	0b	**EVA Port L2/L3 Status (EVA_L23_STS)** This bit is set to '1' by hardware when all EVA PCI Express Ports are indicating that their links are in the L2/L3 power state (level event).
0	0b	**South Port L2/L3 Status (SP_L23_STS)** This bit is set to '1' by hardware when all in the L2/L3 power state (level event).

37.2.3 PREP_STS- Offset 0x000Eh

7			4	3			0
0	0	0	0	0	0	0	0
PERST_STS	RSVD				FRC_PGPOK	RP_PREP_STS	BP_PREP_STS

Bits	Default Value Access	Description
7	0b	PE_RST# Status (PERST_STS) This bit is set to ‘1’ by hardware after PMC has detected a change on PE_RST#.
6:3	0000b	Reserved
2	0b	**ForcePwrGatePOK Status (FRC_PGPOK_STS)** This bit is set to '1' by hardware after PMC has completed sending the ForcePwrGatePOK message to the enabled groups.
1	0b	**Reset Prep Status (RP_PREP_STS)** This bit is set to 1 by hardware when all expected ACK has been received from IP in response for the message sent and message type is Reset Prep.
0	0b	**Boot Prep Status (BP_PREP_STS)** This bit is set to 1 by hardware when all expected ACK has been received from IP in response for the message sent and message type is Boot Prep.

37.2.4 IE_STS

7			4	3			0
0	0	0	0	0	0	0	0
IE_PR_STS	IEWAK_STS	IE_RTSP_MSG_STS	IE_REG_STS	STALL_PMC_IE_HS_STS	RSVD		

Bits	Default Value	Description
7	0b	**IE Partition Reset Status (IE_PR_STS)** This bit is set to '1' when IE FW writes a '1' to the GENCTL."IE-Partition Reset" bit or when PMC sees a rising edge on one or more of the IE error signals which are currently mapped to IE partition reset, not global reset (all are pulse events) or when a IE HW error occurs and is routed to IE partition reset (level event).
6	0b	**IE Wake Status (IEWAK_STS)** This is a shared status bit to flag that an enabled IE wake event has occurred. There are no Event Status registers for this leaf node - the IE wake status and enable registers (typically IEWS and IEWE) serve this purpose - see IEWAK_EE_* for details. The corresponding event enable bits are located in IEWAK_EE_*. This bit is set to '1' by hardware when any IE status / IE enable / IEWAK_EE_* triplet is active (level event).
5	0b	**IE RTSP Message Received Status (IE_RTSP_MSG_STS)** This is a shared status bit to flag messages that have been received on the IE fabric and root space. The event status bits are located in the MBB_MSG_ES_* registers and the corresponding event enable bits are located in MBB_MSG_EE_*. This bit is set to '1' by hardware when any event status / event enable pair is active (level event).
4	0b	**IE Register Write Status (IE_REG_STS)** This is a shared status bit to flag an IE FW write to an enabled register. The event status bits are located in the IE_REG_ES_* registers and the corresponding event enable bits are located in IE_REG_EE_*. This bit is set to '1' by hardware when any event status / event enable pair is active (level event).
3	0b	**Stall PMC/IE Handshaking Status (STALL_PMC_IE_HS_STS)** This bit will be set to '1' by hardware whenever GENCTL.STALL_PMC_IE_HS is '0' (level event).
2:0	000b	Reserved

37.2.5 HOST_PR_CAUSE_0

7			4	3			0
0	0	0	0	0	0	0	0
IE_HRPD	TCO_WDT	IE_PRPC	IH_HR	RSVD	SYSRST	CF9	DO_RESET_IN_ES

Bits		Description
7	0b RW	**IE-Initiated Host Reset With Power Down (IE_HRPD)** This bit is set when IE FW writes a '1' to GENCTL."IE-Initiated Host Reset With Power Down".
6	0b RW	**Host TCO Watchdog Timer Second Expiration (TCO_WDT)** This bit is set when the host TCO watchdog timer reaches zero for the second time.
5	0b RW	**IE-Initiated Host Reset With Power Cycle (IE_PRPC)** This bit is set when IE FW writes a '1' to GENCTL."IE-Initiated Host Reset With Power cycle".
4	0b RW	**IE-Initiated Host Reset Without Power Cycle (IE_HR)** This bit is set when IE FW writes a '1' to GENCTL."IE-Initiated Host Reset Without Power cycle".
3	0b RW	**Reserved**
2:0	0b RW	**SYS_RST# Assertion (SYSRST)** This bit is set based on an asserting edge of the SYS_RESET# pin (post debounce circuitry)
1	0b RW	**Write to I/O Port CF9 (CF9)** This bit is set when host software writes a value of 06h or 0Eh to the CF9 register.
0	0b RW	**Do Reset In Event Status (DO_RESET_IN_ES)** This bit is set when PMC FW writes a “1” to SUS_MISC_CTL.SET_DO_RESET_IN_HER_ES

37.2.6 HOST_PR_CAUSE_1

7			4	3			0
0	0	0	0	0	0	0	0
GLBL_TO_HOST	RSVD	HSMB_HRPC	HSMB_HR	RSVD	MI_HRPD	MI_PRPC	MI_HR

Bits	Default Value	Description
7	0b	**Global Reset to Host Reset Event Status (GLBL_TO_HOST)** This bit is set when the PMC converts a global reset to host partition reset due to xxxx.GBL2HOST being set when the global reset occurred.
6	0b	**RSVD**
5	0b	**Host SMBus Host Reset With Power Cycle (HSMB_HRPC)** This bit is set when the PMC writes a '1' to SUS_MISC_CTL.SET_HSMB_HRPC_ES.
4	0b	**Host SMBus Host Reset Without Power Cycle (HSMB_HR)** This bit is set when the PMC writes a '1' to SUS_MISC_CTL.SET_HSMB_HR_ES.
3	0b	**RSVD**
2:0	0b	**ME-Initiated Host Reset With Power Down (MI_HRPD)** This bit is set when Intel ME FW writes a '1' to GENTCTL."ME-Initiated Host reset with Power Down".
1	0b	**ME-Initiated Host Reset With Power Cycle (MI_PRPC)** This bit is set when Intel ME FW writes a '1' to GENTCTL."ME-Initiated Host reset with Power Cycle".
0	0b	**ME-Initiated Host Reset Without Power Cycle (MI_HR)** This bit is set when Intel ME FW writes a '1' to GENTCTL."ME-Initiated Host reset without Power Cycle".

37.2.7 HOST_PR_CAUSE_2

7			4	3			0
0	0	0	0	0	0	0	0
RSVD							AC_RU_HR

Bits	Default Value	Description
7:1	0000000b	**RSVD**
0	0b	**AC RU Initiated Host Reset (AC_RU_HR)** This bit is set when the AC RU requests a Host Reset.

37.2.8 HOST_RSTOUT

7			4	3			0
0	0	0	0	0	0	0	0
RSVD						HOST_SIDE_RST_VAL	HOST_PRIM_RST_VAL

Bits	Default Value	Description
7:2	000000b	**RSVD**
1	0b	**Host Side Reset (HOST_SIDE_RST_VAL)** Value to drive on the IOSF Host Side RST# signal.
0	0b	**HOST_PRIM_RST# Value (HOST_PRIM_RST_VAL)** Value to drive on the Host_Prim_Rst# pin

37.2.9 SUS_SIG_MON_0

7			4	3			0
1	1	1	1	1	0	0	0
RSVD		PWRBTN_PIN	SUSFLR_STS	GP27_PIN	RSVD	SYSPWER_PIN	PCHPWR_PIN

Bit	Default Value	Description
7:6	11b	**RSVD**
5	1b	**PWRBTN# Pin Value (PWRBTN_PIN)** Live value of the PWRBTN# pin, after synchronization to PMC_CLK and any debounce
4	1b	**SUS Well Power Failure Status (SUSFLR_STS)** This bit is set to '1' by hardware when a global reset is triggered by loss of Primary well power. This includes DeepSx and G3.
3	1b	**GP27 Pin Value (GP27_PIN)** Live value of the GP27 pin, after synchronization to the pmc_clk.
2	0b	**RSVD**
1	0b	**SYS_PWROK Pin Value (SYSPWR_PIN)** Live value of the SYS_PWROK pin, after synchronization to pmc_clk.
0	0b	**PCH_PWROK Pin Value (PCHPWR_PIN)** Live value of the PCH_PWROK pin, after isolation to the Primary well and synchronization to pmc_clk.

37.2.10 SUS_SIG_MON_1

7			4	3			0
0	0	0	0	0	0	1	1
FAST_RST	RSVD					PME_pIN	WAKE_pin

Bit	Default Value	Description
7	0b	**Fast Reset Test Mode (FAST_RST)** FW can check this bit to see if the Fast Reset Test Mode is enabled (‘1’ = enabled)
6:2	00000b	**RSVD**
1	1b	**PME# Pin Value (PME_PIN)** Live value of the PME# pine
0	1b	**WAKE# Pin Value (WAKE_PIN)** Live value of the WAKE# pin

37.2.11 SUS_SIG_MON_2

7			4	3			0
0	1	0	0	0	0	0	0
RSVD		XTAL_OSC_VLD	RSVD				PMC_UG_STS

Bit	Default Value	Description
7:6	01b	**RSVD**
5	0b	**Crystal Oscillator Valid (Xtal_Osc_VLD)** If the 48 MHz Crystal Oscillator is operational this bit is 1
4:1	0000	**RSVD**
0	1b	**PMC Ungate Status (PMC_UG_STS)** This bit is to ‘1’ when the PMC exits a power gated state. This bit is the only way to detect a power gate exit and differentiated it’s behavior from GLOBAL_RST# assertion cases. This bit is reset with a Global reset

37.2.12 SUS_SIG_MON_3

7			4	3			0
0	0	0	0	0	0	0	0
RSVD			PERSTB_IN_VAL	DO_RESET_IN_VAL	RESET_DON_IN_VAL	RSVD	

Bits	Default Value	Description
7:5	000b	**RSVD**
4	0b	**PE_RST# Pin Value (PERSTB_IN_VAL)** Live value of the PE_RST# pin after synchronization to the pmc_clk
3	0b	**DO_RESET_IN# Pin Value (DO_RESET_IN_VAL)** Live value of the DO_RESET_IN# pin, after synchronization to pmc_clk.
2	0b	**RESET_DONE_IN Pin Value (RESET_DONE_IN_VAL)** Live value of the RESET_DONE_IN pin, after synchronization to pmc_clk.
1:0	00b	**RSVD**

37.2.13 INIT_PWR_OK

7			4	3			0
0	0	0	0	0	0	0	0
RSVD		INT_CORE_POK	INT_ASW_POK	RSVD	INT_AUX_POK	INT_SUS_POK	RSVD

Bit	Default Value	Description
7:6	00b	**RSVD**
5	0b	**Internal CORE Well Power OK (INT_CORE_POK)** Live value of the internal CORE well power OK indication, after isolation to the Primary well and synchronization to pmc_clk.
4	0b	**Internal AS Well Power OK (INT_ASW_POK)** Live value of the internal "AS well" power OK indication, after isolation to the Primary well and synchronization to pmc_clk.
3	0b	**RSVD**
2	0b	**Internal AUX Well Power OK (INT_AUX_POK)** Live value of the internal AUX well power OK indication, after isolation to the Primary well and synchronization to pmc_clk.
1	0b	**Internal SUS Well Power OK (INT_SUS_POK)** Live value of the internal Primary well power OK indication, after isolation to the Primary well and synchronization to pmc_clk. The primary well requires that the DSW is up. Note that this bit should never be '0' when the PMC is functional

Bit	Default Value	Description
0	0b	**RSVD**

37.2.14 PMC Soft Strap 1

This register reflects what are read in from the PCH Descriptor Record 119, bits [7:0].

§

38 10 GbE Controller

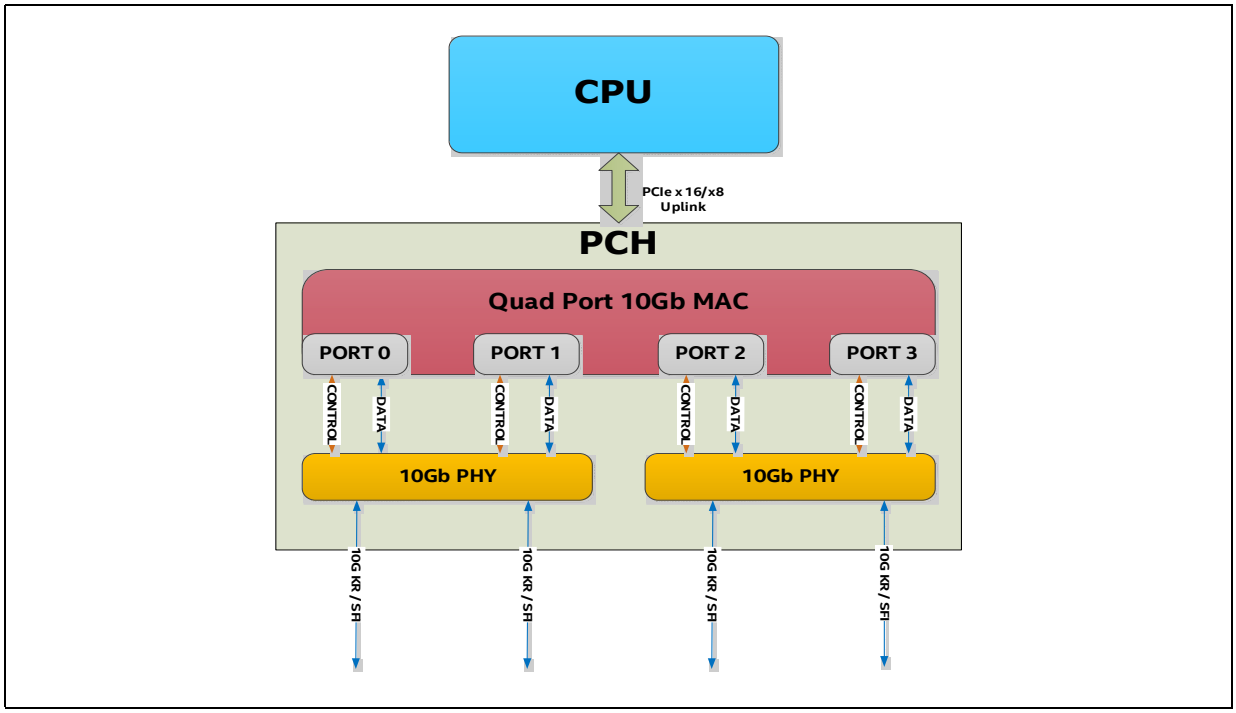
This section describes the external architecture (including device operation, pin descriptions, register definitions, etc.) for the quad-port, 10 GbE controller for the Platform Control Hub (PCH).

Information presented is intended as a reference for architects, logic designers, firmware and software device driver developers, board designers, test engineers, or anyone else who might need specific technical or programming information about the 10 GbE controller.

Note: Not all platforms support the 10 GbE controller even if SKUs that contain the controller. Please check the supported functions/features of the platform to see if the 10 GbE controller supported or not.

38.1 10 GbE Controller Overview

The 10GbE controller supports four XGMII-like interfaces to an integrated SerDes 10 GbE PHY enabling bandwidth of 10 GbE per port.



The 10 GbE controller supports 10 GbE / 1 GbE operations on its network data interface. Auto-negotiation, when configured for backplane Ethernet to automatically select between supported modes on each PHY as shown.

Each interface provides the following physical interfaces and electrical modes.

- Integrated modes of operation:
  - 10GBASE-KR for GbE backplane applications (IEEE* 802.3 clause 72)
  - 10GBASE-KR for backplane applications with Forward Error Correction (FEC) for BASE-R PHYs (IEE802.3 clause 74)
  - 10 GbE SFI SR/LR/DAC (SFF 8431)
  - 1000BASE-KX for backplane applications (IEEE 802.3 clause 74)
- Modes of operation requiring external PHY devices:
  - 10GBASE-T PHY (using an Intel® X557-AT2 (2-port)/ X557-AT4 (4-port) 10GBASE-T PHYs
  - 10 GbE SFI SR/LR/DAC (SFF 8431) re-timer option using Inphi* CS4227 series external PHY
  - 1000BASE-T using Marvell* 88E1514/88E1512/88E1543 external PHY

Note: These are the ONLY supported external PHYs.

Choose the appropriate configuration for your system configuration listed in Table 38-1.

Table 38-1 lists the supported operating modes and link partners.

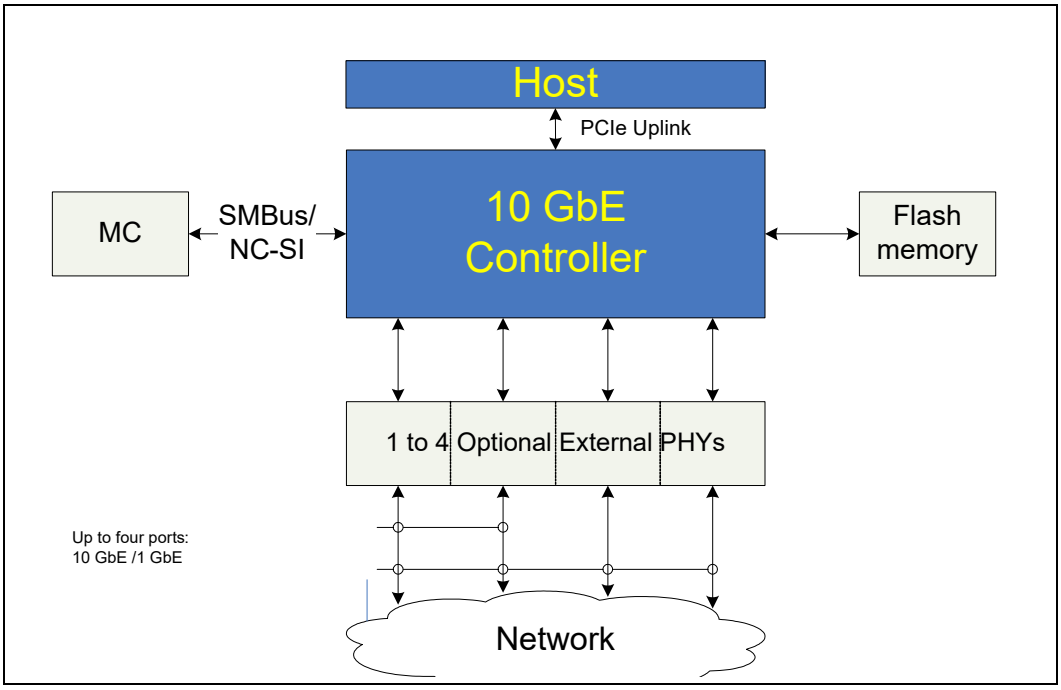
For detailed configurations, refer to the *Intel® X722 Lewisburg/Skylake-D 10 Gigabit Ethernet (GbE) Controller Reference Schematics*.

Table 38-1. 10 GbE LAN Configurations

Connection	Data Rate	Electrical Interface	3rd Party PHYs/Switches
Configurations Native to the PCH			
Backplane supports a direct connection to an aggregation switch.	10 Gb/s	10GBASE-KR	Intel FM5000/FM6000/FM10000 Ethernet switches and Broadcom* BCM5684x-series switches.
SFP+ / QSFP+.	10 Gb/s	SFI	Refer to the *Intel® Xeon® Processor Scalable Family Platform Design Guide* for a list of supported modules/cables.
Backplane supports a direct connection to an aggregation switch.	1 Gb/s	1000BASE-KX	Intel FM4000/FM5000/FM6000/ FM10000 Ethernet switches and Broadcom BCM5684x-series switches.
Configurations Requiring an External PHY			
10GBASE-T.	10 Gb/s	10GBASE-KR	Intel X557-AT2 (2-port)/ X557-AT4 (4-port).
SFP+ SR/LR/DAC for extended PCB reach.	10 Gb/s	10GBASE-KR	Inphi CS4227 (2-port) Inphi CS4223 (4-port)
1000BASE-T.	1 Gb/s	1000BASE-KX	Marvell 88E1514. Marvell 88E1512. Marvell 88E1543.

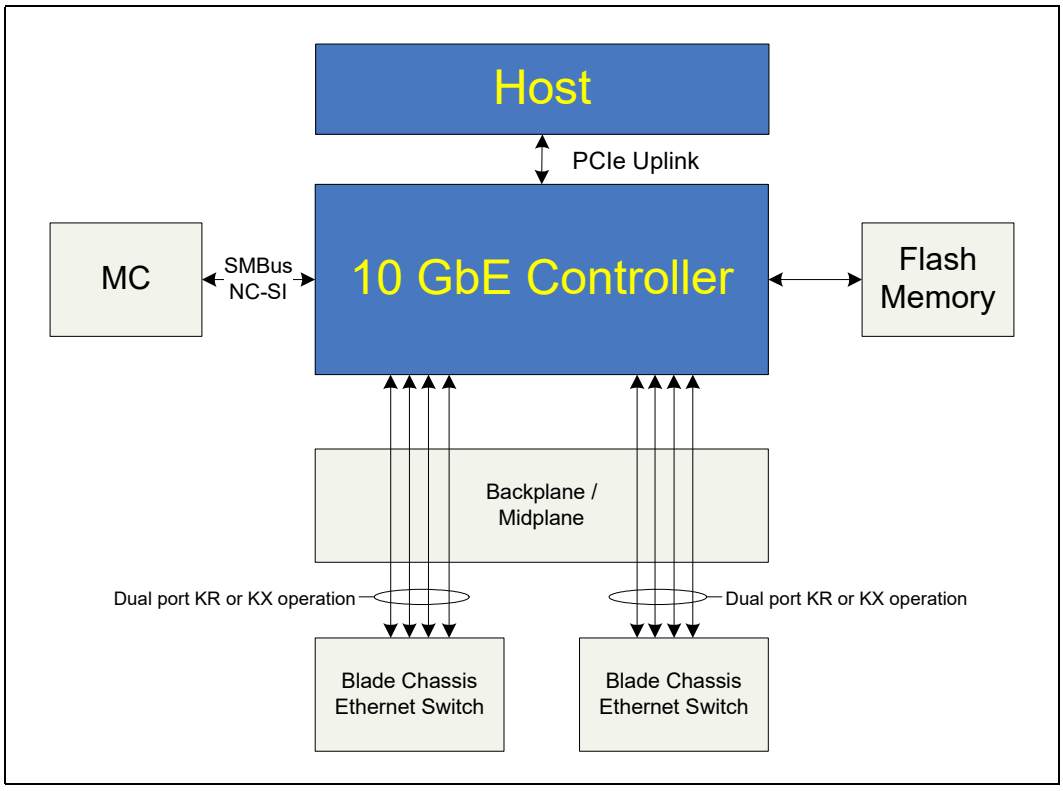
38.2 Typical System Configurations

Figure 38-1. Typical Rack / Pedestal System Configuration



As shown in Figure 38-1, the 10GbE controller is targeted for use in rack mounted or pedestal servers. Some types of Ethernet cables, such as SFP+ direct attach, can be driven directly by the 10 GbE controller, while other types, such as 10GBASE-T, require the external PHY component(s) shown.

Figure 38-2. Typical Blade System Dual-Redundant Star Configuration



As shown in Figure 38-2, the 10 GbE controller is also targeted for use in blade servers.

Blade backplanes typically connect Ethernet controllers in a dual-redundant star to two separate Ethernet switches as shown in Figure 38-2. In this configuration, the 10 GbE controller can be connected ports to each Ethernet switch or can be connected with only one port to an Ethernet switch, with two ports unused.

Figure 38-3 shows the 10 GbE controller's 10 GbE interfaces.

Figure 38-3. 10 GbE Controller Interfaces

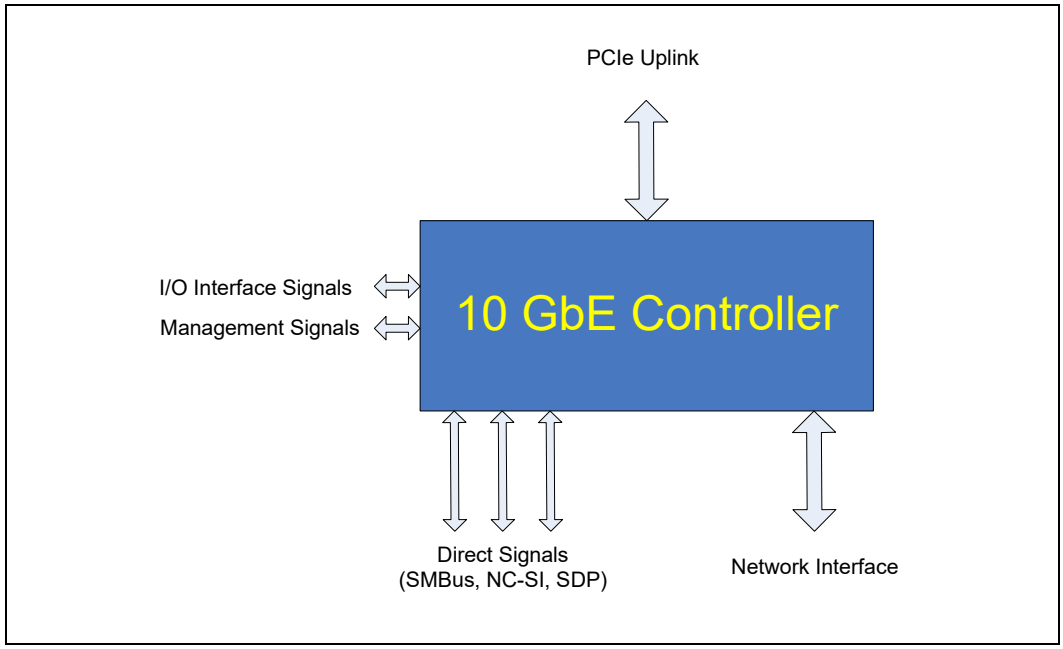


Figure 38-3 shows the 10 GbE controller as part of the Intel® C620 Series Chipset. The 10 GbE controller consists of:

- An integrated PHY interface:
- A digital I/O block that interfaces and manages various control I/O

38.3 High-Speed Signal Interface

The following table lists the 10 GbE controller network data interface pins.

Group Name	Signal Name	Type	Name and Function
(n = 0 through 3 for port#)			
Tx I/O and Rx I/O	LAN_TX_P<n>_P LAN_TX_P<n>_N	OUT	10 GbE / 1 GbE PHY Tx differential output
	LAN_RX_P<n>_P LAN_RX_P<n>_N	IN	10 GbE / 1 GbE PHY Rx Differential Input

38.4 Sideband Signals

The following sideband interfaces are available for the 10 GbE controller:

- MDIO
- I^2C
- LED Interface
- SDPs
- SMBus
- NC-SI

38.5 Low-speed Sideband Signal Interface

Group	Signal Name	I/O Pad Buffer Type	Internal Resistor PD	Internal Resistor PU	Description
(n = 0 through 3 for port#)					
Management Interface for Physical-Layer (PHY) Components. ***Note:*** MDIO and I^2C functions share the same interface pins, so only one can be operational at a time. These interfaces can be configured using NVM.	LAN_I2C_SCL_MDC_P[n]	I/O			I^2C clock of the 2-wire management interface used to access the management registers of an external optical module of port n. One clock pulse is generated for each data bit transferred. Management clock. Clock output for accessing the external PHY management registers. MDC clock frequency is proportional to link speed. At 10 Gb/s link speed, MDC frequency can be set up to 2.4 MHz.
	LAN_I2C_SDA_MDIO_P[n]	I/O			I^2C data of the 2-wire management interface used to access the management registers of an external optical module of port n. Stable during the high period of the clock (unless it is a start or stop condition). Management data. Bi-directional signal for serial data transfers between the MAC and the external PHY. Tri-state buffer requires an external pull up resistor.
LED	LAN_LED_P<n>_[1:0]	O			Two programmable LEDs per port that can be used for link status/link activity indications.
SDP	LAN_SDP_P<n>_[1:0]	I/O			Two general purpose SDP pins per port. Can be used to support IEEE 1588 auxiliary devices or input for external interrupts, etc.

Group	Signal Name	I/O Pad Buffer Type	Internal Resistor PD	Internal Resistor PU	Description
(n = 0 through 3 for port#)					
SMBus	LAN_SMBALRT_N	I/O			SMBus alert. Acts as an interrupt pin of a slave device on the SMBus.
	LAN_SMBCLK	I/O			SMBus clock. One clock pulse is generated for each data bit transferred.
	LAN_SMBDATA	I/O			SMBus data. Stable during the high period of the clock (unless it is a start or stop condition).
NC-SI	LAN_NCSI_ARB_ IN	I			NC-SI arbitration in
	LAN_NCSI_ARB_OUT	O			NC-SI arbitration out
	LAN_NCSI_CLK_IN	I			NC-SI reference clock input. Synchronous clock reference for receive, transmit, and control interfaces. It is a 50 MHz clock ±100 ppm.
	LAN_NCSI_CRS_DV	O			Carrier Sense/Receive Data Valid (CRS/ DV) to the Manageability Controller (MC). Indicates that the data transmitted from the 10 GbE controller to MC is valid.
	LAN_NCSI_RXD[1:0]	O			MC receive data. Data signals from the 10 GbE controller to the MC.
	LAN_NCSI_TX_EN	I			MC transmit enable. Indicates that received data from MC is valid.
	LAN_NCSI_ TXD[1:0]	I			MC transmit data. Data signals from the MC to the 10 GbE controller.

Group	Signal Name	I/O Pad Buffer Type	Internal Resistor PD	Internal Resistor PU	Description
(n = 0 through 3 for port#)					
Miscellaneous	PCI_DIS_N	I			This pin is a strapping pin latched while LAN_DIS_N, PE_RST_N or in-band PCIe reset are asserted. If this pin is not connected or driven high during initialization, then all PCI functions as configured from the NVM are enabled. If this pin is asserted/driven low during initialization, then all PCI functions that are allowed to be disabled as configured in the NVM are disabled. See Section 38.14 for more detail.
	LAN_DIS_N	I			This pin is a strapping option pin latched while LAN_DIS_N, PE_RST_N or in-band PCIe reset are asserted. This pin can be either used as a device disable or for disabling the LAN ports and associated functions based on the NVM configuration See Section 38.14 for more detail. If this pin is not connected or driven high during initialization, then all the LAN ports and associated functions as configured from the NVM are enabled for normal operation. If this pin is asserted/driven low during initialization then the LAN ports and associated functions as configured from the NVM are disabled. Asserting this pin disables the entire device if all the LAN ports are configured to be disabled. When the entire device is disabled, the PCIe link is in L3 state, the PHY is in power down mode, and the output buffers are tri-stated. See Section 38.14 for more detail.

38.6 Host Interface

The connection to the 10 GbE controller is enabled via a dedicated PCIe uplink (X8/X16). See Chapter 22 for more details about the PCIe host interface.

38.6.1 Host Memory Objects

The 10 GbE controller operating system drivers set up a wide variety of host memory objects that are comprehended and manipulated by the 10 GbE controller. All objects are set up in the context of a PCI function. This is important for at least two reasons:

- **Platform security:** For example, many types of the 10 GbE controller host memory objects are privileged, and are only allowed to be set up in the context of a PF. For example, they are dis-allowed in the context of a Virtual Function (VF), which operates at a lower privilege level than a PF.
- **Reliability:** If the operating system resets a PCI function, that function's host memory objects are lost, but the host memory objects of other PCI functions survive.
- **LAN Queue Pairs:** These are ring buffers (one transmit, one receive) for submitting commands to the LAN engine. Commands take the form of packets/data to be transmitted, descriptors for empty host memory buffers to be filled with received packets/data, etc. LQPs are typically mapped into OS kernel space. In a virtualized server, they can be assigned either to the VMM, or to VMs using SR-IOV. The 10 GbE controller supports up to 1536 LQPs that can be assigned to PFs or VFs as needed. The LQPs assigned to a particular PCI function can be used in these important ways:
  - For distributing packet processing work to the different processors in a multi-processor system. On the transmit side, this is done by simply dedicating an independent transmit queue for each CPU to use. On the receive side, packets are classified by the 10 GbE controller under operating system control into groups of conversations. Each group of conversations is assigned its own receive queue and receiving processor. Microsoft* RSS is one popular example of this method.
  - For assigning Traffic Class. Transmit queues assigned to different TCs are serviced at different rates by the 10 GbE controller transmit scheduler. Receive queues assigned to different TCs can be serviced at different rates by a Quality of Service (QOS0-enabled operating system and its software device drivers.
- **Protocol Engine Queue Pairs:** These are ring buffers (one Send Queue, one Receive Queue) for submitting commands to the Protocol Engine. Each Protocol Engine QP can be configured for either RDMA messages or for UDA packets. Commands on RDMA QPs take the form of RDMA messages to be transmitted, descriptors for empty host memory buffers to be filled with received RDMA messages, etc. Commands on UDA QPs take the form of packets/data to be transmitted, descriptors for empty host memory buffers to be filled with received packets/data, etc. Protocol Engine QPs are typically mapped into host *user space*. In a virtualized server, they can be assigned either to the VMM, or to Virtual Machine user space using SR-IOV. The 10 GbE controller supports up to 262,144 Protocol Engine QPs which are allocated to PFs and VFs as the 10 GbE controller initializes and drivers load, and are fixed after that.

- **Admin Queue Pairs:** Each PCI function maps an Admin Queue Pair: one Admin Send Queue and one Admin Receive Queue. The ASQ is a ring buffer used by the host driver for submitting commands to configure the 10 GbE controller. Commands submitted on the ASQ are serviced by the 10 GbE controller's Embedded Management Processor. Some examples are commands to reconfigure: the Tx scheduler, an Ethernet link, power management states like various internal switch and DCB settings, etc. The ARQ conveys events from the EMP to host driver that are not an immediate result of an ASQ command. The host driver posts empty buffers to the ARQ and the EMP fills them with events. Note that commands submitted on a VF ASQ are typically not directly serviced by the EMP, but rather are redirected to the associated PF ARQ. This enables the PF driver to inspect and authorize all VF ASQ commands which are often of a privileged nature.

38.6.2 Ethernet Media Access Controller

The 10 GbE controller integrates four IEEE Std 802.3 compliant Ethernet MACs that operate at 10 GbE. All 10 GbE controller MACs support transmission and reception of jumbo frames of up to 9728 bytes, and 802.3x flow control frames or 802.3bd priority-based flow control frames. The interface of each MAC is XGMII.

The 10 GbE controller also implements either four independent Management Data Input/Output interfaces or four independent I^2C interfaces for connection to external PHYs. These enable host software or the 10 GbE controller firmware to control connected external PHYs, including the ability to read and write PHY registers.

38.6.3 Transmit Scheduler

The 10 GbE controller provides management interfaces that allow each LAN transmit queue or protocol engine transmit queue to be placed into a *queue set*. A *queue set* is a list of transmit queues that belong to the same TC and are treated equally by the 10 GbE controller transmit scheduler. The 10 GbE controller supports a maximum of 384 Virtual Station Interfaces, and an average of four queue sets per VSI for use by LAN and two for use by the Protocol Engine. There is no limit to the number of transmit queues that can belong to a queue set.

Typically, one or more queue sets are assigned to a PCI function/VSI, according to the number of TCs it uses. Since each Protocol Engine transmit queue typically represents a single TCP/IP connection, it is easy to see how a Protocol Engine queue set will often have a large number of members. For LAN, the queue sets are often only one or a small handful of transmit queues, corresponding to the number of host CPUs assigned to generate traffic on that TC.

The 10 GbE controller transmit scheduler supports independent programming of a wide variety of controls that affect queue set behavior. Each queue set can be programmed with an independent static rate limit. Each group of queue sets assigned to a PCI function/VSI can be programmed with DCB Enhanced Transmission Selection settings, group static rate limit, and uplink bandwidth share.

The 10 GbE controller transmit scheduler also implements controls similar to those previously described for the various internal resources that comprise the 10 GbE controller's hierarchy of internal switching components. These internal resources include Virtual Ethernet Bridge, Virtual Ethernet Port Aggregator and SComp v-ports, as well as the physical Ethernet ports of the device.

38.6.4 Host Memory Cache

The 10 GbE controller LAN engine and Protocol Engine use host memory as a backing store for a variety of context objects. The HMC is responsible for caching and managing these context objects. Here are some examples:

- The LAN engine uses two HMC context objects per QP, one for the Transmit Queue and one for the Receive Queue. Parameters in the TQ context include a Transmit Segmentation Offload state. Parameters in the RQ context include a queue base address and associated pointers.
- For each RDMA connection, the Protocol Engine uses a *QP Context* object. For example, a TCP/IP connection context that stores TCP sequence numbers and IRRQ objects that buffer inbound RDMA Read Requests until their associated Read Responses are scheduled for transmit. For each RDMA Memory Region, the Protocol Engine uses a *Memory Region Table Entry* object to store region boundary and access rights information, and a set of *Physical Buffer List Entry* objects to store virtual-to-physical address translations for this region.

38.6.5 LAN Engine

The LAN engine implements the host programming interface for traditional LAN traffic in both virtualized and non-virtualized scenarios. The 10 GbE controller implements 384 VSIs (virtual-NICs) used to distribute traffic to PCI physical functions and virtual functions. These VSIs can connect to the host via 1536 LAN QPs.

The LAN engine also implements all of the 10 GbE controller's performance optimizations for traditional LAN traffic. This includes packet checksum offloads, Transmission Control Protocol/User Datagram Protocol (TCP/UDP Segmentation Offload), RSS and others.

38.6.6 Protocol Engine

The Protocol engine implements iWARP RDMA capability. The Protocol engine offloads TCP/IP processing from the host, places received data payloads directly into user buffers with no host CPU involvement, and eliminates user-kernel context switching when performing I/O by mapping the RDMA programming interface directly into application address space.

The Protocol engine implements the latest RDMA features, including Send Queue Push Mode. It also implements Userspace Direct Access, a means to accelerate select IP packet streams by conveying them directly to/from user space applications using RDMA-style host interfaces (QPs, CQ, etc).

38.6.7 System Management

The 10 GbE controller participates in system management by providing networking services to platform management controllers; also called BMC. The 10 GbE controller is also accessible to these devices to be managed as any platform resource that is managed by the system.

Networking services are provided through the Pass-Through functionality. Several sideband channels are provided to connect to a Management Controller:

- SMBus
- NC-SI
- Management Component Transport Protocol over PCIe.

The 10 GbE controller also supports communication between local software agents and the local BMC through an operating system to BMC capability.

38.6.8 Embedded Management Processor (EMP)

The EMP unit handles all management duties that cannot be performed by the 10 GbE controller's device drivers, and must be carried out on-chip. This includes performing parts of The 10 GbE controller power-on sequence, handling AQ commands, initializing the 10 GbE controller Ethernet ports, participating in various fabric configuration protocols such as DCBX and other Link Layer Discovery Protocols, fielding configuration requests received on one of the 10 GbE controller's BMC management interfaces such as NC-SI, and handling special configuration requests received off an Ethernet port.

38.6.9 Internal Switch

The internal switch handles the 10 GbE controller packet buffering and also implements all its internal Ethernet switching capabilities. The internal switch can logically support up to 16 VLAN-aware bridges, connecting up to 384 VSIs out to the 10 GbE controller Ethernet ports via optional EVB S-Components. The internal switch implements the filtering and forwarding behaviors expected by 802.1Q VLAN-aware bridges.

38.6.10 Receive Scheduler

The receive scheduler prioritizes received packets according to the ETS settings programmed at each Ethernet port.

38.6.11 Receive Filters

The 10 GbE controller receive filters implement all of the 10 GbE controller's logic for queue selection. For each received packet, the forwarding process carried out by the internal switch selects which VSI the packet is associated with. The receive filters then determine which engine(s) handle the packet (EMP, LAN engine, Protocol Engine) and which selected VSI RQs the packet is associated with. Receive filters include flow director, Quad Hash filtering, RSS filters, etc.

38.7 Various Interfaces

38.7.1 Shared Serial Flash Interface

The 10 GbE controller accesses the NVM via the SPI controller of the 10 GbE controller.

The NVM device is required for storage of device firmware, device configuration parameters, identifiers that vary per adapter (like MAC addresses), and register overrides that auto load automatically after reset. The 10 GbE controller assumes that at least 6 MB of the NVM are dedicated for these configurations.

38.7.2 SMBus Interface

SMBus is an optional interface for pass-through and/or configuration traffic between an external BMC and the 10 GbE controller. The 10 GbE controller's SMBus interface supports standard SMBus at 100 kHz and extensions up to a frequency of 1 MHz.

38.7.3 NC-SI Interface

NC-SI is an optional interface for pass-through and/or configuration traffic between an external BMC and the 10 GbE controller.

38.7.4 SDPs

SDPs are typically used to exchange information with or to control external devices (such as PHY devices) under the 10 GbE controller software driver control.

38.7.5 LEDs

The 10 GbE controller implements eight output drivers intended for driving external LED circuits. The 10 GbE controller can be configured so that either two of these outputs are allocated per port or four outputs are allocated per port (this later configuration is used when two ports are disabled). Each of the LED outputs can be individually configured to select which particular event, state, or activity it indicates. In addition, each LED can be individually configured for output polarity and for blinking versus non-blinking (steady-state) indications.

38.7.6 LAN_DIS

See Section 38.5 for more detail.

38.7.7 PCI-DIS

See Section 38.5 for more detail.

38.8 Features

This section lists the 10 GbE controller's feature set.

Table 38-2. PCIe* Host Interface Features (Sheet 1 of 2)

Description
Host primary interface 32 Bytes @ 400 MHz. Can be connected to a virtual switch port fabric, an RCIE fabric or a PCIe link layer fabric.
Requester Features • 64-bit address support for systems with more than 4 GB of physical memory • Maximum of 208 outstanding requests, allocated fairly as needed amongst PCI Functions • Maximum payload size supported: 512 bytes • Maximum read request size supported: 2 KB • All requests use TC TC0/VC0, the best effort service class for general purpose I/O Optimized support for relaxed Ordering transaction attribute • Optimized support for TLP Processing Hints • Optimized support for ID-based Ordering
Completer Features • Up to 4 Peripheral Component Interconnect PFs Device can be configured to disable/hide any number of these PFs. • Each PF implements these Base Address Registers (BARs) — Memory BAR for direct access to most Internal Registers. This BAR can be configured to define either a 32-bit or 64-bit base address. It's size is 256 KB or larger. — MSI-X BAR for direct access to MSI-X-related structures. This BAR can be disabled/hidden. It can be configured to define either a 32-bit or 64-bit base address and it's size is 32 KB. — Expansion ROM BAR for direct host access to one of the 10 GbE controller's option ROM images. This BAR can be disabled/hidden. It defines a 32-bit base address and it's size is 64 KB or larger. — I/O BAR for indirect access to most Internal Registers. This BAR can be disabled/hidden. It defines a 32-bit base address and it's size is 32 bytes. • PF capabilities list (some of these can be disabled/hidden) — PCI Power Management — MSI — MSI-X — PCIe — Vital Product Data: Each PF can access a single shared instance of VPD storage, with a size up to 256 bytes — Advanced Error Reporting — Device Serial Number — Alternative RID Interpretation — SR-IOV — TPH Requester — Access Control Services — Secondary PCIe
Reliability • AER • Support for optional End-to-End CRC generation and checking • Recovery from data poisoning • Completion timeout
Power Management • Supports the PCI Power Management specification and Section 5 of the *PCI Express Base Specification*. • Does not support D1 or D2 power management states. • Does support D0uninitialized, D0active, $D3_{HOT}$, and $D3_{COLD}$ power management states. • $D3_{HOT}$ transition to D0 does preserve configuration context (as indicated by the RO PCI configuration bit No_Soft_Reset=1b)
Interrupt Functionality • INTx: Supports four INTx interrupts conveyed using the PCIe INTx virtual wire signaling mechanism. A given PF can only map a single INTx. • MSI: Supports one Message-Signaled Interrupt per PF. • MSI-X: Supports up to 1168 MSI-X vectors, shared among PFs and VFs. Up to 129 MSI-X interrupts can be assigned to a single PF and up to 17 MSI-X interrupts can be assigned to a single VF, depending on the number of enabled functions. • Sophisticated interrupt moderation using Interrupt Throttling (ITR) and Interrupt Rate Limiting (INTRL).

Table 38-2. PCIe* Host Interface Features (Sheet 2 of 2)

Description
I/O Virtualization • Supports PCI-SIG SR-IOV Specification with up to 128 VFs. VFs can be flexibly assigned to PFs, although reassignment requires re-enumeration of the PCI bus hierarchy. • Each VF implements these BARs — Memory BAR for restricted access to Internal Registers. This BAR can be configured to define either a 32-bit or 64-bit base address. It's size is 16KB or larger. — MSI-X BAR for direct access to MSI-X-related structures. This BAR can be configured to define either a 32-bit or 64-bit base address. It's size is 16KB. • Per-VF Capabilities list (some of these can be disabled/hidden) — MSI-X — PCIe — AER — ARI — TPH requester — ACS

Table 38-3. Link Layer Ethernet Port Features

Description
Ethernet Speed and Interfaces (see Table 38-2). 10 Gb/s: Four ports of XGMII (supporting 10 GbE and 1 GbE) 1 Gb/s: 4 ports over XGMII (supporting 10 GbE and 1 GbE
The 10 GbE controller's Maximum Transmit Unit Size is 9728 - Ethernet header/CRC = 9728 - 18 = 9710 bytes (jumbo frames) MTU can be further reduced by additional header fields such as Virtual Local Area Network tag(s), etc.
Full-duplex operation at all supported speeds
Integrates support for IEEE Std 802.3 Clause 73 Auto-Negotiation for Backplane Ethernet

Table 38-4. Performance On The Network vs. Packet Size

Description
Maximize link capacity when operating at 4x10 Gb/s links with packets larger than 128 bytes at full duplex traffic
Maximize link capacity when operating at 2x10 Gb/s links or 1x10Gb/s link in all packet sizes at full duplex traffic

Table 38-5. Transmit And Receive Scheduling

Description
Queue Sets (see Section 38.6.3**)** • Supports up to 1024 RDMA/UDA Queue Sets (768 typically available) • Supports up to 1024 LAN queue sets (768 typically available) • Each queue set is assigned to the TC of a particular VSI • Round Robin bandwidth distribution between TQs assigned to same queue set • Round Robin bandwidth distribution between RDMA/UDA and LAN queue sets belonging to same TC of VSI
Quanta: • Transmit work is scheduled in units of configurable per chip Quanta bytes. • Quanta can be configured to be 1KB, 2KB, 4KB, 8KB, 16KB, 32KB or 64KB.
VSI: • Supports up to 384 VSIs with average of two TCs allocated per VSI • Independent ETS/SLA configuration per VSI • Configurable bandwidth limit per VSI.
VEB/VEPA: • Supports up to 16 VEB/VEPA switching components • Configurable bandwidth allocation among VEB/VEPA VSIs • Configurable bandwidth Limit of VEB/VEPA egress port
S-components: • Supports up to four S-components, one per physical port • Configurable bandwidth allocation among S-channels • Independent ETS configuration per S-component egress port • Configurable bandwidth limit of S-component egress port
Bandwidth Distribution: • Supports two bandwidth allocation modes — Relative bandwidth allocation - used for ETS, and bandwidth allocation between ingress ports of the switching component — Best effort bandwidth allocation - used for SLA • Supports three arbitration schemes — Weighted Round Robin — Weighted Strict Priority — Combination of WSP and weighted Round Robin • On any given virtual link, minimum bandwidth allocation is 1% of the virtual link bandwidth
Bandwidth Limit: • Configurable bandwidth limit in range of 10 Gb/s - 1 Mb/s with increment of 1 Mb/s • Configurable maximum bandwidth accumulation with a maximum of 200%

Table 38-6. LAN Engine Features

Description
VSI Support For each of the 10 GbE controller's 384 allocated VSIs, the LAN engine allocates the following independent resources: • The LAN engine supports a total of 1536 LQPs — A PF VSI can allocate and use up to 1536 LQPs — A VF VSI can allocate and use up to 16 LQPs • Statistics: One set of IEEE Std 802.3 Clause 30 hardware statistics counters per VSI • TSO context: For each TQ, the LAN engine allocates storage for TSO context like TCP sequence numbers and other header fields changed by the TSO process. This enables each TQ to make independent progress on its TSO operations. • RSS: RSS logic (key and lookup table) is implemented per VSI enabling the PF as any guest operating system assigned to a VF or VMDq2 VSI use their own RSS logic. The following resources are notably not allocated per VSI: • Interrupts: Interrupt vectors are typically allocated per CPU core. Software controls how a single vector is shared amongst interrupt causes (like LAN queues). Typically sharing is limited to a small number of LAN queues to minimize polling performance loss.
Programming Interface. • LAN TQ descriptors: There are different LAN TQ descriptors that define: packet data, transmit context (such as TSO information), flow director filter programming. All TQ descriptors are 16 bytes. The packet data descriptor defines one fragment. If a packet or TSO is comprised of multiple fragments, packet data descriptors can be chained, up to a limit of eight per transmitted Ethernet packet (TSOs are allowed more). TQ completions are signaled either by descriptor writeback, or by updating a software head pointer in host memory. Software controls this signaling mechanism on a per-TQ basis. Software controls signaling frequency on a per-descriptor basis. • LAN RQ descriptors: Each LAN RQ descriptor defines up to two fragments, one for the packet, and one for the header (used when optional header splitting is enabled). For a given RQ, the fragment lengths are fixed and programmed into RQ context. Maximum size of the packet fragment is 16 KB and maximum size of the header fragment is 2 KB. A received packet is allowed to span multiple RQ descriptors, up to a limit of five. When the LAN engine has filled a LAN RQ descriptor, it writes completion status back to the descriptor. RQ descriptors can be configured per queue to be either 16 or 32 bytes in size, depending on the amount of completion status detail desired. • LAN Q properties (TQ and RQ): LAN Qs are mapped into host memory as physically contiguous ring buffers. Maximum LAN Q depth is configurable on a per-Q basis. Supported values range from 8 to 8 KB entries. Maximum LAN TQ size is 8 KB entries x 16 bytes = 128 KB. Maximum LAN RQ size is 8 KB entries x 32 bytes = 256 KB. Each LAN Q can be individually disabled.
Performance Optimizations (available to every VSI) • Packet checksum offloads: Calculates IP, UDP, TCP, and Stream Control Transmission Protocol (SCTP) checksums for insertion into transmitted packets and for integrity checking on received packets. Includes support for UDP and TCP checksums in both IPv4 and IPv6 datagrams. • TCP/UDP segmentation offload, also referred to Large Send Offload for transmitted IPv4 and IPv6 packets. The maximum size of a TSO operation is 256 KB. • Received packet header splitting. This feature enables a received packet's header to be placed in a different host buffer than the packet payload. Each RQ can be configured independently to perform header splitting at a specified header layer: none, IP, TCP, UDP, etc. • RSS: PF instances of the RSS logic implement 256 entry indirection tables, supporting up to 64 RQs/CPUs.VSI instances of the RSS logic implement 64 entry indirection tables, supporting up to 16 RQs/CPUs.
Intel Virtual Machine Device Queues Functionality VMDq defines the hardware offloads that support Virtual Bridges implemented in software (usually in a VMM). The 10 GbE controller supports both VMDq version 1 and version 2. • Some of the major features of VMDq version 1 — Layer 2 filters for sorting packets based on MAC address — Layer 2 filters for sorting packets based on VLAN tags — 1536 LAN QPs that can be flexibly allocated to the PFs for VMDq flows — Default queue mechanism for non-matching packets — MSI-X interrupt per queue • Some of the major features of VMDq version 2 — Internal switching from a TQ to a RQ — Broadcast and multicast replication — Ability to sort packets based on a combination VLAN tag and MAC address filter — Anti-spoofing transmit filters (VLAN and MAC) — Dedicated RSS logic assigned to the VMDq version 2 VSI
Preboot Execution Environment Supports the PXE remote boot standard. Also supports Internet Small Computer System Interface boot via expansion ROM firmware.
Flow director filters: 8 K perfect-match filters stored on-chip

Table 38-7. Protocol Engine iWARP RDMA Features (Sheet 1 of 3)

Category	Description
TCP offload	**IP version** Support IPv4 and IPv6 TCP-offloaded RDMA connections. Certain complex packet formats are not supported with RDMA (such as TCP-IPv6 tunneled with UDP-IPv4 using Teredo protocol).
TCP offload	**Maximum Segment Size** TCP-offloaded RDMA connections MSS: 9728 - Ethernet header/CRC - IP header - TCP header IPv4 MSS = 9728 - 18 - 20 - 20 = 9670 bytes IPv6 MSS = 9728 - 18 - 40 - 20 = 9650 bytes MSS can be further reduced by additional header fields such as TCP option(s), etc.
TCP offload	**ARP Table** Each PCI Function enabled to use the Protocol Engine implements an ARP Table with up to 65536 entries. Each entry contains a six byte Ethernet address, plus control/status information for neighbor reachability detection. For all RDMA connections, the ARP Table supplies a destination Ethernet address for transmitted packets.
TCP offload	**Receive Window Size** Each RDMA connection has a configurable Receive Window with maximum size of 1GB-1B.
TCP offload	**TCP Timestamp** The TCP Timestamp option is supported.
TCP offload	**IP Datagrams/Fragmentation** IP datagrams with IP fragmentation that are received on RDMA connections are forwarded to the Host CPU for reassembly. In most cases, the Host CPU will return reassembled packets to the 10 GbE controller for further TCP and RDMA processing.
general	**Non-permissive IETF RNIC** Using a term coined in the *Marker PDU Aligned Framing for TCP* specification, the device is a Non-permissive IETF RNIC (an RNIC that implements the IETF protocols but not the RDMAC protocols).
general	**PCI Functions enabled to use the Protocol Engine** All PCI Physical Functions, and up to 32 Virtual Functions can be enabled to use the Protocol Engine.
general	**Marker PDU Aligned Protocol Support** Supports insertion of Transmit markers MPA CRC checking on inbound packets can be enabled or disabled per QP. MPA CRC is always generated for outbound iWARP packets.
QP	**Maximum QP Count** The Protocol Engine supports up to 262144 QPs which are allocated to PFs and VFs as the 10 GbE controller initializes and drivers load, and are fixed after that.
QP	**Work Queue Elements** Protocol Engine uses a similar WQE format for SQs, RQs and RQs Each WQE can vary in size, with these options: 32B, 48B, 64B, 80B, 96B, 112B, 128B Fragments per WQE: one to seven, corresponding to above sizes Fragments are specified with virtual addresses and are virtually contiguous. The Protocol Engine performs virtual-to-physical translation using its built-in Memory Management Unit (MMU) SQ RDMA Reads are limited to a single fragment by the iWARP specification A SQ WQE can optionally directly convey 112B of inline data for small message latency optimization.
QP	**Work Queues** Protocol Engine WQs are mapped into host memory as ring buffers. The Protocol Engine allows a WQ/ring buffer to be either physically or virtually contiguous. A physically contiguous WQ/ring buffer is preferred for performance applications because it eliminates a Virtual-to-Physical address translation. Maximum WQ size is 16K entries x 32B = 512 KB. Maximum WQ depth is configurable on a per-WQ basis. Supported values range from 4 to 16K 32B WQEs, in power-of-two increments. Dynamic WQ resizing is not supported.

Table 38-7. Protocol Engine iWARP RDMA Features (Sheet 2 of 3)

Category	Description
QP	**SQ Operations** All RDMA operation types defined by the PostSQ verb are supported and implemented by on-chip logic: Send, Send with Solicited Event, Send with Invalidate, Send with Solicited Event and Invalidate RDMA Write RDMA Read RDMA Read with Invalidate Local STag Bind Memory Window Fast-Register Non-Shared Memory Region Invalidate Local STag Fencing Blocking transmission when ORD limit is reached
QP	**Number of RDMA Reads** The number of outstanding inbound RDMA Reads can be configured independently per QP. This configuration parameter is called *Inbound RDMA Read Queue Depth*. The Protocol Engine allows IRD settings of 2, 8, 32, or 64. The HMC manages the temporary storage for inbound RDMA Reads, which is allocated in Host Memory. The Protocol Engine does not support modifying a QP's IRD after the QP has been created. The number of outstanding outbound RDMA Reads can also be configured independently per QP. This configuration parameter is called *Outbound RDMA Read Queue Depth*. The Protocol Engine allows ORD settings from 0 to 127, in single-step increments. The Protocol Engine *does* support modifying a QP's ORD after the QP has been created, if the proper quiesce conditions are met.
QP	**Maximum iWARP message size supported** Tx RDMA Writes, Tx Sends, Rx RDMA Reads: 2GB - 1 byte (limited by TCP sequence space) Rx Sends, Rx RDMA Writes, Tx RDMA Reads: 4 GB - 1 byte (limited by iWARP specification)
QP	**Send Queue Push Mode** To fully optimize small message latency, the Protocol Engine supports *Send Queue Push Mode*. In this mode, the Host CPU writes or pushes SQ WQEs with up to 112 bytes of inline data to Protocol Engine memory-mapped address space using CPU write-combining buffers. This mode achieves lower latency than can be achieved with standard inline data, because it eliminates a Protocol Engine SQ WQE read from host memory.
CQ	**Completion Queues** The Protocol Engine supports up to 131072 CQs which are allocated to PFs and VFs as the 10 GbE controller initializes and drivers load, and are fixed after that. A CQ/ring buffer can be either virtually or physically contiguous. A physically contiguous CQ/ring buffer is preferred for performance applications because it eliminates a Virtual-to-Physical address translation. Each CQE is 32B, and can optionally be padded to 64B cache-line boundary to avoid memory conflicts. Max CQ size is 1M entries x 32B = 32 MB (or 64 MB if optional 64B CQE size is used) Supports user-defined mapping of WQs to CQs. Supports CQ resizing, CQ size can be increased or decreased while the CQ is active. Supports CQ overflow detection.
EQ	**Event Queues** The Protocol Engine implements 256 Completion Event Queues, allocated amongst the Protocol Engine enabled PCI functions. Each CEQ reports all the Completion Events for a configurable group of CQs, making it easy for software to determine which CQ has new CQEs. The Protocol Engine implements one Asynchronous Event Queue per Protocol Engine enabled PCI function (up to a maximum of 48 AEQs). Each AEQ reports status and errors associated with the Protocol Engine Queue Pairs, Completion Queues, and ARP Table Entries of it's PCI Function. Typically, each active CEQ and AEQ is configured with a dedicated MSI-X vector. Other configurations are supported (e.g., sharing an MSI-X vector amongst a CEQ and an AEQ).
MMU	Protection Domains Each PF or VF enabled to use the Protocol Engine can define up to 32768 Protection Domains
MMU	**Memory Regions and Windows** Each PF or VF enabled to use the Protocol Engine can allocate up to 4M (i.e., 2^{22}) Memory Regions or Memory Windows A single Memory Region or Memory Window can be up to 32TB in size.
MMU	**Host Memory page sizes** Host Memory page sizes supported: 4 KB, 2 MB Each Memory Region can be independently configured for either page size

Table 38-7. Protocol Engine iWARP RDMA Features (Sheet 3 of 3)

Category	Description
MMU	**Physical Buffer List (PBL)** The Protocol Engine allows each Memory Region to be Physically Mapped (i.e., the region is physically contiguous in Host Memory) or Virtually Mapped with a one- or two-level PBL. Each PF or VF enabled to use the Protocol Engine can allocate up to 256M (i.e., 2^{28}) PBL Entries. A single PBL Entry maps a single Host Memory page. The 10 GbE controller does not support Block Mode as defined in the *RDMA Protocol Verbs Specification*
MMU	**Maximum Virtually Mapped Memory** The maximum virtually mapped memory a single PF or VF can register with the Protocol Engine is implementation-limited to 2^{45} bytes = 32 TB. The maximum may be further reduced depending on host page sizes used. For example, if a PF or VF allocates it's maximum limit of 256M PBL Entries, then... ...its maximum virtually mapped memory using 100% 2 MB host memory pages is: MIN(2^{45}, 2^{21} x 2^{28}) = 2^{45} bytes = 32 TB ...its maximum virtually mapped memory using 100% 4 KB host memory pages is: MIN(2^{45}, 2^{12} x 2^{28}) = 2^{40} bytes = 1 TB

Table 38-8. Protocol Engine User Space Direct Access Features

Description
User Space Direct Access Definition UDA enables select IP packet streams to be delivered directly to/from user space applications (bypassing the OS) using RDMA-style host interfaces (QPs, CQ, etc). Host interface resources such as QPs are shared between RDMA and UDA consumers.
UDP Accelerations When multiple UDA consumers wish to receive the same UDP multicast stream, each can register its QP with the Protocol Engine to be members of a multicast group. The Protocol Engine will replicate received UDP multicast datagrams to the QPs in a matching multicast group. Each PF enabled to use the Protocol Engine can define up to 65536 multicast groups.

Table 38-9. Internal Switching Features (Sheet 1 of 2)

Description
VSI Support The 10 GbE controller supports a total of 384 VSIs. VSI assignment is flexible, but the choice to support 384 VSIs is motivated by the following usage example: • 256 VSIs for VFs or VMDq2 • 32 VSIs for PFs (16 for LAN + 16 for RDMA)   — 32 VSIs for VFs with RDMA • 24 control ports (16 for VEBs/VEPAs, 4 for Ethernet ports, 4 for S-comp/E-comp) • 16 mirror ports • Four for EMP • 20 extras

EVB and Bridge Port Extension Functionality
• Supports EVB as defined in the IEEE P802.1Qbg specification
• The 10 GbE controller supports up to four S-components or four eBridge port extenders (one per port), up to 512 S-tags, and up to 384 S-channels.
• The 10 GbE controller supports up to 16 internal VEBs or VEPAs.
• A single Ethernet port can connect up to 384 S-channels. Connecting to these S-channels can be VEBs, VEPAs, or port extenders. The 10 GbE controller must be configured for either VEPA or port extenders (both are not supported simultaneously). Given these rules, plus the global constraints described in the preceding bullets, a single Ethernet port can connect either:
  — Up to 16 VEBs or VEPAs. This case only requires up to 16 S-channels.
  — Up to 384 EBPs or VEBs. Of the 384, only up to 16 can be VEBs.
• Each VEB is compliant with the IEEE 802.1Q Ethernet VLAN-aware bridge specification.
• Supports MAC address forwarding table with 1536 entries.
• Supports MAC and VLAN address forwarding table with 2048 pairs.
• Supports VLAN insertion and removal for up to 256 VLAN tags located anywhere in the 4K VLAN space.
• Supports Private VLANs.
• Supports port mirroring.
• Each VSI can be programmed for promiscuous reception of unicast, broadcast and multicast packets.

Table 38-9. Internal Switching Features (Sheet 2 of 2)

Description
Internal switching operates independently of the state of the LAN ports (also when LAN ports are down).

Table 38-10. System Manageability Features

Description
Sideband Interfaces for connection to an external BMC • SMBus operating at up to 1 Mb/s • DMTF-compliant NC-SI Interface at 100 Mb/s • PCIe (together with MCTP)
Sophisticated filters to select received packet flows for delivery or mirroring to the BMC. Each of the following filters is instantiated per-Ethernet port: • Four MAC filters • Eight VLAN filters • Four ether-type filters • Four to seven IPv4/IPv6 filters • 16 UDP/TCP port filters • One Flexible Total Cost of Ownership filter • Address Resolution Protocol filtering • Neighbor discovery filtering • Remote Management Control Protocol filtering • Internet Control Message Protocol filtering
Ability to internally switch packets for communication between an OS and BMC.
Statistics For each Ethernet port, the 10 GbE controller implements the statistics defined in the following standards: • IEEE Std 802.3 Clause 30 • RFC 2819 - RMON Ethernet statistics group For each VSI, the 10 GbE controller implements the statistics defined in the following standard: IEEE Std 802.3 Clause 30. For each VSI enabled to use the Protocol Engine, the 10 GbE controller silicon implements these additional statistics: • RFC4293: Objects for managing implementations of IP • RFC4022: Objects for managing implementations of TCP RFC4113: Objects for managing implementations of UDP

Table 38-11. Power Management Features

Description
Supports the PCIe power management features defined in the “Power Management” entry in Table 38-2.
Energy Efficient Ethernet Provides the MAC support for Energy Efficient Ethernet as defined in the IEEE P802.3az specification.
Low Power Link Up In a backplane Ethernet environment, when the 10 GbE controller is entering a low power state like $D3_{COLD}$, the 10 GbE controller’s Low Power Link Up logic attempts to re-auto-negotiate its backplane Ethernet ports to their lowest possible link speed.
Advanced Power Management Wake Up Supports APM wake upper-PF: • Magic packet filter. When a magic packet arrives, and if the Magic packet filter is enabled, this can trigger a wake up.

Table 38-12. General Features

Description
Serial Flash Interface (shared SPI interface with other IPs in the 10 GbE controller)
Configurable LED operation for software or Original Equipment Manufacturer customization of LED displays. Default Configuration by Non-volatile Memory for all LEDs for pre-driver functionality
Device disable capability
Watchdog timer
Time Sync (IEEE 1588)
Firmware and Expansion ROM Management • All firmware and expansion ROM code is stored in flash memory and is field upgradeable • Supports field upgrades via host software utility or BMC program • Supports independent update of these objects: EMP firmware and, Protocol Engine RDMA firmware, Expansion ROM code. • Supports secure authentication of these objects during an update procedure: EMP firmware, Expansion ROM code and Protocol Engine RDMA firmware.These objects are protected with a digital signature produced using SHA256 hash and 2048b RSA encryption. • The firmware and expansion ROM field upgrade procedure can be carried out while the 10 GbE controller is in normal operation. The 10 GbE controller does not load and use the new content until a reset occurs. • Failure of the firmware or expansion ROM field upgrade procedure (due to interrupting of Flash programming, or authentication failure) never prevents a reattempt of the field upgrade procedure. Normally the 10 GbE controller reverts to the previously saved firmware or expansion ROM content when a field upgrade fails.
SDPs and support interfaces: • There are 8 SDPs, 8 LEDs, MDIO and I^2C. • SDPs are typically used to exchange information with or to control external devices (such as PHY devices) under the 10 GbE controller software driver control. • Each SDP can be configured as an input, output, or interrupt source.
Device / Port / PCI Function Disable The 10 GbE controller implements two strapping pins that, together with NVM settings, enable the entire 10 GbE Ethernet Controller, or selected Ethernet ports and their associated PCI functions or selected PCI functions to be disabled. Disabling occurs before PCI enumeration, so the disabled resources are completely hidden.

38.8.1 Numbers And Number Bases

Hexadecimal numbers are written with a 0x prefix (like 0xFFFF or 0x1234ABDF). Binary numbers are written with a lowercase b suffix (like 1001b or 10b).

38.8.2 Byte Ordering

This section defines the internal organization of registers and memory structures that span multiple bytes. A few conventions to start with are:

1. Network Order - Ethernet always transmits multiple-bytes fields with the Most Significant (MS) byte first
2. Endian notation - defines how a logical entity (such as a MAC address) is stored in a given structure (like register or descriptor). Two options exist:
   a. Little Endian notation — The MS byte of the logical entity is mapped to the highest byte address of the structure
   b. Big Endian notation — The MS byte of the logical entity is mapped to the lowest byte address of the structure

A few examples follow:

Example 1: A 32-bit counter is equal to 0x01234567 (such as the sequence number in the TCP header). The counter is transferred on the wire as: 01 23 45 67 where 01 is the first byte on the wire and 67 is the last byte.

LE registers store this counter as (in bytes) as follows:

0x01 - highest byte address

0x23

0x45

0x67 - lower byte address

BE registers store this counter as (in bytes) as follows:

0x67 - highest byte address

0x45

0x23

0x01 - lower byte address

Example 2: An L2 type register that holds the value of IPv4 header is equal to 0x0800. The field is transferred on the wire as: 08 00 where 08 is the first byte on the wire.

LE registers store this counter as (in bytes) as follows:

0x08 - highest byte address

0x00 - lower byte address

BE registers store this counter as (in bytes) as follows:

0x00 - highest byte address

0x08 - lower byte address

Example 3: A 48-bit Ethernet MAC address equals to 0x00112348A9BE. The Ethernet MAC address is transferred on the wire as: 00 11 23 48 A9 BE where 00 is the first byte on the wire.

LE registers store this counter as (in bytes) as follows:

0x00 - highest byte address

0x11

0x23

0x48

0xA9

0xBE - lower byte address

BE registers store this counter as (in bytes) as follows:

0xBE - highest byte address

0xA9

0x48

0x23

0x11

0x00 - lower byte address

The following rules determine the Endian-ness of the 10 GbE controller structures:

- The general rule is that all structures are defined in LE notation unless defined otherwise. These structures include:
  - Registers
  - AQ commands
  - Structures in host memory (including any type of descriptors)
  - NVM
  - LAN and PE contexts
- The following structures are in BE notation:
  - Host memory buffers that are received or transmitted
  - Any structures that contains a MAC address (see exception for field vector)
  - Quad hash context programming registers (GL_SWT_LOFV_PE, GL_SWT_LOFV_SW and EMP_SWT_LOFV) are each defined in LE, while register 'n' is mapped to words (63 - 2*'n') and (62 - 2 *'n') in the field vector
  - IP addresses in Protocol Engine host memory
- The following structures have a mixed notation:
  - Field vector is presented in mixed BE/LE notation: words are ordered in BE notation and bytes within the words are presented in LE notation.
  - Type-length-value structures are stored in the NVM in mixed BE/LE notation: words are ordered in BE notation and bytes within the words are presented in LE notation.

38.9 Overview Of Standards

Table 38-13 lists standards relevant to the 10 GbE controller.

Table 38-13. Standards Supported By the 10 GbE controller (Sheet 1 of 6)

Category	Description
base	Title: Computing the Internet Checksum Document: http://www.ietf.org/rfc/rfc1071.txt Description: This RFC describes how to compute the Internet checksums used in IP, TCP and UDP.
base	Title: A TCP/IP Tutorial Document: http://www.ietf.org/rfc/rfc1180.txt Description: Bare bones tutorial of TCP/IP protocol suite: ARP, IP and TCP and Upper Layer Protocols (ULPs). This is included for informative purposes only.
base	Title: Implementing the Internet Checksum in Hardware. Document: http: //www.ietf.org/rfc/rfc1936.txt Description: Techniques for efficiently implementing the Internet checksum in hardware.
Ethernet	Title: "Carrier Sense Multiple Access with Collision Detection (CSMA/CD) Access Method and Physical Layer Specifications" (IEEE Std 802.3-2012) Document: available from standards.ieee.org/getieee802 Description: Specifies the Ethernet MAC and PHY layers up to 100 Gb/s. Includes these now superseded docs (among many others): 802.3ae (10 Gb/s base specification), 802.3an (10GBASE-T), 802.3ap (backplane Ethernet, KX and KR), etc.
Ethernet	Title: "Part 3: Carrier Sense Multiple Access with Collision Detection (CSMA/CD) Access Method and Physical Layer Specifications – Amendment 8: MAC Control Frame for Priority-based Flow Control" (IEEE P802.3bd-2011) Document: available from standards.ieee.org/getieee802 Description: Defines a MAC control frame to support 802.1Qbb priority-based flow control.

Table 38-13. Standards Supported By the 10 GbE controller (Sheet 2 of 6)

Category	Description
Ethernet	Title: "IEEE Standard for Local and Metropolitan Area Networks – Media access control (MAC) Bridges" (IEEE Std 802.1D-2004) Document: available from standards.ieee.org/getieee802 Description: Base specification for Ethernet bridging.
Ethernet	Title: "IEEE Standards for Local and Metropolitan Area Networks - Media Access Control (MAC) Bridges and Virtual Bridged Local Area Networks" (IEEE Std 802.1Q-2011) Document: available from standards.ieee.org/getieee802 Description: Ethernet VLAN-aware bridge specification.
Ethernet	Title: "IEEE Standard for Local and metropolitan area networks— Link Aggregation" (IEEE Std 802.1AX-2008) Document: available from standards.ieee.org/getieee802 Description: Logic and protocols that enable aggregation of one or more Ethernet links into a single logical link. Until recently, link aggregation was defined in the 802.3 specification, but in the 2008 version it was moved to 802.1.
Ethernet	Title: "Media Access Control (MAC) Bridges and Virtual Bridged Local Area Networks — Amendment17: Priority-based Flow Control" (IEEE P802.1Qbb-2011) Document: available from standards.ieee.org/getieee802 Description: Priority-based Flow Control (PFC) is one of the specifications that comprise DCB. PFC enables flow control per TC on IEEE 802 point-to-point full duplex links. This is achieved by a mechanism similar to the IEEE 802.3 Annex 31B PAUSE, but operating on individual priorities.
Ethernet	Title: "Virtual Bridged Local Area Networks — Amendment 18: Enhanced Transmission Selection for Bandwidth Sharing Between Traffic Classes" (IEEE P802.1Qaz-2011) Document: available from standards.ieee.org/getieee802 Description: ETS is one of the specifications that comprise DCB. ETS enables arbitration of bandwidth between TCs. This specification also defines Data Center Bridging Exchange (DCBX) protocol. DCBX enables configuration of DCB features onto an Ethernet LAN.
Ethernet	Title: "Media Access Control (MAC) Bridges and Virtual Bridged Local Area Networks — Amendment 21: Edge Virtual Bridging" (IEEE P802.1Qbg-2012) Document: available from standards.ieee.org/getieee802 Description: EVB is one of the specifications that comprise DCB. EVB defines many of the virtual switching features on end stations like the 10 GbE controller. This includes definition of things like S-channels, which enable the multiplexing of multiple virtual channels on a single physical LAN, VSIs, VEBs, VEPAs, etc. It also defines new management infrastructure for administering the new features.
Ethernet	Title: "Virtual Bridged Local Area Networks — Bridge Port Extension" (IEEE P802.1BR/D3.3) Document: available from standards.ieee.org/getieee802 Description: BPE is a dedicated specification describing the bridge port extender element. It specifies the use of E-channels and a multicast replication service to extend bridge ports across multiple physical or virtual devices.
Ethernet	Title: "IEEE Standard for Local and metropolitan area networks— Station and Media Access Control Connectivity Discovery" (IEEE Std 802.1AB-2009) Document: available from standards.ieee.org/getieee802 Description: Defines Link Layer Discovery Protocol (LLDP) that enables a server to advertise it's identity, capabilities, and interconnections to other entities on an Ethernet fabric.
Ethernet	Title: "IEEE Standard for a Precision Clock Synchronization Protocol for Networked Measurement and Control Systems" (IEEE Std 1588-2008) Document: available from standards.ieee.org Description: Defines a protocol that enables precise synchronization of clocks in systems communicating via packet networks.
Ethernet	Title: "SFF-8436 Specification for QSFP+ Copper and Optical Modules, rev 3.1, 4/22/2009" Document: ftp://ftp.seagate.com/pub/sff/SFF-8436.PDF (see www.sffcommittee.com) Description: Defines the Quad Small Form Factor Pluggable (QSFP+) module mechanicals, electrical interface and pinout, etc.
Ethernet	Title: "SFF-8431 Specifications for Enhanced Small Form Factor Pluggable Module SFP+, rev 4.1, 7/6/2009" Document: ftp://ftp.seagate.com/sff/SFF-8431.PDF (or see www.sffcommittee.com) Description: Defines the SerDes Framer Interface (SFI) high speed electrical interface to a Small Form-factor Pluggable (SFP+) optical module. Also defines the SFP+ management interface.

Table 38-13. Standards Supported By the 10 GbE controller (Sheet 3 of 6)

Category	Description
Ethernet	Title: RMII Specification, rev 1.2, 3/20/1998 Description: Reduced pin count interface used in place of IEEE standard Media Independent Interface (MII). The 10 GbE controller has an Reduced Media Independent Interface (RMII) interface for its NC-SI connection.
Ethernet	Title: Ethernet Alliance, Ethernet Jumbo Frames, ver 0.3, 11/17/2009 Document: EA-Ethernet Jumbo Frames v0 3.pdf Title: Extended Frame Sizes for Next Generation Ethernets Document: AlteonExtendedFrames_W0601.pdf Title: Extended Ethernet Frame Size Support Document: draft-kaplan-isis-ext-eth-02.txt Description: Documents describing jumbo frames. Included for informative purposes only.
test	Title: IEEE Standard Test Access Port and Boundary-Scan Architecture (IEEE Std 1149.1-2001) Document: available from standards.ieee.org Description: Defines a standard interface through which instructions and test data are communicated to an integrated circuit for component- and circuit board-level testing.
Ethernet/ IP	Title: Standard for the Transmission of IP Datagrams over Ethernet Networks Document: http://www.ietf.org/rfc/rfc894.txt Description: This specifies the method for transmitting IP datagrams over Ethernet.
Ethernet/ IP	Title: Standard for the Transmission of IP Datagrams over IEEE 802 Networks Document: http://www.ietf.org/rfc/rfc1042.txt Description: This specifies the method for transmitting IP datagrams over IEEE 802.3 networks.
iARP	Title: Address Resolution Protocol (ARP) Document: http://www.ietf.org/rfc/rfc0826.txt Description: Protocol to convert IP addresses to Ethernet addresses
IP	Title: Internet Protocol Document: http://www.ietf.org/rfc/rfc0791.txt Description: Base specification for IPv4.
IP	Title: Internet Protocol, Version 6 Document: http://www.ietf.org/rfc/rfc2460.txt Description: Base specification for IPv6.
IP	Title: Neighbor Discovery for IP version 6 (IPv6) Document: http://www.ietf.org/rfc/rfc4861.txt Description: IPv6 nodes use neighbor discovery to discover each other's presence, to determine each other's link-layer addresses, to find routers, and to maintain reachability information. This is an important standard for power management.
IP	Title: TCP Processing of the IPv4 Precedence Field Document: http: //www.ietf.org/rfc/rfc2873.txt Description: Corrects a conflict between TCP as defined in RFC793 and DiffServ in handling of the IPv4 precedence field.
TCP	Title: Transmission Control Protocol Document: http://www.ietf.org/rfc/rfc0793.txt Description: Base specification for TCP.
TCP	Title: Window and Acknowledgment Strategy in TCP Document: http://www.ietf.org/rfc/rfc813.txt
TCP	Title: Congestion Control in IP/TCP Internet works Document: http://www.ietf.org/rfc/rfc896.txt Description: Defines the Nagle algorithm, which specifies delaying transmission of small amounts of data when there are Acknowledgments (ACKs) outstanding.
TCP	Title: TCP Extensions for High Performance Document: http://www.ietf.org/rfc/rfc1323.txt Description: Defines the TCP window scale and timestamp options, Round Trip Time Measurement (RTTM) and Protect Against Wrapped Sequences (PAWS).

Table 38-13. Standards Supported By the 10 GbE controller (Sheet 4 of 6)

Category	Description
TCP	Title: Known TCP Implementation Problems Document: http://www.ietf.org/rfc/rfc2525.txt Description: This RFC describes implementation issues with various historical TCP/IP stacks. While it is included here for informative purposes only, it does serve as a good check list to avoid known problems. The 10 GbE controller Protocol Engine is designed to support its recommendations.
TCP	Title: TCP Congestion Control Document: http://www.ietf.org/rfc/rfc5681.txt Description: TCP slow start, congestion avoidance, fast retransmit, and fast recovery algorithms.
TCP	Title: The NewReno Modification to TCP's Fast Recovery Algorithm Document: http://www.ietf.org/rfc/rfc3782.txt Description: Update the fast recovery algorithm that is run after three duplicate ACKs have been received. Changes to the CWND during fast recovery, scheduling additional fast retransmitted packets if the received ACKs do not acknowledge all the data when fast recovery was entered.
TCP	Title: TCP Problems with Path MTU Discovery Document: http://www.ietf.org/rfc/rfc2923.txt Description: Discusses problems with existing RFC 1191 implementations that should be avoided. Serves as an implementation checklist.
TCP	Title: Computing TCP's Retransmission Timer Document: http://www.ietf.org/rfc/rfc2988.txt Description: Defines the standard algorithm that TCP senders are required to use to compute and manage their retransmission timer.
TCP	Title: Increasing TCP's Initial Window Document: http://www.ietf.org/rfc/rfc3390.txt Description: Specifies an optional standard for TCP to increase the permitted initial window from one or two segments to roughly 4KB.
TCP	Title: TCP Congestion Control with Appropriate Byte Counting (ABC) Document: http://www.ietf.org/rfc/rfc3465.txt Description: This experimental RFC defines a small modification to the way TCP increases its congestion window. Instead of increasing cwnd by a constant amount for each acknowledgment, cwnd is increased based on the number of previously unacknowledged bytes each ACK covers.
UDP	Title: User Datagram Protocol Document: http://www.ietf.org/rfc/rfc0768.txt Description: Base specification for UDP.
Tunneling	Title: NVGRE: Network Virtualization using Generic Routing Encapsulation Document: http://datatracker.ietf.org/doc/draft-sridharan-virtualization-nvgre/?include_text=1 Description: MAC in Generic Routing Encapsulation (GRE) over IP encapsulation
Tunneling	Title: VXLAN: A Framework for Overlaying Virtualized Layer 2 Networks over Layer 3 Networks Document: http://datatracker.ietf.org/doc/draft-mahalingam-dutt-dcops-vxlan/?include_text=1 Description: MAC in UDP encapsulation
Storage	Title: SCSI Block Commands - 3 (SBC-3), 11/25/2009, T10/1799-D Document: drafts available from http://www.t10.org/ Description: Defines the SCSI Block Commands - 3 (SBC-3) command set, which maintains a high degree of compatibility with the SBC-2 command set, INCITS 405-2005. Of particular interest to the 10 GbE controller, SBC-3 defines protection information (also known as *Data Integrity Field* or DIF), an industry standard for data integrity that protects data between a block storage initiator and the storage device.
RDMA	Title: Marker PDU Aligned Framing for TCP Specification Document: http://www.ietf.org/rfc/rfc5044.txt Description: LLP is TCP, ULP is DDP. MPA is a framing protocol that enables the preservation of ULP record boundaries.
RDMA	Title: Direct Data Placement over Reliable Transports Document: http://www.ietf.org/rfc/rfc5041.txt Description: LLP is MPA, ULP is RDMAP. DDP protocol provides information to place incoming data directly into a ULP receive buffer without intermediate buffers.
RDMA	Title: A Remote Direct Memory Access Protocol Specification Document: http://www.ietf.org/rfc/rfc5040.txt Description: LLP is DDP, connects directly to the Host CPU/OS via the 10 GbE controller System Interface.

Table 38-13. Standards Supported By the 10 GbE controller (Sheet 5 of 6)

Category	Description
RDMA	Title: RDMA Protocol Verbs Specification, v1.0, April 2003 Document: rdmaconsortium.org/home/draft-hilland-iwarp-verbs-v1.0-RDMAC.pdf Description: Verbs describe the Host application/OS interface to an RNIC. This interface is implemented as a combination of the RNIC system interface, its associated firmware, and host software. It provides access to the RNIC queuing and memory management resources, as well as the underlying networking layers.
Mgmt	Title: System Management Bus (SMBus) Specification, v3.0, 12/20/2014 Document: http://www.smbus.org/specs/SMBus_3_0_20141220.pdf Description: A two-wire interface for communication of management information, based on the principles of operation of I^2C.
Mgmt	Title: Network Controller Sideband Interface (NC-SI) Specification, v1.0.1, 1/10/2013 Document: dmtf.org/sites/default/files/standards/documents/DSP0222_1.0.pdf Description: Standardizes the sideband communication interface between a NIC (the 10 GbE controller) and a BMC.

PCI-IOV	Title: Single Root I/O Virtualization and Sharing Specification, rev 1.1, 1/20/2010 Document: available from www.pcisig.com Description: The SR-IOV specification defines extensions to the PCIe specification that enable the VMs in a virtualized server to efficiently share PCI adapter hardware resources.
software	Title: Microsoft specification for “Receive Side Scaling” (RSS) from MSDN. Document: msdn.microsoft.com/en-us/library/ff567236%28v=VS.85%29.aspx Description: RSS is a network driver technology that enables the efficient distribution of network receive processing across multiple CPUs in multiprocessor systems.

38.10 PCI-Express (PCIe)

38.10.1 Requirements

The 10 GbE controller supports Rev. 3.0 of the PCIe base specification.

In addition to the capabilities required by the PCIe specifications, the 10 GbE controller also supports the following optional functionality as described in this section:

- All PCI functions are native PCIe functions
- Transaction layer mechanisms
  - 64-bit and 32-bit memory address spaces
  - Removal of I/O BAR (optional)
  - Relaxed ordering
  - Flow control update timeout mechanism

  - ID-based ordering (IDO)
  - Packet sizes: Maximum payload size: 2 KB, Maximum read request size: 4 KB
  - Extended tags
  - Function-Level Reset (FLR)
  - TLP Processing Hints (TPH)
- Reliability
  - Advanced Error Reporting (AER)
  - End-to-End CRC (ECRC) generation and checking
  - Recovery from data poisoning
  - Completion timeout
- Power management:
  - Active state power management (L0s and L1 states)
  - Wake capability
- DFT and DFM support for high-volume manufacturing
- The 10 GbE controller supports the following extended capabilities:
  - AER
  - Device Serial Number (DSN)
  - Alternative RID Interpretation (ARI)
  - Single Root I/O Virtualization (SR-IOV)
  - TPH Requester
  - Access Control Services (ACS)

38.10.2 Transaction Layer

38.10.2.1 Size Of Target Accesses

38.10.2.1.1 Memory Accesses

Rules for accesses to the CSR space (both memory BAR and MSI-X BAR):

- Write accesses:
  - CSR writes are 32 bit or 64 bit only
  - Zero-length writes have no internal impact (nothing written, no effect such as clear-by-write). The transaction is treated as a successful operation (no error event)
  - Other accesses (partial writes, larger writes) are handled as completer abort - data is dropped and an error is generated per PCIe rules
- Read accesses:
  - CSR reads are 32 bit or 64 bit only
    - Some 64-bit reads are handled atomically such as not interleaved with any other read requests. This applies mainly to reading counters, where all 64 bits need to be read simultaneously. Such registers are explicitly marked in their description.
  - Partial reads with at least one byte disabled are handled internally as a full read. That is, any side effect of the full read (such as clear by read) is also applicable to partial reads. The completion on PCIe adheres to the specification rules regarding the number of bytes reported in the completion.

  - Zero-length reads generate a completion, but the register is not accessed and undefined data is returned
  - Larger CSR read requests are handled as completer abort - the completion includes a CA status and an error is generated per PCIe rules

Rules for accessing the doorbell space in the memory BAR:

- Write accesses:
  - Write accesses are supported within the limit of the respective PCIe credits
  - A write access that crosses over into the Flash address space is handled as a completer abort
  - Zero-length writes have no internal impact (nothing written, no effect such as clear-by-write). The transaction is treated as a successful operation (no error event)
- Read accesses:
  - Read accesses are replied with stale data. No error indication is provided

Rules for accessing the Flash space in the memory BAR or the expansion ROM BAR:

- Write accesses:
  - Writes to Flash are 8-bit wide only
  - Any larger write accesses are handled as completer abort - data is dropped and an error is generated per PCIe rules
- Read accesses:
  - Reads to Flash are 32-bit wide
  - Partial reads with at least one byte disabled are handled internally as a full read. That is, any side effect of the full read (such as clear by read) is also applicable to partial reads. The completion on PCIe adheres to the specification rules regarding the number of bytes reported in the completion
  - Zero-length reads generate a completion, but the Flash is not accessed and undefined data is returned
  - Larger CSR read requests are handled as completer abort - the completion includes a CA status and an error is generated per PCIe rules

38.10.2.2 I/O Accesses

Rules for accesses to the I/O BAR:

- Write accesses:
  - Write accesses are 32-bit wide
  - Zero-length writes have no internal impact (nothing written, no effect such as clear-by-write). The transaction is treated as a successful operation (no error event)
  - Other accesses (partial writes, larger writes) are handled as completer abort - data is dropped and an error is generated per PCIe rules
- Read accesses:
  - Reads to the I/O BAR are 32-bit wide
  - Partial reads with at least one byte disabled are handled internally as a full read. That is, any side effect of the full read (such as clear by read) is also applicable to partial reads. The completion on PCIe adheres to the specification rules regarding the number of bytes reported in the completion

— Larger CSR read requests are handled as completer abort - the completion includes a CA status and an error is generated per PCIe rules

38.10.2.2.1 Messages

MCTP messages might contain a payload of up to 64 bytes.

38.10.2.2.2 Support For Dynamic Changes

The 10 GbE controller captures the bus number and device number per each configuration write request. However, a dynamic change of the bus number or device number is not supported. Rather, the PCIe link should be quiescent prior to such a change, including reception of all completion for previous requests.

38.10.2.3 Transactions Initiated By the 10 GbE controller

Note: If Extended tags are not enabled, the performance of the device may degrade. In order to ensure usage of extended tags, all functions must enable them in the Extended Tag field Enable field.

38.10.2.3.1 Data Alignment

Requests must never specify an address/length combination that causes a memory space access to cross a 4 KB boundary. The 10 GbE controller therefore breaks requests into 4 KB-aligned requests (if needed). This does not pose any requirement on software. However, if software allocates a buffer across a 4 KB boundary, hardware issues multiple requests for the buffer. Software should consider aligning buffers to a 4 KB boundary in cases where it improves performance.

The general rules for packet alignment are as follows. Note that these apply to all 10 GbE Controller requests:

- The length of a single request does not exceed the PCIe limit of MAX_PAYLOAD_SIZE for write and MAX_READ_REQUEST_SIZE for read.
- A single request does not span across different memory pages as noted by the 4 KB boundary alignment previously mentioned.

If a request can be sent as a single PCIe packet and still meets the general rules for packet alignment, then it is not broken at the cache line boundary but rather sent as a single packet. However, if any of the general rules require that the request is broken into two or more packets, then the request is broken at the cache line boundary.

For requests with data payload, if the payload size is larger than (MAX_PAYLOAD_SIZE - CACHELINE_SIZE), then the request is broken into multiple TLPs staring at the first cache-line boundary following the (MAX_PAYLOAD_SIZE - CACHELINE_SIZE) bytes. For example, if MAX_PAYLOAD_SIZE = 256B and CACHELINE_SIZE = 64 bytes, a 1 KB request starting at address 0x...10 is broken into TLPs such that the first TLP contains 240bytes of payload (since 240bytes + 0x10 = 256bytes is on the cache-line boundary).

The system cache line size is controlled by the GLPCI_CNF2.CACHELINE_SIZE bit, loaded from the NVM Cache Line Size field. Note that the Cache Line Size register in the PCI configuration space is not related to the GLPCI_CNF2.CACHELINE_SIZE and is solely for software use.

38.10.2.4 Messages

Table 38-14 lists the response to messages sent to the device. Unlisted messages are not supported by the device and are treated as an unsupported request.

Table 38-14. Messages In the 10 GbE controller (As a Receiver)

Message Code [7:0]	Routing r2r1r0	Message	10 GbE Controller Response
0x00	011b	Unlock	Silently drop.
0x40 0x41 0x43 0x44 0x45 0x47 0x48	100b	Ignored messages (used to be hot-plug messages)	Silently drop.
0x50	100b	Slot power limit support (has one Dword data)	Silently drop.
0x7E	000b 010b 011b 100b	Vendor_defined type 0	Drop and handle as an unsupported request.
0x7F	100b	Vendor_defined type 1	Silently drop.
0x7F	000b 010b 011b	Vendor_defined type 1 See Section 38.10.2.4.1	Send to MCTP reassembly if Vendor ID = 0x1AB4 (DMTF) and VDM code - 0000b (MCTP). Otherwise, silently drop.

Table 38-15 lists the messages sent by the device.

Table 38-15. Messages In the 10 GbE controller (As a Transmitter)

Message code [7:0]	Routing r2r1r0	Message
0x7F	000b 010b 011b	Vendor Defined Messages (VDM). See Section 38.10.2.4.1.

38.10.2.4.1 VDM

The following vendor defined message is supported: DMTF MCTP.

MCTP VDMs

MCTP VDMs are supported as both master and target. The following header fields are involved:

- Fmt - Set to 11b to indicate a 4-Dword header with data
- Type:
  - [4:3] - Set to 10b to indicate a message
  - [2:0] - Routing r2r1r0 = 000b, 010b or 011b
- Traffic Class - Set to 000b
- TLP Digest - Set to 0b (no ECRC)
- Error Present - Set to 0b
- Attributes[1:0] - Set to 01b (no snoop)

- Tag field - Indicates this is an MCTP packet and the size of padding to Dword alignment added
- Message code = 0x7F (Type 1 VDM)
- Destination ID - captures the target B/D/F for route by ID. Otherwise, reserved
- Vendor ID = 0x1AB4 (DMTF)

38.10.2.5 Transaction Attributes

Figure 38-4. Traffic Class (TC) and Virtual Channels (VC)

The 10 GbE controller only supports TC = 0b and VC = 0b (default).

38.10.2.5.1 TLP Processing Hints (TPH)

The 10 GbE controller supports the TPH capability defined in the PCI Express specification. It does not support extended TPH requests.

Existence of a TLP Process Hint (TPH) is indicated on the PCIe link by setting the TH bit in the TLP header. Using the PCIe TLP Steering Tag (ST) and Processing Hints (PH) fields, the 10 GbE controller can provide hints to the root complex about the destination (socket ID) and about data access patterns (locality in cache) when executing DMA memory writes or read operations.

The 10 GbE controller exposes a PCIe TPH capability structure with no steering table.

Required steps to enable TPH usage:

1. For a given function, the "*TPH Requester Enable"* field in the PCIe configuration *TPH Requester Control register* should be set to either 01b or 11b and the "ST Mode Select" field should be set to one of the two supported values: 000b (No Table Mode) or 010b (Device Specific Mode). If this is not the case, *the PF driver should not enable the TPH in the transmit and receive queue contexts*.
2. Appropriate TPH enable bits in the receive or transmit queue context should be set.
3. Processing hints should be programmed in the *GLTPH_CTRL.Desc_PH* and *GLTPH_CTRL.Data_PH* Processing Hints (PH) fields.
4. Steering information should be programed in the CPUID fields in the receive or transmit queue context.

Note: In order to enable TPH usage, all the memory reads are done without setting any of the byte enable bits.

Steering tag and processing hint programming

Each type of DMA traffic uses a different policy to define how the steering tag (socket ID) and processing hints are generated:

- The policy for LAN traffic.
- The policy for offloaded traffic.
- Accesses to the host memory cache do not use TPH hints.
- Accesses to the admin command queues do not use TPH hints.

38.10.2.6 Device Ordering Rules

The 10 GbE controller meets the PCIe ordering rules as follows:

Deadlock avoidance – The 10 GbE controller meets the PCIe ordering rules that prevent deadlocks:

1. Posted writes overtake stalled read requests. This applies to both target and master directions. For example, if master read requests are stalled due to lack of credits, master posted writes are allowed to proceed. On the target side, it is acceptable to timeout on stalled read requests in order to allow later posted writes to proceed.
2. Target posted writes overtake stalled target configuration writes.
3. Completions overtake stalled read requests. This applies to both target and master directions. For example, if master read requests are stalled due to lack of credits, completions generated by the 10 GbE controller are allowed to proceed.

Consistency of data:

1. Descriptor/Data Ordering — The 10 GbE controller insures that a Rx descriptor is written back on PCIe only after the data that the descriptor relates to is written to the PCIe link.
2. Target NP read requests might pass target posted writes addressing different PCI functions.
3. Completions for target reads (memory, I/O, configuration) do not pass previous posted requests. Here are some specific usages of this rule:
   — Flush following a reset (such as FLR, BME, D3 entry, VFE clear) - When the system issues a reset event, it needs to identify when the device stops sending new posted requests from the function(s) under reset. The completion to the config write of these reset events will be sent after all requests/completions related to that function(s) are flushed out. The device is expected not to issue any new posted transactions from the function(s) under reset.
   — MSI and MSI-X Ordering Rules – System software can change the MSI or MSI-X tables during run-time. Software expects that interrupt messages issued after the table has been updated are using the updated contents of the tables.
      - Since software does not know when the tables are actually updated in the 10 GbE controller, a common scheme is to issue a read request to the MSI or MSI-X table after an update to the table (a PCI configuration read for MSI and a memory read for MSI-X). Software expects that any message issued following the completion of the read request, is using the updated contents of the tables.
      - Once an MSI or MSI-X message is issued using the updated contents of the interrupt tables, any consecutive MSI or MSI-X message does not use the contents of the tables prior to the change.

Independence between target and master accesses:

1. The acceptance of a target posted request does not depend upon the transmission of any TLP.
2. The acceptance of a target non-posted request does not depend upon the transmission of a non-posted request.
3. Accepting a completion does not depend upon the transmission of any TLP.

38.10.2.6.1 Processing Of Target Accesses

The 10 GbE controller meets the specification requirements regarding target accesses as described in the previous section.

In addition, the following behaviors apply:

- Target accesses from different functions might be processed in a different order than the order they arrive
- Completions that belong to requests from different PCI functions might be issued in a different order than the order of the respective requests.

38.10.2.6.2 Relaxed Ordering

The 10 GbE controller takes advantage of the relaxed ordering rules in PCIe. By setting the relaxed ordering bit in the packet header, the 10 GbE controller enables the system to optimize performance in the following cases:

1. Relaxed ordering for LAN descriptor and data reads — When the 10 GbE controller issues a read transaction, its split completion has no ordering relationship with the writes from the CPUs (same direction). It should be allowed to bypass the writes from the CPUs.
   - The *GLLAN_RCTL.RXDESCRDROEN* bit (loaded from NVM) enables relaxed ordering for Rx descriptor reads.
   - The *GLLAN_TCTL.TXDESCRDROEN* bit (loaded from NVM) enables relaxed ordering for Tx descriptor reads.
   - The *GLLAN_TCTL.TXDATARDROEN* bit (loaded from NVM) enables relaxed ordering for Tx data reads.
2. Relaxed ordering for LAN Rx data writes — When the 10 GbE controller issues Rx data writes, it also enables them to bypass each other in the path to system memory because software does not process this data until their associated descriptor writes are done.
   - The *GLLAN_RCTL.RXDATAWRROEN* bit (loaded from NVM) enables relaxed ordering for Rx data writes.
3. The 10 GbE controller does not relax ordering for the following requests:
   - LAN descriptor writes
   - LAN Tx head write back
   - Interrupt messages
   - MCTP messages
   - Protocol Engine traffic
   - HMC requests
   - EMP requests
   - Any other requests not previously mentioned

Relaxed ordering is globally enabled in the 10 GbE controller by clearing the *GLPCI_CNF2.RO_DIS* bit, originally loaded from NVM. It is further controlled through the *Enable Relaxed Ordering* bit in the PCIe Device Control register.

38.10.2.6.3 Id-based Ordering (Ido)

ID-based ordering was introduced in the PCIe rev. 2.1 specification. When enabled, the 10 GbE controller sets IDO in all applicable TLPs defined in the PCIe specification. IDO is not set for MCTP packets.

IDO is enabled when all of the following conditions are met:

- IDO is not disabled from the NVM. Device default is enabled. The value loaded from the NVM is reflected in the GLPCI_CAPSUP register.
- The PCIe *IDO Request Enable* bit (for requests) or the *IDO Completion Enable* bit (for completions) in the Device Control 2 register is set.

38.10.2.7 End-to-End CRC (ECRC)

The 10 GbE controller supports ECRC as defined in the PCIe specification. The following functionality is provided:

- Inserting ECRC in transmitted TLPs:
  - The 10 GbE controller indicates support for inserting ECRC in the *ECRC Generation Capable* bit of the PCIe Configuration registers. This bit is loaded from the global *ECRC Generation Capable* NVM bit.
  - Inserting ECRC is enabled per function by the *ECRC Generation Enable* bit of the PCIe Configuration registers. VFs follow the behavior of their PF.
  - ECRC is not added to MCTP messages (per the MCTP specification).
- ECRC is checked on all incoming TLPs. A packet received with an ECRC error is dropped. Note that for completions, a completion timeout occurs later (if enabled).
  - The 10 GbE controller indicates support for ECRC checking in the *ECRC Check Capable* bit of the PCIe Configuration registers. This bit is loaded from the global *ECRC Check Capable* NVM bit.
  - Checking of ECRC is enabled by the *ECRC Check Enable* bit of the PCIe Configuration registers. ECRC checking is done if enabled by at least one physical function (enablement is not done via VFs).
- ECRC errors are reported on all Physical Functions (PFs) enabled for ECRC checking.
- System software can configure ECRC independently per each physical function.

38.10.3 Error Events And Error Reporting

This section describes error reporting and advanced error reporting.

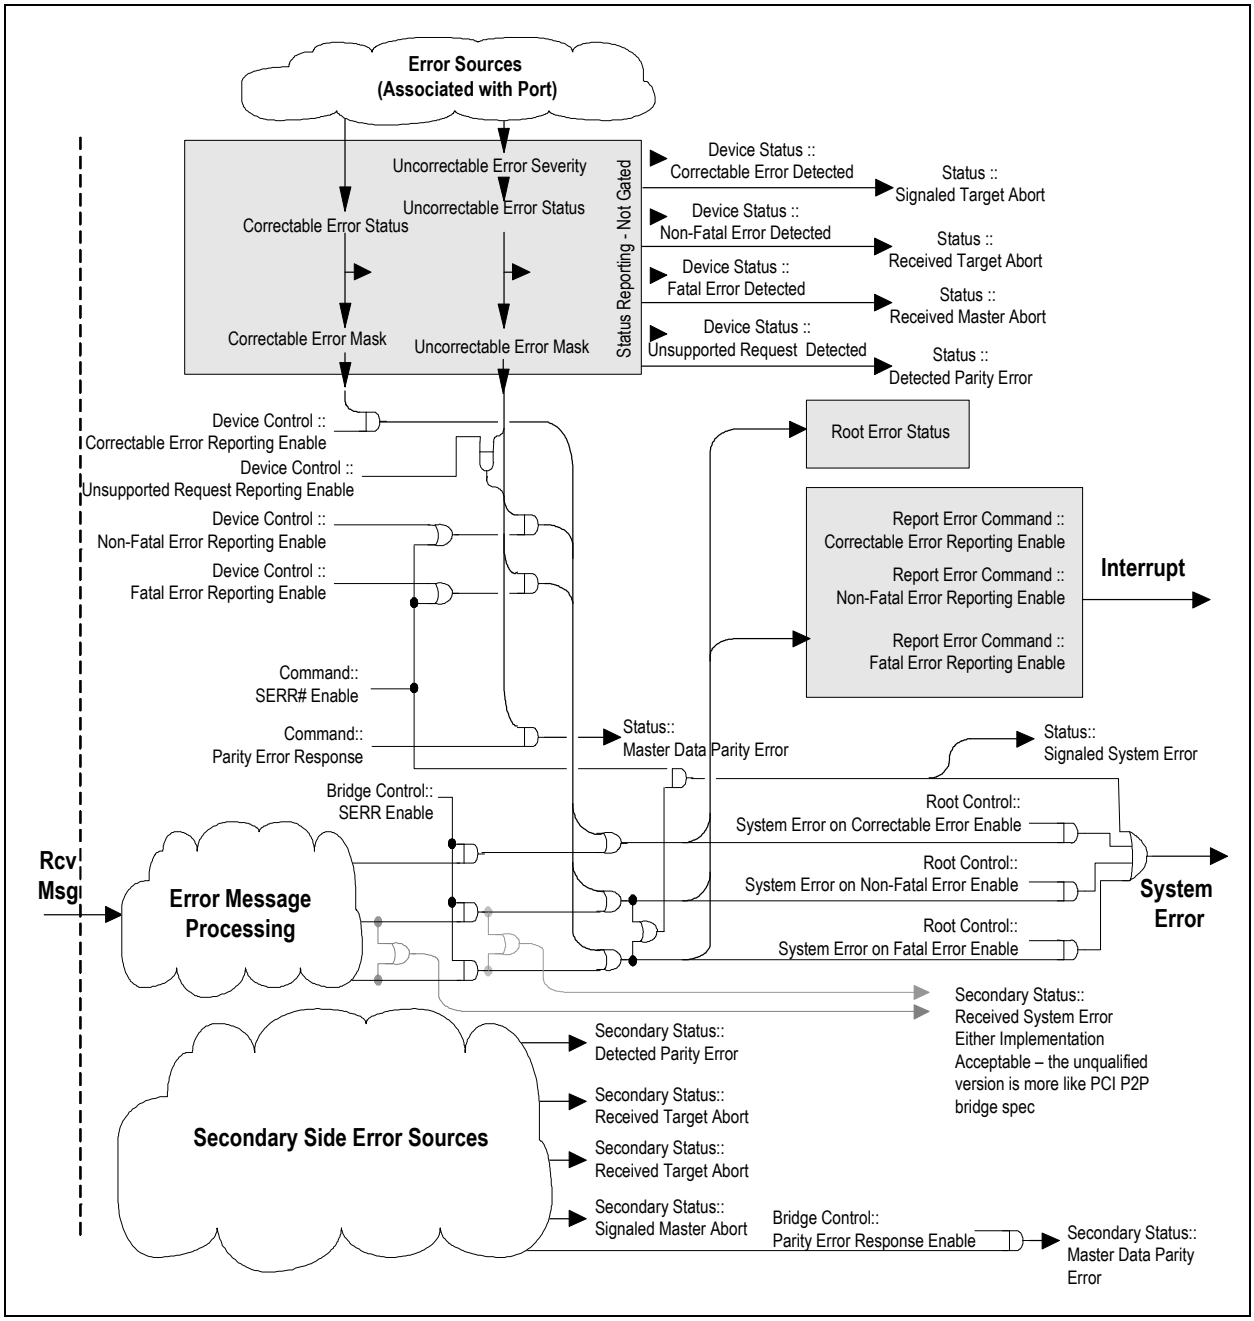
38.10.3.1 General Description

PCIe defines two error reporting paradigms: the baseline capability and the Advanced Error Reporting (AER) capability. The baseline error reporting capabilities are required of all PCIe devices and define the minimum error reporting requirements. The AER capability is defined for more robust error reporting and is implemented with a specific PCIe capability structure. Both mechanisms are supported by the 10 GbE controller, but the AER capability needs to be enabled in the NVM.

The *SERR# Enable* and the *Parity Error* bits from the Legacy Command register also take part in the error reporting and logging mechanism.

In a multi-function device, PCIe errors that are not related to any specific function within the device are logged in the corresponding status and logging registers of all functions in that device (see Section 6.2.4 in the *PCIe Base Specification*). Figure 38-5 shows, in detail, the flow of error reporting in PCIe. See also Figure 6-2 in the PCIe base specification.

Figure 38-5. Error Reporting Mechanism



38.10.3.2 Error Events

Table 38-16 lists the error events identified by the 10 GbE controller and the response in terms of logging, reporting, and actions taken. Refer to the PCIe specification for the effect on the PCI Status register. All the errors reported in SoCs are related to the Transaction layer.

Table 38-16. Response and Reporting Of PCIe Error Events (Sheet 1 of 2)

Error Name	Error Events	Default Severity	Action
Poisoned TLP Received	TLP With Error Forwarding	Uncorrectable ERR_NONFATAL Log Header	See Section 38.10.3.4 for more details. If error is defined as non-fatal (default severity): • Treat as an advisory non-fatal error: Send an ERR_COR Message If error is defined as fatal: • Send ERR_FATAL message
ECRC Check Failed	Failed ECRC check	Uncorrectable ERR_NONFATAL Log Header	See Section 38.10.2.7 for more details. If error is defined as non-fatal (default severity): • Send an ERR_NONFATAL Message If error is defined as fatal: • Send ERR_FATAL message
Unsupported Request (UR)	Receipt of TLP with unsupported Request Type Receipt of an Unsupported Vendor Defined Type 0 Message Invalid Message Code Wrong Function Number Received TLP Outside BAR Address Range Receipt of a Request TLP during $D3_{HOT}$, other than Configuration and Message requests	Uncorrectable ERR_NONFATAL Log header	Send Completion With UR f error is defined as non-fatal (default severity): • Treat as an advisory non-fatal error: Send an ERR_COR Message If error is defined as fatal: • Send ERR_FATAL message
Completion Timeout	Completion Timeout Timer Expired	Uncorrectable ERR_NONFATAL	See Section 38.10.3.3 for more details. If error is defined as non-fatal (default severity): • Treat as an advisory non-fatal error: Send an ERR_COR Message If error is defined as fatal: • Send ERR_FATAL message
Completer Abort	Received Target Access with illegal data size per Section 38.10.2.1	Uncorrectable. ERR_NONFATAL Log header	Send completion with CA If error is defined as non-fatal (default severity): • Treat as an advisory non-fatal error: Send an ERR_COR Message If error is defined as fatal: • Send ERR_FATAL message

Table 38-16. Response and Reporting Of PCIe Error Events (Sheet 2 of 2)

Error Name	Error Events	Default Severity	Action
Unexpected Completion	Received Completion Without a Request For It (Tag, ID, etc.)	Uncorrectable ERR_NONFATAL Log Header	Discard TLP If error is defined as non-fatal (default severity): • Treat as an advisory non-fatal error: Send an ERR_COR Message If error is defined as fatal: • Send ERR_FATAL message
Receiver Overflow	Received TLP Beyond Allocated Credits	Uncorrectable ERR_FATAL	Receiver Behavior is Undefined
Flow Control Protocol Error	Minimum Initial Flow Control Advertisements Flow Control Update for Infinite Credit Advertisement	Uncorrectable. ERR_FATAL	Receiver Behavior is Undefined
Malformed TLP (MP)	Data Payload Exceed Max_Payload_Size Received TLP Data Size Does Not Match Length Field TD field value does not correspond with the observed size PM messages that do not use TC0. Usage of Unsupported VC Target request crosses a 4KB boundary	Uncorrectable ERR_FATAL Log Header	Drop the Packet, Free FC Credits
Completion with Unsuccessful Completion Status		No Action (already done by originator of completion)	Free FC Credits

38.10.3.3 Completion Timeout Mechanism

The 10 GbE controller supports completion timeout as defined in the *PCIe Specification*.

The 10 GbE controller controls the following aspects of completion timeout:

- Disabling or enabling completion timeout
  - The PCIe *Completion Timeout Disable Supported* bit in the Device Capabilities 2 register is hardwired to 1b to indicate that disabling completion timeout is supported
  - The PCIe *Completion Timeout Disable* bit in Device Control 2 register controls whether completion timeout is enabled
- A programmable range of timeout values
  - The 10 GbE controller supports all four ranges as programmed in the *Completion Timeout Ranges Supported* field of the Device Capabilities 2 register. The actual completion timeout value is written in the *Completion Timeout Value* field of Device Control 2 register.

The following sequence takes place when completion timeout is detected:

- The appropriate message is sent on PCIe as listed in Table 38-16.
- The affected queue or client takes action based on the nature of the original request:
  - If the original request was for Tx packet data, the request and any partial packet completions are dropped

  - — Else, the request is handled same way as malicious requests. An interrupt is issued to the respective PF.
- Software might identify the source of the event (whether due to TLP poisoning, to a completion timeout, or an actual malicious event) by reading the error reporting counters or the performance and statistics counters.

38.10.3.4 Error Forwarding (TLP Poisoning)

If a TLP is received with an error-forwarding trailer, the packet is dropped and is not delivered to its destination.

The following sequence takes place when a poisoned TLP is received:

- The appropriate message is sent on PCIe as listed in Table 38-16.
- An interrupt is issued.
- If the TLP is a completion, a completion timeout follows at some later time. Processing continues as described in Section 38.10.3.3.

System logic is expected to trigger a system-level interrupt to inform the operating system of the problem. Operating systems can then stop the process associated with the transaction, re-allocate memory to a different area instead of the faulty area, etc.

38.10.3.5 Completion With Unsuccessful Completion Status

A completion arriving with unsuccessful completion status (either UR or CA) is dropped and not delivered to its destination. A completion timeout follows at some later time. Processing continues as described in Section 38.10.3.3.

38.10.3.6 Error Pollution

Error pollution can occur if error conditions for a given transaction are not isolated to the error's first occurrence. If the PHY detects and reports a receiver error, to avoid having this error propagate and cause subsequent errors at the upper layers, the same packet is not signaled at the data link or transaction layers. Similarly, when the data link layer detects an error, subsequent errors that occur for the same packet are not signaled at the transaction layer.

38.10.3.7 Blocking on Upper Address

The *GLPCI_UPADD* register blocks master accesses from being sent out on PCIe if the TLP address exceeds some upper limit. Bits [31:1] correspond to bits [63:33] in the PCIe address space, respectively.

When a bit is set in *GLPCI_UPADD[31:1]*, any transaction, in which the corresponding bit in its address is set, is blocked and not sent over PCIe. If all register bits are cleared, there is no effect (for example, a packet is sent unconditionally).

Processing a blocked transaction:

- Write transaction
  - — The transaction is dropped.
  - — Set the exceeded upper address limit (write requests) event in the PCIe errors register.
  - — An interrupt is issued.
- Read transaction

  - The transaction is dropped.
  - Set the exceeded upper address limit (read requests) event in the PCIe errors register.
  - The originating internal client is notified.
  - The affected queue or client takes action based on the nature of the original request. An interrupt is issued to the respective PF.

38.10.4 Performance And Statistics Counters

The 10 GbE controller incorporates counters to track the behavior and performance of the PCIe interconnect. The 10 GbE controller implements several types of counters:

- Transaction layer event counters - Section 38.10.4.1
- Link and Physical layer event counters - Section 38.10.4.2
- Latency counters - Section 38.10.4.3
- Bandwidth counters

General characteristics of the counters:

- Software can reset, stop, or start the counters.
- The counters are shared by all PCI functions (service mode of sharing).

Part of the registers that manage the operation of the performance counters are accessed via the GLPCI_LCBADD and GLPCI_LCBDATA register pair.

Reading a register via the GLPCI_LCBADD/GLPCI_LCBDATA pair is done as follows:

- Write the following values into the GLPCI_LCBADD register:
  - ADDRESS - the 18-bit register address. See below for the specific address per each register
  - BLOCK_ID - Defines the sub-unit where the register resides. Use the value 0x7F to access registers mentioned in this section
  - LOCK - use if need to gain access in case of multiple agents accessing the GLPCI_LCBADD/GLPCI_LCBDATA registers
- Read the GLPCI_LCBDATA register.
  - Note that although GLPCI_LCBDATA is a 32-bit register, the registers that maintain the actual count are read as atomic 64-bit reads. The GLPCI_LCBADD contains the address of the low DW, and reading GLPCI_LCBDATA returns a 64-bit value.

Writing a register via the GLPCI_LCBADD/GLPCI_LCBDATA pair is done as follows:

- Write the following values into the GLPCI_LCBADD register:
  - ADDRESS - the 18-bit register address. See below for the specific address per each register
  - BLOCK_ID - Defines the sub-unit where the register resides. For actual values, consult the text below
  - LOCK - use if need to gain access in case of multiple agents accessing the GLPCI_LCBADD/GLPCI_LCBDATA registers
- Write to the GLPCI_LCBDATA register.

38.10.4.1 Event Counters - Transaction Layer

Counters operate in one of the following modes:

- Count mode — the counter increments when the respective event occurred
- Leaky bucket mode — the counter increments only when the rate of events exceeded a certain value. See Section 38.10.4.1.2 for more details.

The list of events supported by the 10 GbE controller are listed in Table 38-17.

Table 38-17. PCIe* Statistic Events Encoding

Events	Event Mapping (Hex)	Description
Cycles	0x00	Increment on each integrated I/O clock tick.
Transaction Layer events		
Bad Request TLPs	0x10	Number of bad TLPs arriving to the transaction layer. These include: • Request caused UR. • Request caused CA. • Malformed TLP.
Bad Completions	0x11	Number of bad completions received. These include: • Unexpected completion. • UR status. • CA status.
Completion Timeout	0x12	Number of completion timeout events.
Poisoned TLP	0x13	Number of TLPs received with poisoned data or data parity.
ECRC Check	0x14	Number of TLPs that fail ECRC check.

38.10.4.1.1 Count Mode

The following CSR fields control operation of the Count mode:

- Four 32-bit counters GLPCI_GSCN_0_3 track events and increment on each occurrence of an event.
  - The four 32-bit counters can also operate in a two 64-bit mode to count long intervals or large payloads.
    - Registers *GLPCI_GSCN_0_3[0]* and *GLPCI_GSCN_0_3[1]* form the first 64-bit counter. Registers *GLPCI_GSCN_0_3[2]* and *GLPCI_GSCN_0_3[3]* form the second 64-bit counter.
    - The GLPCI_GSCL_1.GIO_64_BIT_EN selects between 32-bit and 64-bit modes.
- The GLPCI_GSCL_1.GIO_COUNT_EN_[3:0] bits enable each of the 4 counters.
  - The enable bits for the two 64-bit counters are *GLPCI_GSCL_1.GIO_COUNT_EN_0* and *GLPCI_GSCL_1.GIO_COUNT_ EN_2*, respectively.
- The GLPCI_GSCL_1.GIO_COUNT_START bit starts event counting of enabled counters.
- The GLPCI_GSCL_1.GIO_COUNT_STOP bit stops event counting of running counters.
- The GLPCI_GSCL_1.GIO_COUNT_RESET bit resets the event counters.
- The GLPCI_GSCL_2 associates an event with each of the 4 counters.
  - In 64-bit mode, the GIO_EVENT_NUM_[2,0] fields are used.

38.10.4.1.2 Leaky Bucket Mode

Each of the counters can be configured independently to operate in a leaky bucket mode. When in leaky bucket mode, the following functionality is provided:

- One of four 16-bit Leaky Bucket Counters (LBC) is enabled via the *LBC_ENABLE_[3:0]* bits in the PCIe Statistic Control register #1.
- The LBC is controlled by the *GIO_COUNT_START, GIO_COUNT_STOP, GIO_COUNT_RESET* bits in the PCIe Statistic Control register #1.
- The LBC increments every time the respective event occurs.
- The LBC is decremented every T ms as defined in the LBC_TIMER_N field in the PCIe Statistic Control registers #5...#8 (*GLPCI_GSCL_5_8*).
- When an event occurs and the value of the LBC meets or exceeds the threshold defined in the LBC_THRESHOLD_N field in the PCIe Statistic Control registers #5...#8 (*GLPCI_GSCL_5_8*), the respective statistics counter increments, and the LBC counter is cleared to zero.

38.10.4.2 Event Counters - Link And Physical Layers

This section describes the performance events for the Link and Physical layers and how to manage the counters associated with these events.

The registers responsible for the Link and Physical layers counters are accessed via the GLPCI_LCBADD and GLPCI_LCBDATA register pair.

Two events can be counted concurrently. The event counters include two sets of registers, each managing one event counter. Such pairs are documents as <register_name>[1:0].

The following procedures manage the operation of the event counters (when writing to part of the register, make sure other fields are written with their existing values):

- Resetting the counters configuration
  - — Set the XPPERFCON.GRST bit.
  - — Clear the XPPERFCON.GRST bit (otherwise the logic stays in reset).
- Setting an event:
  - — Write 0x0...0 to the XPPMCL[1:0] registers.
  - — Set the XPPMR[1:0].CENS field to 0x1.
  - — Set the XPPMR[1:0].CNTMD field to 0x1.
  - — Set the XPPMER[1:0].XPRSCA field to 0x1.
  - — Set the event according to Table 38-18.
- Starting a count:
  - — Set the XPPERFCON.GCE bit.
- Stopping a count:
  - — Clear the XPPERFCON.GCE bit.
- Reading the count; reading the counter clears their values:
  - — Read the respective XPPMDH[1:0] and XPPMDL[1:0] register pair in a single 64-bit aligned access.

Table 38-18 lists the Link and Physical Layer events.

Table 38-18. Link And Physical Layer Performance Events

Event	Description	Register Field
Uncorrectable Errors	Counts the total number of uncorrectable errors.	XPPMER[1:0].CNTUCERR
Correctable Errors	Counts the total number of correctable errors.	XPPMER[1:0].CNTCERR
Tx L0s State Utilization	Counts the number of entries to L0s on the Tx lanes.	XPPMER[1:0].TXL0SU
Rx L0s State Utilization	Counts the number of entries to L0s on the Rx lanes.	XPPMER[1:0].RXL0SU
Link Utilization	Counts clocks that a port is receiving data. If one counter counts receiver errors and another counter counts Link Utilization, a bit error rate can be calculated.	XPPMER[1:0].LNKUTIL
Recovery State Utilization	Counts the number of entries to recovery state.	XPPMER[1:0].RECOVERY
ASPM L1 State Utilization	Counts the number of entries to ASPM L1 state (like initiated by the device).	XPPMER[1:0].L1
SW L1 State Utilization	Counts the number of entries to L1 state initiated by software.	XPPMER[1:0].SWL1
Tx and Rx L0s Utilization	Counts number of events where both Tx and Rx are in L0s state.	XPPMER[1:0].RXL0STXL0SU
NAK DLLP Received	Counts number of received NAK DLLPs.	XPPMER[1:0].NAKDLLP

38.10.4.2.1 Bandwidth Counters

The bandwidth counters measure total payload bytes transferred over the PCIe link. Counting is provided per each traffic type (posted, non-posted, completions) per direction (upstream, downstream).

The mechanisms described above hold for the bandwidth counters with the following differences:

- Setting an event:
  - Set the XPPMR[1:0].CENS field to 0x1.
  - Set the XPPMR[1:0].EGS field to 0x2.
  - Set the XPPMR[1:0].FCCSEL field to the desired traffic type (posted, non-posted, completions, or all).
  - Set the XPPPMER[1:0].TXRXSEL field to desired values.
  - Set the XPPPMER[1:0].XPRSCA field to 0x1.
  - Set the XPPERFCON.GCE field to 0x1.

Registers fields used exclusively by the bandwidth counters:

- XPPMR[1:0].FCCSEL - Selects the desired traffic type (posted, non-posted, completions, or all)
- XPPPMER[1:0].TXRXSEL - Selects between monitoring downstream traffic, upstream traffic, or both

38.10.4.2.2 Registers Map

The register fields that control the Link and Physical Layer events are as follows.

Table 38-19. XP PM Compare Low Bits Register (XPPMCL[1:0]) (0x3288, 0x328c)

Field	Bit(s)	Init.	Description
CMPL	31:0	0xFF...F	PM compare low value. Low order bits [31:0] for PM compare register[1:0].

Table 38-20. XP PM Compare Low Bits Register (XPPMDL[1:0]) (0x32e8, 0x32f0)

Field	Bit(s)	Init.	Description
CNTL	31:0	0x00...00	PM data counter low value. Low order bits [31:0] for PM data counter[1:0].

Note: XPPMDL must be read together with the respective XPPMDH register as a single 64-bit aligned read. The registers are simultaneously cleared on read.

Table 38-21. XP PM Data High Bits Register (XPPMDH[1:0]) (0x32ec, 0x32f4)

Field	Bit(s)	Init.	Description
RSVD	31:4	0x0...0	Reserved.
CNTH	3:0	0x0	PM data counter high value. High order bits [35:32] for PM data counter[1:0].

Note: XPPMDH must be read together with the respective XPPMDL register as a single 64-bit aligned read. The registers are simultaneously cleared on read.

Table 38-22. XP PM Response Control Register (XPPMR[1:0]) (0x3294, 0x3298)

Field	Bit(s)	Init.	Description
EGS	20:19	0x0	Event group selection.
CNTMD	15:14	0x0	Count mode.
CENS	13:11	0x0	Counter enable source.

Table 38-23. XP PM Resource Events Register (XPPMER[1:0]) (0x32AC, 0x32B0)

Field	Bit(s)	Init.	Description
NAKDLLP	29	0b	NAK DLLP received - set to enable.
RXL0STXL0SU	28	0b	Tx and Rx L0s utilization - set to enable.
SWL1	27	0b	SW L1 state utilization - set to enable.
L1	26	0b	ASPM L1 state utilization - set to enable.
RECOVERY	25	0b	Recovery state utilization - set to enable.
CNTUCERR	24	0b	Count uncorrectable errors - set to enable.
CNTCERR	23	0b	Count correctable errors - set to enable.
TXL0SU	22	0b	Tx L0s state utilization event - set to enable.
RXL0SU	21	0b	Rx L0s state utilization event - set to enable.
XPRSCA	20:17	0x0	XP Resource Assignment 0001b = Set. Else = Reserved.
LNKUTIL	16:13	0x0	Link utilization - set to 0x1 to enable.
FCCSEL	4:2	0x0	Flow Control Class Select This field selects which flow class for resource event. xx1 = Posted. x1x = Non-posted. 1xx = Completion. ***Note:*** Setting to 111b counts posted, non-posted and completion traffic combined.
TXRXSEL	1:0	0x0	Tx/Rx Select (TXRXSEL) This field selects the traffic direction to monitor. 1x = Transmit. x1 = Receive (from PCIe bus). 11b = Either transmit or receive direction.

Table 38-24. Performance Monitor Local Control Register (XPPERFCON) (0x32C4)

Field	Bit(s)	Init.	Description
RSVD	31:2	0x0	Reserved.
GCE	1	0b	Global count enable.
GRST	0	0b	Global reset.

Table 38-25. XP PM Data Low Bits Register (XPPMDL[1:0]) (0x3280, 0x3284)

Field	Bit(s)	Init.	Description
CNTL	31:0	0x0	PM data counter low value (CNTL). Low order bits [31:0] for PM data counter[1:0].

38.10.4.3 Latency Counter

The latency counter measures the min, max, or average read latency.

Note: Completion timeout events are ignored when the latency counter is enabled.

The latency counters are managed via a set of register fields described below (see also Table , Table 38-27, and Table 38-28). Each of the following sources of traffic has its separate set of registers and counters:

- 0x0 - Rx LAN descriptor fetch
- 0x1 - Tx LAN descriptor fetch
- 0x2 - Protocol engine Rx requests
- 0x3 - Protocol engine Tx requests
- 0x4 - Internal cache load
- 0x5 - Internal management engine read
- 0x6 - Tx LAN packet fetch

The registers are accessed via the GLPCI_LCBADD and GLPCI_LCBDATA registers.

The register fields that control the latency counter operation are:

Table 38-26. NPQ Control Register - NPQC (0x00000)

Field	Bit(s)	Init.	Description
Reserved	31:10	0	Reserved
RTMNTREN	9	0	Latency Counting Enable This bit should set in order to enable latency counters. When set, completion timeout events are ignored.
PERFMNTREN	8	0	Performance Monitor Enable This bit should set in order to enable latency counters. Clearing this bit clears the latency counters.
PERFMNTRAVG	7:4	1	Performance Monitor Average Rate This field sets the averaging rate for all latency average monitors. See definition of NPQRTDLY1.ARTDLY. This field, divided by 16, is the weight (W) in an exponential moving average. The possible values are 1, 2, 4 or 8, which correspond to averaging rates of 0.0625, 0.125, 0.25 or 0.5, respectively.
Reserved	3:0	0x4	Reserved.

Table 38-27. NPQ Round-trip Delay 1 Register - NPQRTDLY1 (0x00030; RO)

Field	Bit(s)	Init.	Description
Reserved	31:16	0	Reserved
ARTDLY	15:0	0	Average Read Requests Round-trip Delay. Captures the average read latency experienced since the last counter reset. Latency is measured from time the read request starts until the time the completion starts to arrive. Average is calculated as exponential moving average. That is, the new average M(n) at sample n equals M(n) = (W/16) * new_sample + (16-W)/16*M(n-1), where W is defined in the NPQC.PERFMNTRAVG field.

Table 38-28. NPQ Round-trip Delay 2 Register - NPQRTDLY2 (0x00034; RO)

Field	Bit(s)	Init.	Description
MAXRTDLY	31:16	0	Maximum Read Requests Round-trip Delay. Captures the maximal read latency experienced since the last counter reset. Latency is measured from time the read request starts until the time the completion starts to arrive.
MINRTDLY	15:0	0	Minimal Read Requests Round-trip Delay. Captures the minimal read latency experienced since the last counter reset. Latency is measured from time the read request starts until the time the completion starts to arrive.

Latencies are measured in cycle counts, where a cycle duration is per Table 38-29.

Table 38-29. Resolution Of The Latency Counters

PCIe Operation Speed	Setting of the GLPCI_CLKCTL.PCI_CLK_DYN Bit	PCIe Operational Link Width	Cycle Duration (ns)
Gen 1 (2.5G)	0b	x	8
Gen 2 (5.0G)	0b	x	4
Gen 3 (8.0G)	0b	x	2
Gen 1 (2.5G)	1b	8 lanes	16
Gen 2 (5.0G)	1b	8 lanes	8
Gen 3 (8.0G)	1b	8 lanes	4
Gen 1 (2.5G)	1b	1 or 4 lanes	32
Gen 2 (5.0G)	1b	1 or 4 lanes	16
Gen 3 (8.0G)	1b	1 or 4 lanes	8

The NPQC register serves other proposes, so using it should be done in the following manner:

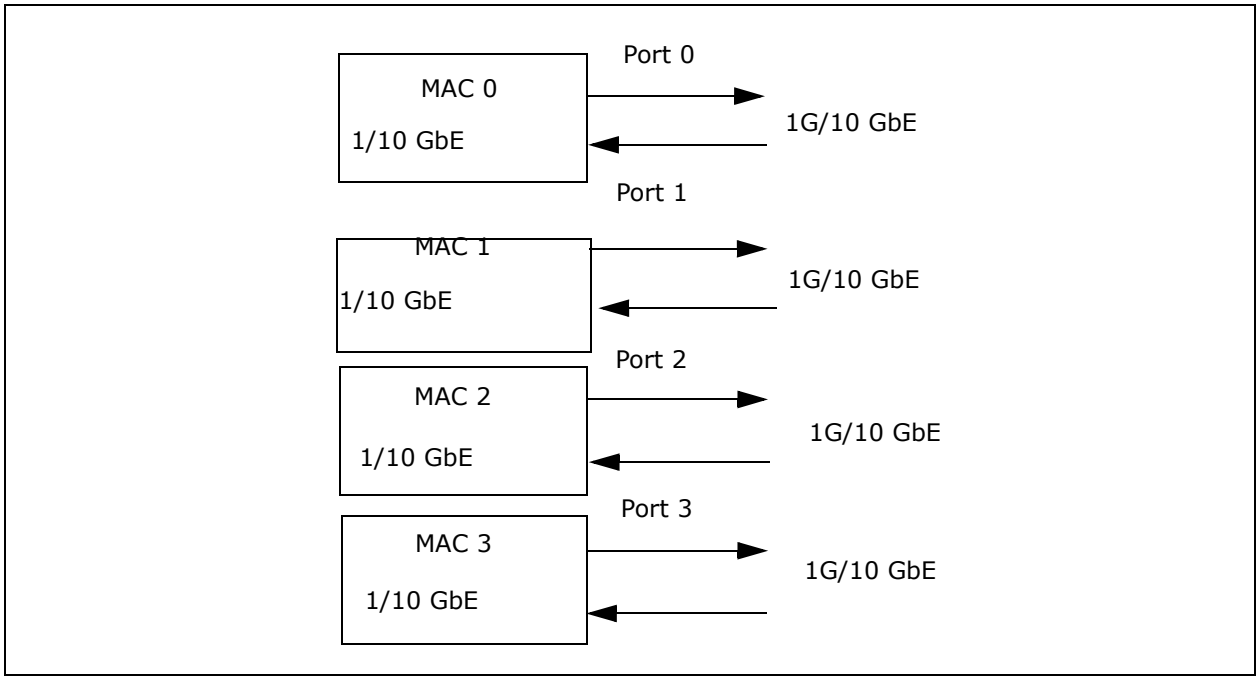
- Read the relevant NPQC register
- Modify the relevant fields from the list above in a local copy
- Write the local copy back to the device

Clearing the latency counters is done by setting the NPQC.PERFMNTREN bit to 0b.

38.10.5 Media Access Control (MAC) Layer

The 10 GbE controller supports up to four full duplex Ethernet MAC ports compliant with IEEE Std802.3-2012 standard (Clause 4 and Annex 4A). The MAC ports can be configured to operate at different speeds of operation as shown in Figure 38-6.

Figure 38-6. 10 GbE Controller MAC Configuration



Each MAC port is associated with a corresponding Media Access Unit (MAU) that provides the physical layer interfaces as explained in Section 38.10.5. The MAUs need to be configured to operate with appropriate physical layer protocols based on the MAC operating speed. Physical layers supported by the 10 GbE controller for different speeds of operation are explained in Section 38.10.7.

38.10.6 Requirements

Following lists the requirements for MAC layer.

38.10.6.1 Port Configurations And Speeds

- Port configuration ID defines the maximum number of enabled ports and the link speeds supported for each. the 10 GbE controller supports two configuration IDs:
  - — Two-port settings — Each port can be independently operated at 10 Gb/s, 1 Gb/s, or disabled
  - — Four-port settings — Each port can be independently run at 10 Gb/s, 1 Gb/s or disabled
- Configuration ID selection is defined in the NVM.
- The 10 GbE controller is able to switch between port configuration IDs (different number of ports) using only a core global reset (no need for POR).
- The 10 GbE controller supports dynamic speed change on each of its ports independently per PHY indication:

— Port 0/1 — 10 Gb/s and 1 Gb/s

— Port 2/3 — 10 Gb/s and 1 Gb/s

38.10.6.2 Port Mapping

- Each PCIe PHY can be flexibly mapped to any of the device ports. Note that a change of mapping requires a reset.
- Firmware reports PMC on link status or port status changes.

38.10.6.3 External PHY Support

- The 10 GbE controller's firmware supports an external PHY configuration pre-operating system mode (through the NVM) and responds to link events.
- The 10 GbE controller's firmware provides an Admin Queue interface so the LAN software device driver can communicate with an external PHY.

38.10.6.4 Pacing

- When a link is set to a speed of 10 Gb/s, support pacing of Tx packets such that the average data rate is lower than the link speed. Pacing is defined at 1Gb/s granularity and is implemented by extending the IPG.
- When a link is set to speed of 10 Gb/s or higher, support pacing of Tx packets such that the duration from one packet to the next does not exceed the equivalent of a given packet rate. Pacing is defined at 10 Mp/s granularity. It is implemented by extending each IPG to insure a certain duration from the first byte of a packet to the first byte of the next packet.
- The 10 GbE controller has a (per port configuration) programmable fixed IPG extension (on top of specification requirements) for all Tx packets to enable a connection through bump on the wire devices.

38.10.6.5 Loopback

The 10 GbE controller is able to run MAC loopback with no dependency on an external line clock or link indication.

38.10.6.6 Link Management

- The 10 GbE controller supports 5 x I^2C/MDIO interfaces in order to have a dedicated one-per-port in the case of four-port SFP+ and an additional one for thermal sensor or an external NVM.
- MDIO/I^2C interfaces can be flexibly assigned and shared between ports by firmware control.

38.10.6.7 MAC Speed Configuration

Table 38-30 lists the possible speed configurations available on each MAC port.

Table 38-30. Mac Port And Possible Speed Configurations

Port	1 Gb/s	10 Gb/s
MAC 0	Y	Y
MAC 1	Y	Y
MAC 2	Y	Y
MAC 3	Y	Y

When LAN ports are disabled in multi-port system configurations, corresponding PCIe functions need to be disabled through the NVM or external disable pins.

The 10 GbE controller supports auto-negotiation protocol when configured for certain physical interfaces. The link speed on each port can either be configured through Link Configuration Admin commands (see Section 38.11.3) or auto selected when auto-negotiation is enabled on the respective ports.

38.10.6.8 Ethernet CRC Generation and Stripping

The 10 GbE controller MAC supports CRC generation (Ethernet frame check sequence). The MACs can be independently programmed to generate and append the 32-bit CRC (FCS) in the transmit direction by setting the *CRC Enable* field in the Set MAC Config AQ command.

The default value is set for the MAC to append the CRC.

Note: When CRC generation is disabled in the MAC, automatic padding in the MAC does not work correctly, therefore all transmitted packets must be at least 64 bytes long.

38.10.6.9 Transmit Padding

The minimum frame size for Ethernet as specified by IEEE Std 802.3 standard is 64 bytes. The 10 GbE controller MAC pads, with ZEROs, Ethernet packets that are smaller than 64 bytes during transmit. Refer to the padding rules for received packets and loop-back packets section for more details.

When interfacing to an external crypto engine, padding is done prior to sending the packet to it meaning that the crypto engine receives packets that are at least 60 bytes long.

38.10.6.10 Jumbo Frame Support

The 10 GbE controller MAC supports transmission and reception of frames of up to 9.5 KB (9728 bytes). Maximum receive and transmit frame size is configured through the Set MAC Config <Max Frame Size > field.

38.10.6.11 Ethernet Flow Control (FC) through Standard Packets

Note: The 10 GbE controller supports receiving/transmitting an FC indication through a side interface (as defined by ONPI specification).

This interface is enabled only when it is not connected directly to an external link (RPT, CLR...).

The 10 GbE controller supports flow control (pause) as defined in 802.3x (IEEE Std 802.3-2008 Annex 31B), as well as the specific operation of asymmetrical flow control (asymmetric pause) defined by 802.3z (IEEE Std 802.3-2008 Annex 28B). The 10 GbE controller also supports Priority Flow Control (PFC) as defined in IEEE P802.1Qbb, sometimes referred to as Class Based Flow Control or (CBFC), as part of the DCB architecture.

Note: A 10 GbE controller port can either be configured to receive 802.3x Link Flow Control (LFC) packets or 802.1Qbb/802.3bd PFC packets. It does not support the reception of both types of packets simultaneously over the same port.

Flow control is implemented to reduce receive buffer overflows, which result in the dropping of received packets. Flow control also allows for local controlling of network congestion levels. This can be accomplished by sending an indication to a transmitting station of a nearly full receive buffer condition at a receiving station.

The implementation of asymmetric flow control allows for one link partner to send flow control packets while being allowed to ignore their reception. For example, not required to respond to PAUSE frames.

The following registers define the basic control functionality. Refer to the registers specified in Section 38.24.1.1.6, Section 38.24.1.2.10, and Section 38.24.2.2 for the other programming related to flow control. In DCB mode, some of the registers are duplicated per Traffic Class (TC), up to eight duplicate copies of the registers. If DCB is disabled, index [0] of each register is used.

- MAC Flow Control (PRTDCB_MFLCN) register — Enables flow control and passing of MAC control packets to the host.
- Flow Control Configuration (PRTDCB_FCCFG) — Determines mode for Tx flow control (no FC, LFC, or versus PFC).
- Flow Control Transmit Timer Value (PRTDCB_FCTTVN[3:0]) — a set of 16-bit timer values to include in transmitted PAUSE frame. A single timer is used in LFC mode and up to eight timers are used in PFC mode.
- Flow Control Refresh Threshold Value (PRTDCB_FCRTV) — 16-bit PAUSE refresh threshold value (in legacy FC PRTDCB_FCRTV must be smaller than PRTDCB_FCTTVN[0]).
- PRTDCB_TC2PFC.TC2PFC bitmap shall be set to 0xFF in LFC mode.

38.10.6.11.1 Mac Control Frames And Reception Of Flow Control Frames

Mac Control Frame — Other Than FC

IEEE 802 reserved the Ether-type value of 0x8808 for MAC control frames as listed in Table 38-31. The MAC control frame format is specified in IEEE 802.3 Clause 31.

Table 38-31. Mac Control Frame Format

DA	The *Destination Address* field can be an individual or multicast (including broadcast) address. Permitted values for the *Destination Address* field can be specified separately for a specific control opcode such as FC packets.
SA	Port Ethernet MAC address (6 bytes).
Type	0x8808 (2 bytes).
Opcode	The MAC control opcode indicates the MAC control function.
Parameters	The *MAC Control Parameters* field must contain MAC control opcode-specific parameters. This field can contain none, one, or more parameters up to a maximum of minFrameSize =20 bytes.
Reserved Field = 0x00	The *Reserved* field is used when the MAC control parameters do not fill the fixed length MAC control frame.
CRC	4 bytes.

MAC Control Frame Receive Identification

Packets with:

- MAC DA = 01-80-C2-00-00-01.
- Ether-type value of 0x8808 are considered to be control frames.
- UC MAC DA (PRTGL_SAL and PRTGL_SAH).

Structure of 802.3x FC Packets

802.3x FC packets are defined by the following three fields (see Table 38-32):

1. A match on the six-byte multicast address for MAC control frames or a match to the station address of the device. The 802.3x standard defines the MAC control frame multicast address as 01-80-C2-00-00-01. A match on the *Type* field. The *Type* field in the FC packet is compared against an IEEE reserved value of 0x8808.
2. A match of the *MAC Control Opcode* field has a value of 0x0001.

Frame-based flow control differentiates XOFF from XON based on the value of the PAUSE *Timer* field. Non-zero values constitute XOFF frames while a value of zero constitutes an XON frame. Values in the *Timer* field are in units of pause quanta (slot time). A pause quanta lasts 64 byte times, which is converted in to an absolute time duration according to the line speed.

Note: XON frame signals the cancellation of the pause that was initiated by an XOFF frame. For example, a pause for zero pause quanta.

Table 38-32. 802.3x Link Flow Control Frame Formats

DA	01_80_C2_00_00_01 (6 bytes).
SA	Port Ethernet MAC address (6 bytes).
Type	0x8808 (2 bytes).
Opcode	0x0001 (2 bytes).
Time	XXXX (2 bytes).
Pad	42 bytes.
CRC	4 bytes.

802.3x Frame Receive Identification

Received frames that are identified as control frames can further be classified as 802.3x if the frames opcode = 0x0001 as listed in Table 38-32. See MAC Control Frame Receive Identification for more details.

The MAC supports the following configuration to further manage 802.3x FC frames' Rx identification:

- UC MAC DA (PRTGL_SAL and PRTGL_SAH).

Priority Flow Control (PFC)

DCB introduces support for multiple TCs assigning different priorities and bandwidth per TC. LFC stops all the TCs. PFC specified in IEEE P802.1Qbb enables more granular flow control on the Ethernet link in an DCB environment as opposed to the PAUSE mechanism defined in 802.3x. The PFC frame format is specified in IEEE P802.3bd.

Table 38-33. PFC Packet Format

DA	01_80_C2_00_00_01 (6 bytes).
SA	Port Ethernet MAC address (6 bytes).
Type	0x8808 (2 bytes).
Opcode	0x0101 (2 bytes).
Priority Enable Vector	0x00XX (2 bytes).
Timer 0	XXXX (2 bytes).
Timer 1	XXXX (2 bytes).
Timer 2	XXXX (2 bytes).
Timer 3	XXXX (2 bytes)
Timer 4	XXXX (2 bytes).
Timer 5	XXXX (2 bytes).
Timer 6	XXXX (2 bytes).
Timer 7	XXXX (2 bytes).
Pad	26 bytes.
CRC	4 bytes.

Table 38-34. Format Of Priority Enable Vector

	ms octet	ls octet
Priority enable vector definition	0	e[7]...e[n]...e[0]
e[n] =1 => time (n) valid e[n] =0 => time (n) invalid		

Each of the eight timers refers to a specific User Priority (UP). For example, Timer 0 refers to UP 0, etc. The 10 GbE controller binds a UP (and therefore the timer) to one of its TCs according to the UP-to-TC binding tables. Refer to the PRTDCB_TUP2TC register for the binding of received PFC frames to Tx TCs, and to the PRTDCB_RUP2TC register for the binding of transmitted PFC frames to Rx TCs.

When a PFC frame is formatted by the 10 GbE controller, the same values are replicated into every *Timer* field and priority enable vector bit of all the UPs bound to the concerned TC. These values as configured in the PRTDCB_RUP2TC register.

The following rule is applicable for the case of multiple UPs that share the same TC as configured in the PRTDCB_TUP2TC register. When PFC frames are received with different timer values for the previous UPs, the traffic on the associated TC must be paused by the highest XOFF timer's value.

PFC Frame Receive Identification

Received frames that are identified as control frames can further be classified as PFC if the frames opcode = 0x0101 as listed in Table 38-33. See MAC Control Frame Receive Identification for more details.

The MAC supports the following configurations to manage PFC frames' identification on Rx:

- UC MAC DA (PRTGL_SAL and PRTGL_SAH).

Operation and Rules

The 10 GbE controller operates in either LFC mode or in PFC mode. Enabling both modes concurrently is not allowed.

The MAC implements the following configurations:

- LFC (PAUSE) is enabled by the *RFCE* bit in the PRTDCB_MFLCN register.
- PFC is enabled by the *RPFCE* bit in the PRTDCB_MFLCN register.

Once the receiver has validated the reception of an XOFF, or PAUSE frame, the device performs the following:

- Increments the appropriate statistics register(s).
- Initialize the pause timer based on the packet's PAUSE *Timer* field (overwriting any current timer's value).
  - In case of PFC, this is done per TC. If several UPs are associated with a TC, then the device sets the timer to the maximum value among all enabled timer fields associated with the TC.
- Disable packet transmission or schedule the disabling of transmission after the current packet completes.
  - In case of PFC, this is done per paused TC.

Resumption of transmission can occur under the following conditions:

- Expiration of the PAUSE timer.
  - In case of PFC, this is done per TC.
- Reception of an XON frame (a frame with its PAUSE timer set to 0b).
  - In case of PFC, this is done per TC.

Both conditions clear the relevant TXOFF status bits in the Transmit Flow Control Status (PRTDCB_TFCS) register and transmission can resume. Hardware records the number of received XON frames.

Timing Considerations

When operating at 10 Gb/s line speed, the 10 GbE controller must not begin to transmit a (new) frame more than 60 pause quanta after receiving a valid XOFF frame, as measured at the wires. When connected to an external 10GBASE-KR PHY with FEC or to an external 10GBASE-T PHY, the response time requirement increases to 74 pause quanta, because of extra delays consumed by these external PHYs.

When operating at 1 Gb/s line speed, the 10 GbE controller must not begin to transmit a (new) frame more than 2 pause quanta after receiving a valid XOFF frame, as measured at the wires.

The IEEE P802.1Qbb draft 2.3, specifies that the tolerated response time for priority XOFF frames is 614.4 ns (equivalent of 12 pause quanta at the link speed of 10 Gb/s). This extra budget in addition to the link delay is aimed to compensate the fact that decision to stop new transmissions from a specific TC must be taken earlier in the transmit data path than for the LFC case.

38.10.6.11.2 PAUSE and MAC Control Frames Forwarding

At 10 Gb/s and Lower Speeds

Two bits in the PRTDCB_MFLCN register control the transfer of PAUSE and MAC control frames to the host. These bits are Discard PAUSE Frames (DPF) and Pass MAC Control Frames (PMCF). Note also that any packet must pass the L2 filters as well.

- The *DPF* bit controls transfer of PAUSE packets to the host. The same policy applies to both LFC and PFC packets as listed in Table 38-35. Note that any packet must pass the L2 filters as well.
- The *PMCF* bit controls transfer of non-PAUSE packets to the host. Note that when LFC frames are not enabled (RFCE = 0b) then LFC frames are considered as MAC Control (MC) frames for this matter. Similarly, when PFC frames are not enabled (RPFCE = 0b) then PFC frames are considered as MC frames as well.

Note: When virtualization is enabled, forwarded control packets are queued according to the regular switching procedure.

Table 38-35. Transfer of PAUSE Packet to Host (DPF bit) in 10 Gb/s MAC

RFCE	RPFCM	DPF	LFC Handling	PFC Handling
0b	0b	X	Treat as MC (according to PMCF setting).	Treat as MC (according to PMCF setting).
1b	0b	0b	Accept.	Treat as MC (according to PMCF setting).
1b	0b	1b	Reject.	Treat as MC (according to PMCF setting).
0b	1b	0b	Treat as MC (according to PMCF setting).	Accept.
0b	1b	1b	Treat as MC (according to PMCF setting).	Reject.
1b	1b	X	Unsupported setting.	Unsupported setting.

38.10.6.11.3 Transmitting PAUSE Frames

The 10 GbE controller generates PAUSE packets to insure there is enough space in its receive packet buffers to avoid packet drop. The 10 GbE controller monitors the fullness of its receive FIFOs and compares it with the contents of a programmable threshold. When the threshold is reached, the 10 GbE controller sends a PAUSE frame. The 10 GbE controller supports both LFC and PFC but not both concurrently (at the same physical port). When DCB is enabled, it sends only PFC, and when DCB is disabled, it sends only LFC.

Note: Similar to the reception of flow control packets previously mentioned, software can enable flow control transmission by setting the PRTDCB_FCCFG.TFCE field only after it is negotiated between the link partners (possibly by auto-negotiation).

PFC

Like Rx flow control, Tx flow control operates in either a link 802.3x compliant mode or in PFC mode, but not in both at the same time.

The same flow control mechanism is used for PFC and for 802.3x flow control to determine when to send XOFF and XON packets. When PFC is used in the receive path, Priority PAUSE packets are sent instead of 802.3x PAUSE packets. See 802.3x Frame Receive Identification for the format of priority PAUSE packets.

A specific consideration for generating PFC packets:

- When a PFC packet is sent, the packet sets all the UPs that are associated with the relevant TC (UP-to-TC association in receive is defined in PRTDCB_RUP2TC register).

Operation And Rules

At 10 Gb/s and lower speeds, The *TFCE* field in the Flow Control Configuration (PRTDCB_FCCFG) register enables transmission of PAUSE packets as well as selects between the LFC mode and the PFC mode.

Refer to Section 38.24.1.2.4 for the criteria used by the device for sending a XOFF frame to the neighbor. The 10 GbE controller sends an additional PAUSE frame if it has previously sent one and the FIFO overflows. This is intended to minimize the amount of packets dropped if the first PAUSE frame did not reach its target.

From the time it has issued a PAUSE frame to the neighbor the 10 GbE controller starts counting down in an internal shadow counter that is used to mirror the pause time-out counter at the partner's end. When this internal counter reaches the value set in PRTDCB_FCRTV register then, if the PAUSE condition is still valid (meaning that the buffer(s) fullness is still above the relevant watermarks), an XOFF message is sent again.

Once the receive buffer fullness reaches the relevant low watermarks, the 10 GbE controller sends an XON message (a PAUSE frame with a timer value of zero). Refer to Section 38.24.1.2.7 for the criteria used by the device for sending a XON frame to the neighbor.

38.10.6.12 Inter Packet Gap (IPG) Control And Pacing

The 10 GbE controller supports transmission pacing by extending the IPG (the gap between consecutive packets). The pacing mode enables the average data rate to be slowed in systems that cannot support the full link rate (10 Gb/s or 1 Gb/s). As listed in Table 38-36, the pacing modes work by stretching the IPG in proportion to the data sent. In this case, the data sent is measured from the end of preamble to the last byte of the packet. No allowance is made for the preamble or default IPG when using pacing mode.

Example 1:

Consider an example of a 64-byte frame. To achieve a 1 Gb/s data rate when link rate is 10 Gb/s and packet length is 64 bytes (16 Dwords), programmers need to add an additional IPG of 144 Dwords (nine times the packet size to reach 1 Gb/s). Which when added to the default IPG gives an IPG of 147 Dwords.

Example 2:

Consider an example of a 65-byte frame. To achieve a 1 Gb/s data rate when link rate is 10 Gb/s and packet length is 65 bytes (17 Dwords when rounded up) programmers need to add an additional IPG of 153 Dwords (nine times the packet duration in Dwords). Which when added to the default IPG gives an IPG of 156 Dwords. Note that in these case, where the packet length counted in Dwords is not an integer, programmers need to count any fraction of a Dword as a whole Dword for computing the additional IPG.

Table 38-36 lists the pacing configurations supported by the 10 GbE controller at link rates of 10 Gb/s. When operating at lower link speeds the pacing speed is proportional to the link speed. Pacing is configured in the *Pacing Config* field in the Set MAC Config admin command.

Table 38-36. Pacing Speeds At 10 Gb/s Link Speed

Pacing Speeds (Gb/s)	Delay Inserted Into IPG	*Pacing Config* field in the Set MAC Config Admin Command
10 (LAN)	None	0000b
9.0	1 Dword for 9 transmitted	1001b
8.0	1 Dword for 4 transmitted	1000b
7.0	3 Dwords for 7 transmitted	0111b
6.0	2 Dwords for 3 transmitted	0110b
5.0	1 Dwords for 1 transmitted	0101b
4.0	3 Dwords for 2 transmitted	0100b
3.0	7 Dwords for 3 transmitted	0011b
2.0	4 Dwords for 1 transmitted	0010b
1.0	9 Dwords for 1 transmitted	0001b
10	None	Default

38.10.6.13 MAC Speed Change At Different Power Modes

Auto-negotiation enables establishment of link speed at the Highest Common Denominator (HCD). During certain low power modes power saving might be more important than link performance. The 10 GbE controller supports an additional mode of operation, where it can configure the PHY to a fixed speed, starting from the lowest speed and checking if the link can be up. This method sets the link speed to the Lowest Common Denominator (LCD) link speed. The link-up process enables the link to come up at any possible speed in cases where power is more important than performance.

38.10.6.14 MAC Errors

The 10 GbE controller's MAC supports identification of the following erroneous packets:

- **L2 CRC Error**
  Packet's FCS check resulted in an error.
- **Undersized Or Oversized Packets**
  Received frame size is smaller than 64 bytes or larger than the configured max. frame size, which was either loaded from the NVM or set using the Set MAC Config command.
- **Illegal Byte Error**
  An illegal control byte is any value that is not legal. Refer to the IEEE802.3 specification for legal symbols, such as /I/,/ E/,/T/, or /D/, /S/, /Seq/, or /LPI/).
- **Error Byte Error**
  Indication that a packet was received with the error control byte (/E/) on the XGMII interface. Indicates that the PCS has encountered an error during the packet's reception.
- **802.3 Length Error**
  <Length> field information in the 802.3 header does not match the packet's actual size.

Packet's containing any one of the previous errors can be filtered by the device or forwarded to a pre-configured VSI based on the SBP flag in the PRT_SBPVSI register.

Note: Packet's shorter than 64 bytes are always filtered by the MAC layer and are not affected by the Store Bad Packets (SBP) configuration.

38.10.6.14.1 MAC Error Counters

Table 38-37 lists the different MAC error counters supported by the device.

Table 38-37. MAC Error Counters

Counter Name	Description
CRC Error	Counts the number of packets received with CRC errors that are not fragments.
Receive Length Error	Counts the number of packets received with error in length field comparison in the 802.3 header.
Receive Undersize	Counts the number of packets with good CRC that are smaller than 64 bytes.
Receive Fragment	Counts the number of packets with bad CRC that are smaller than 64 bytes
Receive Oversize	Counts the number of packet that are larger than the configured max frame size.
MAC Short Packet Discard	Counts the number of packets smaller than 32 bytes that were discarded by the MAC layer.

38.10.7 Link Management Interfaces

The 10 GbE controller supports either MDIO or I^2C interfaces for control plane connection between the MAC (master side) and external PHY devices. The MDIO or I^2C interfaces enable both MAC and firmware access to the PHY for monitoring and controlling of the PHYs functionality. The 10 GbE controller MDIO is compliant with the IEEE Std 802.3 Clause 45 as well as IEEE Std 802.3 Clause 22 frame formats and register address space for accessing legacy PHY devices. The 10 GbE controller I^2C is compliant with the I^2C bus specification.

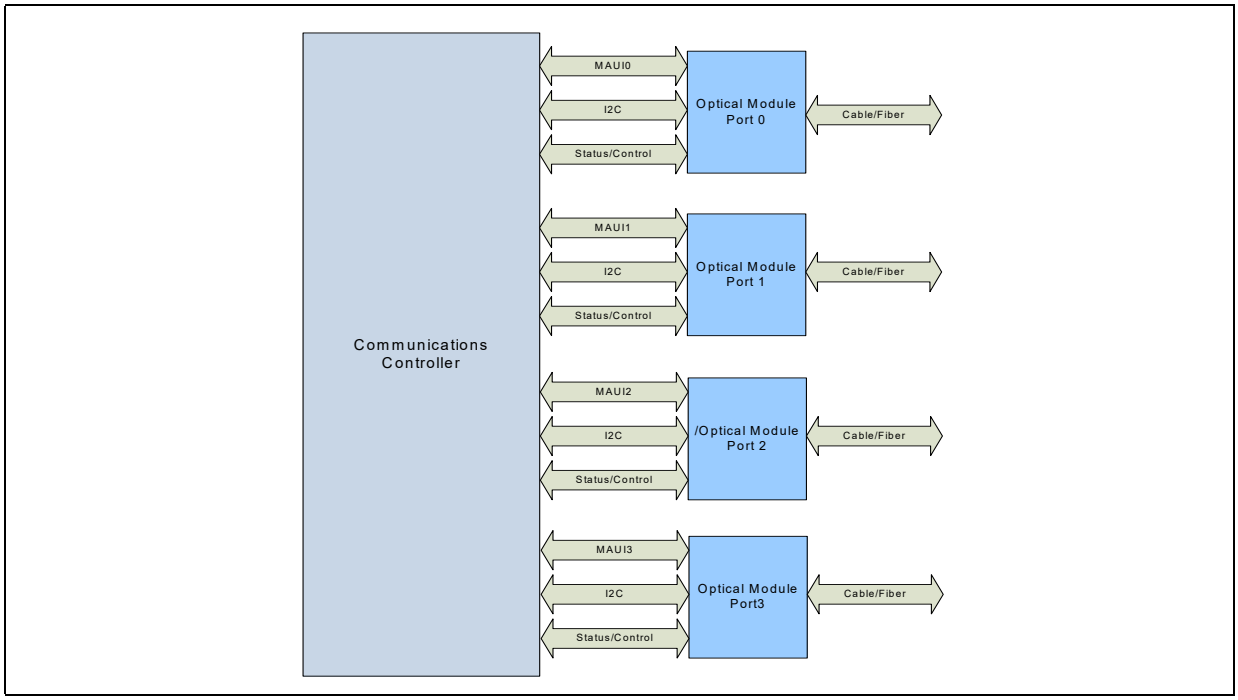
The 10 GbE controller supports up to four management interfaces (one per port) to control external PHYs devices. Depending on the PHY type to manage, the management interface can be configured for either MDIO interface or 2-wire management interface (I^2C). The configuration is done through control bits in the NVM.

Note: Section 38.10.7.2 includes the details on I^2C interface.

In order to manage multi-port PHYs, an I^2C/MDIO interface can be configured to control a quad port PHY or two I^2C/MDIO interfaces can be configured to control two dual port PHYs. The PHY configuration registers for each port are mapped into the respective I^2C/MDIO address space. The 10 GbE controller provides hardware acceleration of MDIO accesses over the 2-wire management interface. The software device driver manages the external devices using the Admin commands (see Section 38.11.3). The software device driver does not have direct access to the MDIO bus except for diagnostic purposes. Firmware performs direct access to MDIO interface for reading and writing to the PHY device as described in the paragraphs that follow.

Figure 38-7 shows the basic connectivity between the MAC and an external PHY/ module.

Figure 38-7. Basic PHY/Module Connectivity



38.10.7.1 MDIO Interface

The MDIO interface is a simple two-wire serial interface between MAC and PHY and is used to access Control and Status registers inside the PHY. The interface is implemented using two 3.3V I/Os:

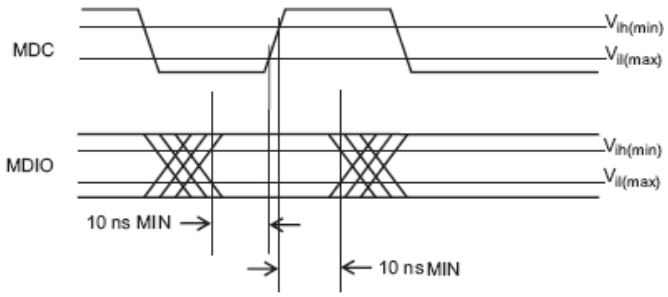
1. MDC — MDIO-interface clock signal driven by a MAC (STA) device.
2. MDIO — Read/write data between MAC and PHY.

38.10.7.1.1 MDIO Timing Relationship To MDC

The MDC clock toggles during a read/write operation at a fixed clock frequency of 2.441 MHz.

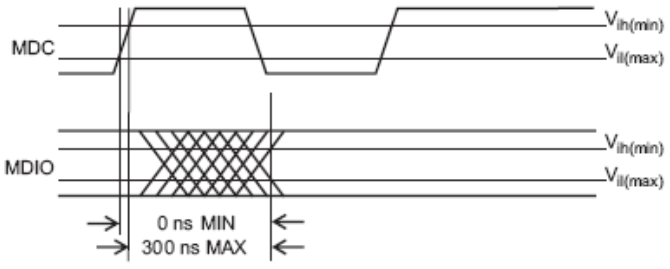
MDIO is a bidirectional signal that can be sourced by the Station Management Entity (STA) or the PHY. When the STA sources the MDIO signal, the STA must provide a minimum of 10 ns of setup time and a minimum of 10 ns of hold time referenced to the rising edge of MDC, as shown in Figure 38-8 (measured at the MII connector).

Figure 38-8. MDIO Timing Sourced By the MAC



When the MDIO signal is sourced by the PHY, it is sampled by the MAC (STA) synchronously with respect to the rising edge of MDC. The clock to output delay from the PHY, as measured at the MII connector, must be a minimum of 0 ns, and a maximum of 300 ns, as shown in Figure 38-9.

Figure 38-9. MDIO Timing Sourced by the PHY



38.10.7.1.2 IEEE Std 802.3 Clause 22 and Clause 45 Differences

IEEE Std 802.3 Clause 45 provides the ability to access additional device registers while still retaining logical compatibility with interface defined in Clause 22. Clause 22 specifies the MDIO frame format and uses an ST code of 01 to access registers. In Clause 45, additional registers are added to the address space by defining MDIO frames that use a ST code of 00.

Clause 45 (MDIO interface) Major Concepts:

1. Preserve management frame structure defined in IEEE 802.3 Clause 22.
2. Define mechanism to address more registers than specified in IEEE 802.3 Clause 22.
3. Define ST and OP codes to identify and control the extended access functions.

38.10.7.1.3 MDIO Management Frame Structure

The MDIO interface frame structure defined in IEEE802.3 Clause 22 and Clause 45 are compatible so that the two systems supporting different formats can co-exist on the same MDIO bus. The 10 GbE controller supports both frame structures to enable interfacing PHYs that support either protocol.

The basic frame format as defined in IEEE802.3 Clause 22 can optionally be used for accessing legacy PHY registers is listed in Table 38-38.

Table 38-38. Clause 22 Basic MDIO Frame Format

	Management Frame Fields							
Frame	**Pre**	**ST**	**OP**	**PRTAD**	**REGAD**	**TA**	**Data**	**Idle**
Read	1...1	01	10	PPPPP	RRRRR	Z0	DDDDDDDDDDDDDDDD	Z
Write	1...1	01	01	PPPPP	RRRRR	10	DDDDDDDDDDDDDDDD	Z

The MDIO interface defined in Clause 45 uses indirect addressing to create an extended address space enabling access to a large number of registers within each MDIO Managed Device (MMD). The MDIO management frame format is listed in Table 38-39.

Table 38-39. Clause 45 Indirect Addressing MDIO Frame Format

	Management Frame Fields							
Frame	**Pre**	**ST**	**OP**	**PRTAD**	**DEVAD**	**TA**	**Address / Data**	**Idle**
Address	1...1	00	00	PPPPP	EEEEE	10	AAAAAAAAAAAAAAAA	Z
Write	1...1	00	01	PPPPP	EEEEE	10	DDDDDDDDDDDDDDDD	Z
Read	1...1	00	11	PPPPP	EEEEE	Z0	DDDDDDDDDDDDDDDD	Z
Post-Read Increment Address	1...1	00	10	PPPPP	EEEEE	Z0	DDDDDDDDDDDDDDDD	Z

To support clause 45 indirect addressing each MMD (PHY — MDIO managed device) implements a 16-bit address register that stores the address of the register to be accessed by data transaction frames. The address register must be overwritten by address frames. At power up or device reset, the contents of the address register are undefined. Write, read, and post-read-increment-address frames must access the register whose address is stored in the address register. Write and read frames must not modify the contents of the address register. Upon receiving a post-read-increment-address frame and having completed the read operation, the MMD increments the Address register by one (up to a value of 0xFFFF). Each MMD supported implements a separate address register, so that the MMD's address registers operate independently of one another.

Idle Condition (IDLE) — The IDLE condition on MDIO is a high-impedance state. All three state drivers must be disabled and the PHY's pull-up resistor pulls the MDIO line to a logic one.

Preamble (PRE) — At the beginning of each transaction, the station management entity must send a sequence of 32 contiguous consecutive one bits on MDIO with 32 corresponding cycles on MDC to provide the PHY with a pattern that it can use to establish synchronization. A PHY must observe a sequence of 32 contiguous consecutive one bits on MDIO with 32 corresponding cycles on MDC before it responds to any transaction.

Start of Frame (ST) — The ST is indicated by:

- <00> pattern for clause 45 compatible frames for indirect access cycles.
- <01> pattern for clause 22 compatible frames for direct access cycles.

These patterns ensure a transition from the default value of one on the MDIO signal, and identifies the start of frame.

Operation **Code (OP)** — The *OP* field indicates the type of transaction being performed by the frame.

For Clause 45 compatible frames:

- A <00> pattern indicates that the frame payload contains the address of the register to access.
- A <01> pattern indicates that the frame payload contains data to be written to the register whose address was provided in the previous address frame.
- A <11> pattern indicates that the frame is an indirect read operation.
- A <10> pattern indicates that the frame is an indirect post-read-increment-address operation.

For Clause 22 compatible frames:

- A <10> pattern indicates a direct read transaction from a register.
- A <01> pattern indicates a direct write transaction to a register.

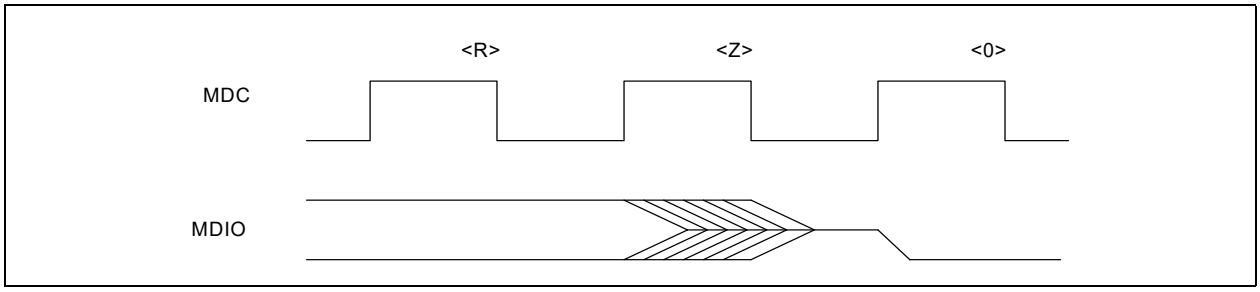
Port Address (PRTAD) — The PRTAD is five bits, allowing 32 unique PHY port addresses. The first PRTAD bit to be transmitted and received is the MSB of the address. A station management entity must have prior knowledge of the appropriate port address for each port to which it is attached, whether connected to a single port or to multiple ports.

Device Address (DEVAD) — The DEVAD is five bits, allowing 32 unique MMDs per port. The first DEVAD bit transmitted and received is the MSB of the address. This field is relevant only in clause 45 compatible frames (ST=<00>).

Register Address (REGAD) — The REGAD is five bits, allowing 32 individual registers to be addressed within each PHY. The first REGAD bit transmitted and received is the MSB of the address. This field is relevant only in clause 22 compatible frames (ST=<01>).

Turnaround (TA) — The TA time is a 2-bit time spacing between the DEVAD field and the Data field of a management frame. This is to avoid contention during a read transaction. For a read or post-read-increment-address transaction, both the STA and the PHY must remain in a high-impedance state for the first bit time of the TA. The PHY must drive a zero bit during the second bit time of the TA of a read or post read-increment-address transaction. During a write or address transaction, the STA must drive a one bit for the first bit time of the TA and a zero bit for the second bit time of the TA. Figure 38-10 shows the behavior of the MDIO signal during the *TA* field of a read transaction.

Figure 38-10.Behavior of MDIO During TA Field of a Read Transaction



- Clause 45 compatible frames have 16-bit address/data fields. For an auto-negation address cycle, it contains the address of the register to be accessed on the next cycle. For the data cycle of a write frame, the field contains the data to be written to the register. For a read or post-read-increment-address frame, the field contains the contents of the register. The first bit transmitted and received must be bit 15.
- Clause 22 compatible frames have 16-bit data fields. The first data bit transmitted and received must be bit 15 of the register being addressed.

38.10.7.1.4 MDIO Direct Access

The software device driver manages the PHYs using the Admin commands (See Section 38.11.3). The device driver does not have direct access to the MDIO bus except for diagnostic purposes. Firmware performs direct access to the MDIO interface for reading and writing to the PHYs as described in the following paragraphs.

The MDI is accessed through registers GLGEN MSCA and GLGEN MSRWD. A single management frame is sent by setting bit GLGEN MSCA.MDICMD to 1b after programming the appropriate fields in the MSCA and MSRWD registers. The GLGEN MSCA.MDICMD bit is auto cleared after the read or write transaction completes. To execute Clause 22 format write operations, the following steps should be done:

1. Data to be written is programmed in field GLGEN MSRWD.MDIWRDATA.
2. Register GLGEN MSCA is initialized with the appropriate control information (start, code, etc.) with bit GLGEN MSCA.MDICMD set to 1b.
3. Wait for bit GLGEN MSCA.MDICMD to reset to 0b when indicating that the transaction on the MDIO interface is complete.

The steps for Clause 22 format read operations are identical to the write operation except that the data in field GLGEN MSRWD.MDIWRDATA is ignored and the data read from the external device is stored in register field GLGEN MSRWD.MDIRDDATA bits. Clause 45 format read/write operations must be performed in two steps. The address portion of the pair of frames is sent by setting register field GLGEN MSCA.MDIADD to the desired address, field GLGEN MSCA.STCODE to 00b (start code that identifies Clause 45 format), and register field GLGEN MSCA.OPCODE to 00b (Clause 45 address register write operation). A second data frame must be sent after the address frame completes. This second frame executes the write or read operation to the address specified in the PHY address register.

38.10.7.2 Two-wire I^{2}C Management Interface

The I^{2}C interface operates via the GLGEN_I2CCMD and GLGEN_I2CPARAMS register set. Since this register set can be used by either software or firmware in alternation, its ownership must be acquired/released via the semaphore ownership taking/release flows.

The I^{2}C interface can be used in two methods, a hardware based access, where the device initiates a transaction following a software device driver or firmware request via the GLGEN_I2CCMD register or a software controlled bit banging using the GLGEN_I2CPARAMS register.

38.10.7.2.1 Hardware-Based I^{2}C Access

The following flows should be used to access an I^{2}C register.

As part of device initialization, or anytime before the actual access, the following parameters should be set:

- *GLGEN_I2CPARAMS.PHYADD* — the address of the device to access.
- *GLGEN_I2CPARAMS.ACCESS_WIDTH* — the width of the data to read or write (byte or word).

Note: The *GLGEN_I2CPARAMS* register should not be modified during an I^{2}c transaction.

To execute a write access, the following steps should be done:

1. Check that register is ready: Poll GLGEN_*I2CCMD.R* bit until it is read as 1b.
2. Command — the *GLGEN_I2CCMD* register is initialized with the appropriate PHY register address in *REGADD* field, the data to write in the *DATA* field and the operation (write) to the *OP* field (0b).
   a. If an interrupt is required, set the GLGEN_*I2CCMD.I* field.
3. Check that command completes: Poll the *GLGEN_I2CCMD.R* bit until it is read as 1b.
   a. Check that no error is indicated in the *GLGEN_I2CCMD.E* field.

To execute a read access, the following steps should be done:

1. Check that register is ready: Poll *GLGEN_I2CCMD.R* bit until it is read as 1b.
2. Command — The *GLGEN_I2CCMD* register is initialized with the appropriate PHY register address in *REGADD* field, and the operation (read) to the *OP* field (1b).
   a. If an interrupt is required, set the *GLGEN_I2CCMD.I* field.
3. Check that command completes: Poll *GLGEN_I2CCMD.R* bit until it is read as 1b.
   a. Check that no error is indicated in the *GLGEN_I2CCMD.E* field.

4. Read the data returned from the *GLGEN_I2CCMD.DATA* field. If a byte access is done (*GLGEN_I2CPARAMS.ACCESS_WIDTH* = 0), only *DATA[7:0]* is valid.

See Section 38.10.7.2.2 for the I^2C commands supported when using the built in read and write commands. All the transactions uses a clock of 100 kHz. When using the bit bang method any command can be given to the I^2C device.

38.10.7.2.2 Bit Bang Based I^2C Access

In this mode, the software device driver or the firmware controls the I^2C interface directly using the *GLGEN_I2CPARAMS* register according to the following table.

Pad	Field Controlling the Output Value	Field Reflecting the Input Value	Field Controlling the Output Enable Value[1]
SDPx_2 I^2C clock)	CLK_OUT	CLK_IN	CLK_OE_N
SDPx_3 (I^2C data)	DATA_OUT	DATA_IN	DATA_OE_N

Notes:
1. 0b = Pad is output. 1b = Pad is input.

38.10.7.2.3 Supported Commands

Note: The gray columns in the tables that follow denote cycles driven by the I^2C device. White columns denote cycles driven by the 10 GbE controller.

When a word read command (*GLGEN_I2CPARAMS.ACCESS_WIDTH* = 1b, *GLGEN_I2CCMD.OP* =1b) is given the following sequence is done by the 10 GbE controller:

Table 38-40. I^2C Read Transaction - Dummy Write

1	7	1	1	8	1	
S	Device Address	Wr	A	Register Address	A	
	From GLGEN_*I2CCMD.PHYADD*	0	0	From GLGEN_*I2CCMD.REGADD*	0	

Table 38-41. I^2C Read Transaction - Word Read

1	7	1	1	8	1	8	1	1
S	Device Address	Rd	A	Data	A	Data	A	P
	From *GLGEN_I2CPARAMS.PHYADD*	1	0	Stored in *GLGEN_I2CCMD.DATA[7:0]*	0	Stored in *GLGEN_I2CCMD.DATA[15:8]*	0	

Note: When GLGEN_*I2CPARAMS.I2C_BYTE_ORDER* field is set, then the read data is considered as a 16 bit word. Thus, the first byte read is stored in GLGEN_*I2CCMD.DATA[15:8]* and the second byte read is stored in GLGEN_*I2CCMD.DATA[7:0]*.

When a byte read command (GLGEN_*I2CPARAMS.ACCESS_WIDTH* = 0b, GLGEN_*I2CCMD.OP* =1b) is given the following sequence is done by the 10 GbE controller.

Table 38-42. I^2C Read Transaction - Dummy Write

1	7	1	1	8	1
S	Device Address	Wr	A	Register Address	A
	From *GLGEN_I2CPARAMS.PHYADD*	0	0	From *GLGEN_I2CCMD.REGADD*	0

Table 38-43. I²C Read Transaction - Byte Read

1	7	1	1	8	1	1
S	Device Address	Rd	A	Data	A	P
	From GLGEN_*I2CPARAMS.PHYADD*	1	0	Stored in GLGEN_*I2CCMD.DATA[7:0]*	0	

When a word write command (GLGEN_*I2CPARAMS.ACCESS_WIDTH* = 1b, GLGEN_*I2CCMD.OP* =0b) is given the following sequence is done by the 10 GbE controller.

Table 38-44. I²C Write Transaction - Word Write

1	7	1	8	1		8	1	8	1	1
S	Device Address	Wr	Register Address	A		Data	A	Data	A	P
	From GLGEN_*I2CPARAMS.PHYADD*	0	From GLGEN_*I2CCMD.REGADD*	0		From in GLGEN_*I2CCMD.DATA[7:0]*	0	From in GLGEN_*I2CCMD.DATA[15:8]*	0	

Note: When *GLGEN_I2CPARAMS.I2C_BYTE_ORDER* field is set, then the data written is considered as a 16 bit word. Thus, the first byte written is taken from *GLGEN_I2CCMD.DATA[15:8]* and the second byte written is taken from *GLGEN_I2CCMD.DATA[7:0].*

When a byte write command (*GLGEN_I2CPARAMS.ACCESS_WIDTH* = 0b, *GLGEN_I2CCMD.OP* =0b) is given the following sequence is done by the 10 GbE controller.

Table 38-45. I²C Write Transaction - Byte Write

1	7	1	8	1	8	1	1
S	Device Address	Wr	Register Address	A	Data	A	P
	From GLGEN_*I2CPARAMS.PHYADD*	0	From GLGEN_*I2CCMD.REGADD*	0	From in GLGEN_*I2CCMD.DATA[7:0]*	0	

38.11 Link Management Topologies

The 10 GbE controller supports the MDIO and 2-wire management interface (I^2C) for connectivity to external modules, re-timers and PHYs. For example, SFP+ or QSFP+ optical and direct attached copper PHYs.

The 10 GbE controller supports up to four management interfaces (one per port) to control external PHY devices. Depending on the PHY type to manage these can be configured for either MDIO or 2-wire management interface. The configuration is done through control bits in the NVM.

Figure 38-11 and Figure 38-12 show the basic examples of connectivity between the MAC and an external module.

Figure 38-11.Basic Example of Module Connectivity (1 of 2)

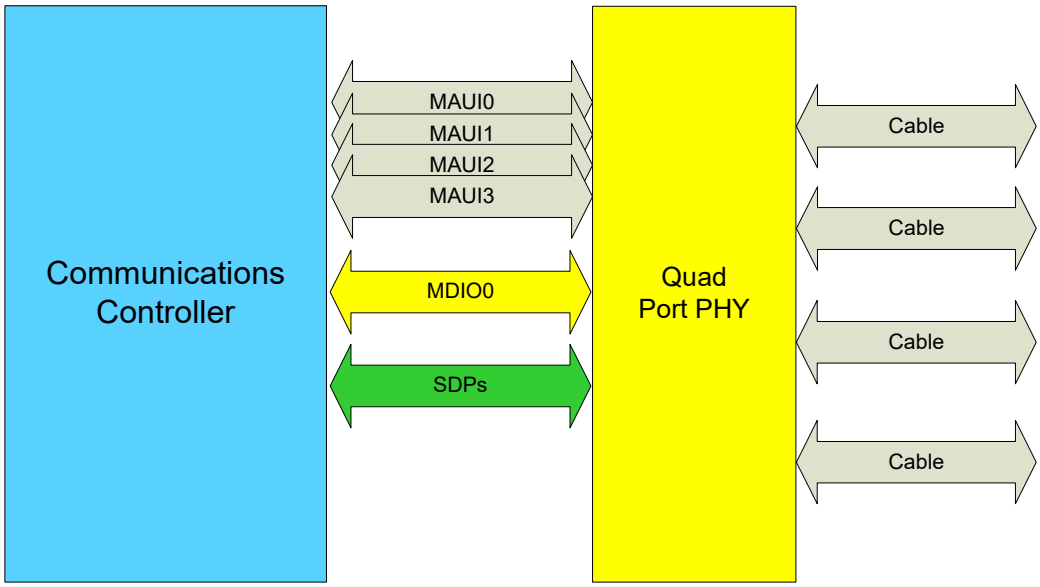


Figure 38-12.Basic Example Of Module Connectivity

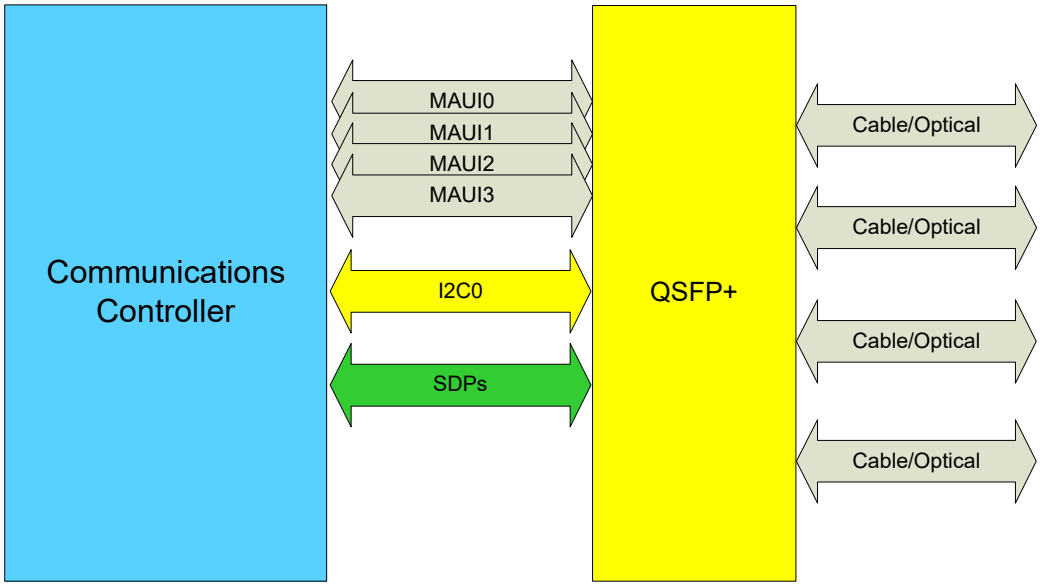

The 10 GbE controller provides hardware acceleration of I^2C accesses over the two-wire management interface. The device driver manages the SFP+/QSFP+ modules using the Admin commands (see Section 38.11.3). The device driver does not have direct access to the I^2C bus except for diagnostic purposes. Firmware performs direct access to I^2C interface for reading and writing to the PHY modules.

The I^2C bus is accessed through registers GLGEN_I2CCMD and GLGEN_I2CPARAMS. I^2C accesses through the hardware controller can be performed through the GLGEN_I2CCMD register. I^2C accesses can also be performed using bit banging through

GLGEN_I2CPARAMS register if needed. Firmware can execute I^2C write/read operations by writing to the I^2C command register. The status of I^2C cycle completion can be performed by reading the GLGEN_I2CCMD register. Refer to the steps that follow to appropriately set the fields:

1. I^2C register address is placed in GLGEN_I2CCMD.DEVADD field.
2. PHY address is placed in GLGEN_I2CCMD.PHYADD field (typically this is 0xA0 or 0xA2 for modules).
3. Command for read or write operation is placed in the GLGEN_I2CCMD.OP field.
4. For a write operation, data to be written is placed in the GLGEN_I2CCMD.DATA field.
5. Successful completion of a write or read operation is indicated by the 10 GbE controller through *Ready* bit (GLGEN_I2CCMD.R). A read error is indicated if GLGEN_I2CCMD.E bit is set along with GLGEN_I2CCMD.R.
6. For a read operation, data can be read from GLGEN_I2CCMD.DATA field when the *Ready* (GLGEN_I2CCMD.R) bit is set.
7. A reset sequence can be sent to the I^2C bus before the actual write/read operation when GLGEN_I2CCMD.Reset bit is set.

38.11.1 External PHY Management Connectivity

The 10 GbE controller has designated 8 GPIO pins as SDPs for use with ports 0 through 3. However, depending on the board layout, system designers have the flexibility to configure any of the GPIO pins, irrespective of their name, as SDPs. This section describes the use of SDP pins for the management of external PHYs and optical/copper modules.

Firmware controls the SDP pins when used for specific hardware functions for PHY management. The device driver uses Admin commands (see Section 38.11.3) to configure and manage the PHYs; the device driver does not directly access the SDP pins except for diagnostic purposes.

Table 38-46 lists the recommended configurations for connecting the 10 GbE controller SDPs, MDIO/I^2C pins to external PHYs or optical/copper modules. The configurations include connectivity to QSFP+ modules, SFP+ modules and 10GBASE-T PHYs, in single, dual or quad port configurations. If mapping of these SDP pins to a specific hardware function is not required then the pins can be used as GPIOs.

Any of the SDP pins configured as an input for dedicated hardware functions can be configured to cause an interrupt to the firmware. The firmware in turn reads the appropriate PHY status registers (through MDC or I^2C interfaces) and might post an event and provide necessary status information to the device driver through Admin commands (see Section 38.11.3).

Table 38-46. Example for SDP, MDIO and I^2C Ports Usage for SFP+ and QSFP+ Modules (Sheet 1 of 2)

Port Num	Pin	SFP+	QSFP+	Quad 10GBASE-T Copper PHY
0	SDP0_0	Mod_ABS	ModPrsL	PhyInt
	MDIO_SDA0 MDC_SCL0	SDA SCL	MDIO_SDA0 MDC_SCL0	

Table 38-46. Example for SDP, MDIO and I²C Ports Usage for SFP+ and QSFP+ Modules (Sheet 2 of 2)

Port Num	Pin	SFP+	QSFP+	Quad 10GBASE-T Copper PHY
1	SDP1_0	Mod_ABS	ModPrsL	PhyInt
	MDIO_SDA1 MDC_SCL1	SDA SCL		
2	SDP2_0	Mod_ABS	ModPrsL	PhyInt
	MDIO_SDA2 MDC_SCL2	SDA SCL		
3	SDP3_0	Mod_ABS	ModPrsL	PhyInt
	MDIO_SDA3 MDC_SCL3	SDA SCL		

38.11.1.1 Transceiver Module Support

The 10 GbE controller MAUI interface with additional usage of low speed interface pins (SDP, I²C and MDIO I/Os) supports connection to transceiver modules compliant with the following Multi Source Agreements (MSAs):

- SFP+ — SFF-8431 Specifications for Enhanced 8.5 and 10 Gigabit Small Form Factor Pluggable Module SFP+ rev 1.0
- QSFP+ — SFF 8436 Rev 3.4 specifications for quad small form factor pluggable module (4 x 10 GbE)

38.11.1.1.1 10 GbE Controller's SFP+ Connectivity Scheme

The following diagrams show the low speed digital signals used when connecting the 10 GbE controller to SFP+ modules.

Note: The diagram shows the minimal connectivity required.

Figure 38-13.Quad 10 GbE SFP+

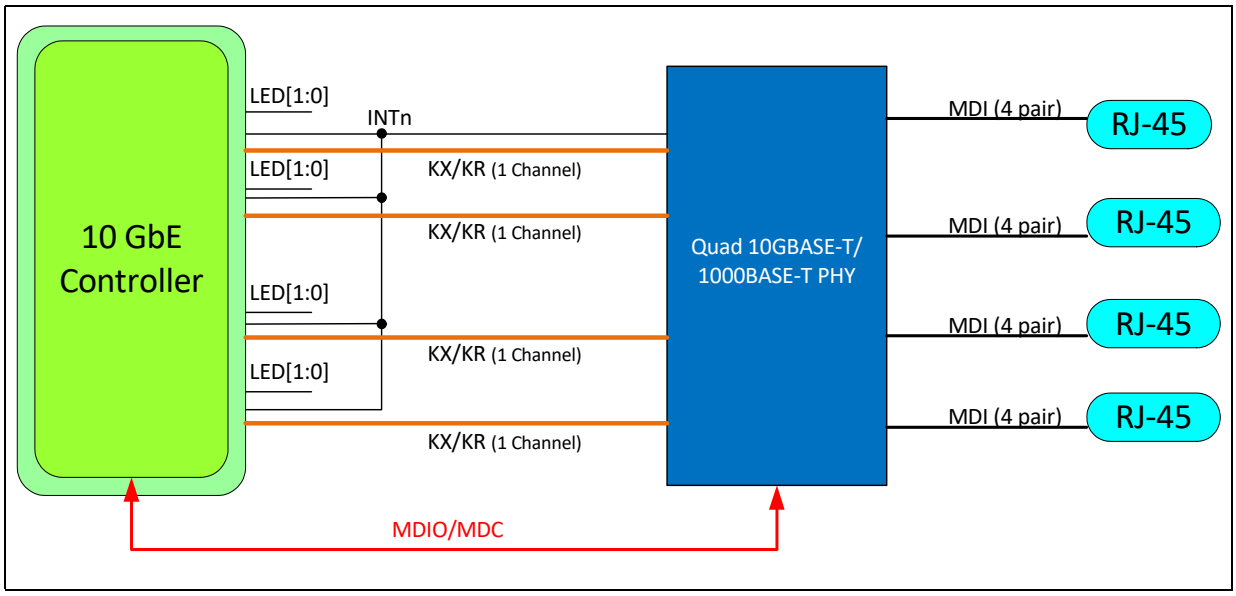
38.11.1.1.3 10GBASE-T/1000BASE-T Connectivity Scheme

The following diagram shows the low speed digital signals used when connecting the 10 GbE controller to 10GBASE-T/1000BASE-T PHYs.

Note: The diagram show the minimal connectivity required.

Figure 38-16.Quad 10GBASE-T/1000BASE-T



38.11.1.1.4 OCP Support

OCP specification (http://www.opencompute.org/wiki/Server/SpecsAndDesigns) defines a Mezz card form factor for NIC cards. This type of card is used to implement NICS based on standalone products. A variant of these cards that includes only a PHY can connect to an integrated MAC.

In the stand alone case, the NIC comes with its own NVM and thus can reflect to the system the currently connected PHY. In the case of PHY cards however, the NVM is tied to the chipset and is independent of the currently connected PHY.

This section describes the capability to the the 10 GbE controller MAC to detect the currently connected OCP PHY and expose it to the system and software adequately.

Supported Configurations

The following configurations are supported:

1. Quad port OCP connected to all 4 lanes of the 10 GbE controller.
2. Dual port OCP connected to lanes 0 and 1 of the 10 GbE controller. Lanes 2 and 3 can be connected to a LOM or left unconnected.
3. Dual port OCP connected to lanes 2 and 3 of the 10 GbE controller. Lanes 0 and 1 can be connected to a LOM or left unconnected.

Note: The port-to-lane mapping might change the ports mapped to the OCP. The I^2C associated to each port should follow the lanes. So, if port 0 is mapped to lane 1 and lane 1 is connected to OCP port 1, I^2C 0 should also be connected to I^2C 1 of the OCP.

Note: The 10 GbE controller supports only OCPs where port pairs are identical.

Use Cases

There are a few use cases expected when implementing an OCP card.

Table 38-47. OCP Use Cases

Use Model	Characteristics
OxM MFG Line	OxM assembles and configures system in their manufacturing flow NVM programming/configuration handled in MFG line Likely includes multiple boot cycles
Distributor	Stocks OEM standard components; configure/ship to order Mainboard contains OEM default NVM image Assembles system from bag-of-parts May be bare-metal assembly. For example, might not load or boot to the operating system)
IHV	Builds system-level solutions to specification for target applications or customers Assembles system from bag-of-parts; programs NVM image during system bring-up flow Expected to have system-level testing prior to shipment to end user
End-user	End user changes mezz card Expected to be a small subset of the usage models; mezz changes would be a relatively rare event. For example, boot flows should be optimized for a case where the mezz has not been changed since last boot)

OCP Card Detect By Firmware

As part of power on flow, if the *OCP Enable* NVM bit is set, firmware should read the first 3 words from the address as defined in the NVM field I^2C auto-detect address on the I^2C port defined by first *I2C auto-detect port* field in NVM and compare it with the signature value stored in the EMP SR section. The first two words contain the ASCII signature OCP_, to make sure that an OCP NVM is being read. The value in the EMP SR should be OCP_nn, where nn is the ASCII value (two bytes) that reflects the OCP card ID. Firmware should first compare the two-word signature to the EMP SR signature to verify that there is a valid OCP NVM at the auto-detect I^2C port and address. The third word is also compared in order to make sure that the OCP card was not replaced with another type of OCP card.

If the OCP ID EMP SR value matches the third word in the OCP card, then the NVM is already updated, and the init flow can proceed normally.

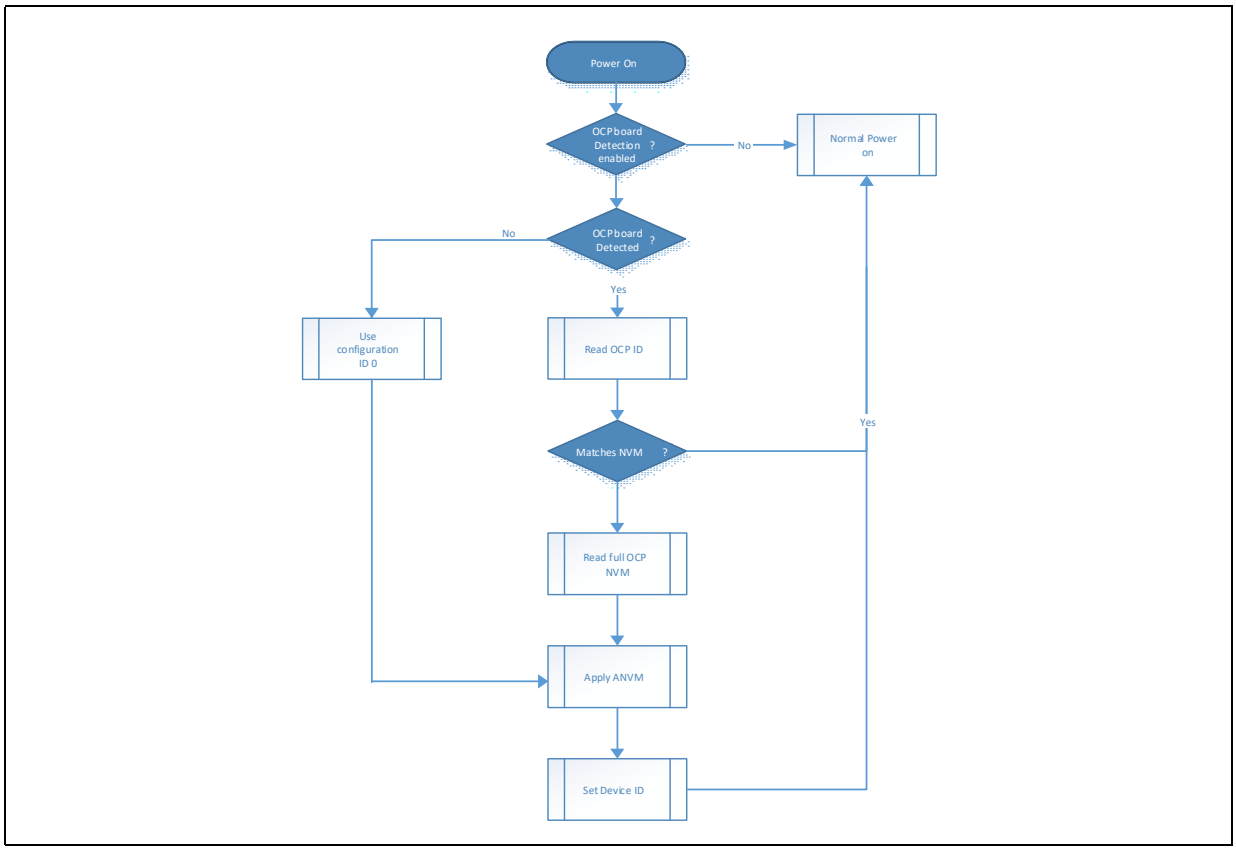
If firmware fails to read from the first I^2C port or reads different signature from the OCP_ signature in EMP SR (such as a valid OCP NVM is not detected), firmware should proceed and try searching for an OCP card at the second I^2C auto-detect port field as defined in NVM.

If a signature is valid, but the OCP ID does not match the EMP SR value, then firmware proceeds to update the NVM as described in the next section.

If an OCP card is expected (*OCP Enable* NVM bit is set), but no OCP card is detected (no valid signature read or I^2C read is not successful on both auto-detect ports), firmware should return the ENOSYS error in the Get PHY abilities AQC for ports that are defined as OCP ports.

Note: The initial value of the signature in the EMP SR might be set to OCP_00, which forces firmware to detect the OCP card as new card, as 0x0 is a reserved card ID that does not represent any valid card.

Figure 38-17.PHY Auto-Detect Flow



NVM Update of Auto-load

The following flow is used to update the NVM:

1. Add to the PCIe alternate auto-load section, an auto load of the device ID of function 0 to 0xFFFF (address - 0x000BE080. PFPCI_DEVID[0]), to indicate to the BIOS that an update is in process.

Note: The BIOS reads the ID approximately 30 seconds after boot; however, the update should finish in less than 30 seconds. Also, step 1 is required for future compatibility to BIOS. This step should be done before the PCI auto-load process. If a PCI auto-load occurs before the auto detect, the value is also 0xFFFF.

2. Read the OCP NVM and check the checksum.
   a. If it does not match, do not change the NVM. Firmware should report an ENOSYS error in the Get PHY abilities AQC for ports that are defined as OCP, but the OCP NVM is corrupted.
   b. Otherwise, continue.
3. In the shadow RAM area, update the following entries:
   a. New 10 GbE Controller signature should be updated to OCP_nn where nn is the ASCII value read from the OCP card.

b. The value of the super feature IDs should be updated according to the value read from the OCP NVM. If an OCP card is not present, index 0 of the configuration should be used. The super feature ID to apply each index to is set according to the mapping of *Port #n OCP connection* fields. For example, if *Port #2 OCP connection* = 1 (port 1), then the index read from offset 0x16:0x17 (OCP port #2) should be applied to super feature ID #F0FB (NIC port #1).

c. Value of the global super-feature configuration ID should be updated according to the values read from the OCP ID EEPROM, the number of ports in the system, number of OCP ports in the system, and number of ports on the OCP card, according to the following flow:

i. If total number of ports in system is two, choose 2-port global configuration.

ii. Else, if number of OCP ports in system is four and number of OCP ports in OCP card is two, choose 2-port global configuration.

iii. Else, choose 4-port global configuration (remaining cases are hybrid configurations, and pure OCP platforms with four OCP port cards).

Table 38-48. OCP NVM Content

Offset	Content
0x8:0x9	OCP global configuration — 4-port
0x10:0x11	OCP global configuration — 2-port
0x12:0x13	Port #0 of OCP configuration
0x14:0x15	Port #1 of OCP configuration
0x16:0x17	Port #2 of OCP configuration
0x18:0x19	Port #3 of OCP configuration

Note: the port #n configuration available entries are defined according to the number of ports field (offset 0xE:0xF). The 10 GbE controller POR supports up to four ports.

d. If the sub-vendor and subsystem IDs are not 0xFFFF, update the sub-vendor and subsystem IDs immediate fields.

4. Apply Adaptive Non-volatile Memory (ANVM)-like flow on the new shadow RAM content.

If one of the indexes is not found, remove report card.

5. Flush shadow RAM to NVM.
6. Remove the entry added at step 1 to PCIe Alternate auto-load section.

BIOS Flow

As part of enumeration of the 10 GbE controller, if the device ID of port 0 is 0xFFFF, firmware is in process of an ANVM-like flow. BIOS waits/revisits the 10 GbE controller later when the device ID has a valid value.

OCP ID NVM

The OCP card includes an I^2C accessible NVM (http://www.atmel.com/devices/AT34C02D.aspx) or equivalent containing the following information:

Table 38-49. OCP NVM content (Sheet 1 of 2)

Offset (byte)	Bits	Description
0x0:0x3	31:0	OCP NVM signature. ASCII value of OCP_.
0x4:0x5	15:0	OCP ID in ASCII. See the table that follows.
0x6:0x7	15:0	OCP Card Version

Table 38-49. OCP NVM content (Sheet 2 of 2)

Offset (byte)	Bits	Description
0x8:0x9	15:0	OCP Global Configuration ID (4-port)
0xA:0xB	15:0	OCP Global Configuration ID (2-port)
0xC:0xD	15:0	Subvendor ID
0xE:0xF	15:0	Subsystem ID
0x10: 0x11	15:0	Number of ports
0x12: 0x13	15:0	Port #0 Configuration ID
0x14: 0x15	15:0	Port #1 Configuration ID
0x16: 0x17	15:0	Port #2 Configuration ID
0x18: 0x19	15:0	Port #3 Configuration ID
0x1A:0xFD		Reserved. Should be zero
0xFE:0xFF	15:0	16-bit Checksum

OCP ID

This field is an ASCII decode of an ID identifying a given type of OCP cards. Two OCPs can have the same ID if and only if the content of all the other fields in the NVM are the same.

The following table defines the ID for the planned OCP cards.

Table 38-50. OCP Cards IDs

Card	ID	Description
No card	0x0	Reserved value to indicate no card. Might be used to indicate that the NVM is not configured with active card.
4-port 10GBASE-T	0x1	QP RJ-45; X557 QP PHY, KR input
2-port 10GBASE-T	0x2	DP RJ-45; X557 DP PHY, KR input
4-port 10G SFP+	0x3	QP Port SFP+, external PHY, KR input
2-port 10G SFP+	0x4	DP Port SFP+, external PHY, KR input
4-port 1000BASE-T	0x5	QP Port RJ-45, external PHY, KR input
2-port 1000BASE-T	0x6	DP Port RJ-45, external PHY, KR input

OCP Card Version

This field gives the OCP card version. The 8 MSBs are major version, while the 8 LSBs are the minor version. Currently, only major version = 1 cards are supported and if the major version changes, an error should be returned. The minor version tracks additive features that might be added to the OCP, without breaking the current functionality.

For example, all 1.x versions uses the same OCP ID format, versions higher than 1.0 might include additional fields describing parameters of the OCP. Firmware capable of reading only 1.0 format, is able to read 1.x, but ignores the additional fields.

Note: The major version has changed to two. Other version cards result in an error (default configuration 0x0 is chosen.

Full OCP Configuration ID

This field gives an ID identifying the ANVM configuration to apply to configure OCP-wide configurations. This typically includes the number of ports, etc. This value selects an option in the ANVM super-feature ID 0xF0FE.

Sub-vendor and Subsystem IDs

These fields enable the OCP vendor to override the value reported in the subsystem and sub-vendor fields in the PCIe configuration space. A value of 0xFFFF is ignored.

A configuration where only one of these two fields is equal to 0xFFFF is not valid.

Number of Ports

This field is used to define how many Port # Configuration ID entries are present. This field is not used to configure the number of exposed functions/ports. This number should be part of the full OCP configuration ANVM feature.

Port #n configuration ID

This field gives an ID identifying the ANVM configuration to apply to configure port #n OCP configurations. This typically includes the PHY type, the function device ID, LED configuration, etc. This value selects an option in the ANVM super-feature ID 0xF0FA/B/C/D according to the port number.

Checksum

Contains a checksum of the NVM calculated according to the following algorithm:

```
#define FIXED_SIZE 254/2
#define EEPROM_SUM 0xBABA

u16 checksum = 0;
u16 length = 0;
u16 word = 0;
int i;
for (i = 0; i < FIXED_SIZE; i++) {
word = Read OCP NVM address 2*i; // 16 bit read, address in byte resolution
checksum += word;
}

checksum = IXGBE_EEPROM_SUM - checksum;
```

Note: In version 1.x, the checksum is calculated over the first 254 bytes of the OCP NVM, to enable further expansion.

38.11.2 Firmware Link Configuration

In the 10 GbE controller all link configurations are performed by firmware. At POR firmware initializes the link and then provides a set of Admin commands, described in Section 38.11.3, to allow for software device drivers' modifications of the link parameters and configurations. All access to the link configurations is performed using the Admin commands and device drivers do not directly access the MAC, PHY or SDP settings. This is required in order to provide the software device driver with an API like interface to the MAC, PHY and SDP registers.

Link initialization by firmware includes reading the initial configuration from the NVM, reading the PHY type connected to the link and programming appropriate values to the MAC and PHY registers to bring up the link. See the detailed flow in Section 38.11.2.0.1 for more information.

The firmware also provides services to the device driver by providing status of the link, modifying the link configuration, and re-initializing the link if requested by the software device driver.

38.11.2.0.1 MAUI Link Setup Flow

The 10 GbE controller MAUI interface is configured at start up by firmware (before the device driver is loaded) in the following manner:

1. Firmware reads default settings from the NVM per port.
2. Firmware reads GPIO, MDC/I^2C settings pre-loaded by hardware from the NVM.
3. If link is setup for backplane connectivity:
   - Firmware waits for link to be established.
   - Based on resulting speed and parameters (FC) firmware configures other blocks in the 10 GbE controller.
4. If link is setup for module connectivity:
   - Firmware verifies that the connected module is a qualified module (when enabled)
   - Based on module type, optical or direct attach, firmware configures the PCS registers.
   - Firmware restarts the link setup.
5. If link is setup for BASE-T PHY connectivity (external PHY):
   - Firmware verifies that the connected PHY is valid.
   - Firmware programs external PHY's registers
   - Firmware restarts the auto-negotiation process on the BASE-T interface.
   - When link is established, firmware programs the internal MAC-PHY interface according to the negotiated speed and parameters (FC) as well as other relevant blocks in the 10 GbE controller.
6. When the internal link is established, firmware generates a LSE if enabled.

Note: If link synchronization is not successful, firmware does not report link-up and continuously polls link indications while waiting for link to be established.

If module or PHY qualification is enabled and connected device is not found in the qualified list, firmware stops the link setup process and reports event to software.

38.11.2.1 Software Link Management

At power up, firmware initializes the link based on the initial configurations loaded from the NVM. Following the initial setup, the software device driver might override any of the link settings; however, even though the software device driver is the owner of the link in SFP mode, it does not directly access the MAC or PHY registers and SDP pins controlling the PHYs instead all access to the link settings is performed through firmware as described in Section 38.11.3.

38.11.3 Link Configuration Admin Commands

The 10 GbE controller supports the following admin commands for configuring and managing the link. Software should use the admin commands to configure the link. This includes configuring the MAC and internal/external PHY devices. The firmware provides link configuration and status services to the device driver based on these admin commands.

Software can use the Get Link Status command to find out the actual status of the link.

Table 38-51. Link Configuration Admin Commands (0x06xx)

Command	Opcode	Description	Detailed Description
Set PHY Config	0x0601	Set various PHY configuration parameters on port.	Section 38.11.3.1.1
Set MAC Config	0x603	Set various MAC configuration parameters on the port.	Section 38.11.3.1.2
Setup Link and Restart[1] AN	0x0605	Sets up the link and restarts link auto-negotiation. This operation could bring down the link. This command needs to be executed for other set link parameters to take effect on the link.	Section 38.11.3.1.3
Get PHY Abilities	0x0600	Get various PHY abilities supported on the port.	Section 38.11.3.1.4
Get Link Status	0x0607	Get link status of the port.	Section 38.11.3.1.5
Link Status Event	0x0607	Firmware sends this asynchronous event notification to software when there is a change in status in any of the event causing conditions (such as link up/down or other link error conditions).	Section 38.11.3.1.6
Set Event Mask	0x0613	Sets event mask. Software can mask some or all of the link status event causing conditions.	Section 38.11.3.1.7

Notes:

1. In SFP mode, the Setup link and restart auto-negotiation command needs to be executed by the device driver in order for any other change in link parameters to take effect on the link. This operation could disrupt the link since the link state may toggle while the link is re-initialized with the new parameters.

38.11.3.1 Link Configuration Commands

This section provides a detailed description of the link configuration Admin commands and its structure.

38.11.3.1.1 Set PHY Config

This command is used by the device driver to set the various PHY configuration parameters supported on the port.

This is a Direct command. The set PHY command parameters data structure is placed in the descriptor.

Note: This command must be followed by the Setup Link And Restart Auto-Negotiation command in order for any changes to the link parameters to actually take place.

Table 38-52. Set PHY Config Command (opcode: 0x0601) (Sheet 1 of 2)

Name	Bytes.Bits	Value	Remarks
Flags	1:0	0x0	
Opcode	2-3	Opcode	Command opcode.
Datalen	4-5	0x0	Must be 0b, value is ignored.
Return value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.

Table 38-52. Set PHY Config Command (opcode: 0x0601) (Sheet 2 of 2)

Name	Bytes.Bits	Value	Remarks
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Set PHY Config	16-31	See Table 38-53.	16-byte data structure that holds the set PHY config command parameters listed in Table 38-53.

Table 38-53 lists the data structure of the set PHY config command parameters such as PHY type, PHY ID, speed ability, pause ability, etc.

Table 38-53. Set PHY Config Command Data Structure (Sheet 1 of 2)

Name	Bytes.Bits	Value	Remarks
PHY Type	0-3	PHY Type	PHY Type Supported On Port One bit per PHY type. The 10 GbE controller might be capable of supporting multiple PHY types. The following parameter indicates the bit number. 00 = Reserved. 01 = 1000BASE-KX. 03 = 10GBASE-KR. 06 - Reserved. 07 = SFI. 11 = 10GBASE-CR1 (used with 4x10 Gb/s QSFP+ direct attach copper). 17 = Reserved. 18 = Reserved. 19 = 10GBASE-T.
			20 = 10GBASE-SR (10 Gb/s SFP+ SR optical module). 21 = 10GBASE-LR (10 Gb/s SFP+ LR optical module). 22 = 10GBASE-SFP + Cu (direct attach copper). 23 = 10GBASE-CR1 (4x10 Gb/s QSFP+ CR over direct attach copper). 30:24 = Reserved. Other bits - Reserved, Must be zero.
			This parameter is used by the device driver to set the various PHY types' configuration parameters to be supported on the port. The port can be configured for a subset of the actual PHY types available on the port. The actual PHY types available are read by the device driver using Set PHY Config command. When auto-negotiation is enabled, the 10 GbE controller negotiates and selects one of the PHY types enabled. When auto-negotiation is disabled, this field should enable only a single value and then the 10 GbE controller is forced to operate in that selected mode.
Link Speed	4	Link Speed	Set link speed on port, only one operational speed is set by the device driver. Bit 4.1 = Reserved. Bit 4.2 = 1 Gb/s. Bit 4.3 = 10 Gb/s. Other bits - Reserved, Must be zero. This parameter is used by the device driver to set the operational link speed of the port. The 10 GbE controller might have the ability to support multiple link speeds on the same port that can be found using the Get PHY ability command (see Section 38.11.3.1.4). One of the link speeds can be enabled due to the result of auto-negotiation. This command can be used by the device driver to manually set the link speed when auto-negotiation is disabled.

Table 38-53. Set PHY Config Command Data Structure (Sheet 2 of 2)

Name	Bytes.Bits	Value	Remarks
Pause ability	5.0:5.1	Pause Ability	5.0 set to 1b to enable IEEE 802.3x Tx link pause ability, or set to 0b to disable pause ability. 5.1 set to 1b to enable IEEE 802.3x Rx link pause ability, or set to 0b to disable pause ability. Auto-negotiation might have be restarted for this configuration to take effect over the link. This parameter is used by the device driver to set the IEEE 802.3x pause ability of the port. The 10 GbE controller's pause ability can be read by using the Get Link Status or Get PHY Abilities commands. The device driver might disable the IEEE 802.3x link pause ability using this command. If the link is already up and configured, the device driver needs to restart auto-negotiation, so the updated pause ability could be advertised to the link partner in order for the setting to take effect on the link.
Low power mode	5.2	Low Power Mode	Set to 1b to enable PHY in low power mode or set to 0b for normal operation. This field is valid only if the PHY supports low power mode. Certain external PHYs connected to the port might have the ability to support low power mode. Setting the PHY in low power mode affects normal operation. This bit should be set to 0b and set restart auto-negotiation to bring the link to normal operation from low power mode.
Enable Link	5.3	Enable Link	Set to 1b to enable the link. Set to 0b to disable the link. Device driver should not force link down when port is being used for manageability or WoL.
Enable AN	5.4	Enable AN	Set to 1b to enable auto-negotiation on the link.
Enable Atomic Link Update	5.5	Enable Atomic Link Update	When this field is set to 1b, firmware automatically executes the Setup Link And Restart Auto-Negotiation command following this command. When this field is set to 0b the device driver maintains the responsibility for sending the Setup Link And Restart Auto-Negotiation command. When automatic link update is enabled, the device driver should be aware that a link change event may occur following the Set PHY Config command.
Reserved	5.6:5.7	Reserved	Reserved, must be zero.
Low Power Control	12	$D3_{COLD}$ LPAN	$D3_{COLD}$ LPAN. Bit 12.0 = Set to 0b to disable $D3_{COLD}$ low power auto-negotiation. Bit 12.0 = Set to 1b to enable $D3_{COLD}$ low power auto-negotiation. Other bits = Reserved, must be zero.
Reserved	13-15	Reserved	Must be set to 0x0, value is ignored.

The following structure describes the response by firmware to the Set PHY Config command.

Table 38-54. Set PHY Config Command Response (Opcode: 0x0601)

Name	Bytes.Bits	Value	Remarks
Flags	1:0	0x0	
Opcode	2-3	Opcode	Command opcode.
Datalen	4-5	0x0	Must be 0x0, value is ignored.
Return Value/ VFID	6-7		Return value. 0x0 command success. Returns EPERM code if the operation is not permitted.
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Param0	16-19	Reserved	Zeroed by firmware, value is ignored.
Param1	20-23	Reserved	Must be 0x0, value is ignored.
Data Address High	24-27	Reserved	Value 0x0.
Data Address Low	28-31	Reserved	

Note: When *Enable Automatic Link Update* is set to 1b, firmware sends a completion for the Set PHY Config command only after making all the necessary configuration changes and executing the Setup Link And Restart Auto-Negotiation command.

38.11.3.1.2 Set MAC Config

This command is used by the device driver to set the various MAC configuration parameters supported on the port. This status is indicated by the command response.

This is a direct command. The Set MAC command parameters data structure is placed in the command descriptor.

Table 38-55. Set MAC Config Command (Opcode: 0x0603)

Name	Bytes.Bits	Value	Remarks
Flags	1-0	0x0	
Opcode	2-3	Opcode	Command opcode.
Datalen	4-5	0x0	Must be 0x0b, value is ignored.
Return Value/ VFID	6-7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Set MAC Config	16-31	See Table 38-56	16-byte data structure that holds the Set MAC Config command parameters is listed in Table 38-56.

Table 38-56 lists the data structure of the Set MAC Config command parameters such as max frame size, etc.

Table 38-56. Set MAC Config Command Data Structure (Sheet 1 of 2)

Name	Bytes.Bits	Value	Remarks
Max Frame Size	0-1	Max Frame Size	16-bit value used to set the maximum frame size of the Ethernet frame on the port. This parameter is used by the device driver to set the maximum frame size on the port both for Rx and for Tx. This parameter should be set to the maximum expected L2 packet size. It is ~1.5 KB or ~9.5 KB depending if jumbo packets are expected on the link.
Reserved	2.0-2.01	Reserved	Must be 0x0.
CRC Enable	2.2	CRC Enable	Bit 0 = Set to 1b to enable the MAC to append the CRC on transmit. Set to 0b if software appends the CRC. This parameter is used by the device driver to enable the MAC to append the CRC on the link. This is the default configuration. This bit is set to 0b if software needs to disable the MAC to append CRC.
Pacing Config	2.3-2.6	Pacing Config	Bit 3:0 = This is 4 bit field that allows configuring PACE parameter in the MAC to slow down the effective data rate as defined in Table 38-36.
Auto Drop blocking packets	2.7		This bit controls the behavior when a no-drop packet is blocking a TC queue. 0b - The PF driver is notified. 1b - The blocking packet is dropped and then PF driver is notified.
Transmit Timer Priority	3	Transmit Timer Priority	This field selects the priority <n> whose Transmit Time Value field should be updated with the value provided in this command.
Transmit Timer Value	4-5	Transmit Timer Value	This is the priority <n> timer value that is included in the XOFF frames being transmitted. <n> is selected in the <Transmit Timer Priority> field previously described. <n> = 0 is used for Link Level FC.

Table 38-56. Set MAC Config Command Data Structure (Sheet 2 of 2)

Name	Bytes.Bits	Value	Remarks
FC Refresh Threshold	6-7	FC Refresh Threshold	This field represents the number of slot times before XOFF expires and a new XOFF is sent. This value is used to calculate the actual refresh period for sending the next pause frame if conditions for a pause state are still valid.
Reserved	8-15	Reserved	Must be 0x0.

The following data structure describes the response by firmware to the Set MAC Config command.

Table 38-57. Set MAC Config Command Response (Opcode: 0x0603)

Name	Bytes.Bits	Value	Remarks
Flags	1-0	0x0	
Opcode	2-3	Opcode	Command Opcode.
Datalen	4-5	0x0	Must be 0x0, value is ignored.
Return Value/ VFID	6-7		Return Value 0x0 = Command success. Returns EPERM code if the operation is not permitted.
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Reserved	16-31	Reserved	Value 0x0.

38.11.3.1.3 Setup Link And Restart Auto-Negotiation

This command is used by the device driver to setup the link and execute previously sent Set PHY Config commands as well as restart the auto-negotiation over the link. This command needs to be executed for any change in link parameters, such as set link speed, etc., to take effect.

Table 38-58. Restart AN Command (Opcode: 0x0605)

Name	Bytes.Bits	Value	Remarks
Flags	1-0	0x0	
Opcode	2-3	Opcode	Command opcode.
Datalen	4-5	0x0	Must be 0x0, value is ignored.
Return value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Command Flags	16	Command	Bit 16.1: — Set to 1b to restart the link. Bit 16.2[1]: — Set to 1b to enable link. — Set to 0b to disable link. Other bits = Reserved, must be zero. This command maybe executed automatically by firmware, following a Set PHY Config command. In such a case these bits are assigned by firmware as follows: Bit 16.1 is set to 1b. Bit 16.2 is copied from the Set PHY Config <Enable Link> field.
Reserved	17-31	Reserved	Must be 0x0, value is ignored.

Notes:

1. Used by the device driver to enable/disable the link without modifying the other link settings. This is useful at POR when an application needs to have link powered down until the device driver loads.

The following structure describes the response by firmware to the Restart Auto-negotiation command.

Table 38-59. Restart Auto-negotiation Command Response (Opcode: 0x0605)

Name	Bytes.Bits	Value	Remarks
Flags	1-0	0x0	
Opcode	2-3	Opcode	Command opcode
Datalen	4-5	0x0	Must be 0x0, value is ignored.
Return Value/ VFID	6-7		Return Value 0x0 = Command success
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Reserved	16-31	Reserved	Value 0x0

38.11.3.1.4 Get PHY Abilities

This command is used by the device driver to find out the various PHY abilities supported on the port.

This is a Direct command.

Table 38-60. Get PHY Abilities Command (Opcode: 0x0600)

Name	Bytes.Bits	Value	Remarks
Flags	1-0	0x0	
Opcode	2-3	Opcode	Command opcode
Datalen	4-5	0x0	Must be 0x0, value is ignored.
Return value/VFID	6-7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Param0	16-19		First Command Parameter 16.0 Report qualified modules. List of qualified modules will be part of the response only when this bit is set to 1b. 16.1 Report Active/Init. 0b = Report the ACTIVE values. For example, the values assigned to each parameter following the last Set PHY Config command. 1b = Report the initial values of the different fields. For example, the values loaded after the last reset event. All other bits are reserved.
Param1	20-23		Second command parameter
Data Address High	24-27	Buff Address	High bits of buffer address
Data Address low	28-31	Buff Address	Low bits of buffer address

Table 38-61 lists the get PHY abilities response structure returned by firmware to the Get PHY Abilities command.

Direct response, opcode and get PHY abilities response data structure are placed in the descriptor.

Table 38-61. Get PHY Abilities Command Response (Opcode: 0x0600)

Name	Bytes.Bits	Value	Remarks
Flags	1-0	0x0	
Opcode	2-3	Opcode	Command opcode
Datalen	4-5	0x0	Must be 0x0, value is ignored.
Return value/VFID	6-7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Param0	16-19		Reserved. Must be set to 0x0.
Param1	20-23		Reserved. Must be set to 0x0.
Data Address High	24-27	Buff Address	Buffer address Buffer content is listed in Table 38-62.
Data Address Low	28-31	Buff Address	

Table 38-62 lists the data structure of the Get PHY Abilities command response. The command response returns various PHY parameters such as PHY type, PHY ID, speed ability, pause ability, etc. The following table lists the format of the buffer content for the Get PHY Abilities reply.

Table 38-62. Get PHY Abilities Command Response Data Structure (Sheet 1 of 3)

Name	Bytes.Bits	Value	Remarks
PHY Type	0-3	PHY Type	PHY Type Supported On The Port One bit per PHY type. The 10 GbE controller might be capable of supporting multiple PHY types. The following parameter indicates the bit number. 00 = Reserved 03 = 10GBASE-KR. 06 = Reserved. 07 = SFI. 11 = 10GBASE-CR1 (used with 4x10 Gb/s QSFP+ direct attach copper). 17 = Reserved 18 = 1000BASE-T. 19 = 10GBASE-T. 20 = 10GBASE-SR (10 Gb/s SFP+ SR optical module). 21 = 10GBASE-LR (10 Gb/s SFP+ LR optical module). 22 = 10GBASE-SFP+ Cu (direct attach copper). 23 = 10GBASE-CR1 (4x10 Gb/s QSFP+ CR over direct attach copper). 24 = Reserved Other bits - Reserved, must be zero. This parameter is used by the device driver to find out the various PHY types supported on the port. The 10 GbE controller might support multiple PHY types on the same port. One of the PHY types might be enabled due to the result of auto-negotiation or manually set by the firmware when auto-negotiation is disabled.

Table 38-62. Get PHY Abilities Command Response Data Structure (Sheet 2 of 3)

Name	Bytes.Bits	Value	Remarks
Link Speed Ability	4	Link Speed	Link rate supported on the port. Bit 4.1 = Reserved. Bit 4.2 = 1 Gb/s. Bit 4.3 = 10 Gb/s. Other bits - Reserved, must be zero. This parameter is used by the device driver to find out the various link speeds supported on the port. The 10 GbE controller might have the ability to support multiple link speeds on the same port. One of the link speeds might be enabled due to the result of auto-negotiation or manually set by the device driver when auto-negotiation is disabled.
Pause Ability	5.0:5.1	Pause Ability	Zero returns 1b if the port supports IEEE 802.3x Tx link pause or returns 0b otherwise. One returns 1b if the port supports IEEE 802.3x Rx link pause or returns 0b otherwise. This parameter is used by the device driver to find out the IEEE 802.3x pause ability of the port.
Low Power Ability	5.2	Low Power Ability	Returns 1b if the PHY has low power ability or returns 0b otherwise. Certain external PHYs connected to the port might have the ability to support low power mode. Setting the PHY to low power mode affects normal operation.
Link Mode	5.3	Link Mode	0b = Link is disabled. 1b = Link is enabled.
AN Mode	5.4	AN Mode	1b = AN is enabled. 0b = AN is disabled.
Enable Module Qualification	5.5	Enable Module Qualification	Returns 1b if a external module or PHY qualification check is enabled.
Reserved	5.6:5.7	Reserved	Reserved, must be 0b.
Low Power Control	12	D3ColdLPAN	$D3_{COLD}$ LPAN. Bit 0: 0b = $D3_{COLD}$ low power auto-negotiation disabled. 1b = $D3_{COLD}$ low power auto-negotiation enabled. Other bits = Reserved, must be zero.
Reserved	13-15	Reserved	Reserved, must be zero.
Current PHY ID/ Vendor OUI	16-19	PHY ID/OUI	This parameter is used by the device driver to find out the PHY/module ID connected on the port. If the 10 GbE controller is connected to an external BASE-T PHY: This four-byte field returns the {OUI, Manufacturer Model#, Revision ID} as defined in IEEE 802.3, 22.2.4.3.1 PHY Identifier (Registers 2 and 3). Bytes 17:16 = Register3. Bytes 19:18 = Register2. If the 10 GbE controller is connected to an external module: This field returns the three-byte vendor OUI of the module (MSB is padded with zeros).

Table 38-62. Get PHY Abilities Command Response Data Structure (Sheet 3 of 3)

Name	Bytes.Bits	Value	Remarks
Current Module Type	20-22	Module Type	Returns the three-byte module ID. First byte: Module identifier. Defined by SFP+ (Addr 0xA0, Byte 0) or QSFP+ (Addr 128, page 0) specifications. Second byte: The following bits might be set to indicate the supported technologies: 0 = SFP+ Cu passive. 1 = SFP+ Cu active. 4 = 10G Base-SR. 5 = 10G Base-LR. 7:6 = Reserved. Remaining bits are reserved. Third byte: GbE compliance code. Defined by SFP+ (Addr 0xA0, Byte 6) or QSFP+ (Addr 134, page0) specifications. This parameter is used by the device driver to find out the module type on the port when connected to external modules. For example, the 10 GbE controller might be connected to an SFP+ or QSFP+ optical or direct attached copper modules. The format of the module type returns the ID and Ethernet compliance code fields as defined in the SFP+ or QSFP+ specifications. There is no separate Ethernet compliance code for SFP+ copper modules. It is reported in a separate byte in SFP+ module. However, the 10 GbE controller uses the unused bits in second byte to report SFP+ direct attach cables.
Qualified Module Count	23		Number of qualified modules to be listed in the following bytes.
Qualified Module ID-n	24+n*24 - 47+n*24		This is a list of qualified modules that are supported by the 10 GbE controller and might be connected. The list contains a 24-byte field per module, based on IEEE Std 802.3 definition of device ID, containing: Vendor OUI (3 bytes). Reserved (1 bytes). Vendor Part# (16 bytes). Vendor Rev# (4 bytes).

38.11.3.1.5 Get Link Status

This command is used by the device driver to find out the link status of the port. Firmware returns link status = up when the link is available for transmission/reception. This command also returns other operating parameters of the link such as negotiated speed, PHY type, etc.

This is a Direct command.

Table 38-63. Get Link Status Command (Opcode: 0x0607) (Sheet 1 of 2)

Name	Bytes.Bits	Value	Remarks
Flags	1-0	0	
Opcode	2-3	Opcode	Command opcode.
Datalen	4-5	0	Must be 0x0, value is ignored.
Return value/VFID	6-7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.

Table 38-63. Get Link Status Command (Opcode: 0x0607) (Sheet 2 of 2)

Name	Bytes.Bits	Value	Remarks
Command Flags	16-17	Reserved	16.1:0. 0 = NOP: LSE notification value is not modified and Get Link Status response returns the most updated value of enable/disable. 1 = Reserved. 2 = Disable link status event notification to software. 3 = Enable link status event notification to software. See Section 38.11.3.1.6 for details on LSE and enabling/disabling LSE events. All other bits are reserved. Must be 0x0, value is ignored.
Reserved	18-31	Reserved	Must be 0x0, value is ignored.

The following structure describes the response by firmware to the Get Link Status command.

Table 38-64. Get Link Status Response (Opcode: 0x0607)

Name	Bytes.Bits	Value	Remarks
Flags	1-0	0x0	
Opcode	2-3	Opcode	Command opcode.
Datalen	4-5	0x0	Must be 0x0, value is ignored.
Return value/VFID	6-7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Command Flags	16-17	Command Flags	Bit 0 = LSE enable: Enable link status event notification to software. Firmware sets this bit to 1b to indicate that LSE is enabled or sets to 0b if LSE is disabled. See Section 38.11.3.1.6 for further details on LSE and enabling/disabling LSE events. All other bits are Reserved. Must be 0, value is ignored.
Get Link Status	18-31	See Table 38-65	14-byte data structure that holds the Get Link Status command response parameters listed in Table 38-65.

Table 38-65 lists the data structure of the Get Link Status command parameters such as link up/down, negotiated/operating speed, fault conditions, etc.

Table 38-65. Get Link Status Response Data Structure (Sheet 1 of 3)

Name	Bytes.Bits	Value	Remarks
PHY Type	0	PHY Type	Returns operating PHY type or PHY type negotiated if auto-negotiation is enabled. The 10 GbE controller might be capable of many different PHY types but only one PHY type is enabled as result of configuration or auto-negotiation. This parameter is an 8-bit integer, each value corresponds to a PHY type as follows. 0x0 = Reserved. 0x1 = 1000BASE-KX. 0x3 = 10GBASE-KR. 0x6 = Reserved 0x7 = SFI. 0xB = 10GBASE-CR1 (used with 4x10 Gb/s QSFP+ direct attach copper). 0xC = SFP+ active direct attach. 0xD = QSFP+ active direct attach. 0x12 = 1000BASE-T. 0x13 = 10GBASE-T. 0x14 = 10GBASE-SR (10 Gb/s SFP+ SR optical module). 0x15 = 10GBASE-LR (10 Gb/s SFP+ LR optical module). 0x16 = 10GBASE-SFP+ Cu (direct attach copper). 0x17 = 10GBASE-CR1 (4x10G QSFP+ CR over direct attach copper). 0x1D:0x1B = Reserved. 1E = Other values are not used. This parameter is used by the device driver to find out the operating PHY type on the port. One of the PHY types might be enabled due to the result of auto-negotiation/parallel detection or manually configured by firmware or software when auto-negotiation is disabled.
Link Speed	1	Link Speed	Returns operating link speed of the port. The PHY might be capable of many speeds but only one speed is enabled as result of configuration or auto-negotiation. This parameter is an 8-bit field, each bit corresponds to a link speed as follows. Only one bit is set at any given time. 1.1 = Reserved. 1.2 = 1000 Mb/s. 1.3 = 10 Gb/s. Other = Reserved, must be zero. This parameter is used by the device driver to find out the operating Link speed on the port. The link might be enabled at one of the link speeds due to the result of auto-negotiation/parallel detection or manually configured by firmware or software when auto-negotiation is disabled.
Link Status	2.0	Function Link Status	Returns 1b if link status = up or returns 0b if the link status = down. In SFP setup it is the port link status. This parameter indicates if the Link is up and ready for data communication.
Link Fault	2.1:2.4	Link Fault	Bit 2.1 = Returns 1b if PHY has detected a link fault condition. The fault could be anywhere in the PHY layer and either on transmit or receive local or remote fault. The following bits provide additional information about a link fault condition. Bit 2.2 = Returns 1b if a transmit link fault condition is detected, 0b otherwise. Bit 2.3 = Returns 1b if a receive link fault condition is detected, 0b otherwise. Bit 2.4 = Returns 1b if a remote fault condition detected, 0b otherwise.
External Port Link Status	2.5	Port's Link Status	Returns 1b if link status = up or returns 0b if the link status = down. This bit returns always the port's link status in SFP mode.

Table 38-65. Get Link Status Response Data Structure (Sheet 2 of 3)

Name	Bytes.Bits	Value	Remarks
Media Available	2.6	Media Available	Returns 1b if media is available for normal link communication or returns 0b otherwise. This parameter is used by the device driver to find out if the media is available on the port. When connected to an external module, this command returns if the media is plugged in and is available for normal communication. ***Note:*** This field is not relevant when connecting to an external 10GBASE-T PHY.
Signal Detect	2.7	Signal Detect	Returns 1b if a receive signal is detected by the PHY or module, or returns 0b otherwise. In the case of external PHYs, for example, this maps to the global signal detect function in the PHY and in some of the PHYs this maps to energy detect function on the link. In the case of external modules, this maps to the inverse of loss of signal function.
AN Completed	3.0	AN Completed	Returns 1b if auto-negotiation completed successfully or returns 0b otherwise. This bit is valid only if the PHY supports auto-negotiation and auto-negotiation is enabled. Typically auto-negotiation is enabled for backplane and BASE-T PHYs.
LP AN Ability	3.1	LP AN Ability	Returns 1b if the link partner is able to perform auto-negotiation or returns 0b otherwise. This bit is valid only if the PHY supports auto-negotiation and auto-negotiation is enabled.
Parallel detection Fault	3.2	Parallel Detection Fault	Returns 1b if the PHY detects parallel detection fault or returns 0b otherwise. This bit is valid only if the PHY supports auto-negotiation with parallel detection enabled.
FEC Enabled	3.3	FEC Enabled	Returns 1b if FEC is enabled on the link or returns 0b otherwise. This bit is valid only for backplane KR. FEC might be enabled on the link during auto-negotiation.
Low Power State	3.4	Low Power State	Returns 1b if the PHY is in a low power state or returns 0b otherwise.
Link Pause Status	3.5:3.6	Link Pause Status	Bit 3.5 - Returns 1b if Tx link pause is enabled on the link during auto-negotiation or returns 0b otherwise. Bit 3.6 = Returns 1b if Rx link pause is enabled on the link during auto-negotiation or returns 0b otherwise. Link pause should be disabled if PFC is enabled on the link. Simultaneous operation of link pause and PFC is not supported.
Qualified Module	3.7	Qualified Module	When the 10 GbE controller is connected to an external SFP+/QSFP+ module, this field indicates if the module is a qualified module whose OUI matches one of the pre-defined qualified modules. 0b = Module was not found in pre-configured list of qualified modules. 1b = Module is qualified.
PHY Temp Alarm	4.0	PHY Temp Alarm	Returns 1b if a temperature alarm condition is reported by the PHY or returns 0b otherwise. Typically an external PHY generates a temperature alarm condition by signaling a PHY interrupt to firmware. The temperature alarm feature should be enabled in the PHY to generate this condition.
Excessive Link Errors	4.1	Excessive Link Errors	Returns 1b if an excessive errors over the link condition is reported by the PHY or returns 0b otherwise.
Port TX Suspended	4.2-4.3	Port TX Suspended	0 = Port's Tx active. 1 = Port's Tx suspended and drained. 2 = Reserved. 3 = Port's Tx suspended and drained. Blocked TC pipe flushed.
Reserved	4.45-4.7	Reserved	Reserved.
Reserved	5	Reserved	
Max Frame Size	6-7	Max Frame Size	Maximum frame size set on this port.
Reserved	8.0-8.1		Must be 0b.
CRC Enable	8.2	CRC Enable	1b = CRC append is enabled on this port. 0b = CRC append is disabled on this port.

Table 38-65. Get Link Status Response Data Structure (Sheet 3 of 3)

Name	Bytes.Bits	Value	Remarks
Pacing Config	8.3-8.6	Pacing Config	This is 4-bit field that enables configuring a pace parameter in the MAC to slow down the effective data rate as listed in Table 38-36.
Reserved	8.7		Must be 0b.
Reserved	9-13	Reserved	Reserved.

38.11.3.1.6 Link Status Event (Opcode: 0x0607)

The Link Status Event (LSE) is generated by firmware to the device driver when there is a change in status in any of the event causing conditions. Event causing conditions listed in Table 38-66 can be individually masked from generating LSE by using the Set Event Mask Command (See Section 38-67). The LSE uses the same link status response data structure listed in Table 38-64 and Table 38-65. Firmware posts this data structure to the admin receive queue with the Flags.*CMP* bit cleared indicating that this is an asynchronous event generated by firmware (such as the message is not in response to an AQ command from software).

The LSE is disabled by default, unless explicitly enabled by software. Software enables an LSE by setting the *LSE Enable* bit when issuing Get Link Status command (See Table 38-63). Firmware disables the LSE immediately after generating an LSE and does not queue further events until LSE is explicitly enabled by software by the Get Link Status command. Firmware also indicates the LSE enabled status through the *LSE Enable* bit in the Get Link Status command response data structure (See Table 38-64).

The LSE is only generated by firmware to respective PF drivers and it is software's responsibility to communicate relevant link status change events to the VF through appropriate PF to VF communication mechanisms. Software is not expected to use any hardware link status interrupt mechanisms. Hardware link status change interrupts are provided only for diagnostic use. Hence, hardware link status interrupts to PFs and VFs should be disabled for normal operation. Software should use the AQ mechanism to get the link status change notifications using the Get Link Status command and LSE.

Table 38-66. Reported Link Events

Event	Description
Link Change	Link state change. For example, the link state changes from link up to link down.
Media Not Available	Event is reported when an external module is pulled out of its cage.
Link Fault	
PHY Temperature Alarm	Event is generated when an external PHY or module generates a temperature alarm interrupt.
Excessive Errors	
Signal Detect Condition	Signal detect of Link Partner's laser signal indication has been asserted or de-asserted.
Auto-Negotiation Completed	
Module Qualification Failure	When working with external modules, firmware might be enabled to perform a validation process where the module ID parameters are compared with a per-configured, NVM loaded, list of qualified modules. If, qualification check is enabled and connected module is not found in the list, then firmware terminates the link initialization process and then generates this event.
Port Tx Suspend	Indicates that the port's Tx data path is temporarily suspended for configuration purposes.

38.11.3.1.7 Set Event Mask

This command is used by the device driver to mask the event causing conditions of the link status event from firmware. The link status event is generated by firmware to the PF as described in Section 38.11.3.1.6.

This is a Direct command.

Table 38-67. Set Event Mask Command (Opcode: 0x0613)

Name	Bytes.Bits	Value	Remarks
Flags	1-0	0x0	
Opcode	2-3	Opcode	Command opcode.
Datalen	4-5	0x0	Must be 0x0 value is ignored.
Return Value/ VFID	6-7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Data Address High	16-19	Reserved	Value 0x0.
Data Address Low	20-23	Reserved	
Event Mask	24-25	Event Mask	
Reserved	26-31	Reserved	

The following structure describes the response by firmware to the Set Event Mask command.

Table 38-68. Set Event Mask Command Response (Opcode: 0x0613)

Name	Bytes.Bits	Value	Remarks
Flags	1-0	0x0	
Opcode	2-3	Opcode	
Datalen	4-5	0x0	
Return Value/ VFID	6-7		
Cookie High	8-11	Cookie	
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Reserved	16-31	Reserved	Must be 0x0, value is ignored.

38.11.4 Non-Volatile Memory (NVM)

38.11.5 General Overview

There are new conditions specific to the 10 GbE controller that induced a new approach concerning NVM access:

- LAN and RDMA traffic can be handled only if the EMP code runs.
- For flexibility reasons, the main EMP code is retrieved from the NVM and not from ROM.

38.11.5.1 Requirements on NVM Access

The basic requirements from NVM access in the 10 GbE controller include the following:

1. Guarantee that only Intel provided firmware code (EMP, PE) is run by the 10 GbE controller.
   a. Intel prevents older NVM images from replacing newer NVM images with an incremented rollback revision number. Note the rollback revision number is separate from any other version fields, that might be used to distinguish versions of NVMs that modify functionality or device settings.

2. Protect NVM update flow from power failure before completion. This implies the image-update procedure of modules uses a double-bank policy.
3. Meet the boot time requirements.
4. Guarantee that NVM settings that are critical for the 10 GbE controller's accessibility from the host be provided only by Intel, but can still be replaced in the field with another Intel provided setting if necessary. It relates to the following NVM module:
   a. RO PCIR registers auto-load

Requirements 1 and 4 imply that the contents of several modules be protected via authentication while others be made RO. Refer to Section 38.11.13 for details about NVM authentication.

38.11.5.2 Operational Limitations

The NVM protection method selected in the 10 GbE controller relies on an authenticate on update concept. It means that the protected modules are not authenticated after initialization, but only before committing to a module update operation. NVM protection is guaranteed by an induction authentication chain, starting from a first secured NVM image and requiring that any step taken later on for modifying the image be secured.

This method induces several limitations and restricted working assumptions:

1. A first good EMP image is loaded into the Flash at the manufacturing site that is assumed to be safe. For example, it can be done as part of the full chipset NVM programming.
   a. It assumes customers (OEM and end-user) know the source of the installed components, the supply chain producing these components is not compromised during manufacturing, and after being deployed the NIC/LOM is *physically* protected from modification.
   b. The possibility exists that unauthorized firmware be loaded into the 10 GbE controller via physical modification post manufacturing, as well as supply chain vulnerabilities. However, firmware updates via programmatic (software) methods are enhanced to require authentication prior to updating NVM settings. Furthermore, host software can independently detect whether the firmware image has an invalid digital signature.
2. In normal operating mode, NVM write accesses are controlled by the 10 GbE controller (by EMP) and cannot be performed via the memory mapped accesses. Memory mapped NVM access remains available for NVM read accesses only. For simplicity and flexibility reasons, NVM write accesses (except for VPD) can be initiated only via an admin command or following to a BMC command, which are both handled by the EMP.
3. All supported Flash parts share the same set of opcodes used by the 10 GbE controller.
4. The blank Flash programming mode is not safe, and must therefore be used only as a last resort to recover from initial mis-configuration. This programming mode is entered either:
   a. When a blank Flash is detected.
   b. When the EMP image loaded (even if authenticated by Intel) does not belong to the 10 GbE controller.

When the host debug mode is entered via DEBUG_EN pin, the host can remove address protection of the PF space and write into the register that controls the blank Flash programming mode.

38.11.6 Shared External Flash

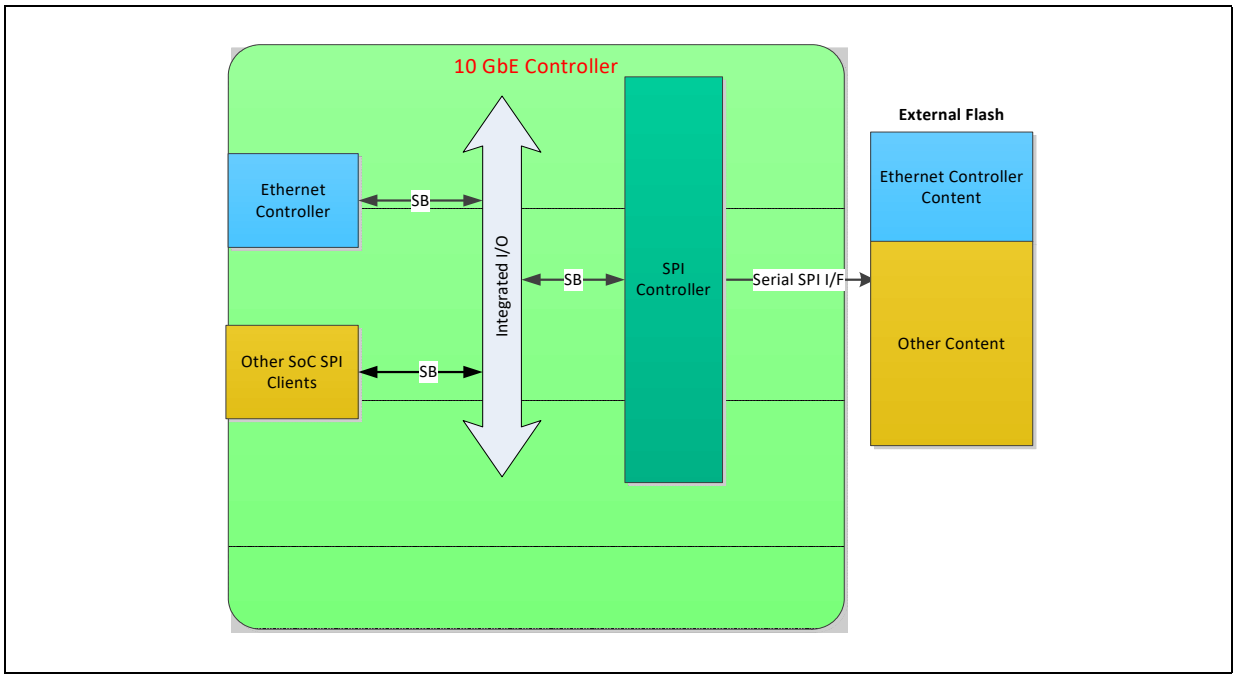
In the 10 GbE controller, the external Flash is shared between several soft IPs. In order to manage the arbitration between these different clients as well as for simplicity and centralization of the physical access logic an additional soft-IP is added: the SPI controller.

The SPI controller is responsible for the following tasks:

- Perform arbitration between the different clients.
- Manage the access control to the different regions.
- Reflect a zero-base address to each of the clients such as each client's first address is address zero.
- Enable access for a software tool for global blank Flash programming.

As shown in Figure 38-18, NVM sharing enables sharing of an external Flash device for the 10 GbE controller and other 10 GbE controller clients.

Figure 38-18.Sample Shared External Flash Illustration



38.11.6.1 Shared External Flash - Blank Flash Programming

In devices supporting a shared external Flash, there are two levels of blank Flash programming, global and local.

Global blank Flash programming is a scenario where the entire Flash content is blank. This condition is identified by the SPI controller when performing its first access to the Flash in order to read its own header. In such a scenario, it is the responsibility of the SPI controller to enable access for a tool to program the full Flash content and it is up to the global Power Control Unit (PCU) to make sure that the 10 GbE controller is not taken out of reset before the Flash has been programmed.

Local blank Flash programming is a scenario where due to some local data error only the 10 GbE controller region has been corrupted and only that single region needs to be re-programmed. In this scenario, it is up to the 10 GbE controller to signal the software device driver of such a condition and to enable host access for re-writing the specific corrupted region. In this case, the host access is done through the 10 GbE controller's sideband direct access. See Section 38.11.8.2 for more details.

38.11.7 Shadow RAM

NVM modules that meet one of these criteria must also be mirrored internally into a shadow RAM that is loaded once after POR:

1. Software must be able to partially update the module without being forced to rewrite the entire module (like SMBus address, VPD, etc.).
   Unlike an EEPROM, Flash devices require rewriting an entire sector even if it comes to updating a single byte. The partial update is first performed against the shadow RAM. Later on, the 10 GbE controller commits the entire updated shadow RAM into the Flash.
2. On device-level resets (in contrast to function-level resets), the module (or parts of it) is auto-loaded by the 10 GbE controller into registers that are mapped to the host memory BAR.
   Auto-load done after PCIe fundamental resets (POR and PERST# must be completed within a bounded time, and cannot wait for the delays involved by a sector erase operation (hundreds of ms) that could have been initiated just before. Flash read accesses are suspended until a Flash sector erase operation completes. NVM auto-load performed further to device-level resets are done from the internal shadow RAM into the registers, without involving Flash read cycles.

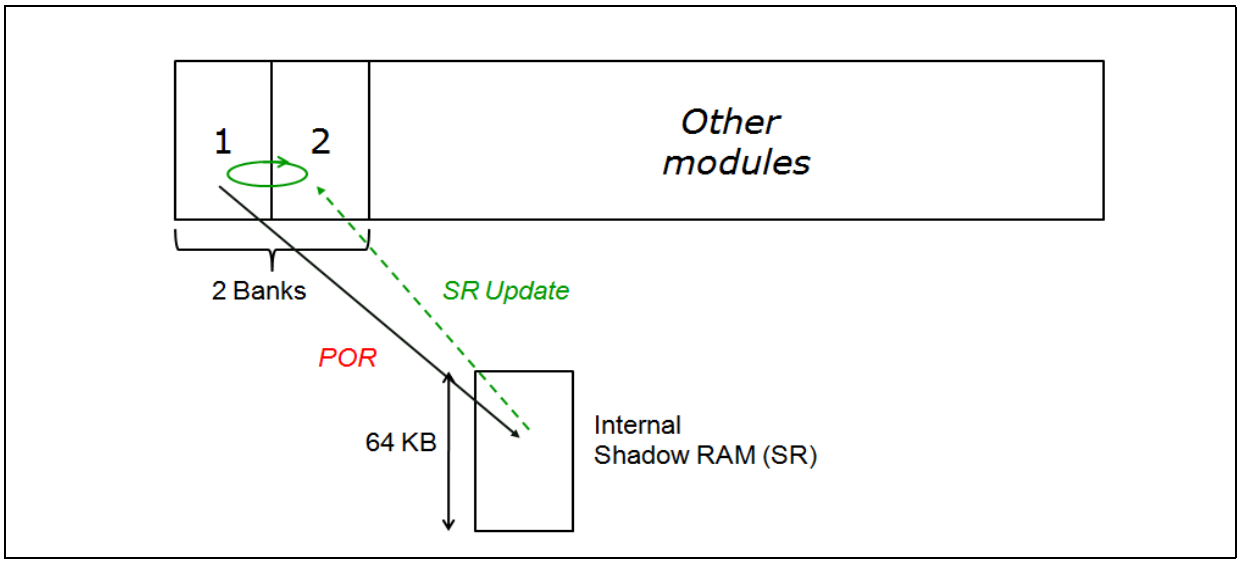
The 10 GbE controller maintains the first 32 x 4 KB sectors of the Flash area allocated to it for the configuration content that must be mirrored into the shadow RAM. These sectors are organized in two equally sized banks, each one capable of containing the entire shadow RAM contents. These banks are referred to as the basic NVM banks. At any time one of these two banks must be valid or else the 10 GbE controller is set by hardware default and enters into blank Flash programming mode (refer to Section 38.11.8.2).

Following a Power On Reset, the 10 GbE controller copies the valid bank of the Flash device into the internal shadow RAM, which is made resilient to device-level resets that might occur later on. The valid bank is the lowest indexed bank with the validity field content read as 01b. The NVM *Validity* field is located at NVM Control Word 1. At any time, the valid bank is referred to as the current basic bank, while the other is referred as the next basic bank. Any further accesses of software to this section of the NVM are directed to the internal shadow RAM. Modifications made to the shadow RAM content are then copied by the 10 GbE controller into the next bank of the NVM, flipping circularly the valid bank between bank 0 and bank 1 of the Flash.

This mechanism also provides a way for software to protect an image-update procedure from power down events by establishing a dual-bank policy even when performing a module partial update.

Figure 38-19 shows the shadow RAM mapping and interface.

Figure 38-19.NVM Shadow RAM



38.11.8 NVM Access Modes

38.11.8.1 Normal Mode

For BIOS read accesses and VPD accesses, any read or write access to the NVM by the host must be preceded by taking ownership of the NVM resource via the Request Resource Ownership admin command. This prevents the following situations:

1. Reading a module that is currently being modified by another entity.
2. Concurrent modifying a module contents.

38.11.8.1.1 Normal Read Access

Read accesses to the NVM do not require the EMP being involved (except if performed via the NVM Read admin command). Available read accesses are as follows:

1. An NVM Read admin command from the PF.
2. VPD register set. The EMP asserts the *Done* bit.
3. Memory mapped read via the memory/expansion ROM BAR. To save host memory addresses, memory BAR access to the NVM is not always available. It is enabled/disabled by setting the Flash_Expose bit in the NVM (or setting the GLPCI_LBARCTRL.FLASH_EXPOSE CSR bit).

38.11.8.1.2 Normal Write Access

Write accesses to the NVM are controlled by the EMP. Two accesses are provided:

1. An NVM Update admin command from the PF.
2. VPD register set. The EMP asserts the *Done* bit.

NVM write access attempts performed via the memory/expansion ROM BARs are not performed by the 10 GbE controller, although PCIe transactions are (apparently) normally completed.

38.11.8.2 Blank Flash Programming Mode

The 10 GbE controller enters blank Flash programming mode based on the following:

1. When a blank Flash is detected. It means that the NVM *Validity* field (NVM Control Word 1) read from the two basic banks is not equal to 01b.
2. When the EMP image read at initialization time does not belong to the 10 GbE controller.
3. When host debug mode is entered via a dedicated JTAG code (0x3E) or via setting of the DEBUG_EN pin, the host can remove address protection of the PF space and then clear the *GLNVM_FLA.LOCKED* bit. It is recommended that Flash programming platforms at manufacturing sites be provided with the JTAG and/or a strapping option as a back-up means.

This mode is not safe and must be used only at manufacturing time and/or as a last resort to recover from initial mis-configurations. Only host access to the Flash and shadow RAM is guaranteed when in this mode.

It is not recommended to enter this mode at run time because no resource ownership taking is required prior to accessing the NVM. Also, taking resource ownership requires an operational EMP, which is not the case when in this mode.

When the 10 GbE controller is in this mode (see steps 1 and 2 previously described), the EMP/PE codes are not loaded from the NVM and the EMP/PE remains disabled. The 10 GbE controller is not able to exchange any kind of traffic over the lines and no Admin command can be posted. The 10 GbE controller is in an unknown operational state where only the Flash programming flow is operational.

38.11.9 NVM Update Flows

The flows described in this section only affects normal programming mode. When in the blank Flash programming mode, refer to NVM access procedures described in Section 38.11.12.

It is assumed that an NVM update sequence does not last beyond the NVM ownership timeout for a write of three minutes. Otherwise, the sequence must be fragmented in several shorter sequences, releasing NVM ownership in between.

The software tool is responsible to re-compute and update the software checksum (word 0x3F) each time a change was made to words 0x00-0x3E further to NVM Update commands issued.

38.11.9.1 Flash High Level Map

Figure 38-20.Flash High Level Map Diagram

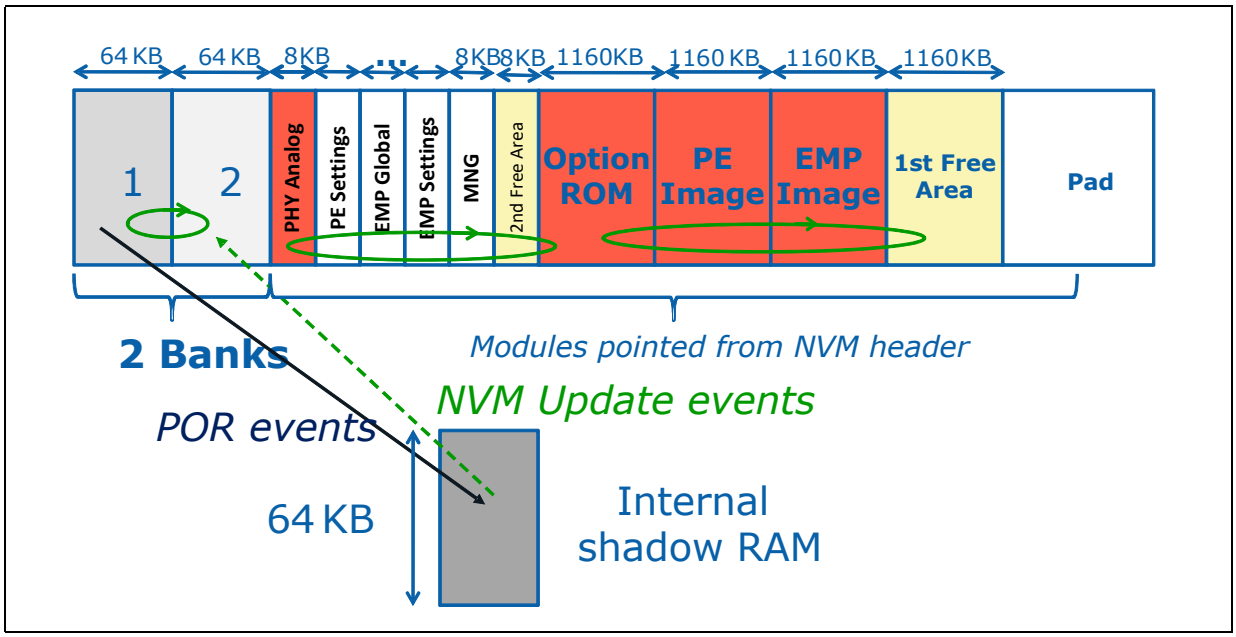


Figure 38-20 shows the high level mapping of the NVM in the 10 GbE controller. It is made of the following areas:

- **Two Basic Banks a, b** — Among other modules, it contains the VPD area. The current valid bank is mirrored into the internal shadow RAM at POR events. Changes that are made in the shadow RAM are finally dumped into the next bank, which becomes the current valid, and so forth cyclically. Refer to Section 38.11.9.2 and Section 38.11.9.3 for the update flows.
- **PE and EMP Image Areas** — Contains the firmware code to be run by PE and the EMP embedded processors. These are the only two modules which require authentication before an update. Refer to Section 38.11.9.5 for the update flow. The last 4 KB sector of the EMP image is covered by authentication but is not part of the compiled EMP code version. This sector contains commands to EMP for updating NVM RO words and modules (refer to Section 38.11.9.6). This last EMP image sector is referred as the RO commands section.
- **Expansion/Option ROM Area (OROM area)** — Contains pre-boot code and settings read by BIOS. Refer to Section 38.11.9.4 for the update flow. Pre-boot code is authenticated by BIOS at initialization time before being executed. Pre-boot code is also internally authenticated on update.
- **First free area** — The free provisioning area used for modifying one of the 1160 KB long areas such as PE or the EMP image areas. Once the new module content has been written into the first free area, the old module area is used as the new first free area, and so forth cyclically.
- **EMP Global, MNG, and EMP Settings Modules** — They contain information to be handled by the EMP. Refer to Section 38.11.9.4 for the update flow.
- **PHY Analog module**. This module is loaded by 10 GbE controller at power-up events only. Refer to Section 38.11.9.5 for the update flow.
- **Second Free Area** — The free provisioning area used for modifying one of the 8 KB long areas such as EMP settings or MNG areas. Once the new module content

has been written into the second free area, the old module area is used as the new second free area, and so forth cyclically.

Refer to Section 38-20 for the detailed NVM map.

38.11.9.2 VPD Update

38.11.9.2.1 First VPD Area Programming

The VPD capability is exposed on the PCIe interface only if the GLPCI_CAPCTRL.VPD_EN bit is set to 1b, regardless to any other sanity check that is performed on the VPD area contents.

The VPD area and VPD pointer must be written on a blank Flash and must contain a valid contents from this first programming. If the VPD *Write Enable* bit is set to 1b in NVM Security Control word (offset 0x02), the entire VPD area can be modified later on by a host via the NVM Update AQ command. If VPD tags were modified, it is required to issue a PCIe reset before write accessing the VPD area from PCIe configuration space.

VPD Area Update from PCIe Configuration Space

The flow described on this section is used once the VPD area contents and pointer have been already programmed in the NVM and loaded into the 10 GbE controller.

1. **A PF VPD Software Performs a VPD Write** — It sets write offset/data into VPD register set of the relevant PF configuration space, setting the VPD *Flag* (bit 15 in VPD Address register 0x0E2).
2. **Hardware Notifies the EMP** — It issues a internal VPD access interrupt to the EMP to notify it of the VPD access and of the PF affected.
3. **The EMP Checks that the VPD Write is Allowed** — It checks that the write offset points to the VPD-RW area (and not to a VPD RO area).
   a. If not, the EMP clears the VPD *Flag* in the PF configuration space to notify PF VPD software that the transaction completed and then exits the flow.
4. **EMP Writes the Change into Shadow RAM**.
5. **The EMP Completes the VPD Access to Software —** The EMP clears the VPD *Flag* in the PF configuration space to notify PF VPD software that the access completed.
6. **The EMP Takes Ownership Over the NVM Resources for a Write** — The EMP checks that the NVM is not busy and not owned by software. It then marks it internally to be owned by the EMP for a write operation, starting the 3-minute timer.
   - If the Flash is busy by a previous sector erase operation or if NVM ownership is held by software, it might that the flow needs to be restarted from step 1. at this stage by successive VPD write accesses initiated by VPD software. That way, successive VPD writes might generate only two next bank erase operations, one for the first and one for the last VPD write in a sequence, thus increasing Flash longevity.
7. **The EMP Erases the Next Bank** — It erases the contents of the next basic bank sectors, via the procedure described in Section 38.11.12.2.
8. **The EMP Copies Shadow RAM into the Next Bank** — It copies the shadow RAM into the next basic bank sectors with the exception of the *Validity* field, which is left as all ones.

9. **The EMP Checks the Flash Write** — The new bank content is read and checked to be identical to the shadow RAM contents. This can be done in the course of writing to the Flash using previous step.
   a. **If not (such as Flash defect), Exit the Flow**. The EMP releases the NVM ownership (internally).
   b. **If the Check was Successful, the EMP Validates the New Bank and Invalidates the Old Bank**.
      - The *Validity* field of the new bank is set to 01b. The EMP checks that the *Validity* field is read as written in the Flash. If not, then go to the previous sub-step.
      - The EMP toggles the state of the BANK1VAL bit in the GLNVM_GENS register to indicate that the non-valid bank became the valid one and vice versa.
      - The current (old) bank is invalidated by setting its *Validity* field to 00b.
      - The EMP releases the NVM ownership (internally).

Note: Users must be made aware that dumping the VPD change into the Flash might take a few hundreds of a ms after the VPD transaction completes to software (by clearing the VPD *Flag*). As a result, they must wait few seconds before they can shut down the system.

If the VPD write access is attempted by the host when the 10 GbE controller has just started a shadow RAM dump (step 8), then it might be that the write request times out.

38.11.9.3 Updating a RW Module or RW Words Mapped Inside Shadow RAM

Besides any RW word in the NVM header, the following NVM modules are affected by this flow:

- PCIR Registers Auto-load (pointed by NVM word 0x08).
- PBA Block (pointed by NVM word 0x16).
- Boot Configuration (pointed by NVM word 0x17).
- VPD Area (pointed by NVM word 0x2F) — if the VPD *Write Enable* bit is set to 1b.
- PXE Setup Options (pointed by NVM word 0x30).
- PXE Configuration Customization Options (pointed by NVM word 0x31).
- Software Alternate MAC Addresses (pointed by NVM word 0x37).
- POR Registers Auto-load (pointed by NVM word 0x38).
- Software RDMA MAC Address (pointed by NVM word 0x39)
- GLOBR Registers Auto-load (pointed by NVM word 0x3B).
- CORER Registers Auto-load (pointed by NVM word 0x3C).

The flow is as follow:

1. Software **takes ownership over the NVM resource for a write**.
2. **Software issues one or several NVM Update commands** — It posts the NVM Update admin command to the EMP with the *Authenticated* bit cleared, providing the following parameters (see Section 38.11.14.3):
   - Address in the NVM header of the pointer to the module or 0x0000 for updating a RW word of the NVM header
   - Offset inside the module
   - Buffer in host memory

- Buffer length (maximum supported is 4 KB)

If the *Last Command* bit is cleared in the command, it means that the command belongs to a complex NVM update operation made of several elementary NVM update commands that are posted in the admin queue. In between completions of elementary commands in a chain, other commands can be posted by a PF, besides other NVM-related commands. The entire NVM change is committed to the Flash part only once the last NVM command of the sequence is processed.

It is assumed that each command in the sequence leaves the shadow RAM with a usable/consistent contents as needed if a device-level reset occurs in the middle of the NVM update sequence.

The Flush on Error (FE) bit must be set for all the commands of a sequence, with the exception of the last one.

3. **The EMP checks that the command is valid and posts a response to software** — It performs the following command validity checks and posts a response (ACK/NACK) to software. If one check fails then the EMP flushes the remaining NVM update commands (if any) of the sequence and exits the flow. Otherwise, if no error is encountered, the EMP schedules the NVM command to run in a separate thread, resuming from the next step.
   a. The pointer location is not a RO module or word. The size of a RO module mapped to the shadow RAM is given at the first word of the module.
   b. The start/end offsets, once applied to the module's location in the basic bank, do not lead to addresses beyond the shadow RAM size. The start/end offsets, once applied to the module's location in the basic bank, do not overwrite contents of a RO module.
   c. If the pointer location is 0x0000, it means that the NVM update operation might affect fields in the NVM header. In that case, it must be checked that the start/end offsets does not lead to write over RO words.
4. **The EMP writes the change into shadow RAM**.
5. If the pointer is to the PFA (0x40), the EMP parses the modified PFA contents and performs the required configuration changes throughout the internal SR according to the meta-data section; otherwise, only the specific section within the PFA is updated.
   a. If items loaded at EMPR only (such as MNG filter module) were modified, firmware updates them into the device RAM or registers.
6. **If the *Last Command* bit is set in the command** — The EMP commits the change into the next basic shadow RAM bank (a or b) by performing the following steps. Otherwise, it completes the command to software, exits the flow and goes back to step 2. when the next command is posted.
7. **The EMP erases next bank** — It erases the contents of the next basic bank sectors, via the procedure described in Section 38.11.12.2.
8. **The EMP copies shadow RAM into next bank** — It copies the shadow RAM into the next basic bank sectors with the exception of the *Validity* field, which is left as all ones.
9. **The EMP checks the Flash write** — The new bank content is read and checked to be identical to the shadow RAM contents. This can be done in the course of writing to the Flash using a previous step.
   a. **If not (such as Flash defect), return an error status —** The command completes to software (in the next step) with the Flash defect error bit set.
   b. If the check was successful, the EMP validates the new bank and invalidates the old bank.

— The *Validity* field of the new bank is set to 01b. The EMP checks that the *Validity* field is read as written in the Flash. If not, then go to the previous sub-step.
— The EMP toggles the state of the BANK1VAL bit in the GLNVM_GENS register to indicate that the non-valid bank became the valid one and vice versa.
— The current (old) bank is invalidated by setting its *Validity* field to 00b.

10. **The EMP posts an event completion on ARQ to software**.
    a. **If the NVM ownership timeout for write ends before reaching this step**, the EMP flushes the remaining NVM update commands (if any) of the sequence, reporting a timeout error status.
11. **Software releases NVM ownership**.
12. **Software initiates a system reset (PERST)** for loading the modifications into the 10 GbE controller.

Note: In order to allow adding a new shadow RAM RW module in the future without requiring a new EMP image be loaded before, the list of concerned modules is not exhaustive, and therefore, the EMP must not check that the module(s) to be updated belongs to the list.

The flow used is the same as that in the previous section, with the additional step that after step 5., firmware updates the immediate fields in the PFA to reflect the change.

38.11.9.4 Reprogramming a Non-Authenticated Module Mapped Outside Shadow RAM

The following flow only supports the full module replacement via a double-bank policy. The following NVM modules are affected by this flow:

1. EMP Global (pointed by NVM word 0x09)
2. Manageability (pointed by NVM word 0x0E)
3. PE Settings (pointed by NVM word 0x3D)
4. EMP Settings (pointed by NVM word 0x0F)
5. Next bank of extension TLVs (pointed by an extension TLV in the PFA module)

Note: It is guaranteed that the contents of the last three modules in the list cannot alter the programming path from the host to the NVM. This means that the EMP cannot break further to a mis-configuration of these modules.

Modules items (steps 1. through 4.) use the second free area pointer (NVM word 0x46) for their bank swap. This free area is made up of two consecutive
4 KB sectors and it is used for the update of one module at a time.

1. Software takes ownership over the NVM resource for a write.
2. Software issues one or several NVM Erase and/or Update commands — It posts an NVM Erase/Update Admin command to the EMP, providing the following parameters (see Section 38.11.14.3):
    - Address in the NVM of the pointer to one of the modules previously listed

    It is software's responsibility to erase a Flash sector prior to writing it.

    If the *Last* command bit is cleared in the command, it means that the command belongs to a complex NVM update operation made up of several elementary NVM Update and/or Erase commands that are posted in the admin queue. In between completions of elementary commands in a chain, other commands can be posted by a PF, besides other NVM-related commands. The pointers are updated in the Flash part only once the last NVM command of the sequence is processed.

The *Flush on Error* (FE) bit must be set for all the commands of a sequence with the exception of the last one.

3. The EMP checks that the command is valid and posts a response to software — It performs the following command validity checks and posts a response (ACK/NACK) to software. If one check fails then the EMP flushes the remaining NVM update commands (if any) of the sequence and exits the flow. Otherwise, if no error is encountered, the EMP schedules the NVM command to run in a separate thread, resuming from the next step.
   a. The pointer location belongs to one of the modules in the list.
   b. The start/end offsets, once applied to the relevant free area, do not lead to addresses beyond the free area devices NVM area size.
   c. The start/end offsets, once applied to the relevant free area, do not spread over two consecutive 4 KB sectors.
4. The EMP erases/writes the free provisioning area — According to the command, the EMP erases the 4 KB sector(s) in the free provisioning area via the procedure previously described in Section 38.11.12.2 or writes the change required by the (elementary) command into it.
5. If the update sequence did not end, the EMP posts an event completion on ARQ to software — If the *Last Command* bit is cleared in the (elementary) command, the EMP completes the command and then goes to back to step 3. of this flow for the processing of the next (elementary) command of the sequence.
6. If the update sequence ended, the EMP swaps pointers — If the *Last Command* bit is set in the command, the EMP swaps between the module's pointer and the free provisioning area pointers in the shadow RAM NVM header.
7. The EMP erases the next bank — It erases the contents of the next basic bank sectors, via the procedure described in Section 38.11.12.2.
8. The EMP copies shadow RAM into the next bank — It copies the shadow RAM into the next basic bank sectors with the exception of the *Validity* field, which is left to all ones.
9. The EMP checks the Flash write — New bank content is read and checked to be identical to the shadow RAM contents. This can be done in the course of writing to the Flash using a previous step.
   a. If it is not (like Flash defect), return an error status — The EMP swaps back the two pointers in shadow RAM and the command completes to software (in the next step) with the Flash defect error bit set.
      - If the check was successful, The EMP validates the new bank and invalidates the old bank. The *Validity* field of the new bank is set to 01b. The EMP checks the *Validity* field is read as written in the Flash. If not, it goes to the previous sub-step.
      - The EMP toggles the state of the BANK1VAL bit in the GLNVM_GENS register to indicate that the non-valid bank became the valid one and vice versa.
      - The current (old) bank is in-validated by setting its *Validity* field to 00b.
10. The EMP posts an event completion on ARQ to software.
    a. If the NVM ownership timeout for write ends before reaching this step, the EMP flushes the remaining NVM update commands (if any) of the sequence, reporting a time out error status.
11. Software releases NVM ownership.

12. Software initiates a device reset (PCIR, CORER, or GLOBR) for loading the modifications into the 10 GbE controller.
13. If the module modified is the manageability or the EMP settings module, then the EMP resets itself to load the new settings into the 10 GbE controller.

Note: The contents of the old module cannot be erased by a software command prior to completing this flow.

Figure 38-21.Initial State Before the NVM Update Command

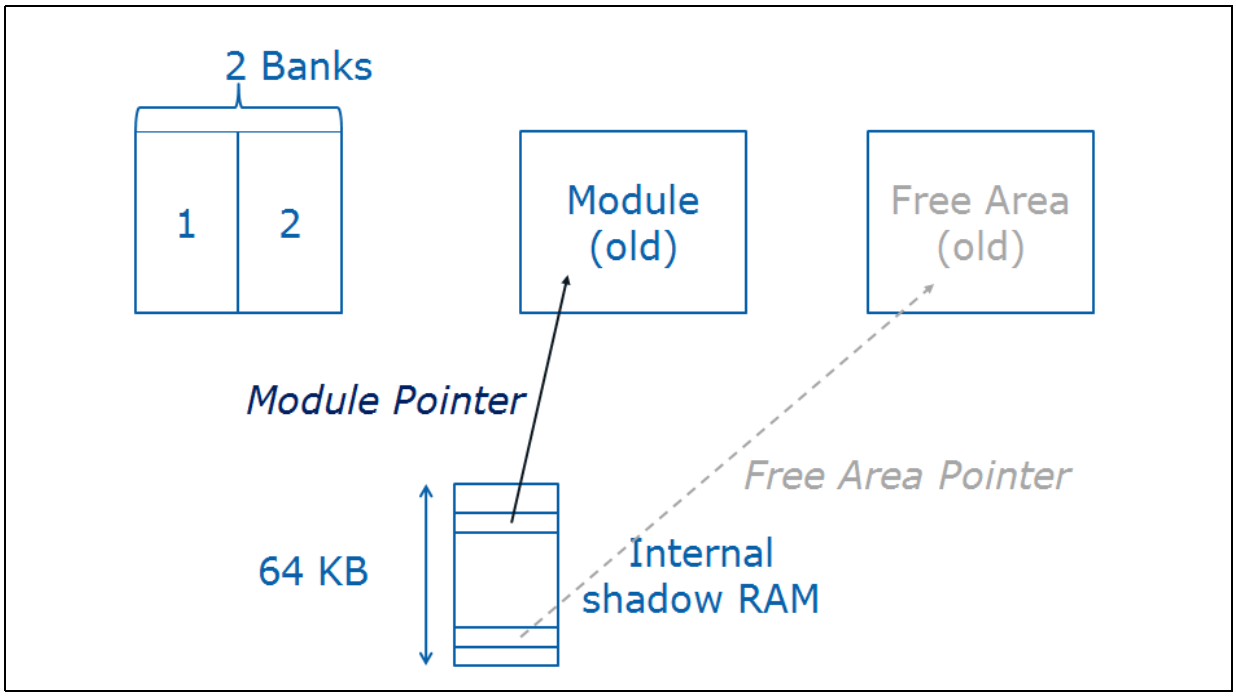

Figure 38-22.Final State After Completion of the NVM Update Command

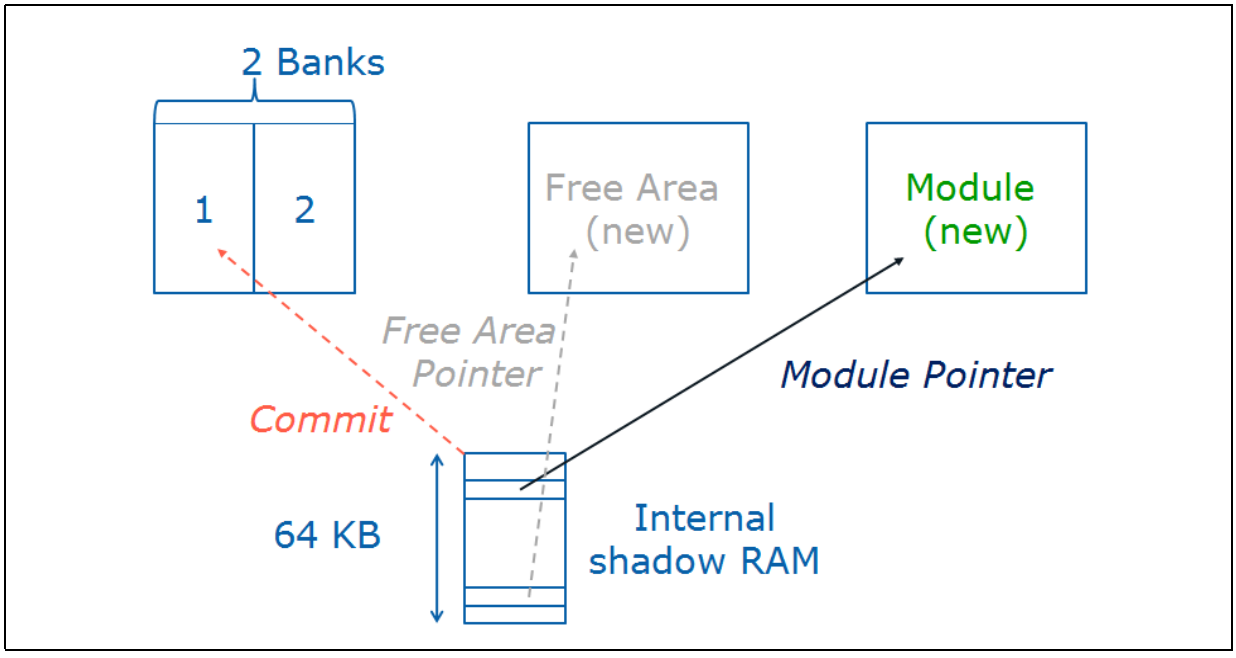


38.11.9.5 Reprogramming An Authenticated Module Mapped Outside Shadow RAM

The following flow only supports the full module replacement via a double-bank policy. The following NVM modules are affected by this flow:

1. Option ROM (pointed by NVM word 0x05)
2. EMP Image (pointed by NVM word 0x0B)
3. The first free area pointer (NVM word 0x40) is used for the bank swap modules. This free area must be sized exactly to 1160 KB. Software then takes ownership over the NVM resource for a write.
4. Software issues one or several NVM Erase and/or Update commands — It posts the NVM Erase/Update admin command to the EMP, providing the following parameters (refer to Section 38.11.14.3):
   - Address in the NVM of the pointer to one of the modules previously listed
   - Offset inside the module
   - Buffer in host memory
   - Buffer length (maximum supported is 4 KB)

   It is software's responsibility to erase a Flash sector prior to writing it.

   If the *Last Command* bit is cleared in the command, it means that the command belongs to a complex NVM update operation made up of several elementary NVM update and/or erase commands that are posted in the admin queue. In between completions of elementary commands in a chain, other commands can be posted by a PF, besides other NVM-related commands. The entire 1160 KB free provisioning area must always be written.

   It is software's responsibility to issue the required NVM Erase commands prior to issuing NVM Update commands.

   The *Flush on Error* (FE) bit must be set for all commands of a sequence with the exception of the last one.
5. The EMP checks that the command is valid and posts a response to software — It performs the following command validity checks and posts a response (ACK/NACK) to software. If one check fails then the EMP flushes the remaining NVM Update commands (if any) of the sequence and then exits the flow. Otherwise, if no error is encountered, the EMP schedules the NVM command to run in a separate thread, resuming from the next step.
   a. The pointer location belongs to one of the modules in the list.
   b. The start/end offsets, once applied to the relevant free area, do not lead to addresses beyond the free area size.
   c. The start/end offsets, once applied to the relevant free area, do not spread over two consecutive 4 KB sectors.
6. The EMP erases/writes the free provisioning area — According to the command, the EMP erases the 4 KB sector in the free provisioning area via the procedure described in Section 38.11.12.2 or writes the change required by the (elementary) command into it.
7. If the update sequence did not end, the EMP posts an event completion on ARQ to software — If the *Last Command* bit is cleared in the (elementary) command, the EMP completes the command and then goes back to step 3. of this flow for the processing of the next (elementary) command of the sequence.
8. The EMP checks the rollback revision — It checks that the rollback revision (lad_srev field in CSS header) of the new module is greater or equal to the rollback revision of the current module.

a. If the check fails, the command is completed to software with the Rollback Revision Check Fails bit set. The EMP goes to step 15.

9. The EMP checks the 10GbE controller *Blank NVM Device ID* and *Module ID* fields — it checks that the the 10 GbE controller *Blank NVM Device ID* field written in the new module is 0x154B. The EMP checks that the 30 LS bits of the *lad_module_id* field in the CSS header correspond to the module currently being updated.
   a. If one of the checks fails, the command is completed to software with the EACCES bit set. The EMP goes to step 15.
   b. Note that before authenticating the PCIe analog, PHY analog module, or option ROM module, the module must be appended with the last 330 words of the module's area, as the CSS header has been moved to the module's trailer.
10. If an update sequence ended, the EMP checks CRC8 and authenticates the module — It reads the new module from the Flash, makes sure its CRC8 is valid and then authenticates its signature according to the procedure described in Section 38.11.13. This can be done in the course of writing to the Flash using the previous steps.
    a. If one of the checks fail, the command is completed to software with the relevant error bit set, either the Public Key Check Fails bit or the Module Signature Check Fails bit. The EMP goes to step 15.
11. The EMP swaps pointers — The EMP swaps between the module's pointer and the free provisioning area pointers in the NVM header of the shadow RAM to point to the next module's bank.
12. The EMP erases next bank — It erases the contents of the next basic bank sectors, via the procedure described in Section 38.11.12.2.
13. The EMP copies shadow RAM into next bank — It copies the shadow RAM into the next bank sectors with the exception of the *Validity* field, which is left as all ones.
14. The EMP checks the Flash write — The new bank content is read and checked to be identical to the shadow RAM contents. This can be done in the course of writing to the Flash at the previous step.
    a. If not (such as Flash defect), return an error status - The EMP swaps back the two pointers in the shadow RAM and the command is completed to software (in the next step) with the Flash defect error bit set.
    b. If the check completed successfully, the EMP validates the new SR bank and invalidates the old SR bank
       - *Validity* field of the new bank is set to 01b. The EMP checks the *Validity* field is read as written into the Flash. If not, it goes to the previous sub-step.
       - EMP toggles the state of the BANK1VAL bit in the GLNVM_GENS register to indicate that the non-valid bank became the valid one and vice versa.
       - The current (old) bank is invalidated by setting its validity field to 00b.
15. **If the module updated was the PE image**, the next CORER event has the effect of reloading the PE image from the Flash.
16. If the module updated was the EMP image and if the last command in the flow completed with an error, then go to next step to report the error.
17. The EMP posts an event completion on ARQ to software — It posts a completion/response to the last Admin command of the sequence.
18. If the module version is stored VPD, software might change the VPD module, which is mapped into PFA, to match the updated version loaded in the Flash.

Note: Software tools are responsible for updating the checksum field's value accordingly.

19. Software releases NVM ownership.
20. If the module updated was the EMP image, the EMP resets itself and reloads from the *new* EMP image.

Note: Contents of the old EMP/PE image cannot be erased by a software command prior to completing this flow.

38.11.9.6 Update Link Mode

This section describes the steps required to change link mode.

Software should follow the following sequence:

1. Take NVM ownership for write (using the Request Resource Ownership AQC).
2. Issue an NVM Config Read Admin command for feature 0xFFF1 (See the note that follows).
3. Compare the read selection with the desired one. If the two are identical, do nothing and exit the flow (See the note that follows).
4. Issue an NVM Config Write Admin command while using one of the command buffers described as follows (according to the desired link mode transition).
   a. Transition to 4x10 GbE: Feature_ID = 0xFFF1; Feature Options = 0x0; Feature selection = 0x0002.
5. Send NVM_Update AQC to trigger a Shadow RAM dump.
6. Wait for the NVM_Update Completion Event.
7. Release NVM ownership (using the Release Shared Resource AQC).
8. Perform PERST reset to apply the new NVM configuration. PERST triggers GLOBR internally.

Note: Steps 2 and 3 are optional.

38.11.10 NVM Clients and Low Level Interfaces

There are several clients that can access the NVM to different address ranges via different access modes, methods, and low-level interfaces. The various clients to the NVM are hardware, software tools (BIOS, etc.), drivers, EMP, PE, BMC (via EMP), and VPD software.

Table 38-70 lists the different accesses to the NVM.

Table 38-70. Clients And Access Types to the NVM (Sheet 1 of 2)

Client	NVM Access Method	Accessed Performed Against	Logical Byte Address Range	NVM Access Interface (CSRs or Other)
VPD Software	Parallel (32-bits)	Shadow RAM	0x000000 - 0x0003FF from VPD module beginning	VPD Address and Data registers. Any write access is immediately pushed by the 10 GbE controller into the Flash.

Table 38-70. Clients And Access Types to the NVM (Sheet 2 of 2)

Client	NVM Access Method	Accessed Performed Against	Logical Byte Address Range	NVM Access Interface (CSRs or Other)
PF Software	Parallel via Memory (CSR)BAR (32-bits read)	Flash Part	0x000000 - 0xFFFFFF	The address is relative to the beginning of the flash.
	Parallel via Expansion ROM BAR (32 bits read only).	Flash Part	0x020000 - 0xFFFFFF	This logical address range is relative to the beginning of the expansion ROM module.
	Via AQC	Flash part/ Shadow RAM	0x000000 - 0x00FFFF	NVM Read, NVM Erase and NVM Update admin commands as described in Section 38.11.14.

38.11.10.1 Memory-Mapped Host Interface

The Flash is read by the 10 GbE controller each time the host CPU performs a read operation to a on that is within the Flash address mapping or upon boot via accesses in the space indicated by the Expansion ROM Base Address register. Accesses to the Flash are based on a direct decode of CPU accesses to a memory window defined in either:

- Memory CSR + Flash Base Address register (PCIe Control register at offset 0x10). The Flash address space is exposed to the host memory BAR when the Flash *Expose* bit is set in the NVM (or the *GLPCI_LBARCTRL.FLASH_EXPOSE CSR* bit is set) or when the 10 GbE controller is in blank Flash programming mode. The Flash size exposed is retrieved from the *GLPCI_LBARCTRL.FL_SIZE* CSR field, and is 8 MB by default (blank Flash programming mode).
- The Expansion ROM Base Address register (PCIe Control register at offset 0x30). The module address space is always exposed to the expansion ROM BAR unless the Flash is blank. The Flash size exposed is retrieved from the *GLPCI_LBARCTRL.EXROM_SIZE* CSR field, and is 512 KB by default. The 10 GbE controller is responsible to map read accesses via the expansion ROM BAR to the physical NVM. Write attempts to the Flash through this BAR are not performed, they are silently dropped. The offset in the NVM of the expansion ROM module is defined by the PCIe expansion/option ROM pointer (Flash word address 0x05). This pointer is loaded by the 10 GbE controller from the Flash before enabling any access to the expansion ROM memory space.
  - When modifying the PXE driver section pointer in the NVM, it is required to issue a PCIe reset on which the updated offset is sampled by hardware.
  - If there is no valid NVM validity field in the two basic banks, then the expansion ROM BAR is disabled.

The 10 GbE controller controls accesses to the Flash when it decodes a valid access. Out of range memory-mapped read access returns arbitrary data.

Notes:

Flash read accesses are assembled by the 10 GbE controller each time the access is greater than a byte-wide access.

The 10 GbE controller byte reads to the Flash take about 2 to 30 ms. The 10 GbE controller continues to issue retry accesses during this time.

During normal operation, the host should avoid memory-mapped accesses to the first two basic banks of the Flash because it might be non-coherent with the shadow RAM contents.

Prior to initiating an NVM read cycle via memory mapped access, PF software is required to take ownership over the NVM resources.

38.11.11 Flash Access Contention

Flash read accesses initiated through PFs might occur concurrently to the EMP modifying the NVM contents. The 10 GbE controller does not synchronize between the different entities accessing the Flash so contentions caused from one entity reading and the other modifying the same locations is possible.

To avoid such a contention between software and EMP accesses, these entities are required to make use of the NVM ownership taking/release flows for any read or write access to NVM. This is also useful to avoid the timeout of the PCIe transaction made to a memory mapped Flash address while the Flash is currently busy with a long sector erase operation.

However, two software entities cannot use the NVM ownership acquiring/release mechanisms: BIOS and VPD software.

- Since VPD software accesses only the VPD module, which is located in the first valid bank of the NVM, VPD accesses are always performed against the shadow RAM first. In this case, the EMP must take/release ownership over the NVM as if it was the originator of the Flash access. It is then hardware/EMP's responsibility to update the NVM according to the Flash update sequence described in Section 38.11.9.2.
- No contention can occur between BIOS and any other software entity (VPD included) as it accesses the NVM while the operating system is down.

However, since BIOS cannot take ownership over the NVM resource, it might be that the Flash part is not accessible when BIOS attempts reading it. This might occur if a Flash erase operation was performed just before PCIe reset. In such a case, read accesses via the expansion ROM BAR returns 0xDEADBEEF.

- It is assumed that the expansion ROM signature check performed by BIOS fails in this case.
- The EMP must avoid initiating sector erase operations at boot time.
- It is assumed and recommended that users do not attempt to update the NVM contents via the BMC while the system is re-booting.
- The BMC should delay PERST# de-assertion or boot running until after the BMC completed any OOB accesses to Flash memory. It is required to route the wake-up signal from the standby button to the BMC and not to the chipset. The BMC issues a system reboot signal to the chipset only after any NVM write access completes.
- If a system reboot is issued by a local user running on the host, there is no technical way to avoid contention in this case.

Note: It is the user's responsibility when accessing the NVM remotely via the BMC to make sure another user in not currently initiating a local host reboot there.

- The EMP is responsible to take NVM ownership on the BMC account prior to performing any NVM read or write access, which is needed for handling an NC-SI command. The NVM ownership is released by the EMP together with completing the NC-SI command. If NVM ownership is not free when processing the NC-SI command, the command completes with a package not ready status.

38.11.12 NVM Access Procedures

Any software read/write or EMP write flow described in this section (except flows executed by VPD software or by BIOS or to flows executed when in blank Flash programming mode) must be preceded by taking NVM ownership. Anytime software is taking NVM ownership, it must re-read the pointers to the module it plans to access because they might have been modified by the EMP in between two ownership takings.

Refer to section that describes NVM ownership taking/releasing procedures as well for the associated timeouts.

38.11.12.1 Flash Erase Flow By The Host

This flow is available to the software PF device driver only when the 10 GbE controller is in blank Flash programming mode.

1. Poll the *MNGSB_MSGCTL.CMDV* bit and make sure it is cleared.
2. Program 10 GbE controller registers for an Erase Message:
   a. *MNGSB_WHDR0.OPCODE_SEL* = Erase (4).
   b. *MNGSB_WHDR0.DEST_SEL* = SPI (1).
   c. *MNGSB_WHDR0.TAG* = 0.
   d. *MNGSB_WHDR1.ADDR* = Byte address of the erased sector, aligned to 4 KB.
   e. *MNGSB_WHDR2.LENGTH* = 0x10 (4 KB).
3. Trigger the Flash Erase transaction.
   a. *MNGSB_MSGCTL.MSG MODE* = Normal (0b).
   b. *MNGSB_MSGCTL.TOKEN MODE* = Normal (0b).
   c. *MNGSB_MSGCTL.HDR_DWS* = Header DWords should always be always 3 for SPI transactions.
   d. *MNGSB_MSGCTL.EXP_RDW* = 0b (no data is expected in return).
   e. *MNGSB_MSGCTL.BARCLR* = 1b (must be 1b for Erase/Write).
   f. *MNGSB_MSGCTL.CMDV* = 1b.
4. Poll the *MNGSB_MDGCTL.CMDV* until it is 0b.
5. Read *MNGSB_RSPCTL.ERR.*
   a. If ERR = 0b then transaction completed successfully.
   b. If ERR = 1b then transaction failed.
6. Steps 2 through 5 can be repeated if needed.

38.11.12.2 VPD Accesses

The VPD module (VPD area) is mapped into the valid basic bank and it is thus mirrored in shadow RAM. It is accessed by VPD software via the PCIe VPD capability structure. Refer to Section 38.11.9.2 for more details.

38.11.13 NVM Authentication Procedure

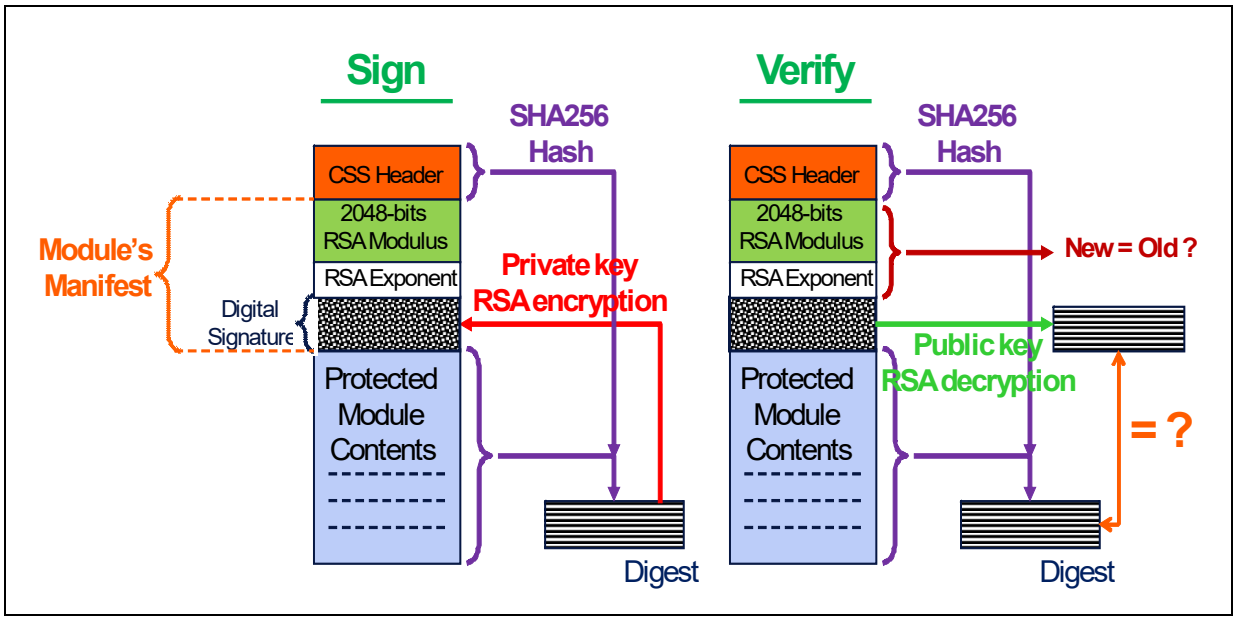
The NVM update integrity feature ensures that only Intel-approved firmware code (or another protected NVM module) is able to be updated on 10 GbE controller devices after manufacturing. This procedure is performed by a RAM-based firmware each time an attempt is made to update one of the protected modules. Refer to NVM update flows in Section 38.11.9 for more details.

Integrity validation of NVM updates is provided by means of a digital signature. The digital signature is a SHA256 hash computed over the protected content (256 bits long) that is then encrypted by a 2048-bits RSA encryption using an Intel private key. This digital signature is stored in what is called the manifest in the NVM module image. Also stored in the manifest is the corresponding RSA modulus (public key) and RSA exponent to be used to decrypt the digital signature.

To verify the authenticity of the digital signature, EMP must first verify that the RSA *Modulus* and RSA *Exponent* fields in the new module loaded are identical to those in the current module. If the RSA *Modulus* and *Exponent* fields are the same, EMP decrypts the digital signature using the 2048-bit RSA *Modulus* and *Exponent* fields stored in the manifest of the old module to extract the expected SHA256 hash of content (stored hash). EMP then performs an independent SHA256 hash over the protected content (computed hash). If the stored hash matches the computed hash, the digital signature is accepted and the NVM module update is applied.

NVM updates are validated prior to invalidating the old NVM configuration, such that the old NVM configuration is still usable if the update fails to validate. After the new NVM is successfully verified, the updated image is committed to the 10 GbE controller's Flash by the EMP.

Figure 38-23.Sign and Verify Procedures For Authenticated NVM Modules



38.11.13.1 Digital Signature Algorithm Details

As previously mentioned, the digital signature generation is a hash computation followed by an RSA encryption. This is performed within Intel as part of the NVM update image generation process and not performed by Intel software in the field, nor by the 10 GbE controller.

The algorithms used are described in the following locations:

- PKCS #1 v2.1: RSA Cryptography Standard, RSA Laboratories, June 14, 2002 - www.rsa.com
- SHA family definition - http://csrc.nist.gov/publications/fips/fips180-3/fips180-3_final.pdf
- SHA usage with digital signatures - http://csrc.nist.gov/publications/nistpubs/800-107/NIST-SP-800-107.pdf
- SHA validation vectors — http://csrc.nist.gov/groups/STM/cavp/documents/shs/SHAVS.pdf

Note: The protected module contents shown in Figure 38-23 starts with the 10 GbE controller's Blank NVM Device ID word of the NVM header and ends with the last word of the 1160 KB long EMP/PE image area, regardless of the size of the EMP/PE code and to the presence and size of a RO commands section at the last sector of the EMP image area.

38.11.13.2 Intel Key Generation And Intel Code Signing System

The integrity of NVM digital signatures requires not only robust private RSA key generation but also continued protection of these private keys into the indefinite future as well as a method to generate new signed images using the existing private keys.

Note: Not all NVM updates increment the Rollback Revision field. Rollback is allowed between supported versions and NVM configuration versions where the rollback version is the same.

38.11.13.3 Protected Modules

Any data that is modified in the field (either by the OEM during manufacturing or by the end user) cannot be included in the signed region of the NVM. The 10 GbE controller cannot generate a signed image by itself because the private key is not available to it to generate the digital signature in the NVM.

Only the following NVM modules require authentication in the 10 GbE controller. Each module is appended by its own digital signature:

- Option ROM
- NVM bank

38.11.13.4 Software Requirements

A software tool must prepare NVM images for the CSS signing step, pre-pending the CSS manifest, applying an Intel rollback revision field. After receiving the signed image, the tool merges the excluded fields back into the NVM image and performs an internal integrity check to verify that the merge was successful (such as a software computation of the digital signature passes).

SVTools (LANconf) MUST implement an NVM update image integrity check option in software prior to applying NVM updates to hardware. SVTools might integrate capabilities to generate self-signed NVM images to assist in the SV and debug process by developers.

CELO (or equivalent manufacturing diagnostics tool) must implement a test to check the GLNVM_FLA *Locked* bit state as part of manufacturing qualification. If after the NVM is programmed, and the 10 GbE controller powers up with the GLNVM_FLA *Locked* Bit not set, an inappropriate NVM image has been loaded during manufacturing (an NVM image with incorrect Flash opcodes). This represents a critical error. With GLNVM_FLA unlocked, unauthorized in-the-field updates can bypass designed firmware integrity checks.

Host software device drivers might implement an interface enabling a network administrator to perform an internal verification check of the signed NVM image. Using Windows drivers, this would take the form of an OID, which reports a SUCCESS or INVALID_PARAMETER. Using Linux, an ethtool command extension is advised to enable command line interrogation of the NVM content using the hash value build into the hardware as well as the saved CSS manifest in the NVM image.

38.11.13.5 Manufacturing Requirement

38.11.13.5.1 End-of-line Verification

OEM's must execute CELO (or an equivalent manufacturing diagnostics tool) to verify the GLNVM_FLA *Locked* bit state (as previously described).

38.11.13.5.2 Post-manufacturing Physical Modification Countermeasures

For add-in NICs and related form factors, applying a conformal epoxy encapsulation coating around the edges of NVM components (Flash and EEPROM) during manufacturing prevents them from being easily removed.

In addition, epoxy is used to coat any traces or vias that could enable direct-probing of the 10 GbE controller. The testing requirement for these coatings must be that they cannot be removed using a standard hobby knife or other hand-held tool.

Note that protection by epoxy encapsulation is just a recommendation, not a security requirement for the 10 GbE controller.

38.11.14 NVM Access Admin Commands and Events

NVM access commands are not supported when the 10 GbE controller is in the blank Flash programming mode. They are available only to the PFs once it has acquired NVM ownership.

Table 38-71. NVM Access Admin Commands And Events

Command/Event	Opcode	Brief Description	Detailed Description
NVM Read	0x0701	Read a segment from the NVM into a host buffer.	Section 38.11.14.1
NVM Erase	0x0702	Erase consecutive 4 KB sectors of the Flash.	Section 38.11.14.2
NVM Update	0x0703	Write a segment of the NVM from a host buffer.	Section 38.11.14.3
NVM Config Read	0x0704	Read Feature Selections.	Section 38.11.14.4
NVM Config Write	0x0705	Program Feature Selections.	Section 38.11.14.5

Note: All parameters in the Admin commands are defined in little endian.

38.11.14.1 NVM Read

This command is useful especially if the host memory-mapped access to the NVM was not enabled with the intent to save memory address space.

Table 38-72. NVM Read Admin Command

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0701	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value/ VFID	6-7		Must be zeroed by the software device driver.
Cookie High	8-11	Cookie	Opaque value, that is copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value, that is copied by the EMP into the completion of this command.
Command Flags	16		NVM Access Admin Command Parameters bit 0 = Last command bit, used to notify EMP that this is the last admin command of a sequence. bits 1:6 = Reserved, must be zeroed. bit 7 = Flash-only bit. When bit 7 is set, the read is done directly from the flash and not from shadow RAM. Relevant only if access address is below 64 KB. Ignored otherwise.
Module_pointer	17		Module pointer location in words from the NVM beginning. A value of 0x0000 means that the command is performed over the Flash part seen as a flat memory.
Length	18-19		Length of the section to be read, which is expressed in bytes from the offset in the module. A value of 0xFFFF means the last byte to be returned is the last byte of the module (if byte 17 was not set to 0x0000). In any case, a (single) read command is limited up to 4 KB.
Offset	20-23		Byte 23 = Reserved, must be zeroed. Bytes 22:20 = Offset in the module, which is expressed in bytes from the pointed module's beginning. This is the byte offset of the first byte returned in the data buffer.
Data Address High	24-27		Address of command buffer.
Data Address Low	28-31		

Table 38-73. NVM Read Response (Sheet 1 of 2)

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0701	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value	6-7		Return Value 0x0 = No error (success). EPERM = The module pointer location specified in the command does not permit the required operation. The word contents is not a pointer. EINVAL = Out of range offset/length (beyond the module's size). EIO = Flash defect. EBUSY = The PF is not permitted to post this command because it does not own the NVM resource. This error code is also returned if the PF attempts to post a command while another NVM command is in process.
Cookie High	8-11	Cookie	Opaque value that is copied by the EMP into the completion of this command.

Table 38-73. NVM Read Response (Sheet 2 of 2)

Name	Bytes.Bits	Value	Remarks
Cookie Low	12-15	Cookie	Opaque value that is copied by the EMP into the completion of this command.
Reserved	16		Reserved.
Module_pointer	17		Module pointer location and copied from the command.
Length	18-19		Length to be read and copied from the command. If a value of 0xFFFF was set in the admin command (and if byte 17 was not set to 0x0000), this field returns the length from the offset to the module's end.
Offset	20-23		Byte 23= Reserved, must be zeroed. Bytes 22:20 = Offset in the module, copied from the command.
Data Address High	24-27		Address of command buffer.
Data Address Low	28-31		

38.11.14.2 NVM Erase

This command is used to erase the contents of 4 KB Flash sectors.

Table 38-74. NVM Erase Admin Command

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0702	Command opcode.
Datalen	4-5		Must be zeroed by the software device driver.
Return Value/ VFID	6-7		Must be zeroed by the software device driver.
Cookie High	8-11	Cookie	Opaque value that is copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value that is copied by the EMP into the completion of this command.
Command_flags	16		NVM Access Admin Command Parameters bit 0 = Last command bit used to notify the EMP that this is the last Admin command of a sequence. bits 7:1 = Reserved, must be zeroed.
Module_pointer	17		Module pointer location in words from the NVM beginning. A value of 0x0000 means that the command is performed over the Flash part seen as a flat memory. Attempting to erase the basic banks or RO modules area is not allowed in normal operating mode. Attempting to erase the valid shadow RAM bank (SRa or SRb) or the valid NVM or OROM banks is rejected in normal operating mode. Besides 0x0000, only the address of a free provisioning area module pointer can be listed here. The next NVM bank can be erased by putting word address 0x42 in this field and the next OROM bank by work address 0x44,
Length	18-19		Length of the section to be erased, which is expressed in 4 KB sector units from the offset in the module. The module's beginning must be aligned to a 4 KB sector for the command to be valid. A value of 0xFFFF means that the last 4 KB sector to be erased is the last sector of the free provisioning area (if byte 17 was not set to 0x0000).
Offset	20-23		Byte 23 = Reserved, must be zeroed. Bytes 22: 20 = Offset in the module, which is expressed 4 KB sector index from the pointed module's beginning.
Reserved	24-27		Reserved.
Reserved	28-31		

This command is an asynchronous command. The EMP reads the command from the ATQ and writes back an immediate completion, intended only as an ACK/NACK that the command has been addressed by the EMP. The EMP checks the validity of the command and returns an error (NACK) on the ATQ completion if it is unable to process the command. If successful (ACK), the EMP then schedules the NVM erase operation to be performed by a lower priority thread, which can be preempted by other AQ commands. Once completed, the EMP posts a completion event on the ARQ. Software must hold the NVM resource lock while performing this operation and must release it once NVM operations complete. Software must not post another NVM command while this command is in process. For example, during the time between posting the request on the ATQ and receiving the completion event on the ARQ.

Table 38-75. NVM Erase Response

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0702	Command opcode.
Datalen	4-5		Reserved.
Return Value	6-7		Return Value 0x0 = No error (success). EPERM = The module pointer location specified in the command does not permit the required operation. The word contents is not a pointer to a free provisioning area or attempt to erase sectors from the basic banks. EINVAL = Out of range offset/length beyond the free area module's limits. ENOENT = The module pointed is not aligned with an 4 KB sector beginning. EBUSY = The PF is not permitted to post this command because it does not own the NVM resource. This error code is also returned if the PF attempts to post a command while another NVM command is in process.
Cookie High	8-11	Cookie	Opaque value that is copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value that is copied by the EMP into the completion of this command.
Reserved	16-31		Reserved.

Table 38-76. NVM Erase Completion (on ARQ) (Sheet 1 of 2)

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0702	Command opcode.
Datalen	4-5		Reserved.
Return Value	6-7		Return Value: 0x0 = No error (success). EIO = Flash defect.
Cookie High	8-11	Cookie	Opaque value that is copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value that is copied by the EMP into the completion of this command.
Reserved	16		Reserved.
Module_pointer	17		Copied from the command.
Length	18-19		Copied from the command. If a value of 0xFFFF was set in the admin command, this field returns the length from the offset to the module's end in 4 KB units.
Offsets	20-23	0x0	Byte 23= Reserved, must be zeroed. Bytes 22:20= Copied from the command.

Table 38-76. NVM Erase Completion (on ARQ) (Sheet 2 of 2)

Name	Bytes.Bits	Value	Remarks
Reserved	24-27		Reserved.
Reserved	28-31		

38.11.14.3 NVM Update

This command is used to write the data given by the attached buffer into a specified location in the NVM. Erasing the relevant sector(s) by posting NVM erase command(s) (see Section 38.11.14.2) is required prior to posting this command.

Table 38-77. NVM Update Admin Command (Sheet 1 of 2)

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0703	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value/ VFID	6-7		Must be zeroed by the software device driver.
Cookie High	8-11	Cookie	Opaque value that is copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value that is copied by the EMP into the completion of this command.
Command_flags	16		NVM Access Admin Command Parameters Bit 0 = Last command bit used to notify EMP that this is the last admin command of a sequence. Bits 2:1 = Preservation mode: • 00b = No preservation. Notify the EMP to avoid any field preservation during a NVM bank update. • 01b = Preserve all (default). Used to notify the EMP to preserve all the necessary customization fields during a NVM bank update. • 11b = Preserve only selected fields. Used to notify EMP to preserve only the immediate fields and section marked as such during a NVM bank update. — PCI serial ID — PF MAC addresses section — Port MAC addresses — Unicast destination address — Software RDMA MAC addresses section — SMBus addresses Bits 6:3 = Reserved, must be zeroed. Bit 7 = Flash-only bit. When bit 7 is set, any flat write (null Module_pointer) into the first 128 KB of the Flash is written directly to the Flash and not in shadow RAM. The bit has no effect when attempting a flat write outside the first 128 KB of the Flash.
Module_pointer	17		Module pointer location in words from the NVM beginning. Attempting to write a RO module is not allowed. A value of 0x00 here means that the command is performed over the Flash part seen as a flat memory. No reset or pointer switch is initiated by the 10 GbE controller in such a case. Any flat write attempt to the first 64 KB of the Flash is performed against the shadow RAM first, and then dumped to the next basic bank in the Flash (see Section 38.11.9.3). Any flat write attempt to the second 64 KB of the Flash is rejected as for write attempts to a RO module. A flat write attempt to the area of a RO module or to a RO word is rejected as well.

Table 38-77. NVM Update Admin Command (Sheet 2 of 2)

Name	Bytes.Bits	Value	Remarks
Length	18-19		Length of the section to be written, which is expressed in bytes from the offset in the module. A (single) write command is limited up to 4 KB and must not spread over two (consecutive) 4 KB sectors. Also, attempting to write a RO word invalidates the entire command. These values must be even (word alignment) when writing to CSR auto-load sections of the shadow RAM area.
Offset	20-23		Byte 23 = Reserved, must be zeroed. Bytes 22:20 = Offset, which is expressed in bytes from the pointed module's beginning. This is the byte offset of the first byte to be written. These values must be even (word alignment) when writing to CSR auto-load sections of the shadow RAM area.
Data Address High	24-27		Address of command buffer.
Data Address Low	28-31		

This command is an asynchronous command. EMP reads the command from the ATQ and writes back an immediate completion, intended only as an ACK/NACK that the command has been addressed by the EMP. The EMP checks the validity of the command and returns an error (NACK) on the ATQ completion if it is unable to process the command. If successful (ACK), the EMP then schedules the NVM erase operation to be performed by a lower priority thread, which can be preempted by other AQ commands. Once completed, the EMP posts a completion event on the ARQ. Software must hold the NVM resource lock while performing this operation and must release it once NVM operations complete. Software must not post another NVM command while this command is in process.For example, during the time between posting the request on the ATQ and receiving the completion event on the ARQ.

Table 38-78. NVM Update Response

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0703	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value	6-7		Return Value 0x0 = No error (success). EPERM = The module pointer location specified in the command does not permit the required operation. The word contents is not a pointer, or an attempt to write a RO module or word. EINVAL = Out of range offset/length (beyond the relative free area module's limits), or write spread over two (consecutive) sectors. EBUSY = The PF is not permitted to post this command because it does not own the NVM resource. This error code is also returned if the PF attempts to post a command while another NVM command is in process.
Cookie High	8-11	Cookie	Opaque value that is copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value that is copied by the EMP into the completion of this command.
Reserved	16-31		Reserved.

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0703	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value	6-7		Return Value 0x0 = No error (success). EIO = Flash defect. EACCES = Security check failed: • Public key check failed. • Module digest check failed. • Module rollback revision check failed. • Device ID check failed. • Module ID check failed.
Cookie High	8-11	Cookie	Opaque value that is copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value that is copied by the EMP into the completion of this command.
Reserved	16		Reserved.
Provisioning_pointer	17		Location in words from the NVM beginning with the free provisioning pointer used for the command. A value of 0x0000 is returned if the command was performed against the shadow RAM.
Length	18-19		Copied from the command.
Offsets	20-23		Byte 23 = Reserved, must be zeroed. Bytes 22:20 = Copied from the command.
Data Address High	24-27		Address of command buffer.
Data Address Low	28-31		

38.11.14.4 NVM Config Read Admin Command

This Admin command reads currently configured feature selections and immediate field values. The features/fields to be read are specified in the command's buffer. It can also be used for reading all features or fields. Feature or field iteration is used for that. The next Feature_ID / Field_ID to read are returned in the command response in this case.

Table 38-80. NVM Config Read Admin Command

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0704	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value/ VFID	6-7		Must be zeroed by the software device driver.
Cookie High	8-11	Cookie	Opaque value that is copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value that is copied by the EMP into the completion of this command.
Command_flags	16		NVM Access Admin Command Parameters. Bit 0 = Single/ Multiple elements. 0b = Only a single Feature_ID, Field_ID is read. 1b = Feature_ID/Field_ID iteration is used. Bit 1 = Feature/field. 0b = Feature selections are read. 1b = Immediate fields are read. Bits 2:7 = Reserved (must be set to zero).
Reserved	17	0x0	Reserved (must be set to zero).
Element Count	18-19	0x0	The number of features/fields returned (zeroed by the software device driver and written by firmware).
Feature_ID/ Field_ID	20-21	See description	Single Feature_ID/Field_ID when bit 16.0 is 0. Feature_ID when bit 16.1 is 0. Field_ID (LS word) when bit 16.1 is 1. Feature_ID/Field_ID to start reading from (iterator) when bit 16.0 is 1. Note Feature_ID/Field_ID = 0 is not valid and indicates that the command should read the data starting from the first Feature_ID/Field_ID in the array. This is only relevant when bit 16.0 is 1.
Reserved	22-23		Reserved
Data Address High	24-27		Address of command buffer.
Data Address Low	28-31		

Table 38-81. NVM Config Read Response

38.11.14.5 NVM Config Write Admin Command

This admin command writes the feature selections and the values of the immediate fields provided in the attached command buffer to the NVM.

Table 38-82. NVM Config Write Admin Command (0x0705) (Sheet 1 of 2)

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0705	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value/ VFID	6-7	0x0	Must be zeroed by the software device driver.
Cookie High	8-11	Cookie	Opaque value that is copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value that is copied by the EMP into the completion of this command.

Table 38-82. NVM Config Write Admin Command (0x0705) (Sheet 2 of 2)

Name	Bytes.Bits	Value	Remarks
Command_flags	16		NVM Access Admin Command Parameters Bit 0 = Reserved zero. Bit 1 = Feature/field. 0b = Feature selections are written. 1b = Immediate fields are written. Bit 2 = Add new configuration. 0b = Regular command. 1b = New configuration added. Bits 3:7 = Reserved, must be zero.
Reserved	17	0x0	Reserved, must be zero.
Element Count	18-19	See description	The number of features/fields in the command buffer.
Reserved	20-23	0x0	Reserved, must be zero.
Data Address High	24-27		Address of command buffer.
Data Address Low	28-31		

Table 38-83. NVM Config Write Response (0x0705)

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0704	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value	6-7		Return Value. 0x0 = No error (success). Others - Error detected in the command.
Cookie High	8-11	Cookie	Opaque value that is copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value that is copied by the EMP into the completion of this command.
Reserved	16-31		Reserved.

38.11.14.6 NVM Config Read / Write Command Buffer

Following is the format of the command buffer attached to the NVM Config Read response and to the NVM Config Write command. The buffer can either be filled with Feature selection fields or Immediate Field fields, depending on bit 16.1 in the command.

Table 38-84. Feature Buffer For NVM Config Read /Write

Parameter	Bytes.Bits	Description
Feature_ID	0-1	Feature_ID
Feature Options	2-3	Feature options for NVM_Config_Read only. Reserved for NVM_Config_Write Bit 0 = OEM only (should be set). Bit 2:1 = Reserved. Bit 3 = If set the Feature fields are mapped in Dword-wise, otherwise are word. Bit 4 = Should be set only in the 10 GbE controller when using a POR CSR. Bit 15:5 = Reserved.
Feature Selection/ Field Value	4-5	Configured feature selection for NVM_Config_Read. Requested feature selection for NVM_Config_Write.

Table 38-85. Immediate Buffer for NVM Config Read /Write

Parameter	Bytes.Bits	Description
Field_ID	0-3	Field_ID
Field Options	4-5	Field options for NVM_Config_Read Reserved for NVM_Config_Write
Field Value	6-9	Field Value

38.11.15 VPD Support

The Flash image can contain an area for VPD. This area is managed by the OEM vendor and does not influence the behavior of hardware. Word 0x2F of the Flash image contains a pointer to the VPD area in the Flash. A value of 0b in the GLPCI_CAPCTRL.VPD_EN register bit means VPD is not supported and the VPD capability does not appear in the configuration space. The register bit must be set to 1b in NVM only once the VPD area has been programmed. Refer to Section 38.11.9.2.1.

The maximum VPD area size provisioned in shadow RAM is 1 KB but it can be smaller. The VPD block is built from a list of resources. A resource can be either large or small. The structure of these resources are listed in the following tables.

Table 38-86. Small Resource Structure

Offset	0	1 — n
Content	Tag = 0xxx,xyyyb (Type = Small(0), Item Name = xxxx, length = yy bytes)	Data

Table 38-87. Large Resource Structure

Offset	0	1 — 2	3 — n
Content	Tag = 1xxx,xxxxb (Type = Large(1), Item Name = xxxxxxxx)	Length	Data

The 10 GbE controller parses the VPD structure during the auto-load process following PCIe reset in order to detect the read only and read/write area boundaries. The 10 GbE controller assumes the following VPD fields with the limitations listed.

Table 38-88. VPD Structure

Tag	Length (bytes)	Data	Resource Description
0x82	Length of Identifier String	Identifier	Identifier string.
0x90	Length of RO Area	RO Data	VPD-R list containing one or more VPD keywords.
0x91	Length of RW Area	RW Data	VPD-W list containing one or more VPD keywords. This part is optional.
0x78	n/a	n/a	End tag.

VPD structure limitations:

- The structure must start with a tag = 0x82.
- The structure must end with a tag = 0x78 before the shadow RAM's end. The tag must also be word aligned.

- If the 10 GbE controller does not detect a value of 0x82 in the first byte of the VPD area, or if no end tag is detected, or if the structure does not follow the information listed in Table 38-88, it assumes the area is not programmed:
  - Any read/write access through the VPD registers set are ignored.
  - EMP considers the VPD area as an empty module and thus allows NVM Update commands to be performed over the area pointed by the VPD area pointer, up to the start of another RO module.
  - The VPD pointer itself remains RO.
- The RO area and RW area are both optional and can appear in any order. A single area is supported by per-tag type. Refer to Appendix I in the PCI 3.0 specification for details of the different tags.
- If a VPD-W tag is found, the area defined by its size is writable via the VPD structure.
- The VPD area can be accessed through the PCIe configuration space VPD capability structure listed in Table 38-88. Write accesses to a RO area or any accesses outside of the VPD area via this structure are ignored. If the VPD *Write Enable* field is set to 1b in the NVM Security Control word, the entire VPD area can be modified via the NVM Update AQ command. Otherwise, the command is completed with an error status.
- VPD area must be mapped into the first valid basic bank of the Flash.
- VPD software does not check the NVM ownership before attempting to access the Flash via dedicated VPD registers. VPD software write access is recorded in the Flash immediately once the Flash part is available (such as not busy by a previous sector erase operation). Refer to Section 38.11.9.2 for more details.

38.12 General Purpose I/O (GPIO)

The 10 GbE controller has a total of 16 GPIOs pins that can be configured as SDPs, LED drivers or dedicated hardware functions such as for connecting to external PHYs or IEEE 1588 auxiliary devices. The GPIO pins can also be configured to be associated with any of the physical ports. The following sections describe the possible configurations for the GPIO pins. Many of the GPIO pins are reserved for specific use and hence named by default as SDP or LED signals. This offers the flexibility to configure any of the GPIO pins, irrespective of their names, to different modes and associated with different ports.

The GPIO pin functionality and other attributes such as I/O direction, default value, interrupt mode etc., can be configured through Global GPIO Control registers. See the Table 38-89 for the list of GPIO pins and their corresponding configuration control registers. The GLGEN_GPIO_CTL has a PIN_FUNC field to configure the pin functionality such as SDP, LED, RoL or 1588 TimeSync modes. The PRT_NUM field is used to configure the port number associated with the GPIO pin. The INT_MODE field is used to configure the GPIO pin to generate an interrupt on the rising edge, falling edge or on both edges. The PHY_PIN_NAME is used to indicate how the GPIO is connected to an external PHY. See the GLGEN_GPIO_CTL register description for additional configuration fields and options. The default value for this register is loaded from the NVM and is typically dependent on the board layout/configuration, number of ports, and PHYs present on the board.

Table 38-89. GPIO Pin Configuration Registers

GPIOn Index (n= 0..29)	Pin Name	GPIO Register
GPIO0	SDP0_0	GLGEN_GPIO_CTL[0]
GPIO1	SDP0_1	GLGEN_GPIO_CTL[1]
GPIO2	SDP1_0	GLGEN_GPIO_CTL[2]
GPIO3	SDP1_1	GLGEN_GPIO_CTL[3]
GPIO4	SDP2_0	GLGEN_GPIO_CTL[4]
GPIO5	SDP2_1	GLGEN_GPIO_CTL[5]
GPIO6	SDP3_0	GLGEN_GPIO_CTL[6]
GPIO7	SDP3_1	GLGEN_GPIO_CTL[7]
GPIO22	LED0_0	GLGEN_GPIO_CTL[22]
GPIO23	LED0_1	GLGEN_GPIO_CTL[23]
GPIO24	LED1_0	GLGEN_GPIO_CTL[24]
GPIO25	LED1_1	GLGEN_GPIO_CTL[25]
GPIO26	LED2_0	GLGEN_GPIO_CTL[26]
GPIO27	LED2_1	GLGEN_GPIO_CTL[27]
GPIO28	LED3_0	GLGEN_GPIO_CTL[28]
GPIO29	LED3_1	GLGEN_GPIO_CTL[29]

Note: GPIO22 through GPIO29 are only used for LED functionality. As such, the GLEN_GPIO_CTL[29:22].*PIN_FUNC* field must be set to LED (001b).

The following registers are used to read and write to the GPIO pins. The GLGEN_GPIO_STAT register is used to read the status of the GPIO pins. This register returns the actual value (0b = high, 1b = low) on the pin. The GLGEN_GPIO_TRANSIT register is used to latch any transition (low-to-high or high-to-low) on the GPIO pins since the last time the register was cleared. The GLGEN_GPIO_SET register is used to set the value (0b = low, 1b = high) of the GPIO output pins when configured as an SDP. The PF (software) is expected to write to a GPIO pin only if it owns it.

38.12.1 LEDs

The 10 GbE controller designates eight pins named LED0_0 through LED3_1 for driving LEDs for ports 0 through 3. However, depending on the board layout, these might be replaced or complemented with any of the GPIO pins by configuring the GPIO to be a LED driver through the GLGEN_GPIO_CTL register as described in Section 38.12.2.1.

In order to configure a GPIO pin as an LED driver using the GLGEN_GPIO_CTL register:

- Set PIN_FUNC to LED
- Set PIN_DIR to output
- Use the PORT_NUM field to assign a port number to the LED pin

The output polarity of the LED pin (active high or active low) can be configured through the LED_INVRT field and the blink mode (blinking versus steady) is configured through the LED_BLINK field. The LED outputs can be individually configured to indicate a particular event, state, or activity by using the LED_MODE field. See Table 38-90 for more information on configuring the LED source mode field. The hardware default configuration for GPIO pins configured as LED outputs can be specified via NVM fields

thereby supporting LED displays configurable to a particular OEM preference. Note that at run-time there is usually no need to override the LED setting, the only exception would be to force a LED to blink in order to physically identify a port.

Table 38-90. LED Source Modes

LED_MODE Value	Mode	Condition[1]
LED_MODE[4] = 0		
0000b	LED_OFF	Always off.
0001b	LINK	True while link is held.
0010b	Reserved	Reserved
0011b	Reserved	Reserved
0100b	Reserved	Reserved
0101b	Reserved	Reserved
0101b	Reserved	Reserved
0110b	LINK_10G	True while the 10 GbE controller has 10 Gb/s link.
0111b	LINK_1G	True while the 10 GbE controller has 1 Gb/s link.
1000b	LINK_10G/1G	True while the 10 GbE controller has 10 Gb/s or 1 Gb/s link.
1001b	Reserved	Reserved
1010b	Combined Ports Activity	Active when any one of the 10 GbE controller's port has an established link with packets being transmitted or received. In this mode LED_BLINK must be set.
1011b	Reserved	Reserved
1100b	LINK_ACT	Asserted steady when link is established and there is no transmit or receive activity. Blinking when there is link and receive or Transmit activity. In this mode LED_BLINK must be cleared at 0b.
1101b	MAC_ACT	Active when link is established and packets are being transmitted or received. In this mode, the LED_BLINK must be set.
1110b	FILTER_ACT	Active when link is established and packets are being transmitted or received that passed MAC filtering. In this mode, the LED_BLINK must be set.
1111b	LED_ON	Always true. Overrides all other settings.
0000b	AGGREGATE_LINK_10G	Asserted when ALL enabled ports have 10 Gb/s link.
0001b	COMBINED_LINK	Asserted when ANY of the enabled ports has link.
0010b	Reserved	Reserved.
0011b	COMBINED_LINK_10G	Asserted when at least one of the enabled ports has 10 Gb/s link.
0100b	COMBINED_LINK_1G	Asserted when at least one of the enabled ports has 1 Gb/s link.
0101b	COMBINED_LINK_10G_NOT_ALL	Asserted when at least one of the enabled ports has 10 Gb/s link but not ALL. ***Note:*** This LED is never asserted when only one port is enabled.
Other	Reserved	Reserved.

Notes:

1. When the condition is true, the LED might blink or be constantly on, depending on the value of LED_BLINK field.

The *LED_INVRT* bit enables the LED source to be inverted before being output or observed by the blink-control logic. LED outputs are assumed to normally be connected to the negative side (cathode) of an external LED.

The LED_BLINK bit controls whether the LED should blink while the LED source is asserted. The blink control can be especially useful for ensuring that certain events, such as ACTIVITY indication, cause LED transitions, which are sufficiently visible to the human eye. The global blink mode bit in GLGEN_LED_CTL register is used to select between blinking every 200 ms or every 83 ms.

Note: LED_ON is not affected by the LED_BLINK control.

Note: The LINK/ACTIVITY source functions slightly different from the others when BLINK is enabled. The LED is:

Off if there is no LINK

On if there is LINK and no ACTIVITY

Blinks if there is LINK and ACTIVITY

Note: Only one software device driver should override any of the LED settings at any time (host-wide). Since this is an administrator specified override, hardware does not enforce this. Typically, there is no need to override the LED hardware defaults loaded from the NVM in a specific board configuration.

The Activity LED does not monitor link status of a specific port. The Activity LED blinks each time a packet is received or transmitted on a port. It blinks regardless of whether it is a host packet or a management packet. In certain cases, the BMC might send a packet to the MAC and the Activity LED might blink correspondingly. If there is no cable connected to the port, then the activity LED can be ignored in this case.

38.12.2 Software-Definable Pins (SDPs)

The 10 GbE controller enables any of the GPIO pins to be configured as SDPs through the GLGEN_GPIO_CTL register as described in Section 38.12.2.1. The 10 GbE controller has designated 16 GPIO pins, SDP0_0 (GPIO0) through SDP3_1 (GPIO7), as SDPs for use with ports 0 through 3. However, depending on the board layout, any of the GPIO pins, irrespective of their name, could be configured as SDPs. In order to configure a GPIO pin for SDP use, set PIN_FUNC to SDP and PIN_DIR to either input or output in the GLGEN_GPIO_CTL register. Use the PORT_NUM field to assign a port number to be associated with the SDP.

The 10 GbE controller SDP pins can be used for hardware connectivity to low-speed, optical-module interfaces, external PHY control or software controllable purposes. The SDP pins can also be configured for use as external interrupt sources. The SDP pins, port ownership, direction and their functions are bound to specific board layout/ configuration. The default values for GPIO control registers (GLGEN_GPIO_CTL[n]) are loaded from the NVM. Typically, there is no need for software to change the default configuration assigned for a specific board layout. Pins assigned for PHY management are owned by firmware and should not be accessed directly by software.

The 10 GbE controller SDP pins can also be configured for use as general purpose external interrupt sources (GPI). To act as GPI pins, the desired pins must be configured as inputs and enabled by the INT_MODE field in the GLGEN_GPIO_CTL register. The INT_MODE field can be used to configure the pin to generate an interrupt on the rising edge, falling edge or on both edges. Rising or falling edge detection occurs by comparing values sampled at the internal clock rate, as opposed to an edge-detection circuit. When detected, a GPIO interrupt is indicated in the PFINT_ITR0 register. The PFINT_GPIO_ENA register is used to enable interrupts to PFs (software) and the EMPINT_GPIO_ENA register is used to enable an interrupt to the EMP (firmware). GLGEN_GPIO_STAT and/or GLGEN_GPIO_TRANSIT registers can be used to read the status of the GPIO pins that caused the interrupt. Software is expected to enable interrupts only for pins that are owned by the PFs.

Software or firmware can read/write to a GPIO/SDP pin as described in Section 38.12.2.1.

The proposed use of SDPs for controlling external PHY devices or modules is explained in Section 38.11.1. Proposed use of the SDPs for 1588 functionality is explained in later in this document and other use cases.

38.12.2.1 Global GPIO Pins

The 10 GbE controller has designated six general purpose I/O pins as Global GPIO pins named GPIO_0 through GPIO_5. These pins are not assigned for a specific usage or port. The mode and port association for these pins can be configured as described in Section 38.12. These pins can be used as SDP, LED, or 1588 TimeSync modes or as general purpose interrupt sources. System designers have the flexibility to assign these GPIO pins for specific use depending on the board configuration.

38.12.3 BMC Interconnects

The 10 GbE controller supports three sideband interfaces:

- SMBus
- Network Controller-Sideband (NC-SI)
- PCIe (together with MCTP)

The SMBus and NC-SI interfaces are described in the sections that follow.

38.12.4 SMBus

SMBus is an optional interface for pass-through and/or configuration traffic between an external BMC and the 10 GbE controller.

The 10 GbE controller also enables reporting and controlling itself using the MCTP protocol over SMBus. The MCTP interface is used by the BMC to only control the NIC and not for pass through traffic. All network ports are mapped to a single MCTP endpoint on SMBus.

38.12.4.1 Channel Behavior

The SMBus specification defines a maximum frequency of 100 kHz. However, when acting as a slave, the 10 GbE controller can receive transaction with a clock running at up to 1 MHz. When acting as a master, it can toggle the clock at 100 kHz, 400 kHz or 1 MHz. The speed used is set by the *SMBus Connection Speed* field in the *SMBus Notification Timeout and Flags* NVM word.

38.12.5 NC-SI Interface

The NC-SI interface in the 10 GbE controller is a connection to an external BMC defined by the DMTF NC-SI protocol. It operates as a single interface with an external BMC, where all traffic between the 10 GbE controller and the BMC flows through the interface.

38.12.5.1 Electrical Characteristics

The 10 GbE controller complies with the electrical characteristics defined in the NC-SI specification.

The 10 GbE controller's NC-SI behavior is configured at power-up in the following manner:

- The *Multi-Drop NC-SI* NVM bit defines the NC-SI topology (point-to-point or multi-drop; the default is point-to-point).

The 10 GbE controller dynamically drives its NC-SI output signals (NC-SI_DV and NC-SI_RX) as required by the sideband protocol:

- At power-up, the 10 GbE controller floats the NC-SI outputs.
- If the 10 GbE controller operates in point-to-point mode, it starts driving the NC-SI outputs some time following power-up.
- If the 10 GbE controller operates in a multi-drop mode, it drives the NC-SI outputs as configured by the BMC.

38.12.5.2 NC-SI Transactions

The NC-SI link supports both pass-through traffic between the BMC and the 10 GbE controller LAN functions, as well as configuration traffic between the BMC and the 10 GbE controller's internal units as defined in the NC-SI protocol.

38.13 Initialization

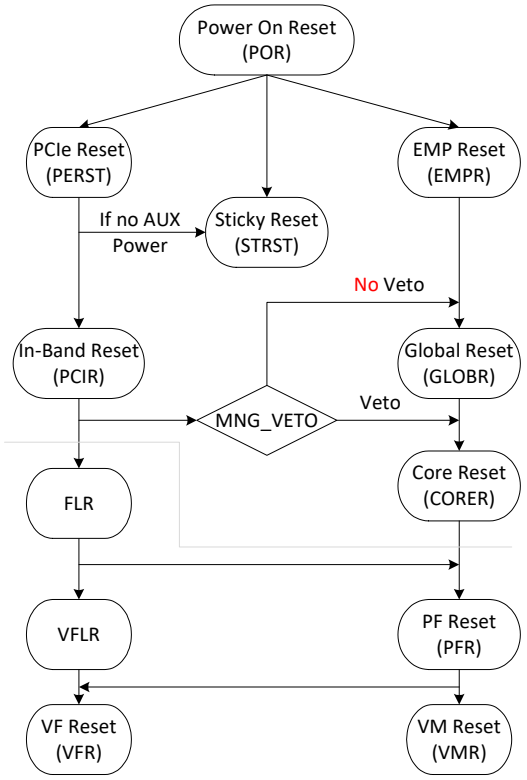
38.13.1 Reset Operation

The following sections lists the hardware and software reset sources that initialize the entire portions of the 10 GbE controller and functions level resets. The reset sources are listed in Section 38.13.1.1 and the reset flows are detailed in Section 38.13.1.2.

38.13.1.1 Reset Sources

This section lists the reset sources supported by the 10 GbE controller while the complete list of initialized logic is listed in Table 38-1. Hierarchical reset tree is shown in the Figure 38-24. Any logic initialized by a specific reset is initialized also by any other reset source that is linked to it and located above it in the reset tree.

Figure 38-24.Hierarchical Reset Tree



Reset Source	Cause List of the Reset Source
Power On Reset (POR)	Power applied to the device
Sticky Reset (STRST)	Internal reset that clears PCIe sticky registers following PCIe reset
PCIe Reset (PERST)	PE_RST_N input signal
In-Band Reset (PCIR)	In-Band PCIe message signalling
EMP Reset (EMPR)	EMP watchdog timer expiration or Force TCO command
Global Reset (GLOBR)	Device driver setting the GLOBR bit in the GLGEN_RTRIG register
Core Reset (CORER)	Device driver setting the CORER bit in the GLGEN_RTRIG register
PF Reset (PFR)	FLR assertion via the PCIe configuration space D3 to D0 transition or Clearing the BME Device driver setting the PFSWR bit in the PFGEN_CTRL register
VM Reset (VMR)	Device driver setting the VMR bit in the VSIGEN_RTRIG register
VF Reset (VFR)	VFLR assertion or setting the VFSWR bit in the GLGEN_VFRTRIG register
PF Level reset (FLR)	Operating sytem sets the FLR bit in the PF PCIe config
VF Level reset (VFLR)	Operating system sets the FLR bit in the VF PCIe config or clearing the VFE bit in the parent s PF PCIe config

Power On Reset (POR) — The 10 GbE controller power on reset signal is translated to a sideband reset and a global reset signal to the 10 GbE controller.

PCIe Reset (PERST) — The PCIe reset signal is kept at the low level when the system is at power down state and at system boot. Transit of PCIe reset to low generates an internal reset signals. If there is no AUX power, the PERST generates an internal STRST signal that clears PCIe sticky bits as listed in Table 39-1. PERST also triggers internally a PCIR, which is detailed later in this section.

Sticky Reset (STRST) — Sticky reset is internal signal triggered by PCIe reset when the 10 GbE controller is not powered by AUX power. This reset clears sticky registers in the PCIe interface (as defined by the PCIe specification). The sticky reset is also initiated by POR.

In-Band Reset (PCIR) — The PCIe supports in-band signaling for PCIe reset (called PCIR). Any cycles on the PCIe bus are gated instantly as well and packet transmission generated by software. The entire data path is initialized other than the EMP cluster. Although the EMP subsystem is not initialized, some packets of the EMP might be lost during a short window of about 1 µs.

Function Level Reset (FLR) — The 10 GbE controller supports the standard FLR interface in the Device Control register of the PCIe capability structure within the PCI configuration space of the PFs. Setting the FLR bit initializes the PCI configuration of the PF (including the VFE flag in the SR-IOV Control/Status register that disables all the VFs of the PF) and initiates an internal PFR described later in this section.

PF Reset (PFR) — PFR initializes the resources and data path of the PF and its VFs with no impact on other PFs, VFs and the EMP subsystem. Any further master cycles of the PF are not initiated while some packets that were already fetched completely might still be sent out. The PFR is generated by one of the following four causes: (1) D0 to $D3_{HOT}$ transition, which is also known as ACPI reset; (2) FLR; (3) PF software sets the PFSWR bit in the PFGEN_CTRL register; (4) De-assertion of the *Bus Master Enable* flag in the PCI configuration space.

VF Level Reset (VFLR) — The 10 GbE controller supports the standard VFLR interface in the Device Control register of the PCIe capability structure within the PCI configuration space of the VFs. Setting the VFLR bit initializes the PCI configuration of the VF and initiates an interrupt to the PF that completes the VFR reset described later in this section. Clearing the VFE flag in the PF configuration space also impacts all its VFs the same as a VFLR.

VF Reset (VFR) — VFR initializes the resources and data path of the VF with no impact on other PFs, VFs and the EMP subsystem. Any further master cycles of the VF are not initiated while some packets that were already fetched completely might still be sent out. The VFR is generated by one of the following two causes: (1) VFLR or clearing the *VFE* bit of the parent PF. Note that after the *VFE* bit is cleared, the PF driver should follow the VFR flow for all the VFs of the PF, including those VFs that are not enabled; (2) PF software sets the *VFSWR* bit in the VPGEN_VFRTRIG register of its VF.

VM Reset (VMR) — There are 384 VSIs where up to 256 of them can be VMDq2 VSIs. Such VSIs are associated with VMs. VMR is a mechanism to reset a VMDq2 VSI. VMR initializes the resources and data path of the VM with no impact on other PFs, VFs, VMs and the EMP subsystem. Any further master cycles of the VM are not initiated while some packets that were already fetched completely might still be sent out. The VMR is generated by the PF software setting the *VMSWR* bit in the VSIGEN_RTRIG register.

Core Reset (CORER) — CORER initializes the shared data path for all functions excluding the EMP subsystem, PCI interface and MAC/PHY logic of all ports. Any further master cycles of all PFs and VFs are not initiated while some packets that were already fetched completely might still be sent out. Even though the EMP subsystem is not cleared, pass-through traffic might be inhibited during the initialization cycle that might take ~20 ms. Also, SMBus accesses are responded with NACK during the initialization cycle. This reset is not expected to be used other than as an escape mechanism in case the 10 GbE controller hangs and the PFR did not resolve the problem. This reset is initiated by the PFs by setting the *CORER* bit in the GLGEN_RTRIG register. The EMP initiates this reset by setting a bit in an internal register.

Global Reset (GLOBR) — GLOBR is a super-set CORER initializing any logic initialized by the CORER plus the MAC/PHY logic of all ports (both internal PHY and external PHY if connected). This reset is not expected to be used other than escape mechanism in case CORER did not resolve the problem. This reset is initiated by the PFs by setting the *GLOBR* bit in the GLGEN_RTRIG register. The EMP initiates this reset by setting a bit in an internal register. Global reset is also initiated following a Force TCO command (if it is not disabled by the F*orce TCO Reset Disable* bit in the NVM).

EMP Reset (EMPR) — EMPR initializes the resources and data path connected to the EMP including its firmware reload. EMPR is triggered internally by the EMP watchdog timer expiration or by EMP setting an internal flag or due to Force TCO command or due to uncorrectable ECC error in one of the EMP memory shells.

Reset Activation	POR	STRST/ PCIR/ PERST	EMPR	GLOBR	CORER	PFR/ FLR	VMR	VFR/ VFLR
Load the NVM to the shadow RAM in the hardware and clear the alternate structure.	+							
Load the EMP and PE firmware from the NVM.	Both+	PE	Both+	PE	PE			
Load device settings from NVM shadow and alternate structure.	Shad	Both	Both	Both	Both

RSS key and table.	+	+	+	+	+	PF		VF
Invalidate FD filters.	+	+	+	+	+	PF		

Notes:

1. PF MAC addresses (switch and WoL) are cleared by hardware at POR and loaded from NVM by the firmware at any of the highlighted reset causes. Following PCIR, the switch MAC addresses are loaded following the assertion of the PCIe reset or in-band reset and the WoL MAC addresses are loaded only following the de-assertion of the PCIe reset.The MAC and PHY are. If the WUC filter is inactive and no port is needed by FW/MNG (PRTPM_GC. EMP_LINK_ON is clear), GLOBR is maintained low by hardware during PCIR de-assertion for power savings.
2. Sticky PCIe context is cleared on PERST if no AUX power.
3. For exception list of registers that are not cleared on PFR.
4. The 10 GbE controller has several flags that control the Bus Master Enable (BME). BME flags on the PCI configuration space (for each PF and VF) and the VMRD flag in the VSIGEN_RSTAT registers for each VM that is not a VF.
   The BME flags of all PFs are cleared by all reset causes indicated by + symbol and a specific PF by FLR.
   The BME flags of all VFs are cleared by all reset causes indicated by + symbol and a specific VF by VFLR.
   The VMRD flags of all VSIs are set by all reset causes indicated by + symbol and a specific VSI by VMR.
   Note that as opposed to BMEs of the function that are cleared by the previous resets (disabling master accesses), the VMRD flags are set (enabling bus master accesses when the BME of their parent PF is set as well).
5. VSIs and its related switch context are cleared by Admin command(s) initiated by the software.
6. Note that as opposed to any logic in The 10 GbE controller that is initialized at the leading edge of PERST#, the WOL filters are initialized at the de-assertion of PERST# (entering the D0u state).

Table 38-91. NVM Section Loaded by Reset Source Covered by GLNVM_ULD Register

NVM Section	POR	PERST	PCIR	EMPR	GLOBR	CORER

Notes:

1. GLOBR registers auto-load only if the MNG_VETO flags in all four PRTPM_GC registers are cleared.

38.13.1.2 Reset Flows

This section describes the reset flows in the 10 GbE controller and software interaction.

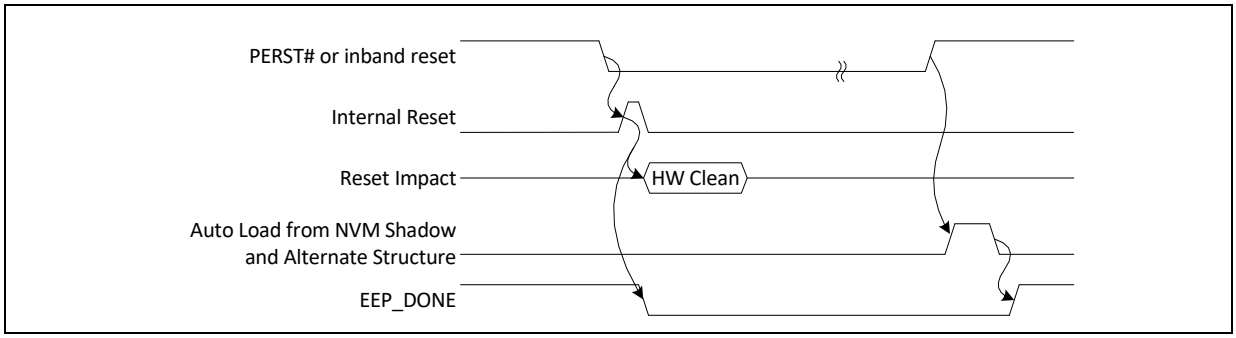
38.13.1.2.1 POR Flow

Refer to the POR flow section for more details.

38.13.1.2.2 PCI Reset and In-Band PCI Reset Flow

The internal reset flow is shown in Figure 38-25 and described by the text that follows.

Figure 38-25.PCI Reset Flow



- Avoid any further master accesses on the PCIe bus and discard any completions for the PF.
- Initialize PCIe registers and core registers as listed in Table 39-1.
- Invalidate the LAN queues mapping tables of the PF and its VFs: VFQTABLEs and VSIQTABLEs.
- Invalidate the FPM tables of the PF and its VFs (function private memory).
- Disable all transmit, receive and admin queues. All packets in the 10 GbE controller are lost. EMP packets might be lost as well for a very short period (in the range of 1 µs).
- Invalidate all filters in the FD table and internal caches.
- Invalidate all internal caches: transmit and receive queue contexts and PE Quad Hash filter.
- Invalidate all associated VSI contexts.
- Clear interrupt settings of all functions.
- The following flags are cleared by the 10 GbE controller at the beginning of the reset flow:
  - The CONF_*_DONE bits in GLNVM_ULD register are cleared.
- The 10 GbE controller repeats the following flow for all previous *_*_DONE flags:
  - If the NVM is not valid:
    - Set the CONF_*_DONE flag in GLNVM_ULD register.
  - If the NVM is valid:
    - Load the matched block from the shadow memory.
    - If EMP_*_REQD is set:

      Load any parameters from the alternate structure into the matched block(s)

      Perform any configuration of the matched block(s).

      Set the EMP_*_DONE flag.
    - Set the CONF_*_DONE flag.
  - At this point, the EMP might start responding the Get Version Admin command, which is blocked until this stage.
    - When checking for hardware configuration to complete, software should either wait for a response to a Get Version Admin command or poll on the CONF_*_DONE bits.

Following these steps, hardware is ready to accept operating system configuration cycles.

38.13.1.2.3 PFR Flow

PFR resets a specific PF. For SR-IOV, it also resets the VFs of this PF. The reset flow is shown in Figure 38-26. It is initiated by the PF driver (setting the *PFSWR* bit in the PFGEN_CTRL register) or operating system (setting the *FLR* flag in the Device Control register) or D0 to $D3_{HOT}$ transition.

Before initiating the PFR, software is expected to disable all transmit and receive queues of the PF as described in the following pseudo code:

```
disable_pf_queues() // disable all Tx and Rx queues of the PF

{
```

```
1. Disconnect all Tx and Rx queues from the interrupt link lists as follow

   Set the FIRSTQ_INDX field to 0x7FF in all PFINT_LNKLSTx register of the PF

   Set the FIRSTQ_INDX field to 0x7FF in all VPINT_LNKLSTx register of the VFs of
   the PF

2. last_q = PFLAN_QALLOC.LASTQ - PFLAN_QALLOC.FIRSTQ // "last_q" is a local
   variable used in the steps below. It is the index of the last queue of the PF and
its VFs (in the PF space)

3. Set the SET_QDIS flag in the GLLAN_TXPRE_QDIS registers for all transmit queues
   of the PF and its VFs. The queue indexes are global ones starting by
   PFLAN_QALLOC.FIRSTQ and up to PFLAN_QALLOC.LASTQ.

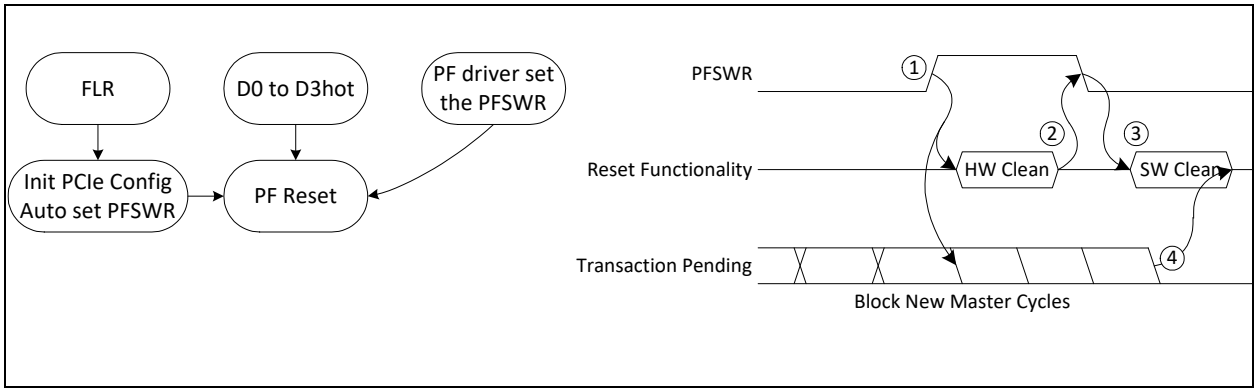
4. Clear QRX_ENA[register index=0,… last_q]     // Disable all Rx queues of the PF

5. Clear QTX_ENA[register index=0,… last_q]     // Disable all Tx queues of the PF.
   Software must guarantee a gap of at least 400 µs from step 3 to this step

6. Wait for the last Rx queue to be disabled and wait for all Tx queues to be
   disabled or time expires (expiration time is defined by the ENDLESS_XOFF_THRESH
   parameter). Note that if the software is not required to take any special
   actions in case the time is expires and can continue to the next step initiating
   the PFR.

}
```

Figure 38-26.PFR Flow



The PF hardware response to PFR is listed in Table 38.1. Note to the following specific events:

- Emulate internal VFR to all its VFs (the hardware response to VFR is described in Section with the exception that the VF's CSRs are not gated on read).
- Avoid any further master accesses on the PCIe bus and discard any completions for the PF and its VFs.
  - — Once all pending requests of the PF are completed, the *Transaction Pending* bit in the Device Status register in the PCIe configuration space is cleared.
  - — Once all pending requests of each VF of the PF are completed, the *Transaction Pending* bit in the Device Status register the VF PCIe configuration space is cleared (per each VF).
- Disable all transmit receive and admin queues of the PF and its VFs (note that some transmit packets that are already fetched completely might be transmitted).
  - — Disabling the transmit queues might take some time until the 10 GbE controller processes all transmit descriptors that are already fetched. Because many queues are active, this process might take longer. The transmit completion

might be further delayed when the TC is paused by flow control. It can happen if other functions have active transmit queues on the same TC as the function under reset. Hardware includes a timeout mechanism that prevents indefinite latency.

  - Disabling the receive queues might take some time as well until the packets of the function's queues are flushed from the shared receive data path. The completion might be further delayed when there are packets of other functions in the pipe that belongs to no-drop TC with no valid receive descriptors. Hardware includes a timeout mechanism that prevents indefinite latency.

- Clear interrupt settings of the PF and its VFs (excluding the CEQ and LAN transmit and receive cause control registers and any interrupt context in the PCIe configuration space). Write 1b to also clear the VFLRE flags in the *GLGEN_VFLRSTAT* registers of all the VFs owned by the PF.

After all the previous steps are completed, hardware does the following:

- Clears the *PFSWR* bit in the *PFGEN_CTRL* register.
- Releases bus master cycles for the PF and its VFs.

The PF software polls the *PFSWR* bit until it is cleared (indicating that hardware completed its reset flow). On top of it, software should also poll the *Transactions Pending* flag in the PCI configuration space of the PF (indicating that all outstanding requests of the PF were completed).

- Once the *Transactions Pending* flag is cleared, the PF software can release the pinned memory structures
- Once the *PFSWR* bit is cleared as well, the PF software can proceeds to the following steps.

Software Note: If the *PFSWR* bit is not cleared within ~100 ms it can be assumed that the shared data-path inhibits PFR completion. In such a case, software might initiate the CORER to overcome any possible lock.

As part of the initialization flow the PF driver checks, the pending transactions of its VFs (by setting the VF index and the offset of the VF Device Status register in the PF_PCI_CIAA register and then polling the pending flag in the PF_PCI_CIAD register). Once the Transactions Pending is found cleared, the PF software does the following:

- Clears the *VFSWR* flag in the *VPGEN_VFRTRIG* registers of its VFs.
- Sets the VFR_STATE in the *VFGEN_RSTAT* registers of its VFs to VFR completed. At this point, the memory structures of the VF can be released and the VF software can start its initialization flow.

As part of the software/hardware initialization flow, the PF software should check for potential race condition with another PF or EMP initiating a global reset (CORER, GLOBR or EMPR):

- Query the reset counters (*CORERCNT, GLOBRCNT* and *EMPRCNT*) in the GLGEN_RSTAT register
- Interrupt enable flow
- Read the *GLGEN_RSTAT* register for the device state (*DEVSTATE*) and the reset counters (*CORERCNT, GLOBRCNT* and *EMPRCNT*)
  - If *DEVSTATE* = Reset requested or Reset in progress then go to the global reset flow
  - If Device state = Device active then

  - If the updated values of the global reset counters equal to the value sampled at the beginning of this procedure then "all good". Software can continue with the rest of the software/hardware initialization flow
  - Else, then go to the global reset flow

38.13.1.2.4 FLR Flow

FLR resets a specific PF. In the case of SR-IOV, it also resets the VFs of this PF.

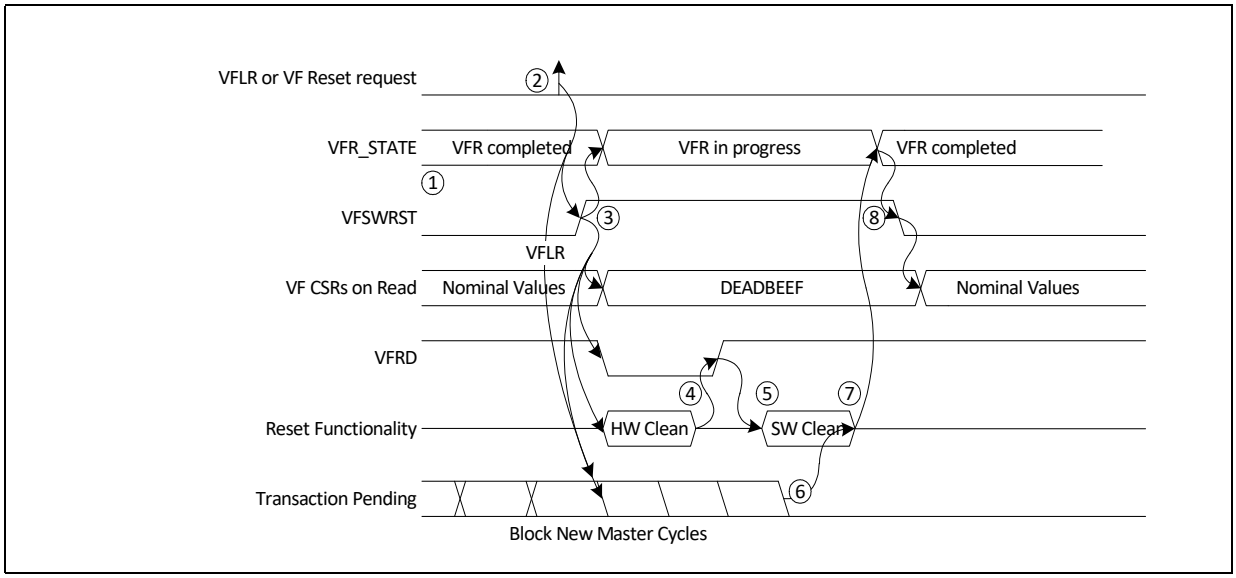
- The following steps are optional:
  - The operating system is expected to clear the BME bit in the Command register in the PCI configuration register of the PF.
  - For SR-IOV, the operating system is expected to also clear the BME bit in the VF Command register in the PCI configuration register of all VFs of this PF.
  - As a response, hardware avoids any new master cycles of the PF and its VFs (including MSI-X initiation).
  - The operating system should poll the Transaction Pending bit in the Device Status register of the PF until it is cleared.
  - For SR-IOV, the operating system should poll also the *Transaction Pending* bit in the VF Device Status register of all VFs of the PF until they are cleared.
  - Note that all the previous steps are expected and recommended but not enforced by the PCI specification.
- The operating system sets the *FLR* bit in the Device Control register of the PF. The operating system is required by PCIe specification to wait 100 ms before it can assume that the FLR sequence is completed by hardware.
- The PF hardware response as follows:
  - Initialize the PCIe configuration space of the PF including clearing the BME bit of the PF and the VFE bit.
    - By clearing the BME, hardware avoids any further master accesses on the PCIe bus and trash any completions for the PF.
    - By clearing the VFE bit, all VFs of the PF avoid any further master accesses on the PCIe bus and discards any completions targeted for these VFs and become hidden on the PCIe bus.
    - As part of the PCIe configuration initialization, the completion timeout is set to its hardware default.
    - Once all pending requests of the PF and its VFs are completed or completion timeout expires (whichever comes first), the *Transaction Pending* bits in the PCIe configuration space are cleared.
  - Auto-set the PFSWR bit in the PFGEN_CTRL register (triggering a PFR described in the section that follows).

Once the *Transaction Pending* bit in the PCIe configuration space of each VF is cleared, the operating system can release all VF memory structures and unload the VF driver (if required). Once the *Transaction Pending* bit in the PCIe configuration space of the PF is cleared, the operating system can release all PF memory structures and unload the PF driver (if required).

38.13.1.2.5 VFR/VFLR Flows

The VF reset flow is shown in Figure 38-27 and detailed in the sections that follow.

Figure 38-27.VF Reset (VFR) Flow



VF Reset Request by the VF Driver

The VF driver requests the VF reset from its parent PF as follows and is shown in Figure 38-27. See also Section that describes the PF response to the VF reset request.

- If needed, clear the RSS tables of VSIs assigned to the VF using *Set RSS Key* and *Set RSS LUT* commands with zero values.
- The VFR_STATE in the VFGEN_RSTAT register in this step is expected to be VFR completed. Note that the VF software gets a control over its VF only after any prior VF reset flow is completed (step 1 in Figure 38-27).
- The VF driver initiates a request to its parent PF to initiate a VF reset. The mechanism for sending this request is outside the scope of this document. It could be done using a VF-to-PF mailbox (Admin command) or any other software based sideband channel (step 2 in Figure 38-27).
- After that, the VF polls the VFR_STATE in the VFGEN_RSTAT register until it is set by the PF to VFR completed (step 8 in Figure 38-27 and explained in Section).
- The VF software proceeds activating the function.

VF Reset Request by the Operating System (VFLR)

The VF reset initiation by the operating system is described as follows and shown in Figure 38-27.

- The following steps are optional:
  - Clear the BME bit in the VF Command register.
  - As a response, hardware avoids any new master cycles of the VF (including MSI-X initiation). Old completions are trashed by hardware.
  - The operating system polls the *Transaction Pending* bit in the VF Device Status register until it is cleared.

- The operating system sets the *FLR* bit in the VF Device Control register (step 2 in Figure 38-27).
- The operating system is required by PCIe specification to wait 100 ms before it can assume that the VFLR sequence is completed by hardware.
- If required, the operating system brings up a new VF (or the same VF). The VF software driver should poll the VFR_STATE in the VFGEN_RSTAT register until it equals to VFR completed (set by the PF software).
- The VF software proceeds activating the function.

Hardware responses to VFLR are as follows:

- Initialize the PCIe configuration space of the VF including the *Bus Master Enable* flag. The *Transaction Pending* bit is cleared when there are no more pending completions.
  - Once the *Transaction Pending* bit in the VF Device Status register is cleared, the operating system can release all VF memory structures and unload the VF driver (if required).
- Set internally the VFSWR bit in the VPGEN_VFRTRIG register of the VF, which initiates a VFR (described in Section).
- Set the matched VFLRE flag in the GLGEN_VFLRSTAT registers and initiate an interrupt to the parent PF. The PF response to the VFLR interrupt is described in Section .

VF Reset Flow by the PF Software Driver

The PF software is called to initiate the VFR by the VF software driver or as a result of a VFLR interrupt. See Figure 38-27.

- Specific step for a VFLR interrupt:
  - The PF software queries the VFLRE flags in the GLGEN_VFLRSTAT registers (of the VFs that it owns).
- Specific step for a VF reset request by the VF driver:
  - PF software sets the *VFSWR* bit in the VPGEN_VFRTRIG register of the VF (step 3 in Figure 38-27).

The hardware response to setting the *VFSWR* bit is listed in Table 38.1. Note that as part of the VF registers, the VFGEN_RSTAT register is cleared as well reflecting VFR in progress state. On top of it, hardware also gates read accesses to the CSRs of the VF returning DEADBEEF or DEADBEAF values and also gates any master accesses.

- When the reset flow is completed, the hardware sets the VFRD flag in the VPGEN_VFRSTAT register.

Once the VFRD flag in the VPGEN_VFRSTAT register is found active, the PF software proceeds with the VF reset flow (step 5 in Figure 38-27).

- Writes 1b to clear, to the matched bit in the GLGEN_VFLRSTAT registers for the VF under reset. Note that the GLGEN_VFLRSTAT registers are composed of 128 bits for the 128 VFs. All PFs have access to the bits of all VFs. However, it is expected that the PFs writes 1b to clear to those bits that match its VFs and only to those bits.
- Disable the receive queues of the VF following the fast queue disable flow per each queue. Note that the hardware auto-disable the transmit queues of the VF.
- Clear the interrupt settings of the VF.
- Clear the queue mapping tables of the VF's VSIs (VSIQTABLEs).

- Clear the filters in the FD table that were assigned by the PF for the VF.
- Remove all the MAC/VLAN filters from the VSIs of the VF and then remove these VSIs.
- If needed, clear the RSS tables of VSIs assigned to the VF using *Set RSS Key* and *Set RSS LUT* commands with zero values.
- The PF driver checks the pending transactions of its VF (by setting the VF index and the offset of the VF Device Status register in the PF_PCI_CIAA register and then polling the pending flag in the PF_PCI_CIAD register) (step 6 in Figure 38-27).
- The following steps in this bullet item are part of re-enabling the VF. It can be executed at this phase before notifying the VF that the reset flow is completed or at a later phase (depending on software implementation):
  - Add the VSIs for the VF (including its Transmit and Receive queues and its Scheduler).
  - Add the MAC/VLAN filters for the VSI.
  - Enable the VFLAN_QTABLE by setting the VPLAN_MAPENA and then program the VFLAN_QTABLE to the queues of the VF.
- The PF software completes the flow by notifying the VF that the reset flow is completed. It sets the VFR_STATE in the VFGEN_RSTAT register to VFR completed and clears the *VFSWR* bit in the VPGEN_VFRTRIG register (step 7 in Figure 38-27).

Hardware response to cleared *VFSWR* flag:

- The VF CSRs are unlocked. As a result, the VF software can see the updated VFR_STATE in the VFGEN_RSTAT register that equals to VFR completed (step 9 in Figure 38-27).
- Master cycles are not blocked anymore by the reset logic.
- The hardware is ready to be used by the VF.

38.13.1.2.6 VMR Flow

Before initiating a VM reset the PF software should disable the interrupts associated with this VM. The VM interrupt causes might share the same interrupt with the PF. In this case the PF software need only to remove the VM interrupts causes from those interrupt linked list. Then the PF software can initiate the VM reset and re-enable the interrupts of the PF.

The PF RDMA driver should also clear all the QH entries associated with this VM and disable PE enable for this VM. PE support may be re-instated after the reset.

The PF sets the *VMSWR* bit in the VSIGEN_RTRIG register:

- Hardware response to VMR is the same as its response to VFR (other than invalidating the VFQTABLE's and VFxxx registers, which the VM does not own).

The PF polls the VMR done indication in the VSIGEN_RSTAT register and then executes the following complementary steps (as the VFR flow):

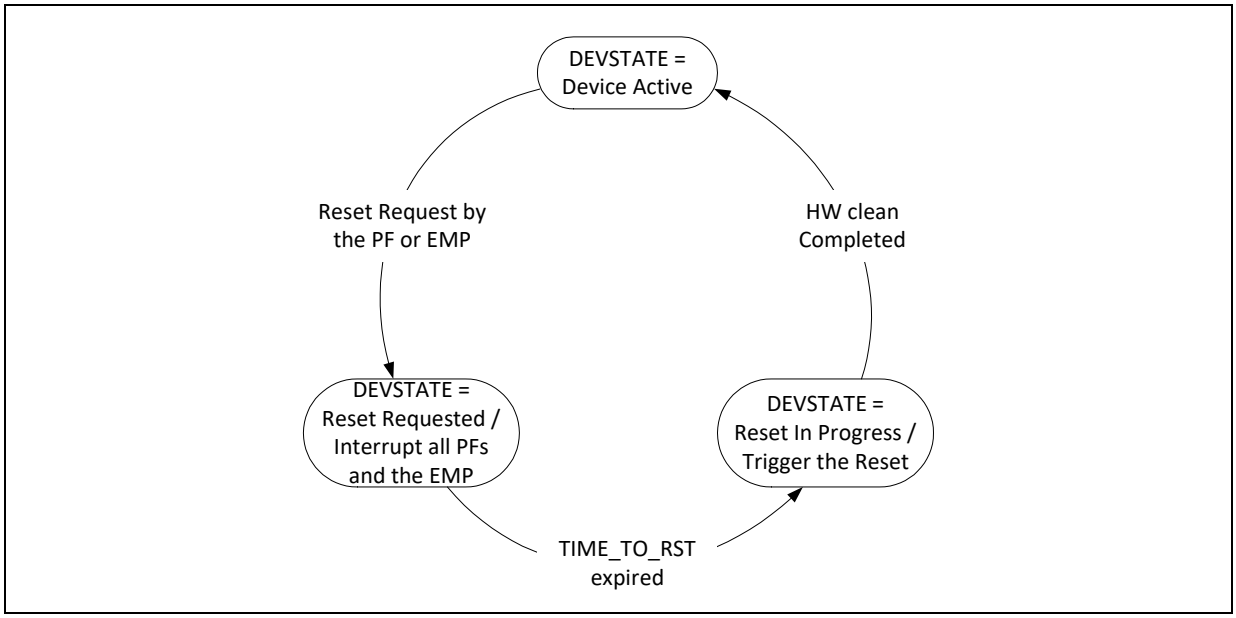
- Disable the transmit and receive queues using the fast queue disable flow.
- Optionally clear the queue mapping tables, FD filters and VSI context.
- The PF polls the *Transactions Pending* flag of the VM verifying that there are no transaction pending of the VM as follows: Set the VSI index in the PFPCI_VMINDEX and then poll the PFPCI_VMPEND register.

- The PF completes the flow by clearing the *VMSWR* bit in the VSIGEN_RTRIG register.

38.13.1.2.7 Core Global and EMP Reset Flows

The global resets can be initiated by the PF software or the EMP firmware. It is expected to be used as a mechanism to resolve potential hardware locks or synchronization lose, bringing the 10 GbE controller to a known functional state. These global resets impact all PFs (and their VFs) as well as the EMP subsystem (EMP reset only). Therefore, graceful flow is enabled by hardware as shown in Figure 38-28 and described in the following sections. The software initiates the global resets by the GLGEN_RTRIG register. The EMP can access the same register or use an internal register.

Figure 38-28.Global Resets Flow



Software and Firmware Interface

GLOBR / CORER — Setting the GLOBR flag or CORER flag in the GLGEN_RTRIG register triggers a graceful global/core reset, respectively.

EMPFWR — EMP firmware watchdog expiration or EMP setting internal EMP reset flag, triggers a graceful EMP reset (EMPR).

DEVSTATE — Global device state exposed to all PFs in the GLGEN_RSTAT registers. The DEVSTATE can be at one of the following states: device active, reset requested; reset in progress.

RESET_TYPE — The RESET_TYPE reflects the last reset cause initiated to the 10 GbE controller. It changes its state once any of the following reset sources is triggered. The RESET_TYPE can be at one of the following states: POR, CORER, GLOBR and EMPR.

RST_CNT — The GLGEN_RSTAT reflects the following counters: CORERCNT, GLOBRCNT and EMPRCNT. These fields are 2-bit counters each. They count the matched reset completion events since POR.

CORER Flow

The PF software or EMP firmware initiates a graceful core reset by setting the CORER flag in the GLGEN_RTRIG register and polling the 10 GbE controller state in the GLGEN_RSTAT register.

Hardware response:

- Changes the GLGEN_RSTAT register are as follows:
  - Set DEVSTATE to reset requested.
  - Set RESET_TYPE to CORER indicating the requested reset.
  - Set TIME_TO_RST by the GLGEN_RSTCTL.GRSTDEL value and start counting down.
- Initiates a GRST interrupt to all PFs and EMP that the reset is about to be fired by hardware.
- The following flags are cleared by the 10 GbE controller at the beginning of the reset flow:
- The CONF_*_DONE bits in GLNVM_ULD are cleared.
- Clear the entire transmit and receive data path, avoid any further master accesses on the PCIe bus and discard any completions for the entire device, and abort any transmission in progress (including packets sent by the EMP).
- Reset internal device logic excluding EMP cluster, PCI interface and MAC/PHY cluster as listed in Table 38-1.
- Once the reset flow is completed, update the GLGEN_RSTAT register as follows:
  - Set DEVSTATE to device active.
  - Increment the CORERCNT by one.
- The 10 GbE controller repeats the following flow for all previous *_*_DONE flags:
  - If the NVM is not valid:
    - Set the CONF_*_DONE flag in GLNVM_ULD register.
  - If the NVM is valid:
    - Load the matched block from the shadow memory.
    - If EMP_*_REQD is set:

      Load any parameters from the Alternate Structure into the matched block(s).

      Perform any configuration of the matched block(s).

      Set the EMP_*_DONE flag.
    - Set the CONF_*_DONE flag.
  - At this point, the EMP might start responding the Get Version Admin command, which is blocked until this stage.

Following the GRST interrupt, all PFs and the EMP poll the 10 GbE controller state in the GLGEN_RSTAT register.

- Keep polling the register as long as DEVSTATE is not equals to device active. Note that as long as DEVSTATE equals to reset requested, the TIME_TO_RST indicates the remaining delay to the internal reset triggering by hardware. Note the PF drivers should avoid any CSR slave accesses other than the one required to query the 10 GbE controller state.

- The GLGEN_RSTAT also indicates the number of the initiated global resets via the GLGEN_RTRIG register (CORER, GLOBR, EMPR). These counters might be needed in case a function initiated consecutive global reset before all other functions had the chance to realized that the previous reset was completed. It would be good practice to avoid too frequent global resets to avoid such cases.
- Check the RESET_TYPE that indicates the reset that was initiated and follow the required initialization flow.
  - Note that also the function that initiated the reset should check the RESET_TYPE since it might reflect a stronger reset initiated by another function.
- Check that the hardware completed to auto-load its settings from the NVM shadow and the alternate structure by polling the CONF_*_DONE flags in GLNVM_ULD register.
  - When checking for the hardware configuration to be done, software should either wait for a response to a Get Version Admin command or poll on the CONF_*_DONE bits.
- The PFs proceeds with their software initialization flow.

GLOBR Flow

Global reset is initiated by the PFs or the EMP by setting the GLOBR flag in the GLGEN_RTRIG. The GLOBR flow is identical to the CORER flow with the following changes:

- GLOBR also initializes the MAC/PHY units.
- GLGEN_RSTAT.RESET_TYPE is set by the hardware to GLOBR (rather than CORER).
- Increment the GLOBRCNT by one (rather than CORERCNT).
- Loading the 10 GbE controller setting from the NVM is listed by the GLOBR column in Table 38-2.

EMPR Flow

EMP reset is expected to be used by the EMP as a mechanism to resolve potential hardware locks or potential lost of synchronization between the firmware and hardware that are not expected to be resolved by CORER nor by GLOBR. The EMPR impacts also all PFs and their VFs, therefore the following graceful flow is recommended.

The EMP flow is identical to the CORER flow with the following changes:

- During normal operation, the EMPR can be initiated only by the EMP by setting an internal EMP reset flag.
- EMPR initializes also the MAC/PHY units as well as the EMP cluster.
- GLGEN_RSTAT.RESET_TYPE is set by hardware to EMPR (rather than CORER).
- Increment the EMPRCNT by one (rather than CORERCNT).
- Loading the 10 GbE controller setting from the NVM is listed by the EMPR column in Table 38-2.

38.13.1.2.8 Auto-Load Shadow RAM

This phase of auto load determines if a properly-configured Flash device is attached:

- If the attached Flash device is not properly configured, the default hardware settings are kept. The power-on flow continues without loading from the NVM.

  - The NVM is expected to be reprogrammed. See Section 38.11.8.2 for more details on how this is done.
- If the attached Flash device is properly configured, auto load proceeds with its first stage. NVM modules loaded to the on-die shadow RAM are read from the NVM.

Once the shadow RAM is ready, the *GLNVM_GENS.FL_AUTO_RD* bit is set. The bit is also set when the NVM is found blank.

38.13.1.2.9 Auto Load Into Device Units

This stage loads the NVM configuration into the device units, either directly from the NVM or indirectly through shadow RAM.

Loading the following NVM modules is tracked and reported as:

- PHY analog
- PCIR registers auto load
- PCIe Transaction Layer (TL) shared
- PCIe ALT auto load
- CORER registers auto load
- GLOBR registers auto load
- POR registers auto load
- EMPR registers auto load

The following CSR fields track the progress of loading the NVM modules following power on and the various resets:

- GLNVM_GENS.FL_AUTO_RD, when set, indicates that the shadow RAM was loaded from the NVM and is ready for use.
- EMP_*_REQD bits in the GLNVM_EMPRQ register (one bit per relevant module) indicate whether the EMP involvement is required during the initialization of the module.
- GLNVM_ULD.CONF_*_DONE bits (one per module previously identified), when set, indicate that the respective units are initialized and ready for use. These bits are identical to the EMP_*_DONE bits.

Default hardware values:

- GLNVM_GENS.FL_AUTO_RD = 0b
- GLNVM_EMPRQ.EMP_*_REQD = 0b
- GLNVM_EMPLD.EMP_*_DONE = 0b
- GLNVM_ULD.CONF_*_DONE = 0b

The flow during a power-on stage is as follows.

- If the NVM is found blank:
  - All GLNVM_ULD.CONF_*_DONE bits are set by the 10 GbE controller.
- If the NVM is found valid:
  - GLNVM_GENS.FL_AUTO_RD is set by firmware when the shadow RAM was loaded from the NVM.
  - GLNVM_EMPRQ.EMP_*_REQD is loaded from the NVM.

— After EMP firmware loads, during its initialization sequence, it sets the GLNVM_EMPLD.EMP_*_DONE bit (for each of the CORER and GLOBLR domains). As a result, hardware sets the GLNVM_ULD.CONF_*_DONE bit to 1b.

38.13.1.2.10 Firmware Initialization

There are two sets of firmware loaded for the 10 GbE controller. The first is for the EMP. This firmware is first to load and is required for all Product Name deployments. It is optionally followed by loading PE firmware required for RDMA and UDA operation.

Once EMP firmware loads, the following Product Name features are enabled:

- The external Ethernet link is active.
- Default internal switching components have been configured.
- Communication with the BMC is possible if supported by the 10 GbE controller and the system (optional).
- OEM specific manageability agents are active and responding to commands from the Ethernet fabric (optional).
- Admin queues for all enabled PCI functions are ready for commands. The EMP responds to each function's Get Version AQ command to indicate that it is safe for software to start using the 10 GbE controller for software device driver initialization (see Section 38.13).
- HMC default profile has been configured.

Once EMP firmware is up and running, the 10 GbE controller can be configured via its management interfaces, and certain device capabilities are then enabled or disabled (such as soft SKUing).

PE firmware is responsible for processing configuration requests for RDMA and UDA functionality that is provided by the PE. PE firmware load begins once the EMP firmware has finished loading along with initialization, and only after primary reset was de-asserted. Loading PE firmware is initiated through the GLPE_FWLDCTRL register. When PE firmware is loaded and initialized, the GLPE_CPUSTATUS0-2 registers indicate that it is safe to start using PE capabilities.

PE firmware is loaded only when the PE is enabled in the GLGEN_PE_ENA.PE_ENA CSR bit, loaded from the NVM.

38.13.1.2.11 MAC Address Initialization

Two sets of station LAN MAC addresses are supported:

- A station MAC address per PF. These addresses are used by the internal switch for L2 filtering of Rx packets, by the Rx classification filters, and for WoL purposes. The addresses are loaded from the NVM.
  - The station MAC addresses for WoL are loaded by the EMP into the *PRTPM_SAL* and *PRTPM_SAH* registers (see Section 38.17.3).
    - Default — A single PF address is loaded per port into *PRTPM_SAL[0,Port]* and *PRTPM_SAH[0,Port].*
- A station MAC address per Ethernet port. These addresses are used for link-level functionality such as flow control frames.
  - The *PRTGL_SAL* and *PRTGL_SAH* registers contain these addresses for the four 10 GbE MACs.

— The *PRTMAC_HSEC_CTL_TX_SA_PART1* and *PRTMAC_HSEC_CTL_TX_SA_PART2* registers contain these addresses for the 40 GbE MACs.

The following table lists how each address can be set or read and where it is stored:

MAC Address Type	Where Stored	How Reported	How Modified
LAN MAC Address (Factory)	NVM PF allocations section		N/A
LAN MAC Address (Current)	NVM PF allocations section; alternate RAM	Manage MAC address read (PF LAN SA)	Write alternate AQ command: Alternate LAN MAC address (LS). Alternate LAN MAC address (MS). or NC-SI Set Address OEM command or manage MAC address write (update LAA only).
Port MAC Address	GLOBR registers auto-load module (PRTGL_SAL/H)	Manage MAC address read (port SA)	Manage MAC address write AQ command (update port address). ***Note:*** Every function within a port is allowed to use this command – the last command takes precedence.
LLDP MAC Address	Use the port MAC address for SA, chassis and port IDs.		
WoL MAC Address	NVM PF allocations section, alternate RAM (PRTPM_SAL/H)	Manage MAC address read (PF WoL SA)	Manage MAC address write AQ command (update LAA and WoL address).
WoL MAC Address Preserve on PFR	RAM	Manage MAC address read (WoL_preserve_on_PFR)	Manage MAC address write AQ command (WoL_preserve_on_PFR). Set by software before D0->Dr/D3 transition, cleared by software after returning to D0). Zero by default after POR/EMPR.
LAA MAC Address	GLOBR registers (PRTGL_SAL/H)	Manage MAC address read (PF LAA SA)	Manage MAC address write AQ command (update LAA address). ***Note:*** Changing the LAA only does not impact the address used to detect magic packets.

The following rules apply:

- The *PF_NUM* field in *PRTPM_SAH* is deducted from the PF issuing the command.
- The *MC_MAG_EN* field in *PRTPM_SAH* is loaded from the NVM and is not affected by the command.
- The *AV* field in *PRTPM_SAH* is set by the EMP when writing a MAC address.

The per-PF MAC address used by the internal switch is managed via the Remove MAC, VLAN Pair and Add MAC, VLAN Pair commands.

Manage MAC Address Read Command

This command is used by the PF driver to read the per-PF station MAC address.

Indirect command:

Name	Bytes.Bits	Value	Remarks
Flags	0-1		See Section 38.27.5.2.1 for details.
Opcode	2-3	0x0107	Command opcode.
Datalen	4-5	0x00	Must be 0x0, value is ignored.
Return Value/ VFID	6-7	0x00	Return value. Zeroed by the software device driver. Written by firmware.

Name	Bytes.Bits	Value	Remarks
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Command Flags	16-17	Reserved	Zeroed by the software device driver.
Reserved	18-23	0x0	Reserved.
Data Address High	24-27	Buff Addr	High bits of return buffer address.
Data Address Low	28-31	Buff Addr	Low bits of return buffer address.

Manage MAC Address Read Response

A firmware acknowledge to the Manage MAC Address Read command.

Indirect response:

Name	Bytes.Bits	Value	Remarks
Flags	0-1		See Section 38.27.5.2.2 for details.
Opcode	2-3	0x0107	Command opcode.
Datalen	4-5	0x00	Must be 0x0, value is ignored.
Return Value/ VFID	6-7	Return Value	Return value. Firmware supplies in the *Return Value* field indication on the completion of the Manage LAA command. 0x0 = No error. Others = Error detected in the command.
Cookie High	8-11	Cookie	Opaque value is copied by firmware from the manage MAC Address Read command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware from the manage MAC Address Read command.
Command Flags	16.0-16.3	Reserved	Zeroed by the EMP.
	16.4	LAN Address Valid	
	16.5	SAN Address Valid	
	16.6	Port Address Valid	
	16.7	WoL Address Valid	
	17.0	MC_MAG_EN	If set, multicast magic packets generate a WoL event (if WoL is enabled for this function).
	17.1	WoL_preserve_on_PFR	Set to preserve WoL MAC on PFR (set by software before D0->Dr/D3 transition, cleared by software after returning to D0 state). Zero by default after POR/EMPR.
	17.2-7	Reserved	
Reserved	18-23	0x0	Reserved.
Data Address High	24-27	Buff Addr	High bits of return buffer address.
Data Address Low	28-31	Buff Addr	Low bits of return buffer address.

Note: All MAC addresses are in big endian order.

Address	Offset	Description
PF LAN SA	0-5	Current device value of the PF LAN MAC address. Validated by *LAN Address Valid* flag. This address is returned from LAA address if valid; otherwise, from alternate RAM if valid; otherwise, from the NVM if valid.
Port SA	12-17	Current device value of the Port MAC address. Validated by the *Port Address Valid* flag.
PF WoL SA	18-23	Current device value of the PF WoL MAC address. Validated by the *WoL Address Valid* flag.

Manage MAC Addresses Write Command

This command is used by the PF driver to write the per-PF station MAC address.

Direct command:

Name	Bytes.Bits	Value	Remarks
Flags	0-1		See Section 38.27.5.2.1 for details.
Opcode	2-3	0x108	Command opcode. 0x0107 is used for reads; 0x0108 is used for writes.
Datalen	4-5	0x00	Must be 0x0, value is ignored.
Return Value/ VFID	6-7	0x00	Return value. Zeroed by the software device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Command Flags	16-16.7	Reserved	Zeroed by driver.
	17.0	MC_MAG_EN	Set to allow multicast magic packets generates a WoL event (if WoL is enabled for this function). Valid only if Write Type = 11.
	17.1	WoL_preserve_on_PFR	Set to preserve WoL MAC on PFR (set by software before D0->Dr/D3 transitions, cleared by software after returning to D0 state). Zero by default after POR/EMPR.
	17.2-5	Reserved	
	17.7:6	Write Type	00b = Update LAA only. 01b = Update LAA and WOL address. 10b = Reserved 11b = Reserved.
SAH	18-19	See Remarks	High 16 bits of the MAC address (big endian order). Example: if MAC address = 11:22:33:44:55:66 then SAH = 0x1122.
SAL	20-23	See Remarks	Low 32 bits of the MAC address (big endian order). Example: if MAC address = 11:22:33:44:55:66 then SAL = 0x33445566.
Data Address High	24-27	Buff Addr	High bits of return buffer address.
Data Address Low	28-31	Buff Addr	Low bits of return buffer address.

Manage MAC Address Write Response

A firmware acknowledge to the Manage LAA command.

Direct response:

Name	Bytes.Bits	Value	Remarks
Flags	0-1		See Section 38.27.5.2.2 for details.
Opcode	2-3	0x0108	Command opcode.
Datalen	4-5	0x00	Must be 0x0, value is ignored.
Return Value/ VFID	6-7	Return Value	Return value. Firmware supplies in the *Return Value* field indication on the completion of the Manage LAA command. 0x0 = No error. Others = Error detected in the command.
Cookie High	8-11	Cookie	Opaque value is copied by firmware from the manage MAC Address Write command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware from the manage MAC Address Write command.
Command Flags	16-17.5	Reserved	Zeroed by the EMP.
	17.7:6	Write Type	00b = Update LAA only. 01b = Update LAA and WOL address. 10b = Update port address. 11b = Reserved.
Reserved	18-23	0x0	Reserved.
Data Address High	24-27	Buff Addr	High bits of return buffer address.
Data Address Low	28-31	Buff Addr	Low bits of return buffer address.

38.13.1.2.12 Power-on Device State

This section describes the specific setting of each of the 10 GbE controller's components required for pre-boot operation. It describes the information loaded from the NVM (per component) and the state attained by each.

- **Manageability** — System management functionality, if enabled, is fully operational by the end of the EMP firmware initialization sub-stage. Some configuration is loaded from the NVM during the power on stage. Capabilities might include the following:
  - — Sideband interfaces
  - — Pass-through manageability (including packet filtering)
  - — Preparation for OS-to-BMC traffic
  - — Preparation for MCTP over PCIe operation
- **Internal MAC and PHY** — If either system management or APM WoL are enabled, then enabled LAN ports are brought up by firmware once EMP firmware initialization completes. Else, enabled LAN ports are brought up following PERST# de-assertion.
  - — See Section 38.13 for more detail.
- **AQ** — A queue (Tx and Rx pair) is activated per enabled PCI function. For example, an AQ is needed for BIOS to change the switch or scheduler configuration.
  - — See Section 38.13 for more detail.
- **Internal Switch** — The internal switch is configured from the NVM for basic switching capabilities to the EMP and the enabled PCI functions. First, the switch

programmable logic is loaded, followed by configuration of a basic switch topology. The topology is for basic L2 functionality.

— See Section 38.21.7.17.2 for more details.

- **DCB** — The NVM loads the LLDP and DCBx setting into the 10 GbE controller. Once EMP firmware initializes and link is up, firmware engages in DCBx negotiation. Firmware then makes the appropriate changes in the 10 GbE controller's configuration based on the outcome of the DCBx protocol. At this stage, DCB capabilities (TCs, ETS, PFC) might be enabled.
- **Tx Scheduler** — As the switch VSIs are enabled, firmware allocates Tx scheduler queue sets per each PF VSI based on the NVM configuration. Each queue set is configured to default behavior. Firmware also generates the required handles to enable system software to update the configuration of each queue set. If DCBx protocol runs, the outcome of the protocol exchange might translate into changes in scheduler configuration.

  — See Section 38.25.4.1 for more details.
- **Host Memory Cache (HMC)** — NVM settings supply the initial HMC configuration using a simple set of rules that enable equal distribution of HMC resources to all PFs that are connected to external Ethernet ports.
- **Power Management** — Some power management capabilities are supported pre-boot or during BIOS initialization.

  — The 10 GbE controller might be enabled for APM wake during power up. See Section 38.18.1 for more details on how APM Wake is configured.
- **LAN** — LAN queues are available for network boot in the BIOS initialization phase. Some LAN configuration is loaded from the NVM during power on, including partitioning of the LAN queues among PFs.
- **PE** — An NVM setting might disable PE operation in the device. The PE is not enabled during power on and BIOS initialization stages. It is configured and initialized in the driver load phase.

38.13.2 BIOS Initialization

This section describes how BIOS code might update the 10 GbE controller's configuration and the capabilities for network boot. The following sections are provided:

- How the BIOS code might change the 10 GbE controller's configuration on each boot.
- Some aspects of supporting network boot.
- The specific setting of each of the 10 GbE controller's components required for the BIOS Init stage.

38.13.2.1 Initial State

The state of the 10 GbE controller when the BIOS begins to access it is described later in this section.

BIOS code must check that the EMP completed device initialization. This is done through the Get Version AQ command described in Section 38.27.11.1.

38.13.2.2 Non-Persistent Configuration

During power up, the 10 GbE controller is factory configured from the NVM. However, the factory configuration might be overridden in two possible ways:

- Persistent configuration — System tools (such as software agents and SMCLP commands) might write into the NVM and change the factory defaults. It is also possible to add alternate values into the NVM so that the factory defaults are preserved and might be restored at a later time.
- Non-persistent configuration — An on-die alternate RAM structure is provided for alternate configuration that is not maintained between cold resets. During a cold reset sequence, the alternate structure might be written by either an external system management agent (via the device management interfaces) or by BIOS level code (like SMASH/CLP commands). The information in the alternate structure is kept during any reset other than cold reset, and is loaded into the 10 GbE controller following the appropriate resets (see the text that follows for more detail), overriding the respective configuration loaded previously from the NVM. This section describes the details of how the alternate structure is handled.

The following mechanisms are provided:

- The configuration is written into an on-die alternate structure:
  - The alternate structure is 8 KB, partitioned into 32-bit entries. Accessing the structure is done by addressing 32-bit entries. An address is therefore 11 bits (2 K Dwords), where address 0x000 points to the beginning of the 8 KB memory.
- The alternate structure is loaded into the device functional units in the following cases:
  - As part of the SMASH/CLP programming:
    - Legacy BIOS — Once the Initialization function is called for the 1st time in the flow.
    - UEFI — Once a Done Alternate Write command is received for each enabled LAN port.
  - As part of executing the following resets: PERST#, PCIR, EMPR, global reset, core reset. In other words, the contents of the alternate structure are only reset on cold resets.
- SMASH/CLP configuration might not be followed by a PCIe reset, and designers cannot rely on a PCIe reset to load the alternate module into the 10 GbE controller.
- Option ROM code and UEFI drivers communicate with the 10 GbE controller via a set of AQ commands:
  - The Read Alternate/Direct and Read Alternate — Indirect commands read from the alternate structure.
  - The Write Alternate/Direct and Write Alternate — Indirect commands write into the alternate structure.
  - The Done Alternate Write command signals the 10 GbE controller that the CLP strings phase completed for the entire device in Legacy BIOS mode and per LAN port in UEFI mode.

38.13.2.2.1 Alternate RAM Structure

The alternate structure is 8 KB, partitioned into 32-bit entries. Accessing the structure is done by addressing 32-bit entries. An address is therefore 11-bits (2 K Dwords), where address 0x000 points to the beginning of the 8 KB memory.

The structure is partitioned as follows:

Section	Address (Dword)	Size (Dword)	Content
Per PF	0 – 1023	1024 - 64 per PF	16 per-PF sections, one per PF. These sections are described in Section and can be accessed by each PF.
EMP	1024 - 1279	256	Reserved for EMP use, including error logging. Can be written and read only by the EMP. In debug mode, this section can be read by the PFs.
Reserved	1280 - 2047	768	Reserved.

Per PF Sections

Table 38-92. Per PF Alt RAM Content

Scope	Address (Dword)	Contents	Used By	PCIe ALT Module in Shadow RAM	GLOBR Registers Auto load	CORER Registers Auto load
PF	0	Current LAN MAC Address (LS)	HW, SW			X
PF	1	Current LAN MAC Address (MS)	HW, SW			X
Reserved	17-2	Reserved	N/A			
PF	18	SRIOV	HW	X		X
Reserved	63-19	Reserved	N/A			

Each entry is associated with one or more NVM modules and is loaded into the 10 GbE controller following reset events that load these modules. Loading into the PCIe units is an exception. Parameters to be loaded into PCIe units are written by the EMP into the PCIe ALT auto-load module in shadow RAM. This is done as part of the BIOS initialization flow. On later resets, the 10 GbE controller automatically loads the module into the PCIe units, saving the need for the EMP to intervene.

The PCIe ALT auto-load module is a regular hardware type 1 auto-load section as described in Section 38.19.2.1.1. The content is dynamically created according to the registers that requires an auto-load value different than the default value or the value loaded from the NVM.

Current LAN MAC address (offset 0x0, 0x1)

Lower Dword:

Field	Bit(s)	Description
MAC Address	31:0	MAC Address. Contains the LS 32-bit of the address.

Upper Dword:

Field	Bit(s)	Description
MAC Address	15:0	MAC Address - Contains the MS 16-bit of the address.
Reserved	30:16	Reserved.

Field	Bit(s)	Description
Valid	31	Valid Bit. 0b = The MAC address two Dwords are invalid and should be skipped. 1b = The MAC address two Dwords are valid and should be processed.

Upper Dword:

Actions taken on a change in this entry:

- When valid, it overrides the MAC address loaded from the NVM.

SRIOV (offset 0x12)

This section describes the SRIOV per PF alternate RAM content. The table that follows lists the specifics.

Field	Bit(s)	Description
SRIOV VFs	6:0	Number of SR_IOV VFs requested for the function. Can be any number between 0 and 127. Valid only when the *Auto* field is set to 0b.
Reserved	28:7	Reserved.
Enable	29	SR-IOV is enabled (global configuration - valid only in function 0).
Valid	31	Valid Bit. 0b = Dword is invalid and should be skipped. 1b = Entry is valid and should be processed.

- If the *Enable* bit is cleared (in function 0):
  - Write to the PCIe alternate auto-load section, GLPCI_CAPSUP.SRIOV_EN = 0.b.

- If the *Enable* bit is set (in function 0):
  - Write to the PCIe alternate auto-load section, GLPCI_CAPSUP.SRIOV_EN = 1b and GLPCI_CAPSUP.ARI_EN = 1b.

The EMP calculates the number of interrupt vectors requested per VF through the GLPCI_CNF2.MSI_X_VF_N registers (done per enabled VF):

- If the value in the GLPCI_CNF2.MSI_X_VF_N field equals the maximum number of vectors using the original number of VFs), the EMP updates MSI_X_VF_N to equal the number calculated along with the update number of enabled VFs. This is the case where the device requests the maximum number of possible vectors.
- Else, MSI_X_VF_N is not changed. This is the case where the device requests less than the maximum number of possible vectors.
- The EMP updates the following registers in shadow RAM PCIe ALT auto-load module:
  - PF_VT_PFALLOC_PCIE
  - GLGEN_PCIFCNCNT
  - GLPCI_CNF2
- The EMP updates the following register fields so hardware is updated immediately:
  - PF_VT_PFALLOC
  - GLGEN_PCIFCNCNT.PCIVFCNT
  - GLPCI_CNF2.MSI_X_VF_N

- As part of each internal CORER flow, the EMP updates the following registers:

— PF_VT_PFALLOC

— GLGEN_PCIFCNCNT_INT

- The Device/Function Capabilities command's *Virtual Function* field reflects the change in allocations.
- Update the number of VSIs and MAC addresses allocated to each PF to be two for each PF (LAN) and one for each VF allocated to this PF. The new allocation should be stored in the SR PF allocation section.

Note: After receiving a Done Alternate Write command, firmware checks the total number of VFs allocated is not larger than 128, and if it is larger, returns an ENOSPC error.

Offset 0x15

Field	Bit(s)	Description
Reserved	30:0	Reserved.
Valid	31	Valid Bit. 0b = Entries 25-22 are invalid and should be skipped. 1b = Entries 25-22 are valid and should be processed.

38.13.2.2.2 AQ Commands

The Table 38-93 lists the different AQ commands used to manage the alternate structure.

Table 38-93. List of AQ Commands for the Alternate Structure

Command	Opcode	Brief Description
Write Alternate - Direct	0x0900	Write up to two parameters into the alternate structure.
Write Alternate - Indirect	0x0901	Write a block of parameters into the alternate structure.
Read Alternate - Direct	0x0902	Read up to two parameters from the alternate structure.
Read Alternate - Indirect	0x0903	Read a block of parameters from the alternate structure.
Done Alternate Write	0x0904	Indication that all CLP strings (for the entire 10 GbE controller in legacy BIOS mode and per LAN port in UEFI mode) have been sent to the 10 GbE controller.
Clear Port Alternate	0x0906	Clear content of alternate RAM relevant to this port.

Write alternate - direct

The Write Alternate - Direct command writes to the alternate structure up to two parameters.

Table 38-94. Write Alternate - Direct Command (Sheet 1 of 2)

Name	Bytes.Bits	Value	Remarks
Flags	0-1		See Section 38.27.5.1.1 for details.
Opcode	2-3	0x0900	Command opcode.
Datalen	4-5	0x00	N/A
Return Value/ VFID	6-7	0x00	N/A
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.

Table 38-94. Write Alternate - Direct Command (Sheet 2 of 2)

Name	Bytes.Bits	Value	Remarks
First Parameter Address	16-19		Address should be within the range allocated to the function inside the alternate structure. Accessing the alternate structure is done by addressing 32-bit entries.
First Parameter Data	20-23		
Second Parameter Address	24-27		Address should be within the range allocated to the function inside the alternate structure. Value of 0xFF..FF means only the first parameter is written. Accessing the alternate structure is done by addressing 32-bit entries.
Second Parameter Data	28-31		

Table 38-95. Completion For The Write Alternate - Direct Command

Name	Bytes.Bits	Value	Remarks
Flags	0-1		See Section 38.27.5.2.2 for details.
Opcode	2-3	0x0900	Command opcode.
Datalen	4-5	0x00	N/A
Return Value/ VFID	6-7		Some comments on specific errors: 0x0 = No error. ENOMEM - Out of memory (access outside the alternate structure). EACCES - Permission denied (access to another PF's area).
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Reserved	16-31		Might contain the values sent in the original command.

Write Alternate - Indirect

The Write Alternate - Indirect command writes a block of parameters to the alternate structure. The command defines the number of Dwords to be written and the starting address inside the alternate structure.

Table 38-96. Write Alternate - Indirect Command

Name	Bytes.Bits	Value	Remarks
Flags	0-1		See Section 38.27.5.2.1 for details.
Opcode	2-3	0x0901	Command opcode.
Datalen	4-5		Size of buffer accompanying the command (in bytes).
Return Value/ VFID	6-7	0x00	N/A
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Alternate Structure Address	16-19		Lowest address to be written into the alternate structure. Accessing the alternate structure is done by addressing 32-bit entries.
Alternate Structure Length	20-23		Number of Dwords to be written into the alternate structure.
Data Address High	24-27	Buff Addr	High bits of buffer address.
Data Address Low	28-31	Buff Addr	Low bits of buffer address.

The following completion is sent for the Write Alternate - Indirect command:

Table 38-97. Completion For The Write Alternate - Indirect Command

Name	Bytes.Bits	Value	Remarks
Flags	0-1		See Section 38.27.5.2.2 for details.
Opcode	2-3	0x0901	Command opcode.
Datalen	4-5	0x00	N/A
Return Value/ VFID	6-7		Some comments on specific errors: 0x0 = no error. ENOMEM - Out of memory (access outside the alternate structure). EACCES - Permission denied (access to another PF's area).
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Reserved	16-31		Reserved.

Read Alternate - Direct

The Read Alternate - Direct command reads from the alternate structure up to two parameters.

Table 38-98. Read Alternate - Direct Command

Name	Bytes.Bits	Value	Remarks
Flags	0-1		See Section 38.27.5.2.1 for details.
Opcode	2-3	0x0902	Command opcode.
Datalen	4-5	0x00	N/A
Return Value/ VFID	6-7	0x00	N/A
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
First Parameter Address	16-19		Address should be within the range allocated to the function inside the alternate structure. Accessing the alternate structure is done by addressing 32-bit entries.
Reserved	20-23	0x00	Reserved.
Second Parameter Address	24-27		Address should be within the range allocated to the function inside the alternate structure. Value of 0xFF..FF means only the first parameter is read. Accessing the alternate structure is done by addressing 32-bit entries.
Reserved	28-31	0x00	Reserved.

The following Completion is sent for the Read Alternate - Direct command:

Table 38-99. Completion For The Read Alternate - Direct Command (Sheet 1 of 2)

Name	Bytes.Bits	Value	Remarks
Flags	0-1		See Section 38.27.5.2.2 for details.
Opcode	2-3	0x0902	Command opcode.
Datalen	4-5	0x00	N/A
Return Value/ VFID	6-7		Some comments on specific errors: 0x0 = no error. ENOMEM - Out of memory (access outside the alternate structure). EACCES - Permission denied (access to another PF's area).
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.

Table 38-99. Completion For The Read Alternate - Direct Command (Sheet 2 of 2)

Name	Bytes.Bits	Value	Remarks
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
First Parameter Address	16-19		Copied from command.
First Parameter Data	20-23		Data read.
Second Parameter Address	24-27		Copied from command. Value of 0xFF..FF means only the first parameter is read.
Second Parameter Data	28-31		Data read.

Read Alternate - Indirect

The Read Alternate - Indirect command reads a block of parameters to the alternate structure. The command defines the number of Dwords to be read and the starting address inside the alternate structure.

Name	Bytes.Bits	Value	Remarks
Flags	0-1		See Section 38.27.5.2.1 for details.
Opcode	2-3	0x0903	Command opcode.
Datalen	4-5		Size of buffer accompanying the command (in bytes).
Return Value/ VFID	6-7	0x00	N/A
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Alternate Structure Address	16-19		Lowest address to be read from the alternate structure. Accessing the alternate structure is done by addressing 32-bit entries.
Alternate Structure Length	20-23		Number of Dwords to be read from the alternate structure.
Data Address High	24-27	Buff Addr	High bits of buffer address.
Data Address Low	28-31	Buff Addr	Low bits of buffer address.

The following completion is sent for the Read Alternate - Indirect command:

Name	Bytes.Bits	Value	Remarks
Flags	0-1		See Section 38.27.5.2.2 for details.
Opcode	2-3	0x0903	Command opcode.
Datalen	4-5	0x00	Actual length of data returned by the command.
Return Value/ VFID	6-7		Some comments on specific errors: 0x0 = no error. ENOMEM - Out of memory (access outside the alternate structure). EACCES - Permission denied (access to another PF's area).
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Alternate Structure Address	16-19		Lowest address read from the alternate structure.
Alternate Structure Length	20-23		Number of Dwords read from the alternate structure.
Data Address High	24-27	Buff Addr	High bits of buffer address.

Name	Bytes.Bits	Value	Remarks
Data Address Low	28-31	Buff Addr	Low bits of buffer address.

Done Alternate Write

The Done Alternate Write command indicates to the 10 GbE controller that the CLP strings have been sent to it:

- Legacy BIOS mode — Sent once per device after all CLP strings have been sent to the 10 GbE controller (for all LAN ports). Following the command, firmware loads the contents of the alternate structure into the device functional units.
- UEFI mode — Sent once per each enabled LAN port. Once the command is received from all enabled ports, firmware loads the contents of the alternate structure into the 10 GbE controller's functional units.

Name	Bytes.Bits	Value	Remarks
Flags	0-1		See Section 38.27.5.2.1 for details.
Opcode	2-3	0x0904	Command opcode.
Datalen	4-5	0x00	N/A
Return Value/ VFID	6-7	0x00	N/A
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
BIOS Mode	16.0	See remarks	0b = Legacy BIOS. 1b = UEFI.
Reserved	16.7 - 16.1	0x00	Reserved.
Reserved	17-31	0x00	Reserved.

The following completion is sent for the Done Alternate Write command:

Name	Bytes.Bits	Value	Remarks
Flags	0-1		See Section 38.27.5.2.2 for details.
Opcode	2-3	0x0904	Command opcode.
Datalen	4-5	0x00	N/A
Return Value/ VFID	6-7		ENOSPC - More than 128 VFs are requested.
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Reserved	16.0	0b	Reserved.
Return Flags	16.1		Reset Needed. When set, indicates that software should do a global reset for the alternate RAM content to take effect.
Reserved	16.2-31	0x00	Reserved.

Clear Port Alternate Write

The Clear Port Alternate command indicates to the 10 GbE controller that the alternate sections of all PF tied to the port. The port is inferred from the PF that sent the command.

Name	Bytes.Bits	Value	Remarks
Flags	0-1		See Section 38.27.5.2.1 for details.
Opcode	2-3	0x0906	Command opcode.
Datalen	4-5	0x00	N/A
Return Value/ VFID	6-7	0x00	N/A
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Reserved	16-31	0x00	Reserved.

The following completion is sent for the Clear Port Alternate command:

Name	Bytes.Bits	Value	Remarks
Flags	0-1		See Section 38.27.5.2.2 for details.
Opcode	2-3	0x0905	Command opcode.
Datalen	4-5	0x00	N/A
Return Value/ VFID	6-7		
Cookie High	8-11	Cookie	Opaque value is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value is copied by firmware into the completion of this command.
Reserved	16-31	0x00	Reserved.

38.13.2.2.3 Example of a SMASH/CLP flow - Legacy BIOS

The following pseudo code provides an example of how such a flow might be performed by legacy BIOS using SMASH/CLP commands. The following guidelines should be kept:

- If a certain PCI function is disabled via this mechanism, pre-boot software does not access any resource of that function (such as any CSR) once it sends the Done Alternate Write AQ command. The 10 GbE controller confirms the command, resets, and disables the function.
- By the time the SMASH/CLP commands are executed and a function is disabled, there is no Tx/Rx activity in the 10 GbE controller (since no queues have been initialized).
- All ports enabled in the NVM have the option ROM enabled (such as the lowest PCI function per port has an expansion ROM BAR).
- BIOS calls all CLP entry points for all functions before getting into the initialization phase.
- It is not guaranteed that a system reset is issued immediately following this sequence. For example, the configuration settings must take place even if such a reset is not issued.

- During the initialization phase, pre-boot software has to issue a global reset followed by a Start LLDP Agent AQ command to start the LLDP agent in firmware.

```
// Initial state:

//  The device is configured from NVM

// The following flow runs per each device

BIOS does PCI enumeration and discovers functions with Option ROM enabled

For each LAN Port with Option ROM enabled // sent to the lowest number PCI function
on the port

    BIOS loads the Option ROM into system RAM

    Set First-Init to true // When Init is later called, it's the 1st call to Init

    For each CLP string received by BIOS for a function within the port

        If the Option ROM for the port supports SMCLP entry point

            BIOS calls SMCLP entry point for port with CLP string

            SMCLP section in Option ROM processes the CLP string

            Option ROM keeps track of SMCLP status for the port

        End-If

    End-For

End-For

For each LAN port with Option ROM enabled

    BIOS calls INIT entry point for the port

End-For

SMCLP Entry Point

If CLP type is SET and action is “Return to default” // clear any pre-existing CLP
configuration

        Send the "Clear Port Alternate" admin command to invalidate all Alternate
Memory parameters for the port and its PFs

End-If

If CLP type is SET

    Generate “Write Alternate - Direct” admin command(s) to the device

    End-If

If CLP type is EXIT // Apply any configuration changes from previous commands that
have not

                        been applied

    Send appropriate admin commands with default values for the PF parameters not
specified by the CLP string that have a default behavior in this mode, different
than the hardware default.

End-If

End SMPCLP Entry Point
```

```
SMCLP INIT Entry point

If First-Init is true // the flow below should only be executed on the 1st call to
Init

    If SMCLP status is false // means no CLP strings have been received for any
functions for the device

        // Option ROM INIT configures the device in a standard operating mode (i.e.
not an OEM specific mode)

    End-if

    If SMCLP status is true // means at least one function had CLP strings

        // This is the time to load the CLP parameters from the Alternate Structure
into the device.

        Send "Done Alternate Write" command indicating end of CLP strings for the
device

    End-if

    // Global Reset should be done only once per device

    If Firmware required a reset in the "Done Alternate Write" response, Issue
Global Reset of the device

    Set First-Init to false

End-if

Continue with INIT code...

End SMCLP INIT Entry Point
```

38.13.2.2.4 Example of a SMASH/CLP Flow - UEFI

The following pseudo code provides an example of how such a flow might be performed by the UEFI drivers using SMASH/CLP commands. The following guidelines should be kept:

- If a certain PCI function is disabled via this mechanism, pre-boot software does not access any resource of that function (such as any CSR) once it sends the Done Alternate Write AQ command for that function. The 10 GbE controller confirm the command, resets, and disables the function.
- By the time the SMASH/CLP commands are executed and a function is disabled, there is no Tx/Rx activity in the 10 GbE controller (since no queues have been initialized).
- A UEFI driver is executed for each enumerated LAN port. For example, any port enabled in the NVM and not disabled by strapping.
- It is not guaranteed that a system reset is issued immediately following this sequence. For example, the configuration settings must take place even if such a reset is not issued.

```
// Initial state:

// The device is configured from NVM

// The following flow runs per each device

BIOS does PCI enumeration and discovers PCI functions

For each enabled LAN Port
```

```
   BIOS calls driver START entry point

   For each CLP string received by BIOS for a function within the port

       SMCLP section processes the CLP string

   End-For

   Driver sends a "Done Alternate Write" command indicating end of CLP strings for
the port

    If Firmware required a reset in the "Done Alternate Write" response, Issue
Global Reset of the device

End-For

SMCLP section in START

If CLP type is SET and action is "Return to default" // clear any pre-existing CLP
configuration

    Send the "Clear Port Alternate" admin command to invalidate all Alternate
Memory parameters for the port and its PFs

End-If

If CLP type is SET

   Generate "Write Alternate - Direct" admin command(s) to the device

   End-If

If CLP type is EXIT // Apply any configuration changes from previous commands

                    // that have not been applied

   Send appropriate admin commands with default values for the PF parameters not
specified by the CLP strings that have a default behavior in this mode, different
than the hardware default.

End-If

End SMPCLP section
```

38.13.2.2.5 Processing The Alternate Structure

If a Done Alternate Write AQ command is received, the *GLNVM_GENS.ALT_PRST* bit is set by the 10 GbE controller. This bit indicates that an alternate structure exists in the 10 GbE controller. As a result of each Done Alternate Write AQ command, the EMP loads the relevant alternate structure parameters into the 10 GbE controller according to the following sequence:

- EMP loads any required parameters from the alternate structure into the hardware.
- EMP ACKs the Done Alternate Write command.
- Global reset is performed:
  - — Initiated by software.
  - — Reset is done only once and not per each instance of the Done Alternate Write AQ command.
  - — Hardware is initialized, including loading of the relevant sections of the alternate structure into hardware.

38.13.2.3 Network Boot

Each PF can be a boot function and can independently support PXE, iSCSI boot:

- All functions are PXE boot (such as up to 16 such functions).
- Up to four functions might be iSCSI boot functions.

38.13.2.4 Device State

This section is limited to changes in the 10 GbE controller's state made in the BIOS initialization stage.

38.13.2.4.1 Switch / Tx Scheduler

Some parameters of the switch and Tx scheduler configuration might change by the contents of the alternate structure. Such changes take effect when the alternate structure is enabled.

38.13.2.4.2 LAN

Expansion ROM code might set LAN QPs for network boot. The sequence of setting a LAN QP is described in Section 38.38, "Programming Interface".

38.13.2.4.3 Interrupts

Interrupts need to be set if used for AQ or LAN queues operation. See Section 38.22.1.1 for the exact flow.

38.13.3 Driver Load

38.13.3.1 Introduction

38.13.3.1.1 Driver Load (Non-Virtualized)

As described earlier in this section, by the time the software device driver loads, the NVM configuration is already complete and PCIe configuration has taken place. During a software device driver load, the following sequence of commands is typically issued to the 10 GbE controller to initialize it for normal operation. The major initialization steps are:

1. Device driver probes the 10 GbE controller for resource allocations.
2. Disable interrupts.
3. Initialize the admin queue - see Section 38.13.
4. Initialize HMC - see Section 38.26.
5. Initialize MAC/PHY - see Section 38.11.1.
6. Initialize power management --Section 38.17.4 (Wake Up).
7. Initialize DCB (including Rx-PB) - see Section 38.24.4.
8. Initialize the switch and Tx scheduler - see Section 38.21.7.17 and Section 38.25.4.19.
9. Initialize statistics by reading the counter's initial values to serve as a baseline.
10. Init Protocol Engine - see Section 38.36.3.1.
11. Initialize 1588.
12. Enable interrupts.

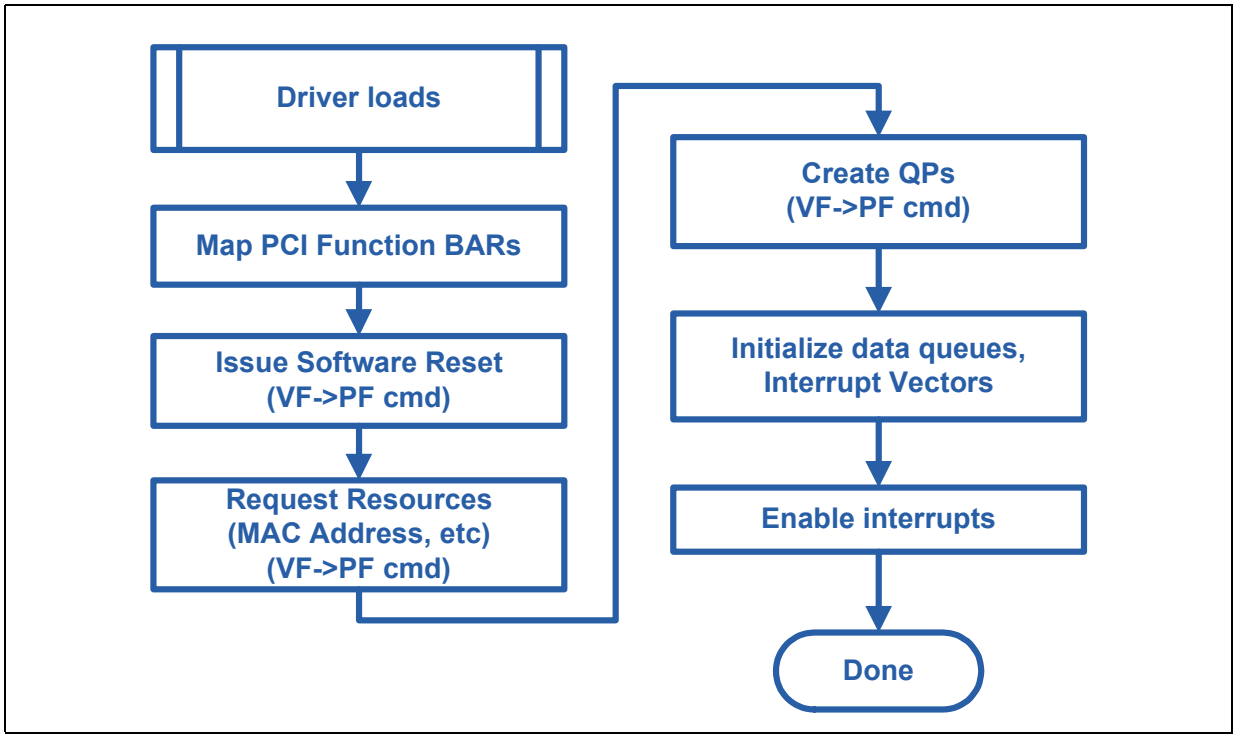
At this point, the 10 GbE controller is ready to initialize VSIs and LAN PE flows. These are done dynamically during operation:

- Initialize VSI.
- Initialize LAN QP; including its interrupts (see Section 38.30.2.2) or Init PE QP (see Section 38.14).
- Configure filters.

38.13.3.1.2 Driver Load (SR-IOV)

The 10 GbE controller approach for virtualized device drivers is to depend heavily on the PF device driver for management of chip resources. The device driver models for newer virtualized operating systems are moving in a direction that require such functionality. The following figure shows the high-level initialization flow for virtualized device drivers that use a VF in a guest operating system.

Figure 38-29.Virtualized Device Driver Initialization Flow



PF Initialization Details

In addition to the regular device driver initialization flow, the PF device driver should apply the following steps to enable support for VMs.

1. After the operating system enables virtual bridging, the PF device driver should create a VEB or a VEPA switching element using the following flow:
   a. Query the switch structure using the Get Switch Configuration command in order to get the SEID number to which this PF is connected. This SEID might be the port or an S-channel.
   b. Create a VEB/VEPA using the Add VEB command (Add VEB). The control port can be either the original VSI of the PF or a dedicated VSI.
   c. Connect the switch in place of the current VSI using the Insert Element command (Add VEB).

d. Connect default and mirror ports as needed using the Add VSI and Connect Elements commands. See Add VSI (0x0210) and Get VSI Parameters (0x0212).

e. Define mirroring rules using the Mirroring Rules commands (Mirroring).

f. Activate malicious driver protection through the GL_MDCK_RX, GL_MDCK_TDAT and GL_MDCK_TCMD registers.

2. When the VMM requests that a virtual port be created, the PF driver should:

a. Create a set of VSIs according to the flow described in the paragraphs that follow. The exact flow depends on the VMM-to-PF API.

b. Define the bandwidth allocated to the VSI and each of its TCs using the Scheduler Configuration commands (Section 38.25.4).

c. If the virtual port is a VF, allow VF access to the network by clearing the associated bit in *GL_VIRT_VFLRE* register.

VF Initialization Details

This section describes the flow used to initialize a VF. Only stages involving the hardware are detailed.

Software Reset

A VF software reset can be asserted only by the PF using the *VPGEN_VFRTRIG.VFSWR* field. Following a VF software reset, the VF should request re-initialization of the queues from the PF.

Following the reset, the PF should preform the clean-up steps described in Section 38.13.1.2.5.

Request Resources and Create Initialize Data Queues

On top of the resources statically allocated to a VF (interrupts, RSS table, etc.), a VF might have a set of VSIs. Each VSI contains objects such as:

- User priorities (transmit queue groups).
- Queue pairs
- Queuing filters

VSIs can be requested either for LAN or iWARP.

The resources should be requested in the following order (operations with the same stage number can be done in any order):

Step	Resource Requested	PF Action	Notes
1	VSI and UPs	Allocate VSIs according to allocation policies using the Add VSI AQ command. See Add VSI (0x0210).	The PF should activate the security features in the VSI (anti spoof, port based VLAN) according to the VF settings.
2	Forwarding table entries (MAC and VLANs)	Add the requested MAC and VLAN and MAC, VLAN pairs using the forwarding table configuration commands (Section 38.21.7.18.8).	
3	Data queue pairs	Create the requested queue contexts as described in Section 38.31.3.1 and Section 38.30.3.3.1.	
	PE resources	The PF flow is described in Section 38.36.3.1.	Before using any PE related resources, the HMC must be properly programmed. See Section 38.26 for more details on the HMC initialization. Virtual function HMC initialization must be performed by the PF driver on behalf of the VF driver

38.14 Device/Port/Function Configuration

38.14.1 General

The 10 GbE controller provides several mechanisms to configure which PCI functions and Ethernet ports are exposed:

- Through NVM configuration
- Bases on power management policy
- Through strapping pins

38.14.1.1 Port-to-function Mapping

The PFGEN_PORTNUM.PORT_NUM per-PF register field (loaded from the NVM) associates each PF with a port.

38.14.2 Disable Through Strapping Pins

For a LAN on Motherboard (LOM) design, it might be desirable for the system to provide BIOS setup capability for selectively enabling or disabling the 10 GbE controller PCI devices, PCI functions, or external Ethernet ports and the associated PCI function. It enables end users more control over system resource management and avoids conflicts with add-in NIC solutions. The 10 GbE controller provides support for selectively enabling or disabling one or more LAN PCI device(s) in the system.

The 10 GbE controller provides strapping pins to disable its external Ethernet ports and/or PCI functions:

- One pin (LAN_DIS_N) is sampled on RSMRST# and PCIe resets to disable Ethernet ports. The specific port(s) to be disabled is determined from NVM. Additional NVM configuration is provided to determine which PCI functions are disabled at the same time. The expected usage is to disable the PCI functions associated with the disabled ports.

- One pin (PCI_DIS_N) is sampled on RSMRST# and PCIe resets to disable PCI functions. The specific functions that are disabled are determined from the NVM.

Some guidelines on usage of LAN_DIS_N and PCI_DIS_N:

- During power up, the PCI_DIS_N and LAN_DIS_N pins are ignored until the NVM is read. From that point, the 10 GbE controller might disable all PCI functions if either PCI_DIS_N or LAN_DIS_N is asserted.
- De-assertion of the PCI_DIS_N or LAN_DIS_N pins requires the system to issue a power on reset/RSMRST#/PE_RST_N/in-band reset to the 10 GbE controller in order to re-enable any disabled PCI functions or external Ethernet ports.
- The PCI_DIS_N and LAN_DIS_N pins should maintain their state during system reset and system sleep states. It should also insure the proper default value on system power up. For example, one could use a GPIO pin that defaults to 1b (enable) and is on system suspend power (such that it maintains its state in S0-S5 ACPI states).

38.14.3 Port And Device Disable

The following mechanisms are provided to enable and disable Ethernet ports:

- NVM configuration
  - Ports are enabled or disabled from the NVM. The PRTGEN_CNF.PORT_DIS per-port register bit (loaded from the NVM) disables external ports other than port 0 (PORT_DIS for port 0 is hard wired to always enabled).
  - When cleared, the respective port is enabled
  - The hardware default value is for port 0 to be enabled and other ports to be disabled
- Soft SKU commands
  - Soft SKU commands might enable or disable LAN ports. The Soft SKU commands are executed either before or after PERST# was de-asserted and in any case, before the first access by BIOS to the 10 GbE controller (like before the first PCIe configuration cycle to the 10 GbE controller).
  - EMP updates the configuration of the ports enabled or disabled through the Soft SKU command by writing to the PRTGEN_CNF.EMP_PORT_DIS register bits.
- Power management
  - If the Ethernet ports are not required in Dr state (such as if manageability is disabled and APME WoL is disabled as well), then all ports are disabled during Dr state.
- Strapping (LAN_DIS_N)
  - When the LAN_DIS_N pin is asserted low, the PRTGEN_CNF.ALLOW_PORT_DIS per-port bits (loaded from the NVM) determine if the port is disabled.
  - The hardware default value for these bits is 0x0 (do not disable).
  - If a bit is set to 0b, LAN_DIS_N has no effect on the port.

Note: If a port is required for manageability purposes, it should not be disabled by the mechanisms previously described.

The result of the previous mechanisms is reflected in the PRTGEN_STATUS.PORT_VALID bit (per port), which denotes if the port is enabled. A bit is cleared (port disabled) if at least one of the previous mechanisms disables the port. The port is then powered down (including MAC, PCS, PHY).

If all ports are disabled, the 10 GbE controller is put in a power-down, reset state. Specifically, the 10 GbE controller does not respond to PCI configuration cycles, the PCIe link is in L3 state, and Ethernet ports are in power down. All PCI functions must be disabled as well via the mechanisms previously described (such as the proper NVM configuration must be set to disable for PFs).

38.14.3.1 Dynamic Port Shutdown

Another related, per-port status bit is the PRTGEN_STATUS.PORT_ACTIVE indication. This is a dynamic state indicating that the port is temporarily inactive and is powered down. When the port is inactive, re-activating it, does not require any reset and the related PCIe function is still active.

A port is active (PRTGEN_STATUS.PORT_ACTIVE = 1b) based on the following rules:

1. PRTGEN_STATUS.PORT_VALID = 1b, as previously described above AND the 10 GbE controller is in D0 state (PMCSR.PowerState = D0).
   - If PRTPM_GC.EMP_LINK_ON is set to 1b (such as the interface is being used for manageability) then the link is kept on. Specifically, hardware ignores disabling the link using the PRTGEN_CNF.ACTIVATE_PORT_LINK.
   - Else,
     - In systems where the application needs to prevent any traffic on link before the device driver is loaded, the PRTGEN_CNF2. ACTIVATE_PORT_LINK is loaded from the NVM with the value of 0b (disable).
     - Once the device driver loads, it uses the Set Link and Restart AN with the command bit 2 set (Enable Link). Following this, the EMP enables the link by writing the value of 1b to the PRTGEN_CNF2. ACTIVATE_PORT_LINK and starts the link bring-up sequence.
     - If the device driver is about to be removed or disabled, then before going down the device driver might disable the link by the Set link and Restart AN with the command bit 2 cleared (Disable Link). Following this, firmware disables the link by writing the value of 0b to the PRTGEN_CNF2. ACTIVATE_PORT_LINK.
2. PRTGEN_STATUS.PORT_VALID = 1b, as previously described, AND the 10 GbE controller is in Dr state (PMCSR.PowerState = D3).
   - If port is enabled for wake-up, follow the description in the wake-up section.
   - Else, behavior is defined by the EMP_LINK_ON bit:
     - The hardware default value for PRTPM_GC.EMP_LINK_ON is 0b (link should be down as it is not required for EMP functionality).
     - BMC might enable manageability by sending the appropriate command. As a result, EMP transitions to pass-through manageability-on state, enables the respective port (if disabled) by setting the PRTPM_GC.EMP_LINK_ON bit for the port, and starts the link bring-up sequence.
     - If the channel is disabled by the BMC (by sending the appropriate command) and EMP has no other needs for the LAN port in Dr state (like proxy), then the EMP reverts the PRTPM_GC.EMP_LINK_ON bit for the port to the value of EMP_LINK_ON bit in the NVM manageability module or is set to zero (in case of the Disable Channel command with the ALD bit set).

38.14.4 Function Disable

The following mechanisms are provided to enable and disable PCI functions.

- NVM configuration
  - PCI functions are enabled or disabled from the NVM. The PFPCI_FUNC.FUNC_DIS per-PF bit (loaded from the NVM) disables PCI functions (other than function 0. FUNC_DIS for function 0 is hardwired to enabled).
  - When cleared, the respective function is enabled.
  - The hardware default value is for function 0 to be enabled and other functions to be disabled.
- Strapping through PCI_DIS_N
  - When the PCI_DIS_N pin is asserted low, the PFPCI_FUNC.ALLOW_FUNC_DIS per-PF register bit (loaded from the NVM) determines if the function is disabled.
  - If this bit is set to 0b, PCI_DIS_N has no effect on the PCI function.
  - The hardware default value is 0b (keep enabled).
- Strapping through LAN_DIS_N
  - When the LAN_DIS_N pin is asserted low, the PFPCI_FUNC.DIS_FUNC_ON_PORT_DIS per-PF bit (loaded from the NVM) determines if the function is disabled.
  - If this bit is set to 0b, LAN_DIS_N has no effect on the PCI function.
  - The hardware default value is 0 (do not disable).
- Soft SKU commands
  - The soft SKU commands are executed either before or after PERST# was de-asserted and in any case, before the first access by BIOS to the 10 GbE controller (such as before the first PCIe configuration cycle to the 10 GbE controller).
  - When a LAN port is enabled or disabled via a Soft SKU command, the EMP identifies (through the PFGEN_PORTNUM registers) the PCI functions associated with the port.
  - EMP then updates the configuration of the functions enabled or disabled by writing to the PFPCI_FUNC.FUNC_DIS register bits.
  - PFPCI_FUNC.FUNC_DIS for function 0 is hardwired to enabled, so is not affected by this mechanism.
  - The GLGEN_PCIFCNCNT register reflects the number of enabled PFs as loaded from the NVM (determined by PFPCI_FUNC.FUNC_DIS only). The value is loaded from the NVM.

The result of the previous mechanisms is reflected in the PFPCI_STATUS1.FUNC_VALID bit (per PF), which denotes if the function is enabled. A bit is cleared (function disabled) if at least one of the previous mechanisms disables the function.

When a function is disabled:

- It does not respond to PCI configuration cycles (unless specified otherwise). Effectively, the function becomes invisible to the system.
- The *PME_En* bit is cleared to avoid issuing PME.

The Ethernet ports associated with disabled PCI functions are still available for manageability purposes.

38.14.4.1 Dummy Function

When PCI function 0 is disabled, it does not disappear from the PCIe configuration space. Rather, the function presents itself as a dummy function. The device ID and class code of this function changes to other values (dummy function device ID 0x10A6, class code 0xFF0000, with an option to load from the NVM) that claims 4 KB of memory. In addition, the function does not require any I/O space and does not require an interrupt line. All other PCI functions keep their respective locations.

38.14.5 Event Flow for Enable/Disable Ports and PCI Functions

This section describes the expected flow to disable or enable PCI functions or Ethernet ports. Following a power-on reset/RSMRST#/PE_RST_N/in-band reset, the LAN_DIS_N and PCI_DIS_N signals should be driven high (or left unconnected) for normal operation.

The following example assumes that PCI functions and/or Ethernet ports are being disabled during the BIOS initialization phase:

1. Following a power-up sequence, the LAN_DIS_N and PCI_DIS_N signals are driven high.
2. The PCIe link is established following PE_RST_N.
3. BIOS goes through PCI bus enumeration.
4. BIOS recognizes that the PCI functions in the 10 GbE controller should be disabled.
5. The BIOS drives the LAN_DIS_N or PCI_DIS_N signal to a low level.
6. The BIOS asserts PCIe reset, either in-band or via PE_RST_N.
7. As a result, the 10 GbE controller samples the LAN_DIS_N and PCI_DIS_N signals and disables the PCI functions and/or external Ethernet ports.
8. BIOS might do device enumeration a second time (the disabled PCI functions are invisible or changed to dummy function).
9. Proceed with normal operation.
10. Re-enable could be done by driving the LAN_DIS_N and PCI_DIS_N signals high and re-issuing a power-on reset/RSMRST#/PE_RST_N/in-band reset.

38.14.5.1 Multi-Function Advertisement

If all but one of the PCI functions are disabled, the 10 GbE controller is no longer a multi-function device. The 10 GbE controller normally reports a 0x80 in the PCI configuration header field header type, indicating multi-function capability. However, if only a single LAN is enabled, the 10 GbE controller reports a 0x0 in this field to signify single-function capability.

38.14.5.2 Legacy Interrupts Use

Each NVM PF configuration module specifies the interrupt line used for each PCI function. When more than one PCI function is enabled, the 10 GbE controller uses the INTA# to INTD# interrupts for interrupt reporting. The specific interrupt pin used is reported in the *PCI Configuration Header Interrupt Pin* field associated with each PCI function.

However, if only one PCI function is enabled, then the INTA# must be used for this PCI function, regardless of the NVM configuration. Under these circumstances, the *Interrupt Pin* field of the PCI header always reports a value of 0x1, indicating INTA# usage.

38.14.5.3 Power Reporting

When more than one PCI function is enabled, the PCI power management register block has the capability of reporting a common power value. The common power value is reflected in the *Data* field of the PCI Power Management registers. The value reported as common power is specified via the *LAN Power Consumption* NVM word (word 0x22), and is reflected in the *Data* field each time the *Data_Select* field has a value of 0x8 (0x8 = common power value select).

When only one PCI function is enabled, the 10 GbE controller appears as a single-function device, the common power value, if selected, reports 0x0 (undefined value), as common power is undefined for a single-function device.

38.15 Shared Resource Management

The 10 GbE controller is a device with multiple external Ethernet ports and that supports multiple PCI functions. Several on-chip resources are shared between device drivers that load the PCI functions exposed by the 10 GbE controller. Additionally, some resources for SR-IOV VFs are managed by the associated PFs. In general, the 10 GbE controller minimizes the requirement for coordination between device drivers running on different PCI PFs through a combination of resource partitioning and programming interface assistance for remaining resources that are shared.

The 10 GbE controller handles shared resources using a number of allocation mechanisms and/or access control mechanisms. Table 38-100 lists the supported mechanisms.

Table 38-100.Supported Mechanism (Sheet 1 of 2)

Class	Description
Dedicated	This resource is associated with a particular 10 GbE controller element and is always available without respect to any other configuration or setting. Examples of elements in this context could be a PCI function or external Ethernet port.
Administered	Administered resources can be re-assigned based on BMC, BIOS settings, or other OEM specific mechanisms. These resources can be changed with a PCI reset but do not change dynamically after the PCI reset.
Profiles	Resources that are allocated via profiles are typically divided up among different entities based on some combination of other input. A profile might dictate that a resource is divided among the active PCI functions in a particular manner. Another possible usage of a profile is to divide resources based on both the number of PCI functions and the number of external Ethernet ports. The division of resources that are allocated by profiles happens between the time that a PCI reset occurs and might be impacted by an initial device driver load, but resource allocation based on profiles require a PCI reset to change after the initial device driver load.
Pool	Resources that are allocated from pools are typically allocated in a fashion that guarantees no resource starvation to an individual consumer of a resource but enables flexible allocation of remaining resources to any consumer that requires additional resources beyond the minimum. Pools are used for resources that do not need to have a maximum number of resources allocated to all consumers at the same time and that the consumers are reasonably able to fail an allocation.
Service	Resources that are possibly allocated on a per-device or per-port basis but are accessed by a software service that has visibility to multiple device driver interfaces that do not need the 10 GbE controller to provide an arbitration mechanism. In these cases each PCI function associated with a given resource provides equal access to the resource as other PCI functions associated with the resource. This enables the software service to have the flexibility to access such resources from any device driver instance that it finds available and to switch between device driver instances as the device drivers are stopped and started. Resources that need to accesses directly by a device driver without support from an overlaying software service cannot be handled in this fashion.

Table 38-100.Supported Mechanism (Sheet 2 of 2)

Class	Description
Arbitrated	Resources that are allocated on a per-device or per-port basis need an access control mechanism that enables multiple consumers of the resource to operate in an independent manner. The 10 GbE controller does this by either providing a firmware interface to access the resource where firmware handles the requests one at a time or by other hardware based arbitration scheme.

Table 38-101.Used Mechanism (Sheet 1 of 2)

Resource	Accessible From PF or VF	Allocation Or Access Type	Description
External Ethernet Ports	PF	Administered and Arbitrated	External Ethernet ports are assigned to the 10 GbE controller PCI physical PCI functions based on NVM settings. PF drivers configure their respective ports via AQ commands.
NVM	PF	Arbitrated	NVM access requires acquiring ownership via an AQ command.
PCI VFs	N/A	Administered	The number of VFs that are active and the assignment of VFs to PFs is handled as part the PCI PF configuration listed previously in this table.
PCI and PCIe	PF and VF	Various	PCIe resources are dedicated or shared per the PCIe specification. Mostly loaded from the NVM and write-disabled to host software.
Admin Queues	PF and VF	Dedicated	Each function has a dedicated AQ command queue.
MSI-X Vectors	PF and VF	Profiles	The 10 GbE controller supports a fixed number of MSI-X vectors that are distributed evenly among PFs and VFs based on the number of active PFs and VFs.
PCIe Performance Counters	PF	Service	Performance counters are a shared resource among PFs (service mode.
HMC	PF and VF	Profiles	Each PF (and VF with PE resources) is allocated a separate PCI function FPM. Each function is allocated some number of SDs (configured via the NVM with an option to override via firmware). See Section 38.26 for more detail.
LAN Queues	PF and VF	Profiles	Queue pairs (Tx/Rx) are allocated to PFs based on NVM configuration. Allocation of QPs to VFs is dynamic and managed by each PF (see Section 38.39).
Hash Instances (RSS, etc.)	PF VF	Dedicated	The 10 GbE controller supports independent hash filters for each VSI.
Quad-hash Filters	PF and VF	Dedicated	Each PF (or VF) is allocated filter entries in FPM and are cached on-die. Caching is FCFS.
TimeSync	PF	Service	The 10 GbE controller supports TimeSync for all PFs per external Ethernet port. The 10 GbE controller provides an indication of which PF owns TimeSync per each LAN port. However, it is system software's responsibility to avoid contention between PFs. See Section 38.39.2.20 for more detail.
Internal Switching Elements	PF	Pool	The internal switch is configured through a combination of control mechanisms (such as NVM, SMASH/CLP) and PF drivers. The following resources are managed: VEBs, VSIs, filter entries, VSI lists, mirroring resources. The general scheme is a basic quota per PF (loaded from the NVM) and FCFS for all the remaining. PF configuration is done via AQ commands.
VSIs	PF	Service	See Section 38.25.5.3 for more detail on the resource allocation mechanism for this resource.
PE Resources	PF and VF	Profiles	QPs, CQs and CEQs are distributed between PFs and VFs based on resource profiles. A single AEQ is allocated per PCI function FPM is used per PF for memory-based resources.
Accelerated Port Bit Vector Table	PF and VF	Arbitrated	The 10 GbE controller provides a single Accelerated Port Bit Vector Table (APBVT) per external Ethernet port. The 10 GbE controller provides arbitration for APBVT manipulation between software device drivers running on separate PCI functions that are associated with the same APBVT.

Table 38-101.Used Mechanism (Sheet 2 of 2)

Resource	Accessible From PF or VF	Allocation Or Access Type	Description
PE Push Pages	PF and VF	Pool	The 10 GbE controller supports a pool of push pages tracking structures that are accessed through the push page array found in BAR0. Each PCI function that is enabled for PE push mode operations uses CQP to request a push page tracking structure using the CQP operation. Push mode pages are allocated by software per process and any process that cannot allocate a push page tracking structure reverts to using in-line operations instead of push operations.
Flow Director	PF Only	Profiles or Service	The 10 GbE controller supports a set of flow director filters, allocated between PFs. Each PF is allocated some guaranteed space. All remaining are allocated as FCFS counters and are allocated evenly among PFs.
Tx Scheduler	PF	Various	Queue sets are allocated with a basic VSI quota per PF (loaded from the NVM) and FCFS for all the remaining. The shared part of the scheduler (such as ETS) is controlled by the PF driver. The per-PF part of the scheduler (like VEB) is controlled by PF via the firmware AQ commands.
Receive Packet Buffer and DCB	PF	Profiles and Service	A receive packet buffer is logically partitioned across the enabled ports. The memory allocated to a port is configured across the TCs according to DCBX protocol resolution. It is done by the PF.
SDPs and LEDs	PF	Arbitrated	SDPs are associated with an Ethernet port or with the device. Association is provided from the NVM. Ownership of a shared SDP is via an AQ command. See Section 38.7 for more details regarding SDP usage with the 10 GbE controller.

38.15.1 Resource Profiles

The concept of resource profiles is used in order to make the 10 GbE controller's resource allocation mechanisms easier to understand. Resource profiles dictate how resources listed in Table 38-100 as profiles are distributed among PCI functions so that software drivers do not need to coordinate allocation of these resources. A resource profile is made up of the set of equations that take input parameters from the system configuration and distributes each resource. Each resource has a different equation for distribution (see the description column in Table 38-100). Also, the following tables list examples of the result calculations for a full set of resources. Since some of the resource distribution equations simply take the number of PCI functions as input while others might need additional input (such as the number of external Ethernet ports or the software usage model that a device driver needs to implement).

Resource	# External Ethernet Ports	# PCI Physical Functions	PCI Function to External Ethernet Port Assignment	# PCI Virtual Functions	Driver Usage Model
LAN Queues	No	Yes	No	Yes	No
MSI-X Vectors	No	Yes	No	Yes	No
Multicast MAC Address Filters	No	Yes	No	No	No
Internal Switching Elements[1]	Yes	Yes	Yes	No	No
Protocol Engine Resources	No	Yes	No	Yes	Yes

Notes:

1. Resource profiles only impact the default settings for internal switching elements. Run-time switch management software has the ability to override the default number of internal switching components and the internal switch topology.

The following table lists a few sample sets of typical input parameters that are used with the 10 GbE controller. The initial values of these resources are found in the NVM but might be overridden by OEM specific configuration mechanisms followed by a PCI reset. Note that the device driver usage model can be changed and locked by the first device driver to load following a PCI reset. All other inputs are set at PCI reset.

Scenario Name	# External Ethernet Ports	# PCI Physical Functions	PCI Function to External Ethernet Port Assignment	# PCI Virtual Functions	Driver Usage Model
Single Port Default	1	1	PF0 -> Port 0	128	Default
Dual Port Default	2	2	PF0 -> Port 0 PF1 -> Port 1	128	Default
Quad Port Default	4	4	PF0 -> Port 0 PF1 -> Port 1 PF2 -> Port 2 PF3 -> Port 3	128	Default
Octal Port Default	8	8	PF0 -> Port 0 PF1 -> Port 1 PF2 -> Port 2 PF3 -> Port 3 PF4 -> Port 4 PF5 -> Port 5 PF6 -> Port 6 PF7 -> Port 7	128	Default
Single Port SR-IOV VF Primary	1	1	PF0 -> Port 0	128	SR-IOV PF Primary
Single Port SR-IOV Even Distribution	1	1	PF0 -> Port 0	128	SR-IOV Even Distribution

The table that follows lists the resulting resource distribution for each of the input scenarios listed in the previous table. With the exception of the switch topology, none of the resource distribution can be changed after the initial device driver load without a PCI reset occurring. If the resource distribution was to change while an active device driver was running, unpredictable results can occur. For example, re-partitioning the host memory cache segment descriptor table while a device driver was active causes the 10 GbE controller to improperly interpret the host memory used for caching resource objects. The 10 GbE controller provides various mechanisms (such as the HMC resource profile locking mechanism) to prevent software from unknowingly causing these types of reconfigurations.

Resource	# LAN QPs Per PF	#LAN QPs Per VF	#MSI-X Vectors Per PF	#MSI-X Vectors Per VF	Default Internal Switch Topology	HMC and PE Resources Per PF	HMC and PE Resources Per VF
Single Port Default	512	8	129	5	PF0 -> Port 0	4096 SDs 256K PE QPs 128K PE CQs 128 PE CEQs	0 SDs 0 PE QPs 0 PE CQs 0 PE CEQs
Dual Port Default	256	8	129	5	PF0 -> Port 0 PF1 -> Port 1	2048 SDs 128K PE QPs 64K PE CQs 128 PE CEQs	0 SDs 0 PE QPs 0 PE CQs 0 PE CEQs

38.16 Power Management

This section defines how Power Management is implemented in the 10 GbE controller.

38.16.1 PCIe Power Management

38.16.2 Auxiliary Power Usage

Auxiliary power might be used for powering the 10 GbE controller while the system is in low power state ($D3_{COLD}$). The 10 GbE controller uses the AUX_PWR pin as an indication that auxiliary power is available to it. The 10 GbE controller uses this indication to advertise $D3_{COLD}$ wake up support in the PMC.PME_Support field and to set the Aux_Power_Detected bit in the PCIe capability structure Device_Status_Register. The AUX_PWR pin is strapped during Power On Reset (POR).

The amount of power required for the function, which includes the entire Network Interface Card (NIC) is advertised in the Power Management Data register, which is loaded from the NVM.

If AUX power usage during $D3_{COLD}$ is supported (as indicated below), all The 10 GbE controller's sticky bits will preserve their values and will only get reset by the power up reset (detection of power rising).

When AUX power is applied to The 10 GbE controller, the actual usage of AUX power during $D3_{COLD}$ is controlled by the following factors:

1. NVM loaded bits:

- EMP_LINK_ON — Bit per port loaded from NVM to PRTPM_GC register which indicates if the relevant port link should be established for EMP functionality. The 10 GbE controller will provide the proper clocking to establish the required port link/s at this state.

2. APME — Bit per function (loaded to PFPM_APM[PF]) indicates if the relevant PF associated to a port link should be established to enable APM WoL. The 10 GbE controller will provide the proper clocking to establish the required port link/s at this state.

PCIe configuration bits:

PME_En - The PME_En bit of the PMCSR PCI config space is used to determine if the 10 GbE controller is allowed to consume AUX power for WoL.

The following pseudo code defines AUX Power usage where APME and PME_En bits refer to a logical OR over all the PFs attached to the port:

```
If (AUX_PWR = 1)

    if ((APME or EMP_LINK_ON or PME_En) = 1)

        AUX power is used to preserve link functionality

    Else

        Link functionality is not preserved during AUX power supply
```

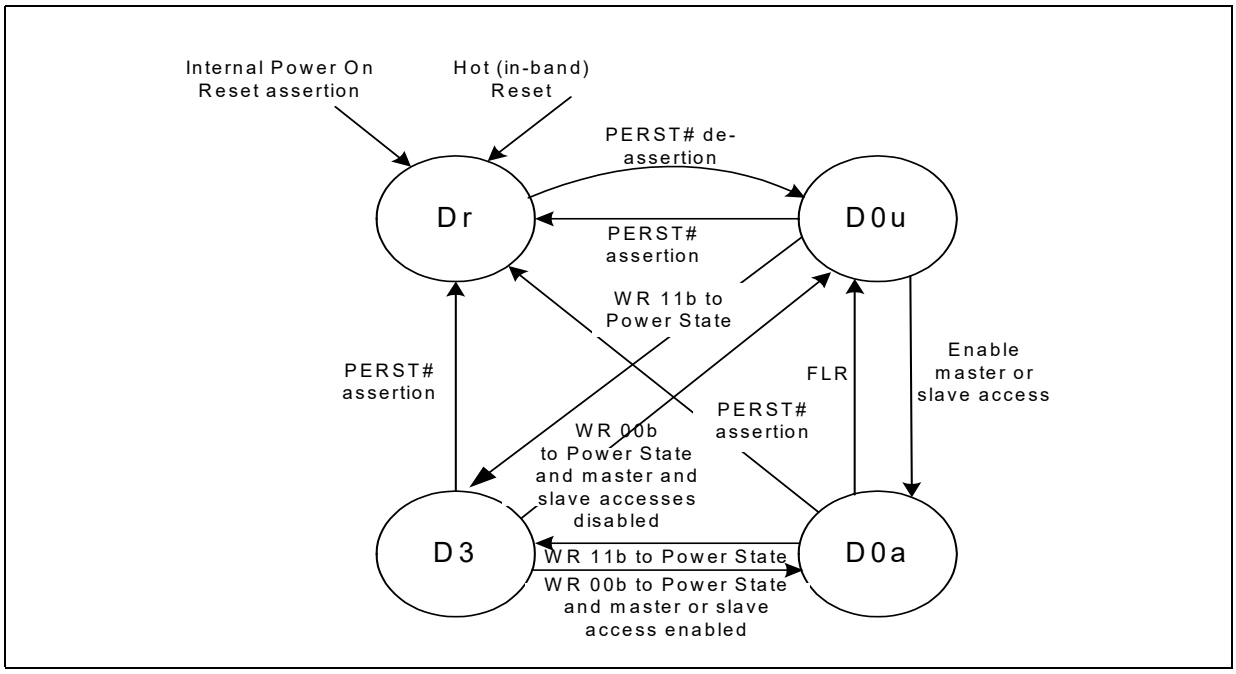
38.16.3 Power States

The 10 GbE controller supports the D0 and D3 architectural power states as described earlier. Internally, the 10 GbE controller supports the following power states:

- D0u (D0 un-initialized) - an architectural sub-state of D0.
- D0a (D0 active) - an architectural sub-state of D0.
- D3 - architecture state $D3_{HOT}$.
- Dr - internal state that contains the architecture $D3_{COLD}$ state. Dr state is entered when PE_RST_N is asserted, a PCIe in-band reset is received, or if the function is disabled.

Figure 38-30 shows the power states and transitions between them.

Figure 38-30.Power Management State Diagram



38.16.3.1 $D0_{uninitialized}$ State

The D0u state is an architectural low-power state. In this state, the device is out of reset (conventional and FLR) but did not complete the enumeration and configuration stage.

38.16.3.1.1 Entry to a D0u State

D0u is reached from either the Dr state (on de-assertion of internal PE_RST_N and auto load of hardware configuration done) or the $D3_{HOT}$ state (by configuration software writing a value of 00b to the *Power State* field of the PCI PM registers while master and slave accesses are disabled). De-assertion of internal *PE_RST_N* causes the entire state of the 10 GbE controller to be cleared except for bits defined as sticky in configuration space. PCIe configuration is loaded from the NVM, followed by establishment of the PCIe link and enumeration. Once this is done, configuration software can access the 10 GbE controller.

38.16.3.2 D0active State

A Product Name Function enters the $D0_{active}$ state each time any single or combination of the Function's Memory Space Enable, I/O Space Enable, or Bus Master Enable bits have been enabled by system software in the PCI Command configuration register.

In this state it can transmit and receive packets if properly configured by the software device driver. The PHY is enabled or re-enabled by the software device driver to operate/auto-negotiate to full line speed/power if not already operating at full capability.

Notes:

1. Wake behavior:
   a. An APM wake event (PM_PME message) due to reception of a Magic packet is not generated when the function is in D0 active state.
   b. Any APM wake up previously active remains active when moving from D3 to D0.
   c. WAKE# pin is never toggled for an APM wake event when a function is in D0.
2. If APM wake is required in D3, software driver should not disable APM wake-up via clearing the *PFPM_APM.APME* bit on entry into D0. Otherwise, APM wake following a system crash and entry into S3, S4 or S5 system power management state is not enabled. Following entry into D0, the software device driver can activate other wake-up filters by writing to the Wake Up Filter Control (*PFPM_WUFC*) register.

38.16.3.2.1 Entry to D0a State

D0a is entered from either the D0u state (by writing a 1b to the *Memory Access Enable* or the *I/O Access Enable* bit or the BME bit of the PCI *Command* configuration register) or from the $D3_{HOT}$ state (by configuration software writing a value of 00b to the *Power State* field of the PCI PM configuration registers while master or slave accesses is enabled). The receive and transmit flows of the appropriate LAN function are enabled.

38.16.3.3 D3 State (PCI-PM $D3_{HOT}$)

The 10 GbE controller functions can transition to D3 when the system writes a 11b to the Power State field of the *Power Management Control/Status Register (PMCSR)*. Any wake-up filter settings that were enabled before entering this state are maintained. The

10 GbE controller does not clear any bit in the PCIe configuration space of a function during the function's transition to D3 state. While in D3, the appropriate function of the 10 GbE controller does not generate master cycles.

Configuration and message requests are the only TLPs accepted by a function in the $D3_{HOT}$ state. All other received requests must be handled as unsupported requests, and all received completions are handled as unexpected completions. If an error caused by a received TLP (such as an unsupported request) is detected while in $D3_{HOT}$, and reporting is enabled, the link must be returned to L0 if it is not already in L0 and an error message must be sent. See section 5.3.1.4.1 in the *PCIe Base Specification*.

38.16.3.3.1 Entry to D3 State

Transition to D3 state is through a configuration write to the *Power State* field of the *PMCSR* PCIe configuration register.

Prior to transition from D0 to the D3 state, the device driver disables scheduling of further tasks to the 10 GbE controller; it masks all interrupts, it does not write to the Transmit Descriptor Tail register or to the Receive Descriptor Tail register.

If wake up capability is needed, system software should enable wake capability by setting to 1b the *PME_En* bit in the *PMCSR* PCIe configuration register of the PF. After Wake capability has been enabled Software device driver should set up the required wake up functionality using the flow described in Section 38.17.4 prior to the D3 transition.

If protocol offload (proxying) capability is required, the software device driver should enable proxying operation.

Notes:

1. The *PMCSR.PME_En* bit setting can be overridden via the *PFPM_APM.APME* bit.
2. If operation during $D3_{COLD}$ is required, even when Wake capability is not required (such as for manageability operation), system should also set the *Auxiliary (AUX) Power PM Enable* bit in the PCIe *Device Control register*.

The 10 GbE controller waits for the completion of all previous TLPs it has sent. Any receive packets that have not been transferred into system memory are kept in the device (and discarded later on D3 exit). Any transmit packets that have not be sent can still be transmitted (assuming the Ethernet link is up).

In preparation for a possible transition to $D3_{COLD}$ state, the device driver might disable up to three LAN ports out of four (LAN disable) and/or transition the remaining link(s) to GbE speed (if supported by the network interface).

38.16.3.3.2 Exit from D3 State

A D3 state is followed by either a D0u state (in preparation for a D0a state) or by a transition to Dr state (PCI-PM $D3_{COLD}$ state). To transition back to D0u, the system writes a 00b to the *PMCSR*. Transition to Dr state is through *PE_RST_N* assertion.

The *No_Soft_Reset* bit in the *PMCSR* in the 10 GbE controller is always set to 1b, to indicate that The 10 GbE controller does not perform an internal reset on transition from $D3_{HOT}$ to D0 so that transition will not disrupt the proper operation of other active Functions. Software is not required to re-initialize the function's configuration space after a transition from $D3_{HOT}$ to D0 (the function is in the D0 state).

The function is reset if the link state had transition to the L2/L3 ready state, on transition from $D3_{COLD}$ to D0, if FLR is asserted or if transition $D3_{HOT}$ to D0 is caused by assertion of PCIe reset (PE_RST pin).

38.16.3.4 Dr State ($D3_{COLD}$)

Transition to Dr state is initiated on several occasions:

- On system power up — Dr state begins with the assertion of the internal power detection circuit (RSMRST#) and ends after the completion of the NVM auto load.
- When the IP is in D3 or D0a state the transition to Dr state begins with a dedicated message. Upon the reception of this message the 10 GbE controller performs the following operations:
  - — Suspends the primary scheduling of new TLPs and waits for the completion of all previous TLPs it has sent.
  - — Responds to all pending non-posted requests.
  - — Completes the scheduling of any of the following pending events:
    - PCI error
    - Assert/de-assert INTx
- Indicate whether the IP needs to stay powered-on during Sx states (such as for supporting WoL or MNG) to the SoC. Note that the 10 GbE controller might indicate that it needs to stay powered-on during Sx if a long NVM transaction (like erase) is in progress.
- After a response is sent, the 10 GbE controller is ready to transition to Dr state and therefore takes additional steps to limit its operation.
  - — PCI error and assert/de-assert INTx messages are not scheduled for any further transmission.
  - — At this point the IP is ready to have its primary reset asserted.

Any wake-up or proxying filter settings that were enabled before entering this reset state are maintained.

The system can maintain PE_RST_N asserted for an arbitrary time. The de-assertion (rising edge) of PE_RST_N causes a transition to D0u state.

While in Dr state, the 10 GbE controller can maintain functionality (for WoL or manageability) or can enter a Dr Disable state (if no WoL and no manageability) for minimal device power. The Dr disable mode is described in the following section.

38.16.3.4.1 Dr Disable Mode

The 10 GbE controller enters a Dr disable mode on transition to $D3_{COLD}$ state when it does not need to maintain any functionality. The conditions to enter either state are:

- The device (all PCI functions) is in Dr state.
- APM WOL is inactive for all PCI functions.
- Proxying is not required for any PCI functions (PFPM_PROXYFC.PPROXYE is cleared to 0b).
- Pass-through manageability is disabled.

Entry into Dr disable is usually done on assertion of PCIe PE_RST_N. It can also be possible to enter Dr disable mode by reading the NVM while already in Dr state. The usage model for this later case is on system power up, assuming that manageability and wake up or proxying are not required. Once the device enters Dr state on power

up, the NVM is read. If the NVM contents determine that the conditions to enter Dr disable are met, the device then enters this mode (assuming that PCIe PE_RST_N is still asserted).

Exit from Dr disable is through de-assertion of PCIe PE_RST_N.

If Dr disable mode is entered from D3 state, the platform can remove the 10 GbE controller power. If the platform removes the 10 GbE controller power, it must remove all power rails from the device if it needs to use this capability. Exit from this state is through power-up cycle to the 10 GbE controller.

Note: The state of the TX_DIS (optical module Tx disable connected to SDP pins) or any of the other SDP pins is undefined once power is removed from the device.

38.16.3.4.2 Entry to Dr State

Dr-entry on platform power up is as follows:

- Assertion of the internal power detection circuit (RSMRST#). Device power is kept to a minimum by keeping the Network interfaces in low power.
- The NVM is then read and determines device configuration.
- If the *APM Enable* bit in the NVM is set, then APM wake up is enabled (for each port independently).
- If the *MNG Enable* bit in the NVM word is set, pass-through manageability is enabled.
- Each of the LAN ports can be enabled if required for WoL or manageability. See Section 38.17 for exact condition to enable a port.

Entry to Dr state from D0a state is through assertion of the PE_RST_N signal. An ACPI transition to the G2/S5 state is reflected in a device transition from D0a to Dr state. The transition can be orderly (such as a user selected a shut down operating system option), in which case the software device driver can intervene. Or, it can be an emergency transition (like power button override), in which case, the device driver is not notified.

Transition from D3 state to Dr state is done by assertion of PE_RST_N signal.

38.16.3.5 Power Gating

When the 10 GbE controller enters Dr disable mode, there is an opportunity to improve the power consumption of the device through power gating.

In order to do this the 10 GbE controller needs to communicate with the power management controller (PMC/RU) that it is ready to can be power gated.

At initialization time (before global Reset ACK is asserted), the 10 GbE controller's firmware determines whether to enable/disable power gating based on NVM loaded configurations. Since the indication is reflected to the power management controller when entering a Dr state, at initial boot, the 10 GbE controller is always powered on and then enters Dr state to indicate the required power state to the power management controller. If the 10 GbE controller needs to be powered-on during Sx states, it stays powered-on; otherwise, it is power gated. Refer to the Global Reset Flow section for more detail.

Note: The gbe_pmc_S5_enable signal is ignored by the 10 GbE controller when entering DeepSx state. In this case, the 10 GbE controller is always power gated.

The logic used by firmware to decide if power gating is allowed in S5 is:

FW_allows_PG_in_S5 =

(Manageability Mode = None) OR

(OEM Capabilities.CEM Capable) OR

(Pass through Mode = NONE and Control Mode = PCIe)

Once the 10 GbE controller is power gated, transition back to Dr state is managed as a standard power up.

The following steps describes the power gating flow:

1. The 10 GbE controller enters the Dr disable state indicating it can be power gated (gbe_pmc_S5_enable = 0). Firmware sets this bit via the FWPWRGATE.PWRGATE_EN aux register.
2. PMC recognizes that the IP should be power gated and sends a power gate I/O controller message to the IP.
3. The 10 GbE controller receives the force power gate message.
4. The Power Gating Control Block (PGCB) power gating sequence begins.

Note: When the IP is power gated, any SDPs and other miscellaneous I/Os being driven by the IP is invalid and should be assigned a default value by the SoC.

38.17 Network Interfaces Power Management

The 10 GbE controller disables a network interface and transitions the interface into low-power state in the following cases:

- All LAN ports are in LAN disable mode as a result of the LAN_DIS_N pin.
- Low power state functionality as described in Section 38.16.2.

When the 10 GbE controller is in low-power state, the 10 GbE controller asserts the respective TX_DIS pin (connected to an SDP pin) to enable powering down an external PHY or optical module as well.

38.17.1 BASE-T LPLU

When connected to an external BASE-T PHY The 10 GbE controller's firmware engine performs the LCD auto-negotiation operation by controlling the advertised speeds of the BASE-T PHY and essentially limiting the speeds being advertised in order to force both link partners to auto-negotiate to the lowest possible speed.

LCD auto-negotiation is attempted in the following order:

- 1 GbE
- 10 GbE

38.17.2 Wake Up Filters

The 10 GbE controller supports issuing a wake-up indication to the host after receiving error free packets when the device is in D3 low power state or in Dr with WoL enabled, using Magic packet filters set from the NVM. Note that support of wake up in Dr is only if the AUX_PWR bit is asserted.

38.17.2.1 Wake Up Filter Types

The following packet types are detected per PF by the 10 GbE controller as a possible wake up.

38.17.2.1.1 Magic Packet

Magic packets are defined in:

http://support.amd.com/TechDocs/20213.pdf as:

"Once the LAN controller has been put into the Magic Packet mode, it scans all incoming frames addressed to the node for a specific data sequence. This sequence indicates to the controller that this is a Magic Packet frame. A Magic Packet frame must also meet the basic requirements for the LAN technology chosen, such as Source Address, Destination Address (which may be the receiving station's IEEE address or a Multicast address which includes the Broadcast address), and CRC. A magic packet must also be a valid non error L2 packet. The specific data sequence consists of 16 repetitions of the IEEE address of this node, with no breaks or interruptions. This sequence can be located anywhere within the packet, but must be preceded by a synchronization stream. The synchronization stream allows the scanning state machine to be much simpler. The synchronization stream is defined as 6 bytes of 0xFF. The device will also accept a Broadcast frame, as long as the 16 repetitions of the IEEE address match the address of the machine to be awakened."

The 10 GbE controller expects the destination address to either:

- Be the broadcast address (FF.FF.FF.FF.FF.FF).
- Match the value of the port L2 Ethernet destination MAC address (DA) set by FW to the relevant filters PRTPM_SAL/H.

On power up firmware loads the PRTPM_SAL/H addresses from the NVM. Each address entry contains:

- MAC address for Magic packet filtering
- Address Valid (AV) indication
- Promiscuous Multicast magic filtering enable (MC) indicating the L2 destination address can be any multicast address
- The PF number (PF_NUM) to be reported if a Magic packet matches this filter

Firmware uses the PFGEN_PORTNUM registers to map the per PF MAC address to the relevant ports.

The 10 GbE controller searches for the contents of the port's Ethernet destination MAC address receive address as the embedded IEEE address. It considers any non-0xFF byte after a series of at least 6 0xFFs to be the start of the IEEE address for comparison purposes. For example, it catches the case of 7 0xFFs followed by the IEEE address). As soon as one of the first 96 bytes after a string of 0xFFs don't match, it continues to search for another set of at least 6 0xFFs followed by the 16 copies of the IEEE address later in the packet. Note that this definition precludes the first byte of the destination address from being FF.

A Magic packet's destination address must match the address filtering enabled in the configuration registers with the exception that broadcast packets are considered to match even if broadcast packet reception is not enabled. If APM wake up (wake up by a

Magic packet) is enabled in the NVM, the 10 GbE controller starts up with the Ethernet MAC destination address loaded from the NVM. This enables the 10 GbE controller to accept packets with the matching IEEE address before the software device driver loads.

Table 38-102.Magic Packet Structure

Offset	# Of Bytes	Field	Value	Action	Comment
0	6	Destination Address		Compare	MAC header – processed by main address filter.
6	6	Source Address		Skip	
12	T=(0/4/8)	Possible S-TAG		Skip	
12 + T	S=(0/4)	Possible VLAN Tag		Skip	
12 + T + S	D=(0/8)	Possible Length + LLC/SNAP Header		Skip	
12 + T+ S + D	2	Type		Skip	
Any	6	Synchronizing Stream	FF*6+	Compare	
any+6	96	16 Copies of Node Address	A*16	Compare	Compared to relevant Station Addresses (PRTPM_SAH, PRTPM_SAL) registers.

38.17.3 Wake Up and Virtualization

When operating in a virtualized environment, all wake-up capabilities are managed by a single entity (such as the VMM or an IOVM). In an IOV architecture, the physical (PF) driver controls wake up and none of the Virtual Machines (VMs) has direct access to the wake-up registers. The wake-up registers are not replicated per VF.

38.17.4 Wake Up Flows

38.17.4.1 Wake Up Enable Flow

A WoL register set exists in each PF. Each set consists of the following wake-up filters and registers:

1. *PFPM_WUC* - Wake Up Control Register.
2. *PFPM_WUS* - Wake Up Status Register.

Before entering D3, the software device driver should set the needed filters to send to the WoL VSI (retrieved from the Discover Function Capabilities command) in the switch using existing switch AQ commands and set the requested WoL filters using the Set WoL Filter AQ command. If needed, the software device driver should set the WoL VSI to promiscuous mode to enable firmware to receive all traffic. The switch AQ commands should enable software to set this VSI as filters destination.

Software can add up to four filter rules per port for this VSI. Subsequent filters are rejected by firmware.

If filters need to be deleted, the Clear all WoL Switch filters command should be used and not the regular delete filter commands.

Note: ACPI filters might be defined earlier in the software device driver life, but adding forwarding rules to the ACPI VSI should be done at the last moment to prevent overloading firmware with host traffic.

The ToQueue option is ignored for filters sent to the ACPI VSI. Only regular VLAN can be set for this VSI.

The filters set to ACPI VSI are cleared at PF reset or a PCI reset event.

Wake up is activated only when the device enters Dr.

At power up, values loaded from the NVM into the following per PF registers define enablement of APM wake-up functionality:

1. The NVM *APM Enable* bit is loaded to the *PFPM_APM.APME* register bit to enable:
   a. Detection of a Magic packet destined to the PF.

Note: The software device driver can query firmware via the Get Wake Reason AQ command to read the filter that woke up the system. If the wake up was due to a magic packet, then there is no reporting of the reason (PFPM_WUS register is not updated).

38.17.4.2 Wake Up Disable Flow

Once the 10 GbE controller wakes the system following transition to D0 the software device driver might disable WoL directly by:

1. Clearing all the pending wake-up status bits in the *Wake Up Status* (*PFPM_WUS*) register.
2. Clearing the relevant bits in the *PFPM_WUC register.*
3. Clear all WoL filters using the Set WoL Filter AQ command.

Note: This flow is not used by regular Intel drivers.

38.17.4.3 ACPI Wake-Up Flow

Once wake up is enabled, the 10 GbE controller monitors incoming packets, if a packet passes at least one of the enabled wake-up filters, the 10 GbE controller:

- Sets the *PME_Status* bit in the PFPM_WUS and PCI *PMCSR* register.
- If the *PME_En* bit in the *PMCSR* configuration register is set, asserts PE_WAKE_N and/or sends a PM_PME PCIe message.
- Sets one or more of the bits in the *PFPM_WUS* register. The 10 GbE controller sets more than one bit if a packet matches more than one filter.

Note: In addition, a link state change wake-up also causes similar results. Sets the *PFPM_WUS.PME_Status* and the *PMCSR.PME_Status* bit, asserts the PE_WAKE_N signal, and/or sends a PM_PME PCIe message and sets the relevant bit in the *PFPM_WUS* register.

The PE_WAKE_N signal remains asserted, PM_PME messages are periodically sent to the host, and the 10 GbE controller ignores any subsequent ACPI wake-up packets and link change events for that function until the operating system either writes a 1b to the *PME_Status* bit of the *PMCSR* register or writes a 0b to the *PME_En* bit or until de-assertion of PERST.

38.18 Protocol Offload (Proxying)

The 10 GbE controller provides a proxy capability to receive, respond or generate packets instead of the host, this is manly targeted (but not limited) to avoid spurious wake up events and reduce system power consumption when the device is in D3 low power state and system is in S3 or S4 low power states.

The 10 GbE controller supports protocol offload (proxying) of:

1. A single IPv4 ARP request per function.
   — Responds to IPv4 address resolution request with a host MAC (L2) address (as defined in RFC 826).
2. Two IPv6 Neighbor Solicitation (NS) requests per function, where each NS protocol offload request includes 2 IPv6 addresses, for a total of 4 possible IPv6 addresses per function.
   — Responds to IPv6 NS requests with a host MAC (L2) address (as defined in RFC 4861).
3. When NS protocol offload is enabled, the 10 GbE controller also supports protocol offload of up to two IPv6 Multicast-Address-Specific MLD (Multicast Listener Discovery) Queries (either MLDv1 or MLDv2) per function. In addition, the 10 GbE controller also responds to General MLD Queries, used to learn which IPv6 multicast addresses have listeners on an attached link.
   — MLD protocol offload is supported when NS protocol offload is enabled so that IPv6 routers discovers the presence of multicast listeners (that is, nodes wishing to receive multicast packets), for packets with the IPv6 NS solicited-node multicast address and continue forwarding these NS requests on the link.
   — MLD protocol offload is supported for either MLD Multicast Listener Query packets or MLD Multicast Address and Source Specific Query packets that check for IPv6 Multicast Listeners with the solicited-node multicast address placed in the IPv6 destination address field of the IPv6 NS packets that are off-loaded by the 10 GbE controller.
   — Responds to the IPv6 MLD Queries, with the solicited-node multicast address placed in the IPv6 destination address field of the IPv6 NS packets that are off-loaded by the 10 GbE controller (as defined in RFC 2710 and RFC 3810).

Note: When protocol offload is supported by the 10 GbE controller the Features Enable NVM word should be set such as the appropriate *Proxy Enable for Port X* bits are set. EMP assigns a VSI for each port that supports protocol offload.

When proxying is enabled over a port, the PRTPM_GC.EMP_LINK_ON bit is set to 1b by EMP for enabling the link establishment.

38.18.1 Proxying Filters

The 10 GbE controller supports issuing protocol offload (proxying) of packets using pre-defined filters per PF.

Proxy filters are enabled if the corresponding bit in the per PF *Proxying Filter Control* (*PFPM_PROXYFC*) register is set to 1b.

38.18.1.1 Proxy Pre-defined Filters

The following packet types are detected per PF by the 10 GbE controller's pre-defined filters:

- General and directed ARP/IPv4 request packet
- General and directed NS IPv6 packet
- MLD IPv6 packet

Each of these packet type filters is enabled if the corresponding bit in the per PF *Proxying Filter Control* (*PFPM_PROXYFC*) register is set to 1b.

38.18.1.1.1 ARP/IPv4 Request Packet

The 10 GbE controller supports receiving ARP request packets for proxying if the *Directed ARP* bit or the *ARP* bit is set in the Enabled Features in the Set Proxying Configuration AQC *Proxying Filter Control* (*PFPM_PROXYFC*) register.

- If the *Directed ARP* bit is set, a successfully matched packet is a packet that passes the packet structure comparisons as defined in Section 38.21.6.2.6, has a broadcast MAC address or passed the proxy MAC address filtering and the target IP address matches the IPv4 address programmed in the *IPv4 internal Address Table* programmed through Set Proxying Configuration command (see Section 38.18.5.1).
- If the *ARP* bit is set, a successfully matched packet is a packet that passes the packet structure comparisons as defined in Section 38.21.6.2.6, has a broadcast MAC address or passed the proxy MAC address filtering.

The 10 GbE controller handles ARP request packets that have VLAN tagging.

ARP packet structure is described in Section 38.21.6.2.6.

38.18.1.1.2 NS IPv6 Packet

The 10 GbE controller supports receiving IPv6 NS packets sent by a node to determine the link-layer address of a neighbor, or to verify that a neighbor is still reachable for wake up or proxying.

If the *NS* or *NS_DIRECTED* bits are set in the Enabled Features in the Set Proxying Configuration AQC *Proxying Filter Control* (*PFPM_PROXYFC*) register packet is sent to firmware for protocol offload.

- If the *NS_DIRECTED* bit is set a successfully matched packet that is directed to the EMP is a packet that passes the packet structure comparisons as defined in Section 38.21.6.2.5, matches one of the pre configured MAC address (unicast or multicast), a ICMPv6 type of 0x87 (NS), correct ICMPv6 checksum, and the IPv6 destination address field matches one of the possible four programmed IPv6 solicited-node multicast addresses programmed through Set NS Proxy Table Entry command (see Section 38.18.5.3). EMP is responsible to further filter the incoming packets on the ICMPv6 target IPv6 address.
- If the *NS* bit is set a successfully matched packet is a packet that passes the packet structure comparisons as defined in Section 38.21.6.2.5, matches one of the pre configured MAC address (unicast or multicast), a ICMPv6 type of 0x87 (NS) and a correct ICMPv6 checksum. EMP is responsible for the rest of the filtering as defined in the NS_DIRECTED section.

The 10 GbE controller handles NS IPv6 packets that have VLAN tagging.

NS packet structure is described in Section 38.21.6.2.5.

38.18.1.1.3 MLD IPv6 Packet

The 10 GbE controller supports receiving IPv6 IPV6 MLD packets sent by an IPv6 router to discover the presence of multicast listeners (that is, nodes wishing to receive multicast packets) on its directly attached links, and to discover specifically which multicast addresses are of interest to those neighboring nodes.

After receiving the following MLD packets (either MLDv1 as defined in RFC 2710 or MLDv2 as defined in RFC 3810):

1. Multicast Listener Query (ICMPv6 Type = decimal 130). Defined in MLDv1 and MLDv2.
2. Multicast Listener Report (ICMPv6 Type = decimal 131). Defined in MLDv1 and MLDv2.
3. Version 2 Multicast Listener Report Message (ICMPv6 Type = decimal 143). Defined in MLDv2 only.

If the *MLD* bit is set in the *Proxying Filter Control* (*PFPM_PROXYFC*) register packet is sent to firmware for protocol offload.

- If the *MLD* bit is set a successfully matched packet is a packet that passes the packet structure comparisons as defined in Section 38.21.6.2.5, matches one of the pre-configured MAC address (unicast or multicast), a ICMPv6 type of 0x82, 0x83 or 0x8F (MLD), correct ICMPv6 checksum.

The 10 GbE controller handles MLD IPv6 packets that have VLAN tagging.

MLD packet structure is described in Section 38.21.6.2.5.

Note: Currently, the Microsoft operating system API to driver for MLDv2 does not support specifying a source address list for filter mode. It means that no source address fields are inserted by the EMP in the MLDv2 reports returned. Such support has to be added by the EMP in the future if it is required for getting the Microsoft* logo.

38.18.2 Proxying and Virtualization

When operating in a virtualized environment, all proxying capabilities are managed by a single entity (such as the VMM or an IOVM). In an IOV architecture, the physical (PF) driver controls proxying and none of the VMs has direct access to the proxying registers. The proxying registers are not replicated per VF.

38.18.3 Protocol Offload (Proxying) Flow

A proxying register set exists per PF. Each set consists of the following proxying registers:

4. *PFPM_PROXYFC* - Proxying Filter Control register.
5. *PFPM_PROXYS* - Proxying Status register.

Proxying filters (not directly accessed as device registers):

6. MAC — L2 address table that holds four MAC addresses.
7. *IP4* — IPv4 Address table that holds one IPv4 addresses.
8. *IP6* — IPv6 Address table that holds four IPv6 addresses.

The PF driver can enable proxying by sending commands to firmware via the Admin command queue and receiving firmware responses via the Admin Event queue.

Note: Proxy filters values are preserved across resets. The filters can be added/removed using Admin commands. The actual filtering can be enabled/disabled using the PFPM_PROXYFC register.

38.18.3.1 Protocol Offload Activation

To enable protocol offload, the PF software device driver should implement the following flow:

9. Software device driver should make sure that all packets that are needed for proxy offload are forwarded to the WoL and proxy VSI as exposed in Discover Function Capability AQC response before enabling proxy offload.
10. Software device driver programs the relevant proxying filtering tables and registers by sending *Admin Queue commands to add IPv4/IPv6 table entries and set the PFPM_PROXYFC control register. The s*oftware device driver sends to firmware the information required to execute a specific protocol offload via the *Set (protocol offload type) Proxy Table Entry command* via the Admin queue. The supported Proxy Table Entry commands are:
    — Set Proxying Configuration command (see Section 38.18.5.1).
    — Set NS Proxy Table Entry command (see Section 38.18.5.3).
    a. Firmware loads the table entries into internal memory: It loads the solicited-node multicast addresses into the device internal IPv6 proxy tables. A multicast address is derived from a unicast IPv6 address posted by software by prefixing as follows:

       FF02::1:FFXX:XXXX, where XXXXXX are the 24 LS bits of the unicast IPv6 address.
    b. Firmware clears all pending proxying status bits in the *Proxying Status* (*PFPM_PROXYS*) register.
    c. Firmware programs the *Proxying Filter Control* (*PFPM_PROXYFC*) register to define packets that should be forwarded to the EMP for protocol offload.
    d. Firmware responds with a *Set Proxy Table Entry/SetNS Proxy Table Entry Responses* (see Section 38.18.5.2 and Section 38.18.5.4) via the Admin queue to acknowledge completion of the command and indicate if command was completed successfully.
11. Following the successful completion of the previous flow, hardware directs the configured packet types to the EMP and firmware creates the proxy responses according to the configuration.

When the 10 GbE controller is in D0 power state, the software device driver might read the PFPM_PROXYS register directly. When the 10 GbE controller is in D0 power state the software device driver might send a *Set Proxying Configuration Command* (see Section 38.18.5.1) with all or some of the proxying conditions cleared to disable some or all proxying functionality.

38.18.3.2 Proxying Packet Flow

Once proxying is enabled by setting the *PFPM_PROXYFC.PPROXYE* bit to 1b, the 10 GbE controller monitors incoming packets by filtering them with all of the proxying filters enabled in the *PFPM_PROXYFC* register. If a packet passes one of the enabled proxying filters and does not pass any of the enabled wake-up filters, the 10 GbE controller:

1. Executes the relevant protocol offload for the packet and not forward the packet to the host. For NS/MLD proxying, firmware must complete the filtering by looking for a match between the target IPV6 address carried inside the ICMPv6 payload and the addresses loaded by software via the Set NS Proxy Table Entry command.

2. Sets one or more bits in the *Proxying Status (PFPM_PROXYS)* register according to the proxying filters matched.
   — Note that the 10 GbE controller sets more than one bit in the *PFPM_PROXYS* register if a packet matches more than one filter.
3. Wakes the system and forwards a packet that matches the proxying filters but cannot be supported to the host for further processing if configured to do so by the software device driver via the *Set Proxying Configuration command*.

Notes:

1. When the device is in D3, a packet that matches one of the enabled proxying filters as defined in the *PFPM_PROXYFC* register and one of the enabled wake-up filters as defined in the *PFPM_WUFC* register wakes up the system and protocol offload (proxying) occurs.
2. Protocol offload is not executed for illegal packets with CRC errors or checksum errors and the packets are silently discarded.
3. Once a packet that meets the criteria for proxying is received, the 10 GbE controller should respond to the request after less than 60 seconds.

38.18.3.3 Disabling Protocol Offload

To disable protocol offload the software device driver should implement the following steps:

1. If IPv6 addresses were configured to this PF — Send a *Set NS Proxy Table Entry command* (see Section 38.18.5.3) with the relevant IPv6 table entries to be removed.
   a. Firmware clears the table entries from FLU and internal memory so that the proxying resources are available for other PFs.
   b. Firmware responds with a *Set NS Proxy Table Entry Response* (see Section 38.18.5.4) via the Admin queue to acknowledge completion of the command and indicate if the command was completed successfully.
2. If IPv4 addresses were configured to this PF — Send a *Set Proxying Configuration command* (see Section 38.18.5.1) with the relevant IPv4 table entry to be removed.
   a. Firmware clears the table entry from FLU and internal memory so that the proxying resources are available for other PFs.
   b. Firmware responds with a *Set Proxying Configuration Response* (see Section 38.18.5.2) via the Admin queue to acknowledge completion of the command and indicate if the command was completed successfully.
3. Send a *Set Proxying Configuration Command* (see Section 38.18.5.1) with all of the proxying conditions cleared to disable all proxying functionality.
   a. Firmware clears all proxying status bits in the *Proxying Status* (*PFPM_PROXYS*) register.
   b. Firmware clears any required bits in the *PFPM_PROXYFC* register.
   c. Firmware responds with a *Set Proxying Configuration Response* (see Section 38.18.5.2) via the Admin queue to acknowledge completion of the command and indicate if command was completed successfully.

Note: Steps #2, #3 can be combined to a single Admin queue message.

38.18.4 WoL Related Commands

38.18.4.1 Set WoL Filter AQ

This command sets a filter for the port attached to the PF that sent the command.

Table 38-103.Set WoL Filter Command (Opcode: 0x0120)

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x120	Command Opcode.
Datalen	4-5	144/0	Length of buffer.
Return value/ VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value, is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value, is copied by firmware into the completion of this command.
Filter Index	16-17		17.7: Filter type: flex/magic. 0b = set a flex filter. 1b = Set the magic packet filter. 17.6-16.3: Reserved. 16.2 – 16.0: The filter to set: 0-7. Relevant only if not magic packet.
Command Flags	18-19	0x0	Bit 15: Action: 0b = clear filter. 1b = set filter. Bit 14: No WoL in TCO traffic: 0b = Pass through packets might cause a wake up. 1b = Pass through packets are not candidate for wakeup. Bit 13: WoL filter preserve on PFR. Relevant for set filter action only. Set by software before D0->Dr/D3 state transition, cleared by software after returning to D0 state. 0b = Not preserve WoL filter on PFR (default upon POR/EMPR). 1b = Preserve WoL filter on PFR. Bit 12:0: Reserved.
Valid Flags	20-21	0x0	Bit 15 = Filter Action is valid. Bit 14 = No WoL in TCO traffic action is valid. Bit 13:0 = Reserved.
Reserved	22-23	0x0	Reserved.
Data Address High	24-27		Address of buffer.
Data Address Low	28-31		

Table 38-104.Buffer Content (for ACPI Filters)

Name	Bytes.Bits	Remarks
Filter	0 - 127	128 bytes of the filter. Should be compared to the content of the first 128 bytes of the packet. Each byte is compared if its mask is set. Byte 0 corresponds to the first byte of the packet.
Mask	128 – 143	16 bytes of mask – 1 bit per byte of the filter. Bit = 0: Compare byte. Bit = 1: Skip byte.

Table 38-105.Set WoL Filter Response (Opcode: 0x0120)

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0120	Command opcode
Datalen	4-5	0	Length of buffer
Return value/VFID	6-7		Return value. ERANGE: Filter Index is larger than 7.
Cookie High	8-11	Cookie	Opaque value, is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value, is copied by firmware into the completion of this command.
Reserved	16-23		Reserved.
Data Address high	24-27		Address of buffer.
Data Address low	28-31		

38.18.4.2 Get Wake Reason AQ

This command can be used by the software device driver to receive information of the reason of a wake-up event.

Note: This command provides only reasons related to the firmware-based filtering. Hardware-based filters are exposed in the PFPM_WUS register.

Table 38-106.Get Wake Up Reason Command (Opcode: 0x0121)

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x121	Command opcode.
Datalen	4-5	0	
Return value/ VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value, is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value, is copied by firmware into the completion of this command.
Reserved	16-31	0x0	Reserved

Table 38-107.Get Wake Up Reason Response (Opcode: 0x0121) (Sheet 1 of 2)

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0121	Command opcode
Datalen	4-5	0	
Return value/VFID	6-7		Return value. ENOENT: No WoL event recorded
Cookie High	8-11	Cookie	Opaque value, is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value, is copied by firmware into the completion of this command.
Reserved	16-17		
WoL Reason	18-19		18 = Index of matching filter (0xFF – no filter matched). 19 = Reserved.

Table 38-107.Get Wake Up Reason Response (Opcode: 0x0121) (Sheet 2 of 2)

Name	Bytes.Bits	Value	Remarks
Reserved	20-31		Reserved.

38.18.5 Protocol Offload Related Commands

The following section describes Admin commands related to protocol offload. The Protocol Offload commands can only be generated by PFs.

38.18.5.1 Set Proxying Configuration Command

Description — Software device driver requests to set the *PFPM_PROXYFC* register and supply the ARP offload parameters for the PF.

Command Type — Indirect Command.

Table 38-108.Set Proxying Configuration Command Table Entry

Name	Bytes.Bits	Value	Remarks
Command Flags	0-1.2	Reserved	Must be 0x0, value is ignored.
	1.3	Initialize IPv4 Table	Set to 1b to initialize/clear the IPv4 address table, this bit has the same effect as removing IPv4 address (bit 1.7 set and a valid Table ID).
	1.4	Unsupported Control	0b = Discard unsupported proxy packet. 1b = Wake the system on reception of unsupported proxy packet (packet is still discarded).
	1.5	Enable	Enable PFPM_PROXYFC.
	1.6	Add IPv4	Add IPv4 address entry.
	1.7	Remove IPv4	Remove IPv4 address entry.
Table ID	2-3	Table ID	16 bit Table index ID, valid only to remove IPv4 address entries (bit 1.7 is set).
Enabled Offloads	4-7	Enabled Offloads	bit 5 = ARP Directed offload is enabled. bit 11 = ARP offload is enabled. All other bits are reserved.
IPADDR	8-11	IP Address	Local IP address in Little Endian order.
MACADDR	12-17	MAC Address	MAC address in Big Endian order.

Table 38-109.Set Proxying Configuration Command Descriptor Fields (Sheet 1 of 2)

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0x0	
Opcode	2-3	Opcode	0x0104.
Datalen	4-5	Length of Buffer	Length of table entry.
Return value	6-7	Return Value	Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value, is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value, ife copied by firmware into the completion of this command.
Reserved	16-19	Reserved	Must be 0x0, value is ignored.
Reserved	20-23	Reserved	Must be 0x0, value is ignored.
Data Address High	24-27	Data Address High	Data Address High. High 32 address bits (bits 63:32) of buffer address that holds the *Set Proxying Configuration command* structure.

Table 38-109.Set Proxying Configuration Command Descriptor Fields (Sheet 2 of 2)

Name	Bytes.Bits	Value	Remarks
Data Address Low	28-31	Data Address Low	Data Address Low. Low 32 address bits (bits 31:0) of buffer address that holds the *Set Proxying Configuration command* structure.

38.18.5.2 Set Proxying Configuration Response

Description — Acknowledge to *Set Proxying Configuration command*.

Response Type — In direct response.

Table 38-110.Set Proxying Configuration Command Descriptor Fields

Name	Bytes.Bits	Value	Remarks
Reserved	0-1	Reserved	Value is ignored.
Table ID	2-3	Table ID	16 bit Table index ID provided by the EMP.
Reserved	4-17	Reserved	Value is ignored.

Table 38-111.Set Proxying Configuration Response Descriptor Fields

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0x0	
Opcode	2-3	Opcode	0x0104.
Reserved	4-5	0x0	Must be 0x0, value is ignored.
Return Value	6-7	Return Value	Return Value. Firmware supplies in the *Return value* field indication on the completion of the *Set Proxying Configuration command*. 0x0 = No error. Others = Error detected in the command.
Cookie High	8-11	Cookie	Opaque value, copied by firmware from the *Set Proxying Configuration command*.
Cookie Low	12-15	Cookie	Opaque value, copied by firmware from the *Set Proxying Configuration command*.
Reserved	16-31	Reserved	Reserved.

38.18.5.3 Set NS Proxy Table Entry Command

Description — PF driver supplies IPv6 NS protocol offload information via the *Set NS Proxy Table Entry command*.

Command Type — Indirect command, opcode and address of the IPv6 NS table entry command structure are placed in the descriptor, all other values are inserted in the structure.

Table 38-112.Set NS Proxy Table Entry Command Descriptor Fields (Sheet 1 of 2)

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0x0	
Opcode	2-3	Opcode	0x0105.
Datalen	4-5	Data Length	Length in bytes of buffer.
Return value	6-7	0x0	Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value, is copied by firmware into the completion of this command.

Table 38-112.Set NS Proxy Table Entry Command Descriptor Fields (Sheet 2 of 2)

Name	Bytes.Bits	Value	Remarks
Cookie Low	12-15	Cookie	Opaque value, is be copied by firmware into the completion of this command.
Reserved	16-19	Reserved	Must be 0x0, value is ignored.
Reserved	20-23	Reserved	Must be 0x0, value is ignored.
Data Address High	24-27	Data Address High	Data Address High. High 32 address bits (bits 63:32) of buffer address that holds the *IPv6 NS table entry command* structure.
Data Address Low	31-29	Data Address Low	Data Address Low. Low 32 address bits (bits 31:0) of buffer address that holds the *IPv6 NS table entry command* structure.

Following is the IPv6 NS table entry command structure placed in the buffer pointed to by the descriptor.

Table 38-113.IPv6 NS Table Entry Command Structure

Name	Bytes.Bits	Value	Remarks
Table index	0-1	Table ID	16-bit table index ID 0, valid only to remove MAC 0 address entry (bit 8.1 is set).
Table index	2-3	Table ID	16-bit table index ID 1, valid only to remove MAC 1 address entry (bit 8.3 is set.
Table index	4-5	Table ID	16- bit table index ID 2, valid only to remove IPv6 0 address entry (bit 8.5 is set).
Table index	6-7	Table ID	16-bit table index ID 3, valid only to remove IPv6 1 address entry (bit 8.7 is set).
Control	8.0	Add MAC 0	Add MAC 0 address entry.
Control	8.1	Remove MAC 0	Remove MAC 0 address entry.
Control	8.2	Add MAC 1	Add MAC 1 address entry.
Control	8.3	Remove MAC 1	Remove MAC 1 address entry.
Control	8.4	Add IP 0	Add IP 0 address entry.
Control	8.5	Remove IPv6 0	Remove IPv6 0 address entry.
Control	8.6	Add IP 1	Add IP 1 address entry.
Control	8.7	Remove IPv6 1	Remove IPv6 1 address entry.
Control	9.0	Command Sequence Reference	0x0 for IPv6 0/1, 0x1 for IPv6 2/3.
Control	9.1	Initialize IPv6 Table	Set to 1b to initialize/clear the IPv6 address table, this bit has the same effect as removing all IPv6 addresses.
Control	9.2	Initialize MAC Table	Set to 1b to initialize/clear the MAC address table, this bit has the same effect as removing all MAC addresses.
Control	9.3	Enable NS	NS offload is enabled.
Control	9.4	Enable NS Directed	NS directed offload is enabled.
Control	9.7-9.5	Reserved	Must be 0x0, value is ignored.
MAC Address 0	10-15	MAC Address 0	Exact MAC Address 0 in Big Endian order.
MAC Address 1	16-21	MAC Address 1	Exact MAC Address 1 in Big Endian order.
MAC Address	22-27	Local MAC Address	Local MAC address in Big Endian order.
IPv6 addr 0	28-43	IPv6 Address	IPv6 address 0 in Little Endian order.
IPv6 addr 1	44-59	IPv6 Address	IPv6 address 1 in Little Endian order.

38.18.5.4 Set NS Proxy Table Entry Response

Description — Firmware response to the *Set NS Proxy Table Entry command*.

Response Type — Indirect response, Opcode, return value and address of the IPv6 NS table entry response structure are placed in the descriptor, all other values are inserted in the structure.

Table 38-114.Set NS Proxy Table Entry Response Descriptor Fields

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0x0	
Opcode	2-3	Opcode	0x0105.
Datalen	4-5	Data Length	Data length of buffer in bytes.
Return Value	6-7	Return Value	Return Value. Firmware supplies in the *Return value* field indication on the completion of the *Set NS Proxy Table Entry command*. 0x0 = No error. Others = Error detected in the command.
Cookie High	8-11	Cookie	Opaque value, copied by firmware from the *Set NS Proxy Table Entry command*.
Cookie Low	12-15	Cookie	Opaque value, copied by firmware from the *Set NS Proxy Table Entry command*.
Reserved	16-19	Reserved	Must be 0x0, value is ignored.
Reserved	20-23	Reserved	Must be 0x0, value is ignored.
Data Address High	24-27	Data Address High	Data Address High. High 32 address bits (bits 63:32) of buffer address that holds the *IPv6 NS table entry command* structure.
Data Address Low	31-29	Data Address Low	Data Address Low. Low 32 address bits (bits 31:0) of buffer address that holds the *IPv6 NS table entry command* structure.

Following an IPv6 NS table entry response structure is placed in the buffer pointed to by the descriptor.

Table 38-115.IPv6 NS Table Entry Response Structure

Name	Bytes.Bits	Value	Remarks
Table index	0-1	Table ID	16 bit table index ID for MAC address 0.
Table index	2-3	Table ID	16 bit table index ID for MAC address 1.
Table Index	4-5	Table ID	16 bit table index ID for IPv6 address 0.
Table Index	6-7	Table ID	16 bit table index ID for IPv6 address 1.
Control	8-9	Reserved	Must be 0x0, value is ignored.
MAC Address 0	10-15	MAC Address 0	Exact MAC address 0 in Big Endian order.
MAC Address 1	16-21	MAC Address 1	Exact MAC address 1 in Big Endian order.
Mac Address	22-27	MAC Address	Local MAC address in Big Endian order. Supplied in the *Set NS Proxy Table Entry command*.
IPv6 Addr 0	28-43	IPv6 Address	IPv6 address 0 in Little Endian order. Supplied in the *Set NS Proxy Table Entry command*.
IPv6 Addr 1	44-59	IPv6 Address	IPv6 address 1 in Little Endian order. Supplied in the *Set NS Proxy Table Entry command*.

38.19 Non-Volatile Memory Map

38.19.1 NVM Organization

38.19.1.1 Hierarchical NVM Map

Table 38-116 lists in a hierarchical order of all the modules and sub-modules that are defined in the 10 GbE controller's NVM map. They are referred to separately as NVM sections. All details concerning these sections are found in Section 6.2.

Note that the root section named Init Module (NVM header) is not listed in Table 38-74. Details about this section can be found in Section 38.19.2.

Table 38-116.Hierarchical NVM map (Sheet 1 of 4)

Address of Pointer in Parent Section	1st Level Section	2nd Level Section	3rd Level Section	Description
0x04	PHY Module			Auto load section of the internal PHY configuration.
0x06	RO PCIR Registers Auto-load			Contains RO parameters that configure the PCIe transaction layer (note that it is currently empty).
0x37	VLAN Configuration Block			Original factory default MAC addresses defined for LAN and RDMA.
0x39	Software RDMA MAC Address			MAC addresses to be used for RDMA
0x28	Reserved			Reserved
0x16	PBA Block			The PBA block contains the complete PBA number including the dash and the first digit of the 3-digit suffix.
0x30	PXE Setup Options			Setup options for the PXE driver that is defined per PCIe function.
0x31	PXE Configuration Customization Options			Configuration customization options for the PXE driver that is defined per PCIe function.
0x2F	VPD Module			Vital Product Data (VPD) loaded by an OEM. It contains RO and RW information about a NIC/ LOM.
0x17	Boot Configuration Block			Contains the required setup used for boot operations.
0x08	PCIR Registers Auto-load			Default setup to registers and internal memories that load on PCIR events.
0x38	POR Registers Auto-load			Default setup to registers that load on POR events.
0x3C	CORER Registers Auto-load			Default setup to registers and internal memories that load on CORER events.
0x3B	GLOBR Registers Auto-load			Default setup to registers that load on GLOBR events.
0x4F	Core Mem Config			Read margin settings to the device's core memories. RO module.
0x4A	Protocol Engine Auto-load Section			Default setup to registers and internal memories that load on CORER events related to the Protocol Engine.
0x48	EMP SR Settings			This section contains the modes of operation of the EMP that must be stored in the shadow RAM.

Table 38-116.Hierarchical NVM map (Sheet 2 of 4)

Address of Pointer in Parent Section	1st Level Section	2nd Level Section	3rd Level Section	Description
	0x05	SR PF Allocations		This section contains the allocation of resources per PF that must be stored in shadow RAM.
	0x0F	MNG MAC Addresses		This section contains the Pass Through LAN Ethernet MAC addresses, 4 addresses per port.
	0x10	PF MAC Addresses		This section contains the PF Ethernet MAC addresses, one address per PF.
0x07	Auto Generated Pointers			Pointers to type 1/2 words used by EMP and software. The module must be mapped to shadow RAM word address 0x7D80.
0x3E	PCIe ALT Auto-load			Modified factory default settings to registers that load on PCI reset events. The module must be mapped to shadow RAM word address 0x7E00. Any change performed to the module contents in shadow RAM is not dumped into the Flash memory.
0x04	PHY Analog			Configure the analog section of the SerDes PHY.
0x53	PE Settings			Default settings to PE registers.
0x09	EMP Global			This section contains two sub-sections: 1. Vendor Specific Settings: Settings for external PHY or modules. This part has a proprietary format in order to enable advanced PHY setting. 2. List of Qualified Modules: Parameter list of up to 16 modules. Per-module list holds OUI, revision and version numbers. These settings are loaded into the external devices via the MDIO interface.
0x0E	Manageability Module Header			This section contains parameters related to the manageability functionality such as connection type and others. It also points to sub-sections configuring the filters and the sideband interfaces.
	0x03	Pass Through Control Words Structure 0		This section contains the initial setting of the pass-through filters for a port. This section is used only in SMBus legacy pass-through mode. This section is repeated per port.
	0x04	Pass Through Control Words Structure 1		
	0x05	Pass Through Control Words Structure 2		
	0x06	Pass Through Control Words Structure 3		
	0x08	Flexible TCO Filter Configuration Structure		This section contains the setting of the manageability flex filters for all ports.
	0x07	Sideband Configuration Structure		This section describes the setting of the different pass-through interfaces (SMBus, NC-SI and MCTP).
	0x0B	OEM Section		This section is the header of the OEM specific data identifying the OEM for which this data is defined.
0x48	EMP SR Settings			This section contains the modes of operation of the EMP stored in shadow RAM

Table 38-116.Hierarchical NVM map (Sheet 3 of 4)

Address of Pointer in Parent Section	1st Level Section	2nd Level Section	3rd Level Section	Description
	0x05	PF SR Allocations		This section contains the allocation of resources per PF and the PF MAC address.
0x0F	EMP Settings			This section contains the modes of operation of the EMP.
	0x07	PHY Capability Data Structure 0		The PHY capabilities data structure contains all the parameters to control the internal and external PHY operation.For example, interface type and mode, etc. Data structure is repeated per port.
	0x08	PHY Capability Data Structure 1		
	0x09	PHY Capability Data Structure 2		
	0x0A	PHY Capability Data Structure 3		
	0x0B	External-to-Internal PHY Mapping 0		This section provides the internal PHY mode that is selected for each external PHY/module counter part. The 10 GbE controller provides multiple PHY interface for connecting different types of external PHYs and optical or copper modules. End users can plug in different types of modules into the SFP+ or QSFP+ connectors and choose from several connectivity options when using external PHYs. For example a 10GBASE-T PHY could use a a SFI or KR connection to connect to the 10 GbE controller. Firmware has to read the PHY or module ID and choose the appropriate interface to operate with that external module. Further, when working with an external 10GBASE-T PHY, auto-negotiation might result in several speed modes.For example, when a 10GBASE-T PHY can auto-negotiate to 1 GbE. This section is repeated per port.
	0x0C	External-to-Internal PHY Mapping 1		
	0x0D	External-to-Internal PHY Mapping 2		
	0x0E	External-to-Internal PHY Mapping 3		
	0x0F	LLDP Configuration		Default settings to the embedded LLDP agent.
	0x14	LLDP OEM TLVs		A set of fixed-structure LLDP TLVs for EMP use.
0x46	2nd Free Provisioning Area			Free area used as the new bank when updating 8 KB long modules that are mapped outside the shadow RAM.
0x05	Expansion/Option ROM (OROM)			It contains pre-boot code and settings read by BIOS. Pre-boot code is authenticated by BIOS during initialization before being executed by an EMP on update.
0x0C	PE Image			It contains the PE processor code.
0x0B	EMP Image			It contains the EMP processor code.
0x40	1st Free Provisioning Area			Free area used as the new bank when updating 1160 KB long modules.
0x42	Reserved 4th Free Provisioning Area			Free area to be used as the new bank when updating future 64 KB long modules mapped outside the shadow RAM.
0x44	Reserved 3rd Free Provisioning Area			Free area to be used as the new bank when updating future 16 KB long modules mapped outside the shadow RAM.
0x49	Feature Configuration			Holds the currently used set of selections for the current NVM (shadow RAM).

Table 38-116.Hierarchical NVM map (Sheet 4 of 4)

Address of Pointer in Parent Section	1st Level Section	2nd Level Section	3rd Level Section	Description
0x4D	Configuration Metadata			Adaptive NVM Configuration Meta Data for each feature.
0x4E	Immediate Value			Adaptive NVM Immediate Value. Holds the currently used values of the immediate fields. This section keeps copies of the values (shadow RAM).
0x4B	Reserved			Reserved.
0x50	Firmware Log Area			Scratch pad area used by firmware to log events.

38.19.2 NVM Header

Table 38-117 lists the format of the NVM header section. It includes words with a specific content and pointers to the first level of NVM modules. See Section 38.20 for more details.

- **Bold** items are pointers to modules.
- The Auth / RO column indicates the following:
  - — Auth — The pointed module is authenticated and the pointer is read-only
  - — RO — The pointed module and/or the pointer are read-only, or the word is read-only
  - — No — The word or the module is read/write

  A read-only item can be written in blank Flash programming mode.
- The CSR Format column indicates whether the pointed module uses the formats described in Section 38.19.2.1.
- The module in the shadow RAM column indicates whether the module is mapped into the basic banks mirrored into the internal shadow RAM. If marked as No, the most significant bit of the pointer (bit 15) must be set to 1b to indicate that the pointer value (in bits 14:0) is expressed in 4 KB sector units. Otherwise, it is expressed in word units.
- Maximum provisioned size indicates the following:
  - — Modules mapped in shadow RAM — How much has been accounted for the module in the shadow RAM, though the module can exceed this limit as long as the entire shadow RAM contents is not exceeding its size.
  - — Modules mapped outside shadow RAM — This is the maximum size the module can take because it has to fit within the associated free provisioning area.
  - — The maximum size provisioned for the NVM header itself is 256 words.

Notes:

1. Only the pointer is loaded not the module's contents.
2. RO pointer, while the pointed area is RW.
3. Some items load on CORER, others on EMPR.
4. Pointer and module contents are loaded only into shadow RAM.
5. VPD pointer is a RO pointer, regardless to its own value and to the value of the GLPCI_CAPCTRL.VPD_EN bit. If VPD Write Enable bit is cleared in NVM, VPD area cannot be modified via the NVM Update Admin command, but only via the VPD register set in the PF config space.
6. The module must be mapped to the shadow RAM word address 0x7E00. Any change performed to the module contents in shadow RAM is not dumped into Flash memory. Software cannot directly modify the module contents via NVM update commands, but only indirectly via the Alternate Structure admin commands.
7. Pointer and module contents.
8. Loaded after a CORER and the PE is enabled.

38.19.2.1 Structure Of Hardware Modules

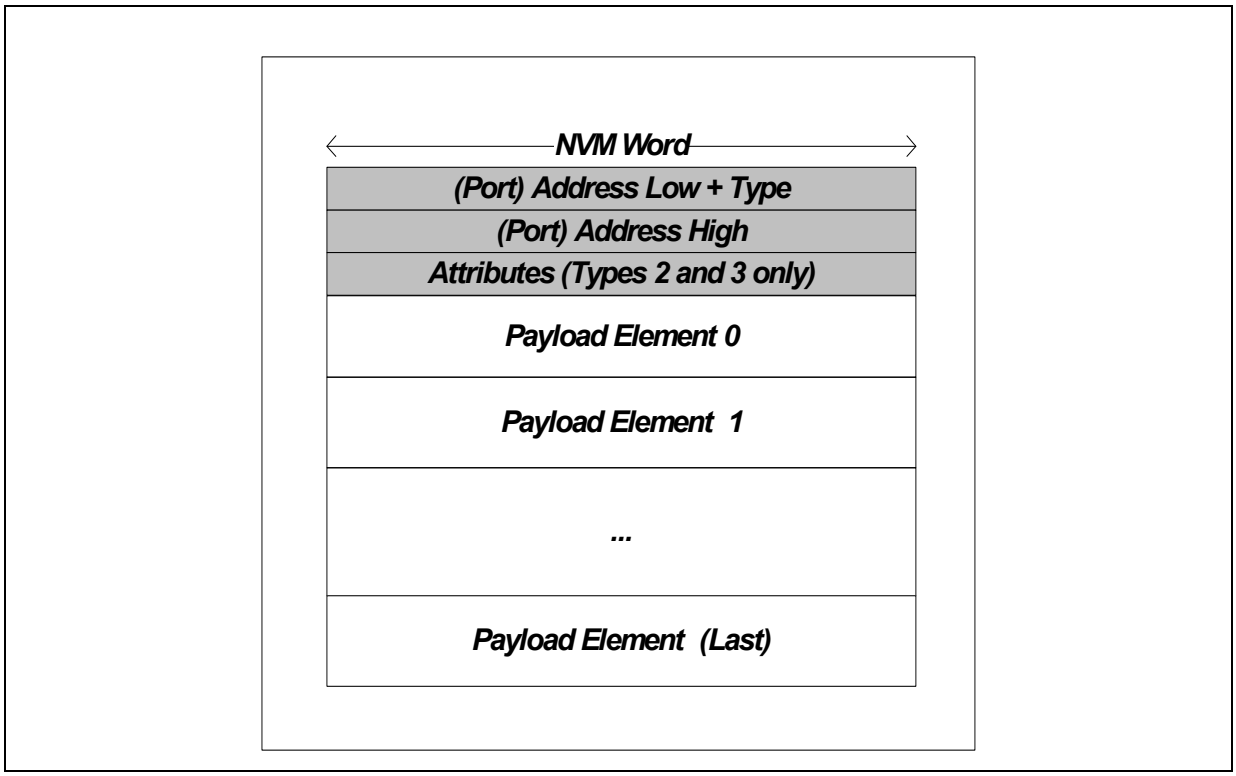
An NVM module read by the EMP to configure hardware (as listed Table 38-75) is built according to one of the following structures:

- Fixed functionality structure — Each NVM word is allocated to one or more fixed fields and the contents of the NVM word are loaded to fixed CSRs in the 10 GbE controller. In Table 38-75, these modules are referred as CSR format = No modules.
- Flexible functionality module — The structure defines the device address or addresses into which the NVM words are loaded. Therefore, the module might be used for different purposes based on its contents. In Table 38-75, these modules are referred as CSR format = Yes modules.

The remainder of this section describes the structure of the contents of a flexible functionality module. The general structure of the module is shown in Figure 38-31.

A CSR format module can be made of a mix of repeating Type 1, 2, 3 and 4 segments. Each segment is described by its own header (the shaded fields in Figure 38-31).

Figure 38-31.Structure of a Flexible Functionality Module



Description of the fields in Figure 38-31:

- **(Port) Address** — A 28-bit value that defines the starting address to which data Dwords are loaded. Serves as either a direct address to load into (Types 1 and 2) or as an indirect address referred to as a port address (Type 3 and 4). A port is made of a 32-bit address register followed by data registers of total size width. Address low is a 12-bit field mapped to word[15:4].
- **Type** — A 4-bit command field mapped to word[3:0] bits that defines the type of flexible module. Descriptions are as follows:
  - — Type 1 (0001b) — Loads a single 32-bit data segment
  - — Type 2 (0010b) — Load a set of 32-bit data Dwords into consecutive addresses
  - — Type 3 (0011b) — Loads a set of 32-bit data Dwords through an address port
  - — Type 4 (0100b) — Loads, through an address port, a sequence of data blocks into arbitrary addresses
- **Attributes** — A 16-bit optional word that defines attributes of the module
  - — **Width** — A 3-bit field mapped to word[2:0] bits that describes the width (in 32-bit Dwords) of a data element
    - 000b = Data is 32-bit wide
    - 001b = Data is 64-bit wide
    - 010b = Data is 128-bit wide
    - 011b = Data is 256-bit wide
    - Else = Reserved
  - — **Skip** — A 2-bit field mapped to word[4:3] bits that describes the number of address bytes to be skipped for getting the address of the next payload element (Type 2) or port register involved (Type 3 or 4).

- 00b = Skip 4 bytes
- 01b = Skip 8 x 4 bytes = 32 bytes
- 10b = Skip 32 x 4 bytes = 128 bytes
- 11b = Reserved

— **Length** — An 11-bit field mapped to word[15:5] bits that contains the number of data elements, each of Width bits

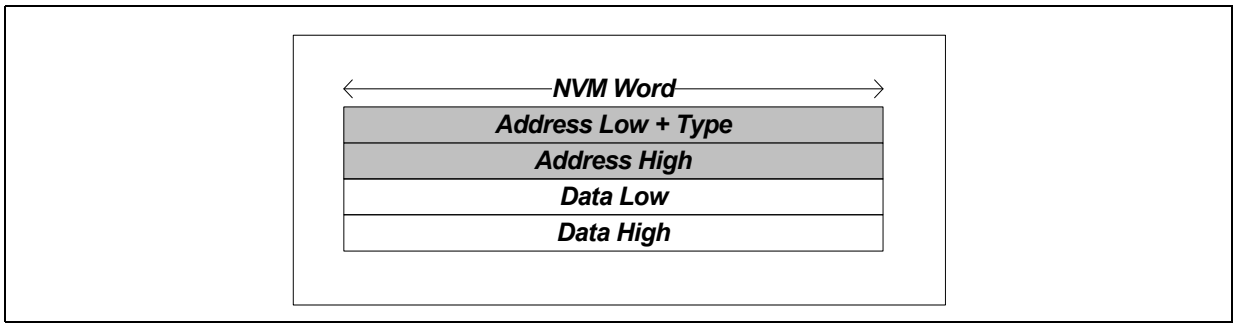
- **Payload Elements** — A sequence of address or data elements to be loaded into the 10 GbE controller. The structure of the *Payload* field varies with each type and is described in the sections that follow.

38.19.2.1.1 Type 1 Module

Used to specify a single 32-bit data segment. The *Address* field defines the address into which the 32-bit data is loaded. See Figure 38-32.

The common use of a Type 1 module is to concatenate a list of such structure to load a set of 32-bit values into various CSRs.

Figure 38-32.Structure of a Type 1 Module



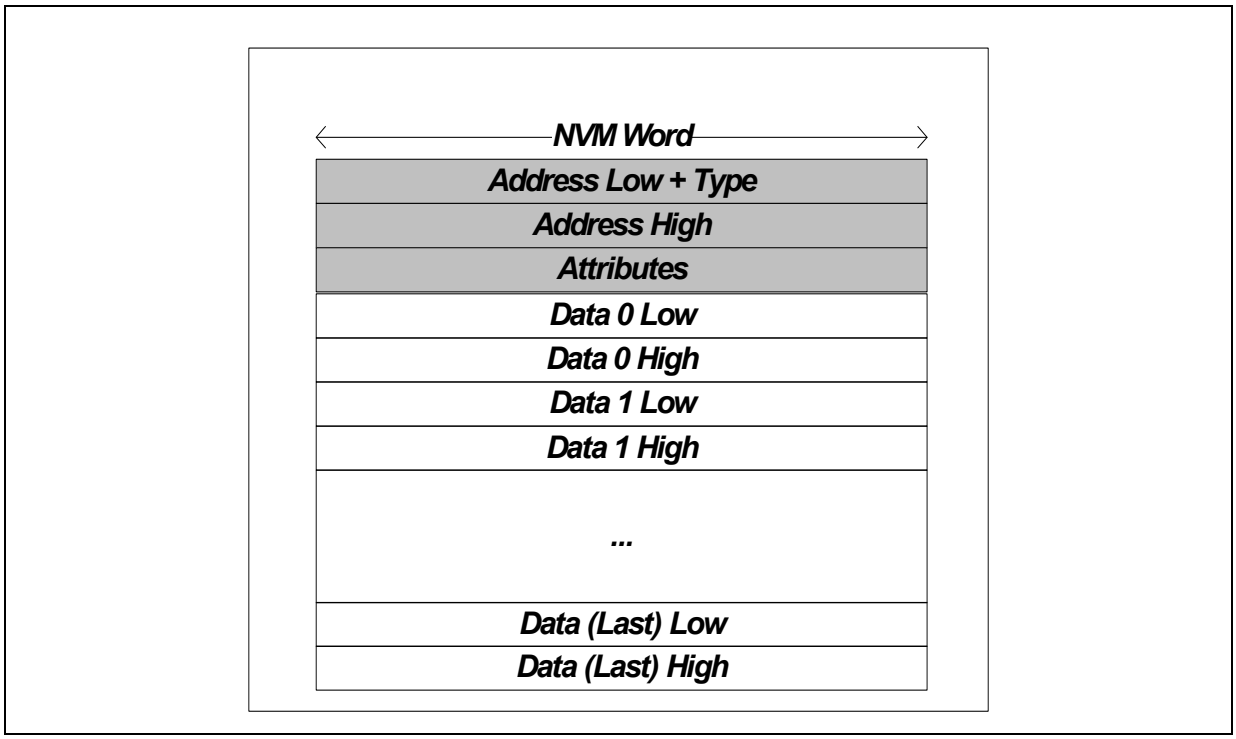
38.19.2.1.2 Type 2 Module

Used to load a sequence of data into consecutive addresses, such as a memory array. See Figure 38-33.

The *Address* field defines the first address to be loaded. Data is loaded as width-size elements into consecutive addresses. The *Attributes* field applies the following information:

- Width = 000b
- Skip = see previous description
- Length = see previous description

Figure 38-33.Structure of a Type 2 Module



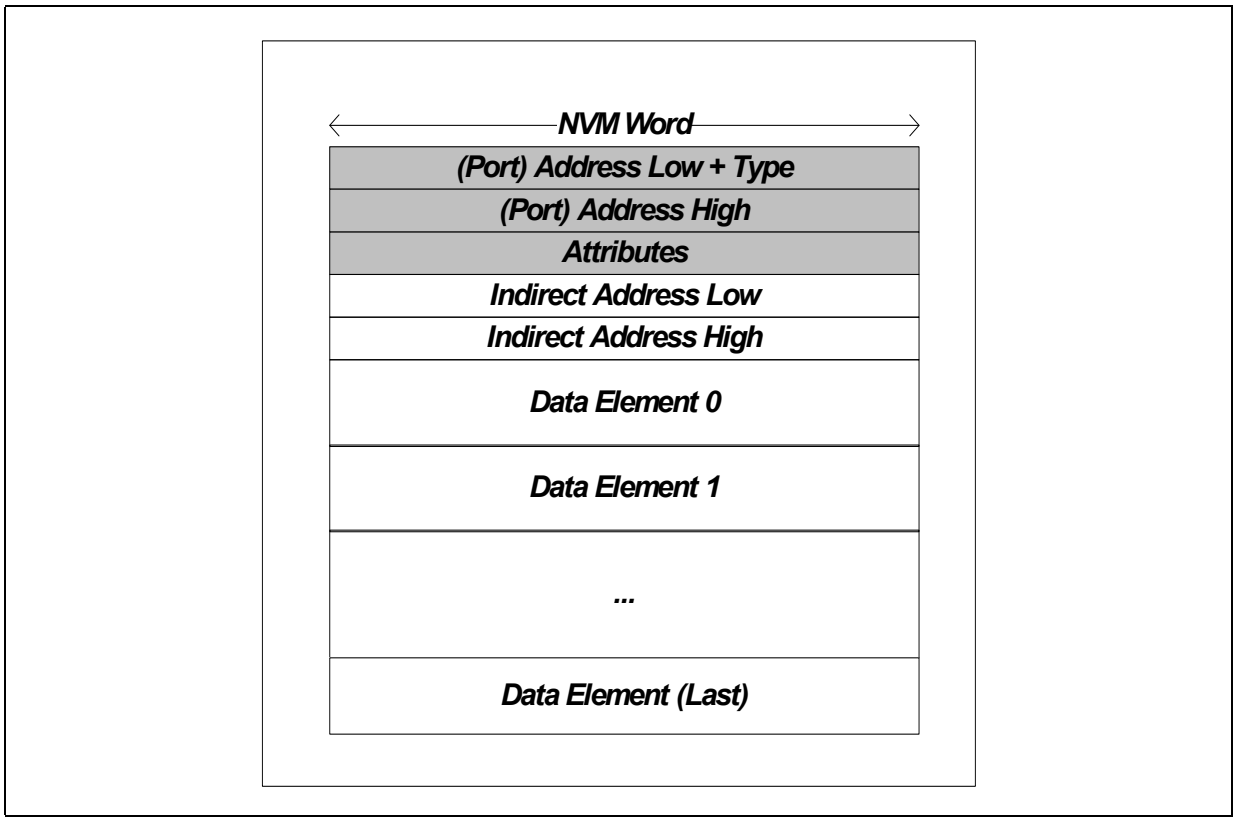
38.19.2.1.3 Type 3 Module

Used to load a sequence of data through an address port.

Figure 38-34 shows the structure of a Type 3 module. The following fields have special values:

- The ***Port Address*** field defines the address of the port address register through which address/data is loaded. The Port Address register is followed by the Port Data registers.
- The ***Attributes*** field applies with the following fields:
  - Width — The size of a single data element written into the port during one port load cycle
  - Length — Number of data elements written through the port
  - Skip — Encodes the number of bytes between the addresses of the port registers involved
- The ***Indirect Address*** field defines the first consecutive address to write to. It is written into the Port Address register for the first item and from then on the indirect address is increased (by the 10 GbE controller) with each write of a new data element from the list. Consecutive data elements are written into the port.
- The ***Data Elements*** field are made of length elements, each of the width DWords. Each port load cycle handles one data element.

Figure 38-34.Structure of a Type 3 Module



The following figures describe two cases of using a Type 3 module:

- Figure 38-35 shows a case of loading 32-bit values into a Global (GL) port.
- Figure 38-36 shows a case of loading 64-bit values into a PRT port.

Figure 38-35.Access Through a Type 3 Module of 32-Bits Wide Data Elements

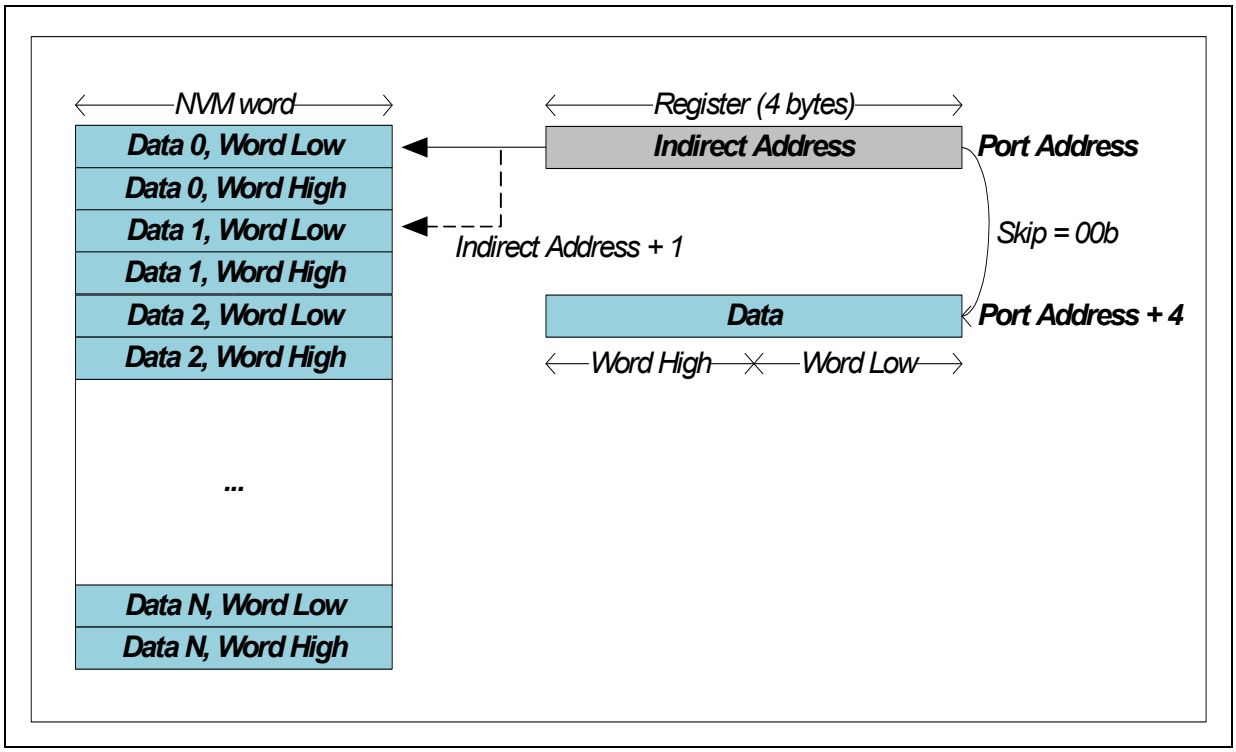


Figure 38-36.Access Through a Type 3 Module of 64-Bits Wide Per Port Data Elements

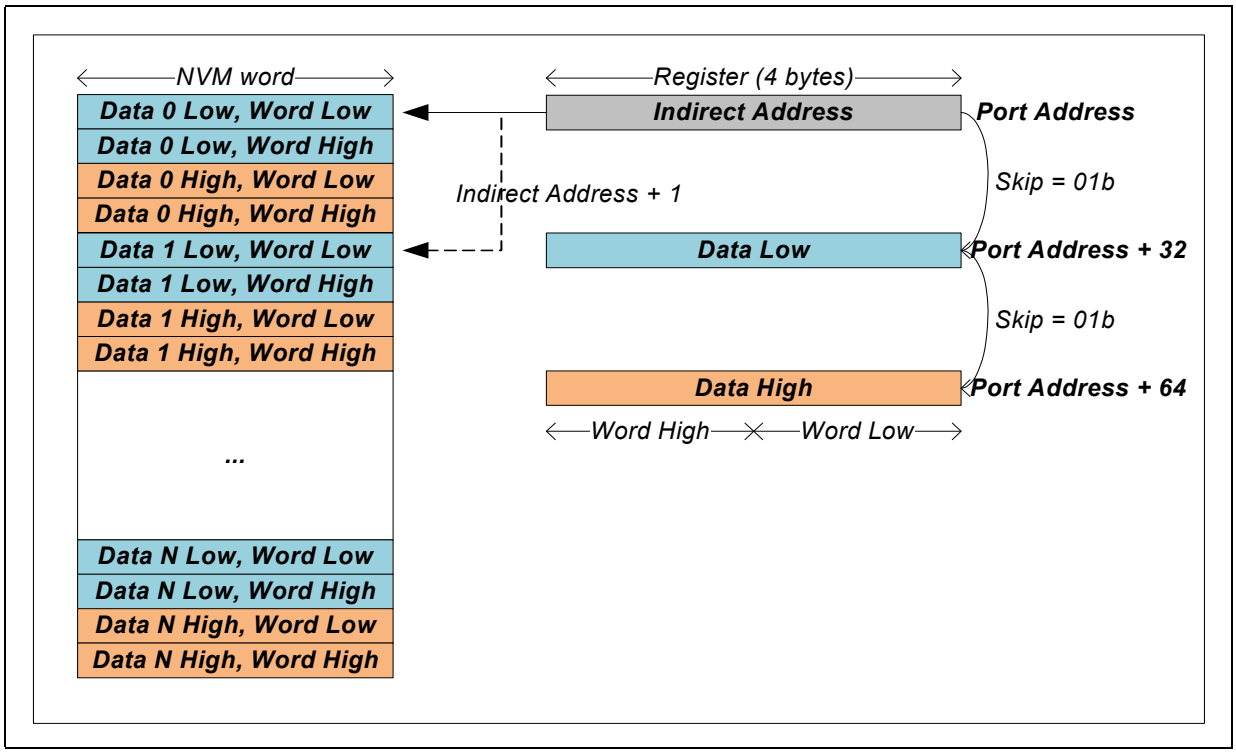


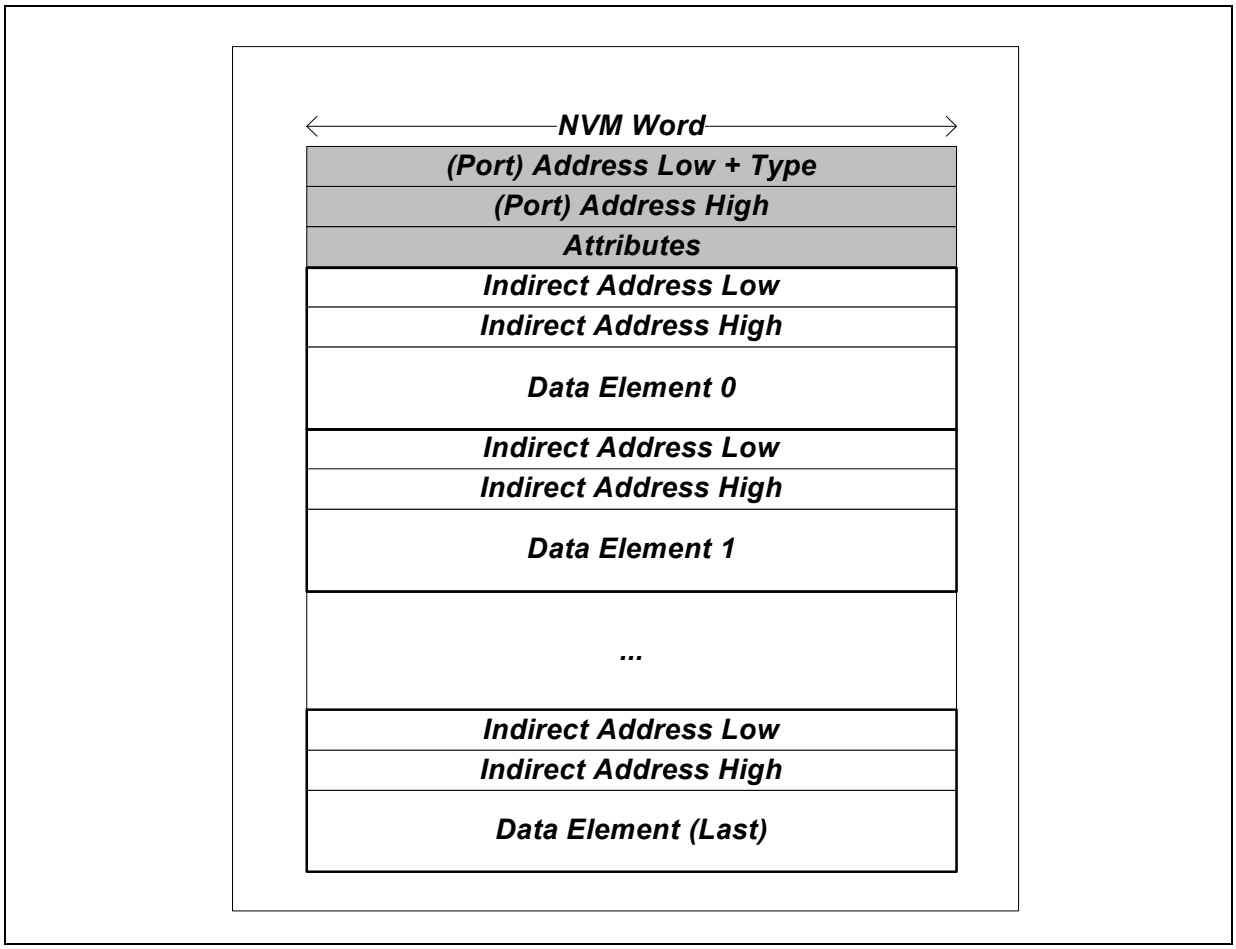
38.19.2.1.4 Type 4 Module

Used to load, through an address port, a sequence of scattered data elements at arbitrary addresses.

Figure 38-37 shows the structure of a Type 4 module. The following fields have special values:

- The ***Port Address*** field defines the address of the port address register through which address/data is loaded. The port address register is followed by the port data registers.
- The ***Attributes*** field applies with the following fields:
  - — Width — The size of a single data element written into the port during one port load cycle
  - — Length — Number of data elements written through the port, not including the indirect address words (the words colored in grey in Figure 38-37 and Figure 38-38).
  - — Skip — Encodes the number of bytes between the addresses of the port registers involved
- The ***Indirect Address*** fields define the address that the following data element is written into. It is written into the Port Address register.
- The ***Data Element*** is written into the port data register. The sequence of writing (the indirect address and its data element) into the port is repeated per each data element (length times).

Figure 38-37.Structure of a Type 4 Module



The following figures show two cases of using a Type 4 module:

- Figure 38-38 shows a case of loading 32-bit values into a global (GL) port.
- Figure 38-39 shows a case of loading 64-bit values into a PRT port.

Figure 38-38.Access Through a Type 4 Module of 32-Bits Wide Data Elements

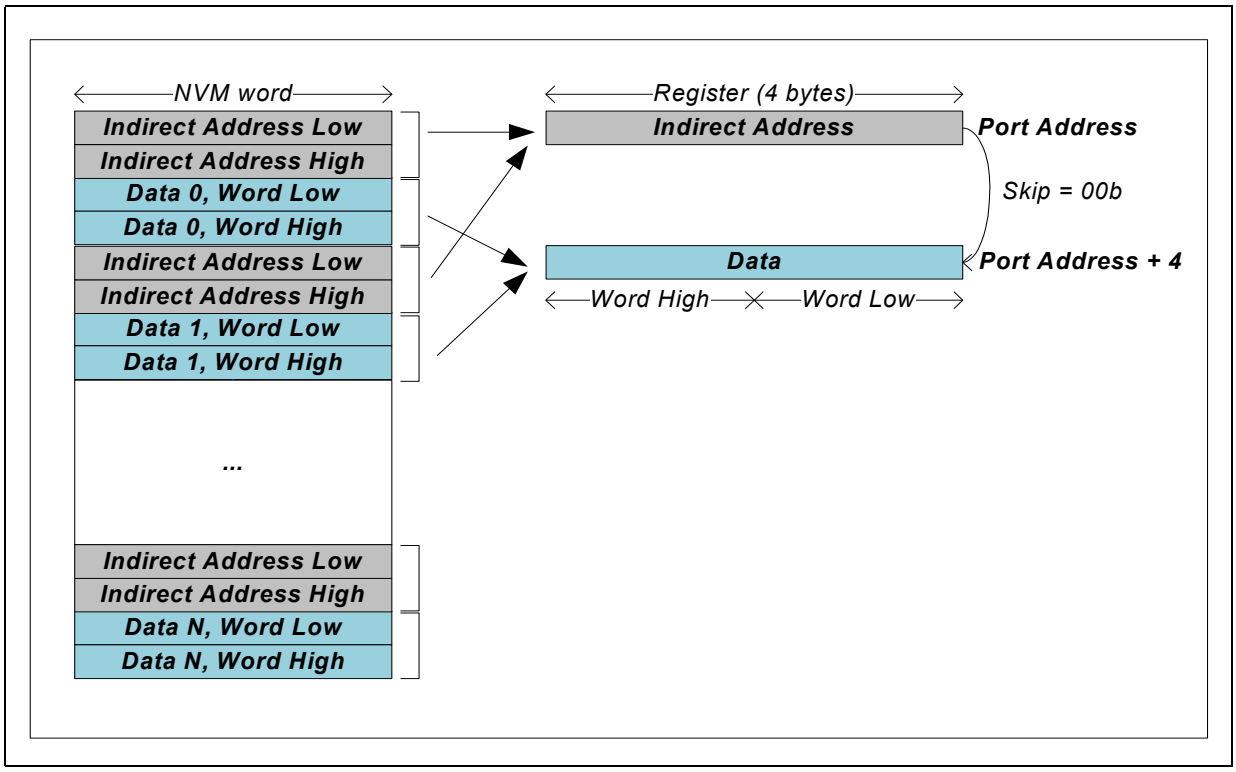


Figure 38-39.Access Through a Type 4 Module of 64-Bits Wide Per Port Data Elements

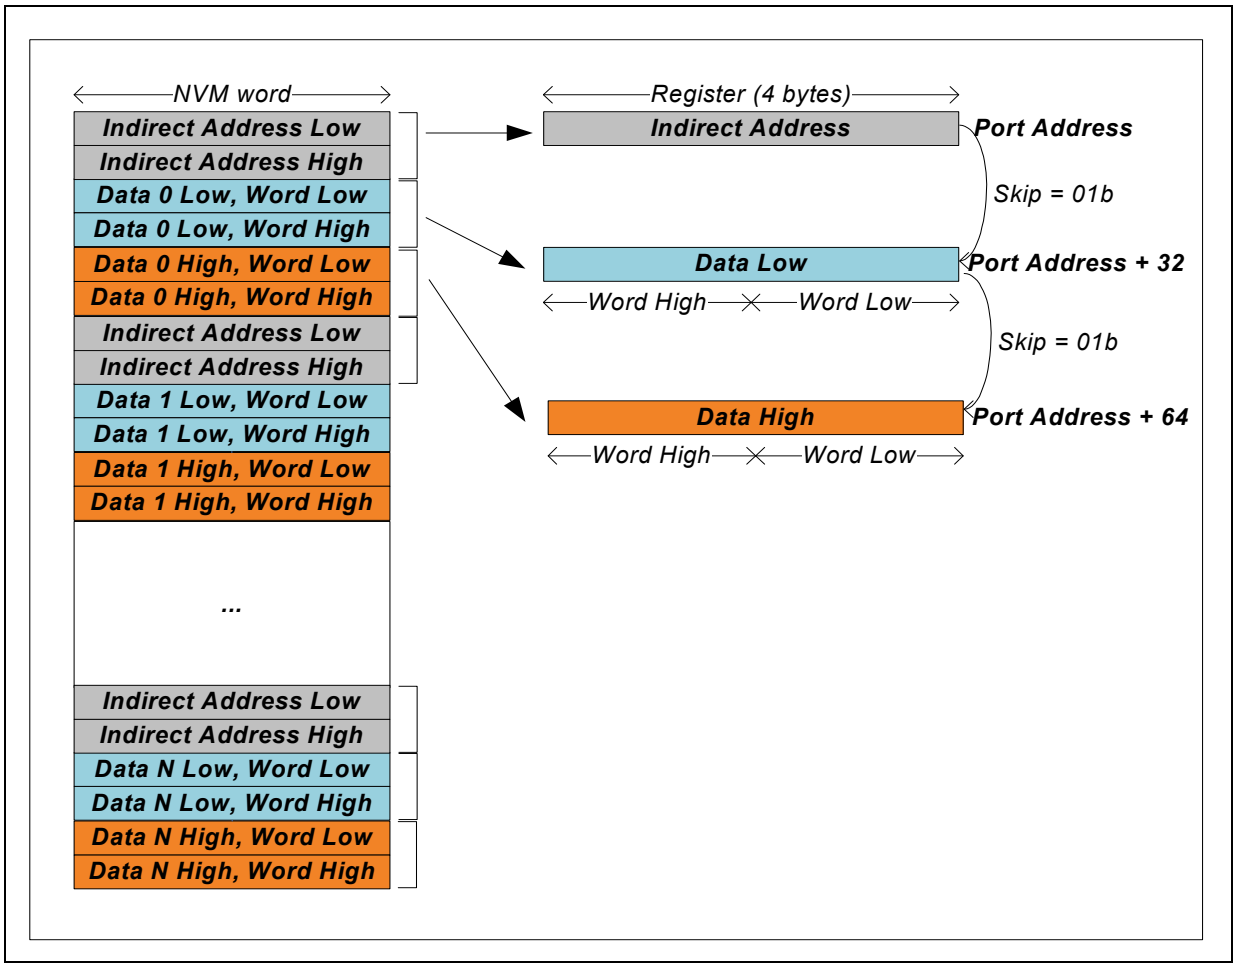

38.19.2.1.5 Auto Generated Pointers

Type 1 and Type 2 items are generated by the auto map generation tool from the project's register database. These items are automatically mapped into the Registers Auto-load NVM modules according to their loading trigger (see Table 38-75) and with no possibility to perform manual changes. Until the list of Type 1/2 items stabilizes, each invocation of the tool might lead to a different mapping offset in the destination module.

EMP code and software tools cannot accommodate these variations in mapping offset, and hence, they need a fixed method for accessing some predefined Type 1/2 items. The auto-generated pointers module is automatically defined by the auto map generation tool for this purpose. It is pointed to by NVM word 0x07. It lists the mapping address in NVM of the pre-defined Type 1/2 items via a 2-word structure per item.

The word address in shadow RAM of an item is given by the sum of the contents of its two associated words: pointer + offset. If the item is relative to an array of registers and/or to a register with a scope different than global, the offset is given for the first data word of the Type 1/2 array, for array instance [0] and scope instance [0].

In the auto-generated pointers module, the location of the 2-word structures relative to an item is made invariant along the project's life. The alias name of the Type 1/2 register appears in the names of the two words in the structure.

Following is the list of auto-generated pointers, listed in the order by which they appear in the module:

1. PFPM_APM
2. PRTPM_GC
3. GLGEN_STAT
4. GLPCI_SERL
5. GLPCI_SERH
6. PRTGL_SAL
7. PRTGL_SAH
8. GLPCI_CAPSUP
9. PRTDCB_MFLCN
10. PRTDCB_FCCFG
11. PFGEN_PORTNUM
12. PFPCI_FUNC2
13. PFPCI_CLASS
14. PF_VT_PFALLOC
15. GLGEN_PCIFCNCNT
16. GLPCI_REVID
17. PFPCI_DEVID
18. GLPCI_SUBVENID
19. PFPCI_SUBSYSID
20. GLPCI_VENDORID
21. GLPCI_CNF2

38.19.2.2 NVM Integrity Checks By Software

This section describes the NVM integrity fields inserted in the Product Name NVM map to provide a basic detection of a faulty Flash part.

A software checksum check is performed by the PF driver just after completion of its initialization sequence. It covers only modules mapped into shadow RAM. If the checks fails, another try is attempted, and if it fails again, the PF driver disables Tx/Rx operations with the 10 GbE controller.

Modules mapped outside the shadow RAM include a CRC8 field. EMP is responsible to check the CRC8 of the modules it loads/updates from/to Flash. It also provides software tools with the ability to check the integrity of these modules upon request because the PF driver does not include this check in its initialization sequence.

38.19.2.2.1 Software Checksum

The *Software Checksum* field covers the entire 64 KB shadow RAM contents (reserved words included) with the exception of the VPD area and to the PCIe ALT auto-Load module, which are skipped.

The *Software Checksum* word is located at word 0x3F. Its value is computed such that after adding all the covered words, including the *Software Checksum* word itself, the sum is 0xBABA.

Each time software tools are modifying one of these areas, it must update the *Software Checksum* field accordingly.

Each time EMP is updating the contents of one of these areas by its own initiative (not as part of an NVM Update AQ command) or for handling an MC command received over SMBus or NC-SI, it must update the *Software Checksum* field accordingly.

The CRC polynomial used is: X^8+X^2+X+1.

Similarly, the following modules include CRC8 fields in their header and in the headers of their sub-modules:

- PE settings module
- EMP global module
- Manageability module
- EMP settings module

EMP is responsible to check CRC8 validity of these modules (and their included sub-modules) on every EMPR, excepted to PE settings module, which is handled by PE on CORER events. If CRC8 is invalid after two tries (every try takes 260 ms for a 800 KB long EMP image), EMP must report the error in the GL_MNG_FWSM.EXT_ERR_IND and CRC_ERROR_MODULE register fields by posting to the MC an AEN # 0x82 - NVM error (enable bit = 18) over NC-SI and by using the Status Data Byte 2[5] in the SMBus alert.

If the CRC8 error occurred on the EMP code, ROM-EMP must report the error only to the host by setting a bit in a register and must not run the code loaded from RAM. It must also open the hardware NVM security to enable fixing the issue via software tools.

If the CRC8 error occurred on the manageability module, NC-SI/SMBus interfaces are disabled.

If the CRC8 error occurred on the EMP global module then the settings are not loaded to the PHY.

CRC8 of PE Image and PE Settings modules are checked by PE itself. When an error occurs on PE Image, the PE processor is held in reset and the error is reported in GLPE_FWLDSTATUS register. If the error occurs on PE Settings, the settings are not used and the error is reported in GLPE_FWLDSTATUS register.

Each time software tools are updating one of these modules, they must update its CRC8 field accordingly.

EMP must check the concerned CRC8 fields before committing an NVM Update command that was explicitly addressed for one of these modules. If a CRC8 field read from the free provisioning area of the Flash is not valid, the command completes with the EIO (Flash defect status).

38.19.2.2.2 NVM Integrity Summary

Table 38-118.NVM Integrity Summary Table

NVM Module	Integrity Check	When[1]	By	Number of Tries	Action on Error
Shadow RAM (excluding VPD area)	Checksum	Driver Init	PF Driver	2	Disable Rx/Tx paths for the host (but not for MC) and report the failure to user/ admin.
VPD area	No	N/A	N/A	N/A	N/A
PCIe Analog	CRC8	EMPR	EMP	2	Report the failure in GL_MNG_FWSM.EXT_ERR_IND. Post to the MC an AEN # 0x82 - NVM error (enable bit = 18) over NC-SI and then use the Status Data Byte 2[5] in the SMBus alert.
PHY Analog	CRC8	EMPR	EMP	2	Report the failure in GL_MNG_FWSM.EXT_ERR_IND. Post to the BMC an AEN # 0x82 - NVM error (enable bit = 18) over NC-SI and then use the Status Data Byte 2[5] in the SMBus alert.
PE Settings	CRC8	CORER	PE	2	PE reports the failure by setting bits in GLPE_FWLDSTATUS. PE will not use the settings read from this module.
EMP Global	CRC8	EMPR	EMP	2	Report the failure in GL_MNG_FWSM.EXT_ERR_IND. Post to the MC an AEN # 0x82 - NVM error (enable bit = 18) over NC-SI and then use the Status Data Byte 2[5] in the SMBus alert. Do not load the data into the PHY.
Manageability	CRC8	EMPR	EMP	2	Report the failure in GL_MNG_FWSM.EXT_ERR_IND. Disable NC-SI/SMBus.
EMP Settings	CRC8	EMPR	EMP	2	Report the failure in GL_MNG_FWSM.EXT_ERR_IND. Post to the BMC an AEN # 0x82 - NVM error (enable bit = 18) over NC-SI and then use the Status Data Byte 2[5] in the SMbus alert.
Option ROM	Yes	Boot Time	BIOS		
PE Image	CRC8	CORER	PE	1	PE reports the failure by setting bits in GLPE_FWLDSTATUS. PE is held in reset state.
EMP Image	CRC8	EMPR	ROM-EMP	2	Report the failure in GL_MNG_FWSM.EXT_ERR_IND. Do not run the RAM code. Open hardware NVM security by clearing the FLA.LOCKED bit. Check CRC8 before committing an EMP/PE image update. In case of an CRC8 error, report the error in the AQ completion and reject the update.

Notes:

1. Besides the integrity check performed by EMP before committing NVM Update commands.

38.19.2.3 Header of NVM Modules

38.19.2.3.1 Header of all NVM Modules Mapped to Shadow RAM

Modules read by hardware do not contain pointers to sub-modules and they are not authenticated.

Table 38-119.NVM Header of Modules Mapped to Shadow RAM

Number of Words	Field or Segment Name	Description and Comments
1	Module Length	Length of the module contents expressed in words (*Module Length* field excluded). It must be set to N. Modules are size limited to the size of the shadow RAM (64 KB).
N	Word 1	
	Word 2	
	...	
	Word N	

38.19.2.3.2 Header/Trailer of Authenticated NVM Modules

This section concerns the following modules:

1. EMP image (pointed by NVM word 0x0B).
2. PE image (pointed by NVM word 0x0C).
3. Option ROM (pointed by NVM word 0x05).

For the last module, the first 330 words listed in Table 38-120 are mapped at the end of the area allocated to the module (at its trailer), though for the sake of the authentication, these words are mapped at the module's header, as listed in Table 38-120.

Since authenticated modules are by definition, they cannot be modified *in the fields because* no holes are present in such modules.

In Table 38-120, fields colored in cyan are protected by the authentication signature.

Table 38-120.Header of Authenticated NVM Modules (Sheet 1 of 2)

Number of Words	Field or Segment Name	Description and Comments
64	CSS Header	
128	RSA Public Key	This field is skipped due to SHA256 Hash computing.
2	RSA Exponent	This field is skipped due to SHA256 Hash computing.
128	Encrypted SHA256 Hash	This field is skipped due to SHA256 Hash computing.
1	10 GbE Controller Blank NVM Device ID	A unique Intel-provided device ID that identifies the 10 GbE controller controller among other Intel controllers. It must be set to 0x3A84 in the 10 GbE controller.
2	Max Module Area	It is the maximum Flash area expressed in words that can be used by the module, starting from CSS header (included). It is set to 580 K words (1160 KB) for an EMP and PE image modules and to 4 K words (8 KB) for other authenticated modules.
2	Current Module Area	It is the Flash area expressed in words that is currently used by the module, starting from CSS header (included).

Table 38-120.Header of Authenticated NVM Modules (Sheet 2 of 2)

Number of Words	Field or Segment Name	Description and Comments
1	Module Format Version + CRC8	Bit 15 = CRC8 field is used. Set to 1b if a CRC8 is computed over the module, set to 0b otherwise. It must always be set to 0b in the OROM module. Bits 14:8 = Module format version. Set to 0x02touse the currently-defined format. Bits 7:0 = CRC8 value computed over the entire area allocated to the module (1160 KB for EMP image), starting from CSS header (excluding the fields not covered by the RSA authentication signature) and including all the remaining bytes of the area (excluding this word that is skipped for the sake of CRC8 computing.
1	Code Revision	Bits 15:8 = Major revision number. Bits 7:0 = Minor revision number. Major revision number of EMP and of the PE images shall match one to the other. Otherwise PE is maintained disabled by EMP. For other authenticated modules it is just the image revision number (not necessarily referring to any embedded code).
1	Reserved Spare Word	Must be zeroed.
2 or 1	Parent Module Length	Length of the parent module contents expressed in words, module header and *Parent Module Length* field excluded. It excludes all the descendant modules. Modules read by firmware are NOT size limited to 128 KB. • For modules parsed by firmware (EMP image and PE Images), this length field is two words long and it covers for the firmware code, its padding words, and for the EMP image also the last 4 KB sector reserved for the RO commands section. It must be set to 0x0006DEB4. • For modules parsed by hardware (PCIe analog and PHY analog modules), this length field is one word long and it does not include padded words.
N	Parent Word 1	Firmware module content formatting is specific to each module.
	Parent Word 2	
	...	
	Parent Word N	

38.19.2.4 Trailer of the EMP Image Module

In Table 38-121, fields colored in cyan are protected by the authentication signature.

The last 4 KB sector of the EMP image has the following format:

Table 38-121.RO Commands Section Format (Sheet 1 of 2)

Number of Words	Field or Segment Name	Description and Comments
1	RO Commands Version	Default is 0xFFFF, which means the section is empty and the remaining words are discarded.
1	10 GbE Controller Blank NVM Device ID	A unique Intel-provided device ID that identifies the 10 GbE controller among other Intel controllers. It must be set to 0x3A84 in the 10 GbE controller.
1	Minimum EMP Code Revision	Minimum EMP code revision number required for being able to parse the RO commands section. It must be lower or equal to the code revision number read from the EMP image header listed in Table 38-120.
1	RO Commands Length	Length in words (N), starting from next word.

Table 38-121.RO Commands Section Format (Sheet 2 of 2)

Number of Words	Field or Segment Name	Description and Comments
N	RO Commands Word 1	Format of the RO commands is described in Section 38.19.2.4.1.
	RO Commands Word 2	
	...	
	RO Commands Word N	

38.19.2.4.1 Format of the RO Commands

The RO command words can contain the following two structures:

1. Shadow RAM Word Write Command (2 words)
2. CSR Write Command (4 words)

Each command starts with a type field.

Table 38-122 describes the different commands types:

Table 38-122.RO Commands Types

Type	Description
xxx1b	Word auto load.
0010b	CSR auto load.
Other	Invalid type, parsing is stopped here.

Figure 38-40.Shadow RAM Word Write Command

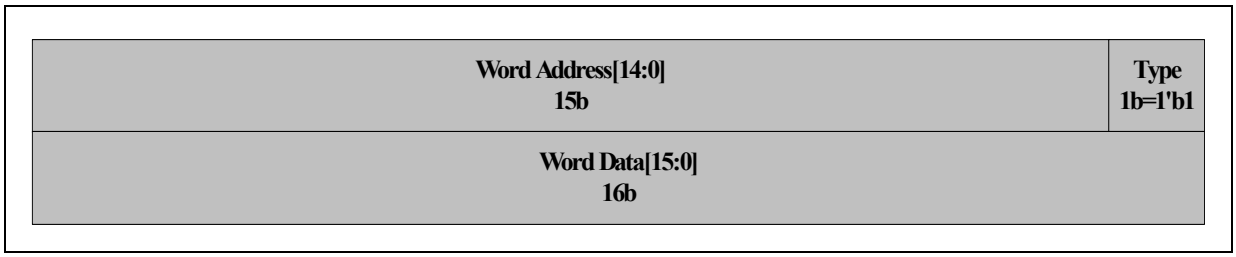

Figure 38-41.CSR Write Command

38.20.1 Init Module Section Summary Table

This is the NVM header module that contains pointers to all other 1st level sections. It includes also words that are relative to the entire NVM map. See Section 38.20 for details on the inner structure.

38.20.1.1 NVM Control Word 1 (0x0000)

Bits	Field Name	NVM Image Value	Description
15:8	Reserved	0x02	Reserved.
7:6	NVM Validity	01b	The *Signature* field indicates to the device that there is a valid NVM present. If the *Signature* field is not 01b, the other bits in this word are ignored, no further NVM read is performed, and the default values are used for the configuration space IDs. 00b = NVM not present 0. 01b = NVM present. 10b = NVM not present 2. 11b = NVM not present 3.
5:0	Reserved	0x09	Reserved.

38.20.1.2 RO Commands Version (0x0001)

Bits	Field Name	NVM Image Value	Description
15:0	RO Commands Version	0xFFFF	Contains the version of the RO Commands section mapped to the last 4 KB sector of the EMP Image.

38.20.1.3 Reserved_0 (0x0003)

Bits	Field Name	NVM Image Value	Description
15:0	Reserved_0	0x0000	Reserved.

38.20.1.4 Internal PHY PLL Configuration Module Pointer (0x0004)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	Internal PHY Configuration Module Pointer	0x0	Points to the Internal PHY PLL Configuration section.

38.20.1.5 OROM Pointer (0x0005)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	1b	Pointer Type. Only the 4 KB sector unit is supported for this pointer. 0 = Word units. 1 = 4 KB sector units.
14:0	PCIe Expansion/Option ROM Pointer	0x7FFF	Points to the OROM section.

38.20.1.6 RO PCIR Registers Auto-Load Module Pointer (0x0006)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	PCIR Registers Auto-Load Module Pointer	0x7FFF	Points to the RO PCIR Registers Auto-Load Module section. For more detail on the RO PCIR Registers Auto-Load Module inner structure, see Section 38.20.2.

38.20.1.7 Auto Generated Pointers Pointer (0x0007)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	Auto Generated Pointers Module Pointer	0x7FFF	Points to the Auto Generated Pointers Module section. For more detail on the Auto Generated Pointers Module inner structure, see Section 38.20.31.

38.20.1.8 PCIR Registers Auto-Load Module Pointer (0x0008)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	PCIe TL Shared Module Pointer	0x7FFF	Points to the PCIR Registers Auto-Load Module section. For more detail on the PCIR Registers Auto-Load Module inner structure, see Section 38.20.18.

38.20.1.9 EMP Global Module Pointer (0x0009)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	1b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	EMP Global Module Pointer	0x7FFF	Points to the EMP Global Module section. For more detail on the EMP Global Module inner structure, see Section 38.20.32.

38.20.1.10 EMP Image Pointer (0x000B)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	1b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	EMP Image Pointer	0x7FFF	Points to the EMP Image section.

38.20.1.11 CSR Protected List Pointer (0x000D)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	CSR Protected List Pointer	0x7FFF	Points to the CSR Protected List section. For more detail on the CSR Protected List inner structure, see Section 38.20.3.

38.20.1.12 Manageability Module Pointer (0x000E)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	1b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	Manageability Configuration Module Pointer	0x7FFF	Points to the Manageability Module Header section. For more detail on the Manageability Module Header inner structure, see Section 38.20.33.

38.20.1.13 EMP Settings Module Pointer (0x000F)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	1b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	EMP Module Pointer	0x7FFF	Points to the EMP Settings Module Header section.

38.20.1.14 SW Compatibility Word 1 (0x0010)

Five words in the NVM image are reserved for compatibility information. New bits within these fields are defined as the need arises for determining software compatibility between various hardware revisions.

Bits	Field Name	NVM Image Value	Description
15:12	Reserved	0x0	Reserved.
11	LOM	0b	Indicates whether the NVM attached to LAN silicon contains dedicated module for option ROM. Used by option ROM update applications. 0 = NIC (Attached flash contains module for option ROM). 1 = LOM (Attached flash has no module for option ROM).
10	Server	1b	Legacy. Not currently used. 0 = Client 1 = Server
9	Reserved	0b	Reserved.
8	OEM/Retail	0b	Legacy. Not currently used. 0 = Retail 1 = OEM
7:0	Reserved	0x00	Reserved.

38.20.1.15 SW Compatibility Word 2 (0x0011)

Five words in the NVM image are reserved for compatibility information. New bits within these fields are defined as the need arises for determining software compatibility between various hardware revisions.

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0xFFFF	Reserved.

38.20.1.16 SW Compatibility Word 3 (0x0012)

Five words in the NVM image are reserved for compatibility information. New bits within these fields are defined as the need arises for determining software compatibility between various hardware revisions.

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0xFFFF	Reserved.

38.20.1.17 SW Compatibility Word 4 (0x0013)

Five words in the NVM image are reserved for compatibility information. New bits within these fields are defined as the need arises for determining software compatibility between various hardware revisions.

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0xFFFF	Reserved.

38.20.1.18 SW Compatibility Word 5 (0x0014)

Five words in the NVM image are reserved for compatibility information. New bits within these fields are defined as the need arises for determining software compatibility between various hardware revisions.

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0xFFFF	Reserved.

38.20.1.19 PBA Flags (0x0015)

Bits	Field Name	NVM Image Value	Description
15:0	PBA Flags	0xFAFA	A flag value of 0xFAFA indicates that the PBA is stored in a separate PBA block.

38.20.1.20 PBA Block Pointer (0x0016)

Bits	Field Name	NVM Image Value	Description
15:0	PBA Block Pointer		

38.20.1.21 Boot Configuration Start Address (0x0017)

Address of iSCSI Boot configuration module. This is a word pointer. The block length is embedded in the module.

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	iSCSI Boot Configuration Start Address	0x7FFF	This module is 1504 bytes long and must be mapped in the first valid 4 KB sector of the Flash. Points to the Boot Configuration Block section. For more detail on the Boot Configuration Block inner structure, see Section 38.20.12.

38.20.1.22 Software Reserved Word 1 - Dev Starter Version (0x0018)

Dev_Starter map version used to produce this image. This word must be filled manually.

Bits	Field Name	NVM Image Value	Description
15:12	Major		NVM major version.
11:8	Decimal Point	0x0	Decimal Point. Used by automatic NVM reading tools. Must be always set to 0x0.
7:0	Minor		NVM minor version.

38.20.1.23 Software Reserved Word 2 (0x0019)

Bits	Field Name	NVM Image Value	Description
15:4	Reserved	0xFFF	Reserved.
3	WoL Control Port 3	0b	Wake On LAN feature for port 3. 0 = Enabled — Supported and enabled 1 = Disabled — Disabled or not supported
2	WoL Control Port 2	0b	Wake On LAN feature for port 2. 0 = Enabled — Supported and enabled 1 = Disabled — Disabled or not supported
1	WoL Control Port 1	0b	Wake On LAN feature for port 1. 0 = Enabled — Supported and enabled 1 = Disabled — Disabled or not supported
0	WoL Control Port 0	0b	Wake On LAN feature for port 0. 0 = Enabled — Supported and enabled 1 = Disabled — Disabled or not supported

38.20.1.24 Software Reserved Word 3 (0x001A)

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0xFFFF	Reserved.

38.20.1.25 Software Reserved Word 4 (0x001B)

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0xFFFF	Reserved.

38.20.1.26 Software Reserved Word 5 (0x001C)

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0xFFFF	Reserved.

38.20.1.27 Software Reserved Word 6 (0x001D)

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0xFFFF	Reserved.

38.20.1.28 Software Reserved Word 7 (0x001E)

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0xFFFF	Reserved.

38.20.1.29 Software Reserved Word 8 (0x001F)

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0xFFFF	Reserved.

38.20.1.30 Software Reserved Word 9 (0x0020)

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0xFFFF	Reserved.

38.20.1.31 Software Reserved Word 10 (0x0021)

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0xFFFF	Reserved.

38.20.1.32 Software Reserved Word 11 (0x0022)

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0xFFFF	Reserved.

38.20.1.33 Software Reserved Word 12 (0x0023)

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0xFFFF	Reserved.

38.20.1.34 Software Reserved Word 13 (0x0024)

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0xFFFF	Reserved.

38.20.1.35 Software Reserved Word 14 (0x0025)

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0xFFFF	Reserved.

38.20.1.36 Software Reserved Word 15 (0x0026)

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0xFFFF	Reserved.

38.20.1.37 Software Reserved Word 16 (0x0027)

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0xFFFF	Reserved.

38.20.1.38 Software Reserved Word 18 - Map Version (0x0029)

Automatically generated by the NVM update tool.

Bits	Field Name	NVM Image Value	Description
15:0	Map Version		

38.20.1.39 Software Reserved Word 19 - NVM_Image_Version (0x002A)

Automatically generated by the NVM update tool.

Bits	Field Name	NVM Image Value	Description
15:0	NVM Image Version		

38.20.1.40 Software Reserved Word 20 - NVM Structure Version (0x002B)

Bits	Field Name	NVM Image Value	Description
15:12	Major	0x1	NVM major version.
11:8	Decimal Point	0x0	Decimal Point. Used by automatic NVM reading tools. Must be always set to 0x0.
7:0	Minor	0x3	NVM structure minor version.

38.20.1.41 Software Reserved Word 22 - EETRACK ID 1 (0x002D)

This word is for the first word of the eTrack_ID number written by EEPROM Manager Tool.

Bits	Field Name	NVM Image Value	Description
15:0	eTrack_ID Word 1	0xFFFF	EEPROM Manager Tool writes a unique 32-bit eTrack_ID number in two sequential NVM words. The eTrack_ID is written when EEPROM Manager Tool creates an image on the Intel network. The eTrack_ID DB tracks NVM images back to a specific SCM build.

38.20.1.42 Software Reserved Word 23 - EETRACK ID 2 (0x002E)

This word is for the second word of the eTrack_ID number written by EEPROM Manager Tool.

Bits	Field Name	NVM Image Value	Description
15:0	eTrack_ID Word 2		

38.20.1.43 VPD Module Pointer (0x002F)

Word pointer to Vital Product Data module. Block length is embedded in the module.

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0b	Pointer Type:. 0 = Word units. 1 = 4 KB sector units.
14:0	VPD Pointer	0x7FFF	Vital Product Data Pointer. Points to the VPD Module section. For more detail on the VPD Module inner structure, see Section 38.20.6. 0x7FFF is the default unless VPD relative section is specified. The VPD section size is usually 64 words and is initialized to 0 or 0x7FFF. During run time this module is accessible through the VPD capability in the PCI configuration space. This module must be mapped in the first valid 4KB sector of the Flash.

38.20.1.44 PXE Setup Options Pointer (0x0030)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	PXE Setup Options Pointer	0x7FFF	Points to the PXE Setup Options section. For more detail on the PXE Setup Options inner structure, see Section 38.20.10.

38.20.1.45 PXE Configuration Customization Options Pointer (0x0031)

Word 0x31 of the NVM contains settings that can be programmed by an OEM or network administrator to customize the operation of the software. These settings cannot be changed from within the Control- S setup menu. The lower byte contains settings that would typically be configured by a network administrator using an external utility; these settings generally control which setup menu options are changeable. The upper byte is generally settings that would be used by an OEM to control the operation of the agent in a LOM environment, although there is nothing in the agent to prevent their use on a NIC implementation. The default value for this word is 0x4000.

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	PXE Configuration Customization Options Pointer	0x7FFF	Points to the PXE Configuration Customizations Options section. For more detail on the PXE Configuration Customizations Options inner structure, see Section 38.20.11.

38.20.1.46 PXE Version (0x0032)

Word 0x32 of the NVM is used to store the version of the boot agent that is stored in the Flash image. When the Boot Agent loads, it can check this value to determine if any first-time configuration needs to be performed. The agent then updates this word with its version. Some diagnostic tools to report the version of the Boot Agent in the Flash also read this word.

Bits	Field Name	NVM Image Value	Description
15:12	Major Version	0x0	PXE Boot Agent Major Version. Default value is 0.
11:8	Minor Version	0x0	PXE Boot Agent Minor Version. Default value is 0.
7:0	Build Number	0x00	PXE Boot Agent Build Number. Default value is 0.

38.20.1.47 IBA Capabilities (0x0033)

Word 0x33 of the NVM is used to enumerate the boot technologies that have been programmed into the Flash. This is updated by Flash configuration tools and is not updated or read by IBA.

Bits	Field Name	NVM Image Value	Description
15:14	Signature	01b	Signature. Must be set to 01b to indicate that this word has been programmed by the agent or other configuration software.
13:6	Reserved	0x00	Reserved. Must be 0.
5	Reserved	1b	Reserved
4	iSCSI boot	0b	iSCSI is present if set to 1b. 0 = Not Present 1 = Present
3	efi ebd driver	1b	EFI UNDI driver is present if set to 1b. 0 = Not Present 1 = Present
2	RPL	0b	RPL module is present if set to 1b. Reserved bit for devices. 0 = Not Present 1 = Present
1	PXE/UNDI Driver	1b	PXE UNDI driver is present if set to 1b. 0 = Not Present 1 = Present
0	PXE Base Code	1b	PXE Base Code is present if set to 1b. 0 = Not Present 1 = Present

38.20.1.48 Software Reserved Word 24 - Original EETRACK ID 1 (0x0034)

Bits	Field Name	NVM Image Value	Description
15:0	Original EETRACK ID 1	0x0000	

38.20.1.49 Software Reserved Word 25 - Original EETRACK ID 2 (0x0035)

Bits	Field Name	NVM Image Value	Description
15:0	Original EETRACK ID 2	0x0000	

38.20.1.50 iSCSI Option ROM Version (0x0036)

Word 0x36 of the NVM is used to store the version of iSCSI Option ROM updated. The value must be above 0x2000 and the value below (word 0x1FFF = 16 KB NVM size) is reserved for future expansion for a pointer to combo option ROM component version structure. iSCSIUtl, FLAUtil, DMiX update iSCSI Option ROM version if the value is above 0x2000, 0x0000, or 0xFFFF. The pointer (0x0040 - 0x1FFF) should be kept and not be overwritten.

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0xFFFF	Reserved.

38.20.1.51 VLAN Configuration Block Pointer (0x0037)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	VLAN Configuration Block Pointer	0x7FFF	Points to the VLAN Configuration Block section. For more detail on the VLAN Configuration Block inner structure, see Section 38.20.13.

38.20.1.52 POR Registers Auto-Load Module Pointer (0x0038)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	POR Registers Auto-Load Module Pointer	0x7FFF	Points to the POR Registers Auto-Load Module section. For more detail on the POR Registers Auto-Load Module inner structure, see Section 38.20.18.

38.20.1.53 EMPR Registers Auto-Load Pointer (0x003A)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	EMPR Registers Auto-Load Module Pointer	0x7FFF	Points to the EMPR Auto-Load section. For more detail on the EMPR Auto-Load inner structure, see Section 38.20.4.

38.20.1.54 GLOBR Registers Auto-Load Pointer (0x003B)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	GLOBR Registers Auto-Load Module Pointer	0x7FFF	Points to the GLOBR Registers Auto-Load Module section. For more detail on the GLOBR Registers Auto-Load Module inner structure, see Section 38.20.18.

38.20.1.55 CORER Registers Auto-Load Pointer (0x003C)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	CORER Registers Auto-Load Module Pointer	0x7FFF	Points to the CORER Registers Auto-Load Module section. For more detail on the CORER Registers Auto-Load Module inner structure, see Section 38.20.18.

38.20.1.56 Software Checksum (0x003F)

Bits	Field Name	NVM Image Value	Description
15:0	Checksum		The SW Checksum field covers the whole 64 KB shadow RAM contents (reserved words included), excepted to the VPD area and to the PCIe ALT Auto-Load module which are skipped. Its value is computed such that after adding all the covered words, including the SW Checksum word itself, the sum is 0xBABA.The checksum word is used to ensure that the base NVM image is a valid image. The initial value in the 16-bit summing register should be 0x0000 and the carry bit should be ignored after each addition. This word is used strictly by the SW. The HW does not calculate nor check its content but rather checks the NVM validity field in the NVM Control Word 1.

38.20.1.57 1st Free Provisioning Area Pointer (0x0040)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	1b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	1st Free Provisioning Area Pointer	0x7FFF	Points to the 1st Free Provisioning Area section.

38.20.1.58 1st Free Provisioning Area Size (0x0041)

Bits	Field Name	NVM Image Value	Description
15:10	Reserved	0x00	Reserved.

Bits	Field Name	NVM Image Value	Description
9:0	1st Free Provisioning Area Size	0x138	Size expressed in 4 KB sector units.

38.20.1.59 Reserved for 4th Free Provisioning Area Pointer (0x0042)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	1b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	2nd Free Provisioning Area Pointer	0x7FFF	Points to the 4th Free Provisioning Area section.

38.20.1.60 Reserved for 4th Free Provisioning Area Size (0x0043)

Bits	Field Name	NVM Image Value	Description
15:10	Reserved	0x00	Reserved.
9:0	2nd Free Provisioning Area Size	0x010	Size expressed in 4 KB sector units

38.20.1.61 Reserved for 3rd Free Provisioning Area Pointer (0x0044)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	1b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	3rd Free Provisioning Area Pointer	0x7FFF	Points to the 3rd Free Provisioning Area section.

38.20.1.62 Reserved for 3rd Free Provisioning Area Size (0x0045)

Bits	Field Name	NVM Image Value	Description
15:10	Reserved	0x00	Reserved.
9:0	3rd Free Provisioning Area Size	0x020	Size expressed in 4 KB sector units

38.20.1.63 2nd Free Provisioning Area Pointer (0x0046)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	1b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	2nd Free Provisioning Area Pointer	0x7FFF	Points to the 2nd Free Provisioning Area section.

38.20.1.64 2nd Free Provisioning Area Size (0x0047)

Bits	Field Name	NVM Image Value	Description
15:10	Reserved	0x00	Reserved.
9:0	2nd Free Provisioning Area Size	0x002	Size expressed in 4 KB sector units

38.20.1.65 EMP SR Settings Pointer (0x0048)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	EMP SR Settings Pointer	0x7FFF	Points to the EMP SR Settings Module Header section. For more detail on the EMP SR Settings Module Header inner structure, see Section 38.20.19.

38.20.1.66 Feature Configuration Pointer (0x0049)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	Feature Configuration Pointer	0x7FFF	Points to the Feature Configuration section. For more detail on the Feature Configuration inner structure, see Section 38.20.19.

38.20.1.67 PE CORER Registers Auto-load Pointer (0x004A)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	PE CORER Config Pointer	0x7FFF	Points to the PE CORER Registers section. For more detail on the PE CORER Registers inner structure, see Section 38.20.18.

38.20.1.68 Configuration Metadata Pointer (0x004D)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	1b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	Configuration Metadata Pointer	0x7FFF	Points to the Configuration Metadata section. For more detail on the Configuration Metadata inner structure, see Section 38.20.18.

38.20.1.69 Immediate Values Pointer (0x004E)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	Immediate Values Pointer	0x0	Points to the Immediate Values section. For more detail on the Immediate Values inner structure, see Section 38.20.26

38.20.1.70 Core Mem Config Pointer (0x004F)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	Core Mem Config Pointer	0x7FFF	Points to the Core Mem Config Section. For more detail on the Core Mem Config inner structure, see Section 38.20.5.

38.20.1.71 FW Scratch Pad Area Pointer (0x0050)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	1b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	FW Scratch Pad Area Pointer	0x7FFF	Points to the FW Scratch Pad Area Section. For more detail on the FW Scratch Pad Area inner structure, see Section 38.20.

38.20.1.72 FW Scratch Pad Area Size (0x0051)

Bits	Field Name	NVM Image Value	Description
15:10	Reserved	0x00	Reserved.
9:0	FW Scratch Pad Area Size	0x040	Size expressed in 4 KB sector units.

38.20.1.73 POR CORER Registers Auto-Load Pointer (0x0052)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	1b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	POR CORER Config Pointer	0x7FFF	Points to the POR CORER Registers Section. For more detail on the POR CORER Registers inner structure, see Section 38.20.18.

38.20.1.74 Internal PHY 0 Configuration Module Pointer (0x0054)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	1b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	Internal PHY Configuration Pointer	0x0	Points to the Internal PHY 0 Configuration 0 Section. For more detail on the Internal PHY 0 Configuration 0 inner structure, see Section 38.20.28.

38.20.1.75 Soft SKUs(0x0055)

Bits	Field Name	NVM Image Value	Description
15	Reserved	0x0	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	Soft SKUs	0x4	Number of ports enable to operate at 10 GbE. Valid values are 0, 2, and 4.

38.20.1.76 Internal PHY 1 PLL Configuration Module Pointer (0x0056)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	1b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	Internal PHY Configuration Pointer	0x0	Points to the Internal PHY 1 PLL Configuration 0 Section. For more detail on the Internal PHY 1 PLL Configuration 0 inner structure, see Section 38.20.42.

38.20.1.77 Internal PHY 1 Configuration Module Pointer (0x0057)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	1b	Pointer Type. 0 = Word units. 1 = 4 KB sector units.
14:0	Internal PHY Configuration Pointer	0x0	Points to the Internal PHY 1 Configuration 0 Section. For more detail on the Internal PHY 1 Configuration 0 inner structure, see Section 38.20.28.

38.20.1.78 Internal PHY Configuration Override Module Pointer (0x0058)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0x0	Pointer Type. 0b = Word units. 1b = 4 KB sector units.
14:0	Internal PHY Configuration Module Pointer	0x0	Points to the Internal PHY Configuration Module Pointer section. For more detail on the Internal PHY Configuration Override inner structure, see Section 38.20.28

38.20.1.79 SW-Data-Recovery (0x0059)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0x0	Pointer Type. 0b = Word units. 1b = 4 KB sector units.
14:0	SW-Data-Recovery Pointer	0x7FFF	Points to the SW-Data-Recovery section. For more detail on the SW-Data-Recovery inner structure, see Section 38.20.7

38.20.1.80 PCIR-Data-Recovery (0x005A)

Bits	Field Name	NVM Image Value	Description
15	Pointer Type	0x0	Pointer Type. 0b = Word units. 1b = 4 KB sector units.
14:0	PCIR-Data-Recovery Pointer	0x7FFF	Points to the PCIR-Data-Recovery Pointer section. For more detail on the PCIR-Data-Recovery Pointer inner structure, see Section 38.20.8

38.20.1.81 Spare NVM Header Words[n] (0x005B + 1*n, n=0...164)

Bits	Field Name	NVM Image Value	Description
15:0	RESERVED	0x7FFF	

38.20.2 RO PCIR Registers Auto-load Module Section Summary Table

Contains read-only parameters that configure the PCIe transaction layer.

Word Offset	Description	Page
0x0000	Module Length	2522
0x0001	LO PCIR Data	2523

38.20.2.1 Module Length (0x0000)

Bits	Field Name	NVM Image Value	Description
15:0	Module Length		

38.20.2.2 LO PCIR Data (0x0001)

Raw data module length: variable.

This word must be disabled at the image level.

38.20.3 CSR Protected List Section Summary Table

Defines the list of the protected CSRs and their default settings. These registers are made RO to the host as they contains settings which are critical for the host to flash access when in blank flash programming mode.

Word Offset	Description	Page
0x0000	Module Length	2523
0x0001	Reserved (must be disabled at the image level)	
0x0002 - 0x0005	NVM contents for GLGEN_STAT	2523
0x0006 - 0x0009	NVM contents for GLNVM_ALTIMERS	2524
0x000A - 0x000D	NVM contents for GLGEN_PE_ENA	2524
0x001D - 0x0020	NVM contents for GLPCI_LBARCTRL	2524
0x0021 - 0x0028	Reserved	
0x0029 - 0x00A3	NVM contents for GLNVM_PROTCSR	2524

38.20.3.1 Module Length (0x0000)

Bits	Field Name	NVM Image Value	Description
15:0	Module Length		Length in: 2-bytes unit - 1. First Section -> Word: CSR Protected List -> Module Length Last Section -> Word: CSR Protected List -> Starting Address Low at GLNVM_PROTCSR[0]

38.20.3.2 GLGEN_STAT (0x0002 - 0x0005)

38.20.3.2.1 Address Low at GLGEN_STAT (0x0002)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLGEN_STAT	0x12C	
3:0	Type	0x1	

38.20.3.2.2 Address High at GLGEN_STAT (0x0003)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLGEN_STAT	0x00B6	

38.20.3.2.3 Data Low of GLGEN_STAT (0x0004)

38.20.3.2.4 Data High of GLGEN_STAT (0x0005)

38.20.3.3 GLNVM_ALTIMERS (0x0006 - 0x0009)

38.20.3.3.1 Address Low at GLNVM_ALTIMERS (0x0006)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLNVM_ALTIMERS	0x140	
3:0	Type	0x1	

38.20.3.3.2 Address High at GLNVM_ALTIMERS - 0x0007

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLNVM_ALTIMERS		

38.20.3.3.3 Data Low of GLNVM_ALTIMERS (0x0008)

38.20.3.3.4 Data High of GLNVM_ALTIMERS (0x009)

38.20.3.4 GLPCI_LBARCTRL (0x001D - 0x0020)

38.20.3.4.1 Address Low at GLPCI_LBARCTRL (0x001D)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLPCI_LBARCTRL	0xBE484	
3:0	Type	0x1	

38.20.3.4.2 Address High at GLPCI_LBARCTRL (0x001E)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLPCI_LBARCTRL		

38.20.3.4.3 Data Low of GLPCI_LBARCTRL (0x001F)

38.20.3.4.4 Data High of GLPCI_LBARCTRL (0x0020)

38.20.3.5 GLNVM_PROTCSR (0x0029 - 0x00A3)

38.20.3.5.1 Starting Address Low at GLNVM_PROTCSR[n] (0x0029)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLNVM_PROTCSR	0xB6010	
3:0	Type	0x2	

38.20.3.5.2 Starting Address High at GLNVM_PROTCSR[n] (0x002A)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLNVM_PROTCSR		

38.20.3.5.3 Attributes at GLNVM_PROTCSR[n] (0x002B)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x3C	
4:3	Skip	00b	
2:0	Width	000b	

38.20.3.5.4 Data Low of GLNVM_PROTCSR[n] (0x002C + 2*n, n=0...59)

38.20.3.5.5 Data High of GLNVM_PROTCSR[n] (0x002D + 2*n, n=0...59)

38.20.4 EMPR Auto-Load Section Summary Table

Read margin settings to the device's core memories which are loaded by HW auto-load only on the first EMPR event that occurs after POR.

The contents of this module is checked against the CSR Protected List.

Word Offset	Description	Page
0x0000	Module Length	2525
0x0001	EMPR Autoload Data	2525

38.20.4.1 Module Length (0x0000)

Bits	Field Name	NVM Image Value	Description
15:0	Module Length		Length in: 2-bytes unit - 1. First Section -> Word: EMPR Auto-Load -> Module Length Last Section -> Word: EMPR Auto-Load -> EMPR Auto-Load Data

38.20.4.2 EMPR Autoload Data (0x0001)

Raw data module length: variable

Contains patches

38.20.5 Core Mem Config Section Summary Table

Read margin settings to the device’s core memories, which are loaded by hardware auto-load on every CORER event. The contents of this module is checked against the CSR Protected List.

Word Offset	Description	Page
0x0000	Module Length	2526
0x0001	Core Mem Config Data	2526

38.20.5.1 Module Length (0x0000)

Bits	Field Name	NVM Image Value	Description
15:0	Module Length		Length in: 2 bytes unit - 1. First section -> Word: Core Mem Config -> Module Length Last section -> Word: Core Mem Config -> Core Mem Config Data

38.20.5.2 Core Mem Config Data (0x0001)

Raw data module length: variable

38.20.6 VPD Module Section Summary Table

VDP loaded by OEM. It contains RO and RW info about the NIC/LOM.

Word Offset	Description	Page
0x0000	[New Word]	See 38.20.6.1

38.20.6.1 [New Word] (0x0000)

Raw data module length: 512 words

38.20.7 SW-Data-Recovery Section Summary Table

Word Offset	Description	Reference
0x0000	Section Length	See section 38.20.7.1
0x0001	Section Header	See section 38.20.7.2
0x0002	Original EE-Track-ID Word 1	See section 38.20.7.3
0x0003	Original EE-Track-ID Word 2	See section 38.20.7.4
0x0004 + 1*n, n=0...4	PBA	See section 38.20.7.5
0x0009	MAC Addresses Length	See section 38.20.7.6
0x000A + 3*n, n=0...3	MAC Addresses Word 0	See section 38.20.7.7
0x000B + 3*n, n=0...3	MAC Addresses Word 1	See section 38.20.7.8
0x000C + 3*n, n=0...3	MAC Addresses Word 2	See section 38.20.7.9

38.20.7.1 Section Length (0x0000)

Bits	Field Name	NVM Image Value	Description
15:0	Section Length		Length in: 2 Bytes unit - 1 First Section -> Word: SW-Data-Recovery Section -> Section Length Last Section -> Word: SW-Data-Recovery Section -> MAC Addresses word 2

38.20.7.2 Section Header (0x0001)

Bits	Field Name	NVM Image Value	Description
15	Recovery Mode	0x0	
14:4	Reserved	0x0	Define the current status of NVM-Recovery-Mode. Set by firmware when entering recovery mode to keep the status POR-persistent. Firmware must clear this bit after an NVM update is done by software.
3	MAC Addresses Valid	0x0	
2	PBA Valid	0x0	
1	EETRACK-ID Valid	0x0	
0	PCIR Section Valid	0x0	Define the validity of the PCIR-Data-Recovery section. 0b = Data wasn't programmed yet by firmware. 1b = Data programmed and valid.

38.20.7.3 Original EE-Track-ID word 1 (0x0002)

The original EE-Track-ID of the device.

Taken from words 0x34-0x35 in NVM.

If this field is empty (all 0xFF's), firmware must copy the current ETID from words 0x2D-0x2E to words 0x34-0x35 and use this field.

Bits	Field Name	NVM Image Value	Description
15:0	ETID	0x0000	

38.20.7.4 Original EE-Track-ID word 2 (0x0003)

The original EE-Track-ID of the device.

Taken from words 0x34-0x35 in NVM.

If this field is empty (all 0xFF's), firmware must copy the current ETID from words 0x2D-0x2E to words 0x34-0x35 and use this field.

Bits	Field Name	NVM Image Value	Description
15:0	ETID	0x0000	

38.20.7.5 PBA[n] (0x0004 + 1*n, n=0...4)

PBA section.

Bits	Field Name	NVM Image Value	Description
15:0	PBA	0x0000	See respective bits in the PRTPM_SAH register.

38.20.7.6 MAC Addresses Length (0x0009)

Length of the MAC addresses field [words].

Bits	Field Name	NVM Image Value	Description
15:0	MAC Addresses Length	0x004	

38.20.7.7 MAC Addresses Word 0[n] (0x000A + 3*n, n=0...3)

The PF MAC address table in the NVM that is loaded by firmware to PRTPM_SAL/H. The full table is kept to revert all MAC addresses in SFP mode.

Bits	Field Name	NVM Image Value	Description
15:0	MAC Addresses Word 0	0x0	

38.20.7.8 MAC Addresses Word 1[n] (0x000B + 3*n, n=0...3)

The PF MAC address table in the NVM that is loaded by firmware to PRTPM_SAL/H. The full table is kept to revert all MAC addresses in SFP mode.

Bits	Field Name	NVM Image Value	Description
15:0	MAC Addresses Word 1	0x0	

38.20.7.9 MAC Addresses word 2[n] (0x000C + 3*n, n=0...3)

The PF MAC address table in the NVM that is loaded by firmware to PRTPM_SAL/H. The full table is kept to revert all MAC addresses in SFP mode.

Bits	Field Name	NVM Image Value	Description
15:0	MAC Addresses Word 2	0x0	

38.20.8 PCIR-Data-Recovery Section Summary Table

Word Offset	Description	Reference
0x0000	Section Length	See section 38.20.8.1
0x0001 + 1*n, n=0...23	PCIR Word	See section 38.20.8.2

38.20.8.1 Section Length (0x0000)

Bits	Field Name	NVM Image Value	Description
15:0	Section Length		Length in: 2 Bytes unit - 1 First Section -> Word: PCIR-Data-Recovery Section -> Section Length Last Section -> Word: PCIR-Data-Recovery Section -> PCIR Word

38.20.8.2 PCIR Word[n] (0x0001 + 1*n, n=0...23)

Bits	Field Name	NVM Image Value	Description
15:0	PCIR Field	0x0	

38.20.9 PBA Block Section Summary Table

The PBA block contains the complete PBA number including the dash and the first digit of the 3-digit suffix.

Word Offset	Description	Page
0x0000	PBA Section Length	2529
0x0001	Word1	2529
0x0002	Word2	2530
0x0003	Word3	2530
0x0004	Word4	2530
0x0005	Word5	2530

38.20.9.1 PBA Section Length (0x0000)

Bits	Field Name	NVM Image Value	Description
15:0	PBA Section Length Field	0x0006	Length in words of the PBA Block.

38.20.9.2 Word1 (0x0001)

Bits	Field Name	NVM Image Value	Description
15:0	Word1 Field		PBA Number stored in hexadecimal ASCII values.

38.20.9.3 Word2 (0x0002)

Bits	Field Name	NVM Image Value	Description
15:0	Word2 Field		PBA Number stored in hexadecimal ASCII values.

38.20.9.4 Word3 (0x0003)

Bits	Field Name	NVM Image Value	Description
15:0	Word3 Field		PBA Number stored in hexadecimal ASCII values.

38.20.9.5 Word4 (0x0004)

Bits	Field Name	NVM Image Value	Description
15:0	Word4 Field		PBA Number stored in hexadecimal ASCII values.

38.20.9.6 Word5 (0x0005)

Bits	Field Name	NVM Image Value	Description
15:0	Word5 Field		PBA Number stored in hexadecimal ASCII values.

38.20.10 PXE Setup Options Section Summary Table

Setup options for the PXE driver. It is defined per PCIe function.

Word Offset	Description	Page
0x0000	Section Length	2532
0x0001 + 1*n, n=0...15	Setup Options PCI Function	2530

38.20.10.1 Section Length (0x0000)

The length of the section in words. Note that section length does not include a count for the section length word.

Bits	Field Name	NVM Image Value	Description
15:0	Section Length		

38.20.10.2 Setup Options PCI Function[n] (0x0001 + 1*n, n=0...15)

The main setup options for PF n are stored in this word. These options are those that can be changed by the user with the Control-S setup menu.

Bits	Field Name	NVM Image Value	Description
15:13	Reserved	000b	Reserved. Must be 000b.

Bits	Field Name	NVM Image Value	Description
12:10	FSD	000b	Control forcing speed and duplex during driver operation. 000b = Auto-negotiate 001b = Reserved 010b = Reserved 011b = Not valid (treated as 000b) 100b = Reserved 101b = Reserved 110b = Reserved 111b = 1000 Mb/s full duplex Only applicable for copper-based adapters. Not applicable to 10 GbE. Default value is 000b.
9	Reserved	0b	Reserved
8	DSM	1b	Display Setup Message. If the bit is set to 1b, the "Press Control-S" message displays after the title message. Default value is 1b.
7:6	PT	00b	Prompt Time. These bits control how long the "Press Control-S" setup prompt message is displayed, if enabled by DIM. 00b = 2 seconds (default) 01b = 3 seconds 10b = 5 seconds 11b = 0 seconds ***Note:*** The "Press Ctrl-S" message is not displayed if 0 seconds prompt time is selected.
5	iSCSI Boot disabled	0b	When this bit is set and adapter port is neither iSCSI primary nor secondary, Setup code must not be loaded. Otherwise iSCSI banner and Setup menu should be accessible as in current design. 0 = Enabled 1 = Disabled This bit must be changed at factory level and not be altered by any end-customer tools. ***Note:*** For regular NICs and LOM design this bit should be always cleared in NVM image. Otherwise, iSCSI setup is accessible for the user.
4:3	DBS	00b	Default Boot Selection. These bits select which device is the default boot device. They are only used if the agent detects that the BIOS does not support boot order selection, or if the *MODE* field of word 31h is set to MODE_LEGACY. 00b = Network boot, then local boot (default). 01b = Local boot, then network boot. 10b = Network boot only. 11b = Local boot only.
2:0	PS	000b	Protocol Select. These bits select the active boot protocol. 000b = PXE (default value). 001b = RPL (only if RPL is in the Flash). 010b = iSCSI Boot primary port (only if iSCSI Boot is using this adapter). 011b = iSCSI Boot secondary port (only if iSCSI Boot is using this adapter). 100b = Reserved All other values are reserved. Only the default value of 00b should be initially programmed into the adapter. Other values should only be set by configuration utilities.

38.20.11 PXE Configuration Customizations Options Section Summary Table

Configuration customization options for the PXE driver. It is defined per PCIe function.

Word Offset	Description	Page
0x0000	Section Length	2532
0x0001 + 1*n, n=0...15	Configuration Customization Options PCI Function	2532

38.20.11.1 Section Length (0x0000)

The length of the section in words. Note that section length does not include a count for the section length word.

Bits	Field Name	NVM Image Value	Description
15:0	Section Length		

38.20.11.2 Configuration Customization Options PCI Function[n] (0x0001 + 1*n, n=0...15)

Contains settings that can be programmed by an OEM or network administrator to customize the operation of the software. These settings cannot be changed from within the Control- S setup menu. The lower byte contains settings that would typically be configured by a network administrator using an external utility; these settings generally control which setup menu options are changeable. The upper byte is generally settings that would be used by an OEM to control the operation of the agent in a LOM environment, although there is nothing in the agent to prevent their use on a NIC implementation. The default value for this word is 0x4000.

Bits	Field Name	NVM Image Value	Description
15:14	Signature	01b	Signature. Must be set to 01b to indicate that this word has been programmed by the agent or other configuration software.
13:12	Reserved	00b	Reserved. Must be 0.
11	Continuous Retry	0b	Selects Continuous Retry operation. If this bit is set, IBA does NOT transfer control back to the BIOS if it fails to boot due to a network error (such as failure to receive DHCP replies). Instead, it restarts the PXE boot process again. 0 = Disable 1 = Enable If this bit is set, the only way to cancel PXE boot is for the user to press **ESC** on the keyboard. Retry is not attempted due to hardware conditions such as an invalid NVM checksum or failing to establish link. Default value is 0b.

Bits	Field Name	NVM Image Value	Description
10:8	Operating mode	000b	Selects the agent's boot order setup mode. This field changes the agent default behavior to make it compatible with systems that do not completely support the BBS and PnP Expansion ROM standards. 000b = Normal mode — The agent attempts to detect BBS and PnP Expansion ROM support as it normally does. 001b = Force Legacy mode. The agent does not attempt to detect BBS or PnP Expansion ROM supports in the BIOS and assumes the BIOS is not compliant. The user can change the BIOS boot order in the Setup Menu. 010b = Force BBS mode. The agent assumes the BIOS is BBS compliant, even though it might not be detected as such by the agent's detection code. The user CANNOT change the BIOS boot order in the Setup Menu. 011b = Force PnP Int18 mode. The agent assumes the BIOS allows boot order setup for PnP Expansion ROMs and hooks interrupt 0x18 (to inform the BIOS that the agent is a bootable device) in addition to registering as a BBS IPL device. The user CANNOT change the BIOS boot order in the Setup Menu. 100b = Force PnP Int19 mode. The agent assumes the BIOS allows boot order setup for PnP Expansion ROMs and hook interrupt 0x19 (to inform the BIOS that the agent is a bootable device) in addition to registering as a BBS IPL device. The user CANNOT change the BIOS boot order in the Setup Menu. 101b = Reserved for future use. If specified, is treated as a value of 000b. 110b = Reserved for future use. If specified, is treated as a value of 000b. 111b = Reserved for future use. If specified, is treated as a value of 000b.
7:6	Reserved	00b	Reserved. Must be 0.
5	Disable Flash Update	0b	Disable Flash Update. If this bit is set to 1b, the user is not allowed to update the flash image using PROSet. Default value is 0b. 0 = Enable flash update. 1 = Disable flash update.
4	Disable Legacy OS Wakeup Menu	0b	Disable Legacy Wakeup Support. If this bit is set to 1b, the user is not allowed to change the Legacy OS Wakeup Support menu option. Default value is 0b. 0 = Enable legacy wakeup support. 1 = Disable legacy wakeup support.
3	Disable Boot Selection Menu	0b	Disable Boot Selection. If this bit is set to 1b, the user is not allowed to change the boot order menu option. Default value is 0b. 0 = Enable 1 = Disable
2	Disable Protocol Selection Menu	0b	Disable Protocol Select. If set to 1b, the user is not allowed to change the boot protocol. Default value is 0b. 0 = Enable 1 = Disable
1	Disable Title Message Display	0b	Disable Title Message. If this bit is set to 1b, the title message displaying the version of the Boot Agent is suppressed; the Control-S message is also suppressed. This is for OEMs who do not wish the boot agent to display any messages at system boot. Default value is 0b. 0 = Enable 1 = Disable
0	Setup Menu	0b	Disable Setup Menu. If this bit is set to 1b, the user is not allowed to invoke the setup menu by pressing Control-S. In this case, the NVM may only be changed via an external program. Default value is 0b. 0 = Enable 1 = Disable

38.20.12 Boot Configuration Block Section Summary Table

Contains the required setup to be used for the boot operations.

Word Offset	Description	Page
0x0000	Boot Signature	2537

38.20.12.1 Boot Signature (0x0000)

Bits	Field Name	NVM Image Value	Description
15:0	Boot Signature	0x5369	Boot Signature: 'i', 'S' (0x3569)

38.20.12.2 Block Size (0x0001)

Bits	Field Name	NVM Image Value	Description
15:0	Block Size		Length in: 1-byte unit. First Section -> Word: Boot Configuration Block -> Boot Signature Last Section -> Word: Boot Configuration Block -> Reserved

38.20.12.3 Structure Version (0x0002)

Bits	Field Name	NVM Image Value	Description
15:8	Reserved	0x00	Reserved.
7:0	Structure Version	0x01	Version of this structure. Should be set to 0x1.

38.20.12.4 iSCSI Flags (0x0094)

Bits	Field Name	NVM Image Value	Description
15:10	ARP Timeout	0x0F	Timeout value for each try.
9:8	ARP Retries	01b	Retry value.
7:6	Reserved	00b	Reserved.
5:4	Ctrl-D Entry	00b	Ctrl-D Entry. 00b = Enabled 01b = Reserved 10b = Reserved 11b = Disabled — Skip Ctrl-D entry.

Bits	Field Name	NVM Image Value	Description
3:2	Authentication Type	00b	Authentication Type. 00b = None 01b = One Way CHAP 10b = Mutual CHAP 11b - Reserved
1	Enable DHCP for iSCSI Target	1b	Enable DHCP for getting iSCSI target information. 0 = Disabled — Use static target configuration. 1 = Enabled — Use DHCP to get target information by the Option 17 Root Path.
0	Enable DHCP	1b	Enable DHC. 0 = Disabled — Use static configurations from this structure. 1 = Enabled — Overrides configurations retrieved from DHCP.

38.20.12.5 iSCSI Initiator IP[n] (0x0095 + 1*n, n=0...1)

Bits	Field Name	NVM Image Value	Description
15:0	iSCSI Initiator IP	0x0000	Initiator DHCP flag. Not set = This field should contain the initiator IP address. Set = This field is ignored.

38.20.12.6 Subnet Mask[n] (0x0097 + 1*n, n=0...1)

Bits	Field Name	NVM Image Value	Description
15:0	iSCSI Initiator IP	0x0000	Initiator DHCP flag. Not set = This field should contain the subnet mask. Set = This field is ignored.

38.20.12.7 Gateway IP[n] (0x0099 + 1*n, n=0...1)

Bits	Field Name	NVM Image Value	Description
15:0	iSCSI Initiator IP	0x0000	Initiator DHCP flag. Not set = This field should contain the gateway IP address. Set = This field is ignored.

38.20.12.8 iSCSI Boot LUN (0x009B)

Bits	Field Name	NVM Image Value	Description
15:0	iSCSI Boot LUN	0x0000	Target DHCP flag. Not set = iSCSI target LUN number should be specified. Set = This field is ignored.

38.20.12.9 iSCSI Target IP[n] (0x009C + 1*n, n=0...1)

Bits	Field Name	NVM Image Value	Description
15:0	iSCSI Initiator IP	0x0000	Target DHCP flag. Not set = IP address of iSCSI target. Set = This field is ignored.

38.20.12.10iSCSI Target Port (0x009E)

Bits	Field Name	NVM Image Value	Description
15:0	iSCSI Target Port	0x0CBC	Target DHCP flag Not set = TCP port used by iSCSI target. Default is 3260. Set = This field is ignored.

38.20.12.11VLAN ID (0x0168)

Bits	Field Name	NVM Image Value	Description
15:0	VLAN ID	0x0001	Reserved area, since the function is disabled due to Microsoft restrictions. VLAN ID to include the tag in iSCSI boot frames. A valid VLAN ID is between 1 and 4094. Zero means no VLAN tag support.

38.20.12.12Boot LUN (0x017A)

Bits	Field Name	NVM Image Value	Description
15:0	Target LUN	0x0000	Target LUN.

38.20.12.13VLAN ID (0x017B)

Bits	Field Name	NVM Image Value	Description
15:0	VLAN ID	0x0000	VLAN ID for the Port. Default is 0x0.

38.20.12.14Target Boot Order (0x017C)

Bits	Field Name	NVM Image Value	Description
15:8	Reserved	0x00	Reserved for future use. Should be set to 0x0.
7:0	Target Boot Order	0x00	Target Boot Order. Valid range is 0-4, with 0 meaning no boot order.

38.20.12.15Boot LUN (0x0182)

Bits	Field Name	NVM Image Value	Description
15:0	Target LUN	0x0000	Target LUN.

38.20.12.16VLAN ID (0x0183)

Bits	Field Name	NVM Image Value	Description
15:0	VLAN ID	0x0000	VLAN ID for the Port. Default is 0x0.

38.20.12.17Target Boot Order (0x0184)

Bits	Field Name	NVM Image Value	Description
15:8	Reserved	0x00	Reserved for future use. Should be set to 0x0.
7:0	Target Boot Order	0x00	Target Boot Order. Valid range is 0-4, with 0 meaning no boot order.

38.20.12.18Boot LUN (0x018A)

Bits	Field Name	NVM Image Value	Description
15:0	Target LUN	0x0000	Target LUN.

38.20.12.19VLAN ID (0x018B)

Bits	Field Name	NVM Image Value	Description
15:0	VLAN ID	0x0000	VLAN ID for the Port. Default is 0x0.

38.20.12.20Target Boot Order (0x018C)

Bits	Field Name	NVM Image Value	Description
15:8	Reserved	0x00	Reserved for future use. Should be set to 0x0.
7:0	Target Boot Order	0x00	Target Boot Order. Valid range is 0-4, with 0 meaning no boot order.

38.20.12.21Boot LUN (0x0192)

Bits	Field Name	NVM Image Value	Description
15:0	Target LUN	0x0000	Target LUN.

38.20.12.22VLAN ID (0x0193)

Bits	Field Name	NVM Image Value	Description
15:0	VLAN ID	0x0000	VLAN ID for the Port. Default is 0x0.

38.20.12.23Target Boot Order (0x0194)

Bits	Field Name	NVM Image Value	Description
15:8	Reserved	0x00	Reserved for future use. Should be set to 0x0.
7:0	Target Boot Order	0x00	Target Boot Order. Valid range is 0-4, with 0 meaning no boot order.

38.20.12.24iSCSI Flags (0x01C2)

For detail on the inner structure, see Section 38.20.12.4.

38.20.12.25iSCSI Initiator IP[n] (0x01C3 + 1*n, n=0...1)

For detail on the inner structure, see Section 38.20.12.5.

38.20.12.26Subnet Mask[n] (0x01C5 + 1*n, n=0...1)

For detail on the inner structure, see Section 38.20.12.6.

38.20.12.27Gateway IP[n] (0x01C7 + 1*n, n=0...1)

For detail on the inner structure, see Section 38.20.12.7.

38.20.12.28iSCSI Boot LUN (0x01C9)

For detail on the inner structure, see Section 38.20.12.8.

38.20.12.29iSCSI Target IP[n] (0x01CA + 1*n, n=0...1)

For detail on the inner structure, see Section 38.20.12.9.

38.20.12.30iSCSI Target Port (0x01CC)

For detail on the inner structure, see Section 38.20.12.10.

38.20.12.31VLAN ID (0x0296)

For detail on the inner structure, see Section 38.20.12.11.

38.20.12.32Boot LUN (0x02A8)

For detail on the inner structure, see Section 38.20.12.12.

38.20.12.33VLAN ID (0x02A9)

For detail on the inner structure, see Section 38.20.12.13.

38.20.12.34Target Boot Order (0x02AA)

For detail on the inner structure, see Section 38.20.12.14.

38.20.12.35Boot LUN (0x02B0)

For detail on the inner structure, see Section 38.20.12.15.

38.20.12.36VLAN ID (0x02B1)

For detail on the inner structure, see Section 38.20.12.16.

38.20.12.37Target Boot Order (0x02B2)

For detail on the inner structure, see Section 38.20.12.17.

38.20.12.38Boot LUN (0x02B8)

For detail on the inner structure, see Section 38.20.12.18.

38.20.12.39VLAN ID (0x02B9)

For detail on the inner structure, see Section 38.20.12.19.

38.20.12.40Target Boot Order (0x02BA)

For detail on the inner structure, see Section 38.20.12.20.

38.20.12.41Boot LUN (0x02C0)

For detail on the inner structure, see Section 38.20.12.21.

38.20.12.42VLAN ID (0x02C1)

For detail on the inner structure, see Section 38.20.12.22.

38.20.12.43Target Boot Order (0x02C2)

For detail on the inner structure, see Section 38.20.12.23.

38.20.12.44iSCSI Flags (0x02F0)

For detail on the inner structure, see Section 38.20.12.4.

38.20.12.45iSCSI Initiator IP[n] (0x02F1 + 1*n, n=0...1)

For detail on the inner structure, see Section 38.20.12.5.

38.20.12.46Subnet Mask[n] (0x02F3 + 1*n, n=0...1)

For detail on the inner structure, see Section 38.20.12.6.

38.20.12.47Gateway IP[n] (0x02F5 + 1*n, n=0...1)

For detail on the inner structure, see Section 38.20.12.7.

38.20.12.48iSCSI Boot LUN (0x02F7)

For detail on the inner structure, see Section 38.20.12.8.

38.20.12.49iSCSI Target IP[n] (0x02F8 + 1*n, n=0...1)

For detail on the inner structure, see Section 38.20.12.9.

38.20.12.50iSCSI Target Port (0x02FA)

For detail on the inner structure, see Section 38.20.12.10.

38.20.12.51VLAN ID (0x03C4)

For detail on the inner structure, see Section 38.20.12.11.

38.20.12.52Boot LUN (0x03D6)

For detail on the inner structure, see Section 38.20.12.12.

38.20.12.53VLAN ID (0x03D7)

For detail on the inner structure, see Section 38.20.12.13.

38.20.12.54Target Boot Order (0x03D8)

For detail on the inner structure, see Section 38.20.12.14.

38.20.12.55Boot LUN (0x03DE)

For detail on the inner structure, see Section 38.20.12.15.

38.20.12.56VLAN ID (0x03DF)

For detail on the inner structure, see Section 38.20.12.16.

38.20.12.57Target Boot Order (0x03E0)

For detail on the inner structure, see Section 38.20.12.17.

38.20.12.58Boot LUN (0x03E6)

For detail on the inner structure, see Section 38.20.12.18.

38.20.12.59VLAN ID (0x03E7)

For detail on the inner structure, see Section 38.20.12.19.

38.20.12.60Target Boot Order (0x03E8)

For detail on the inner structure, see Section 38.20.12.20.

38.20.12.61Boot LUN (0x03EE)

For detail on the inner structure, see Section 38.20.12.21.

38.20.12.62VLAN ID (0x03EF)

For detail on the inner structure, see Section 38.20.12.22.

38.20.12.63Target Boot Order (0x03F0)

For detail on the inner structure, see Section 38.20.12.23.

38.20.12.64iSCSI Flags (0x041E)

For detail on the inner structure, see Section 38.20.12.4.

38.20.12.65iSCSI Initiator IP[n] (0x041F + 1*n, n=0...1)

For detail on the inner structure, see Section 38.20.12.5.

38.20.12.66Subnet Mask[n] (0x0421 + 1*n, n=0...1)

For detail on the inner structure, see Section 38.20.12.6.

38.20.12.67Gateway IP[n] (0x0423 + 1*n, n=0...1)

For detail on the inner structure, see Section 38.20.12.7.

38.20.12.68iSCSI Boot LUN (0x0425)

For detail on the inner structure, see Section 38.20.12.8.

38.20.12.69iSCSI Target IP[n] (0x0426 + 1*n, n=0...1)

For detail on the inner structure, see Section 38.20.12.9.

38.20.12.70iSCSI Target Port (0x0428)

For detail on the inner structure, see Section 38.20.12.10.

38.20.12.71VLAN ID (0x04F2)

For detail on the inner structure, see Section 38.20.12.11.

38.20.12.72Boot LUN (0x0504)

For detail on the inner structure, see Section 38.20.12.12.

38.20.12.73VLAN ID (0x0505)

For detail on the inner structure, see Section 38.20.12.13.

38.20.12.74Target Boot Order (0x0506)

For detail on the inner structure, see Section 38.20.12.14.

38.20.12.75Boot LUN (0x050C)

For detail on the inner structure, see Section 38.20.12.15.

38.20.12.76VLAN ID (0x050D)

For detail on the inner structure, see Section 38.20.12.16.

38.20.12.77Target Boot Order (0x050E)

For detail on the inner structure, see Section 38.20.12.17.

38.20.12.78Boot LUN (0x0514)

For detail on the inner structure, see Section 38.20.12.18.

38.20.12.79VLAN ID (0x0515)

For detail on the inner structure, see Section 38.20.12.19.

38.20.12.80Target Boot Order (0x0516)

For detail on the inner structure, see Section 38.20.12.20.

38.20.12.81Boot LUN (0x051C)

For detail on the inner structure, see Section 38.20.12.21.

38.20.12.82VLAN ID (0x051D)

For detail on the inner structure, see Section 38.20.12.22.

38.20.12.83Target Boot Order (0x051E)

For detail on the inner structure, see Section 38.20.12.23.

38.20.13 VLAN Configuration Block Section Summary Table

Word Offset	Description	Page
0x0000	Section Header	2545
0x0001	VLAN Block Signature	2545
0x0002	Structure Version and Size	2546
0x0003	Port 0 VLAN Tag	2546
0x0004	Port 1 VLAN Tag	2546
0x0005	Port 2 VLAN Tag	2546
0x0006	Port 3 VLAN Tag	2546

38.20.13.1 Section Header (0x0000)

Bits	Field Name	NVM Image Value	Description
15:0	Block Length		Length in: 2-bytes unit - 1. First Section -> Word: VLAN Configuration Block -> Section Header Last Section -> Word: VLAN Configuration Block -> Port 3 VLAN tag Section length in words.

38.20.13.2 VLAN Block Signature (0x0001)

Bits	Field Name	NVM Image Value	Description
15:0	VLAN Block Signature	0x4C56	'V' =0x56, 'L' = 0x4C.

38.20.13.3 Structure Version and Size (0x0002)

Bits	Field Name	NVM Image Value	Description
15:8	Structure Version and Size	0x0C	Total byte size of the configuration block. 0x06 = 1-port adapter. 0x08 = 2-port adapter. 0x0C = 4-port adapter default value). All other values are reserved.
7:0	Structure Version	0x01	The version of this structure. Should be set to 0x01.

38.20.13.4 Port 0 VLAN Tag (0x0003)

Bits	Field Name	NVM Image Value	Description
15:13	VLAN Priority	000b	The value of VLAN priority (0-7).
12	Reserved	0b	Reserved. Must be set to 0b.
11:0	VLAN Tag ID	0x000	The value of VLAN ID (1-4095). 0 means no VLAN configured for port.

38.20.13.5 Port 1 VLAN Tag (0x0004)

For detail on the inner structure, see Section 38.20.13.4.

38.20.13.6 Port 2 VLAN Tag (0x0005)

For detail on the inner structure, see Section 38.20.13.4.

38.20.13.7 Port 3 VLAN Tag (0x0006)

For detail on the inner structure, see Section 38.20.13.4.

38.20.14 POR Registers Auto-load Module Section Summary Table

Default setup to registers that load on POR events.

Word Offset	Description	Page
0x0000	Module Length	2547
0x0001 - 0x003F	NVM Contents for GLGEN_GPIO_CTL	2547
0x0040 - 0x0041	NVM Contents for GLGEN_LED_CTL	2548
0x0042 - 0x004C	NVM Contents for GLGEN_I2CPARAMS	2548
0x004D - 0x0057	NVM Contents for GLGEN_MDIO_I2C_SEL	2548
0x0058 - 0x005F	NVM Contents for GLGEN_MDIO_CTRL	2549
0x0060 - 0x0063	NVM Contents for GL_MNG_HWARB_CTRL	2549
0x0064 - 0x0086	NVM Contents for PFGEN_PORTNUM_CAR	2549
0x0087 - 0x00A9	NVM contents for PFPM_APM	2550
0x00AA - 0x00B4	NVM Contents for PRTGEN_CNF	2551
0x00B5 - 0x00BF	NVM Contents for PRTPM_GC	2551
0x00C0 - 0x00CA	NVM Contents for PRTGEN_CNF2	2552
0x00CB - 00CE	NVM Contents for GLGEN_CLKSTAT	2553

Word Offset	Description	Page
0x00D7 - 00F9	NVM Contents for PFPCI_FUNC	2553
0x00FA - 00FD	NVM Contents for GLPCI_CNF	2554

38.20.14.1 Module Length (0x0000)

Bits	Field Name	NVM Image Value	Description
15:0	Module Length		Length in: 2-bytes unit - 1. First Section -> Word: POR Registers Auto-Load Module -> Module Length Last Section -> Word: POR Registers Auto-Load Module -> Starting Address Low at TAR_ACC_APRVD_SAI_LIST[0]

38.20.14.2 GLGEN_GPIO_CTL (0x0001 - 0x003F)

38.20.14.2.1 Starting Address Low at GLGEN_GPIO_CTL[n] (0x0001)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLGEN_GPIO_CTL	0x100	
3:0	Type	0x2	

38.20.14.2.2 Starting Address High at GLGEN_GPIO_CTL[n] (0x0002)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLGEN_GPIO_CTL	0x0088	

38.20.14.2.3 Attributes at GLGEN_GPIO_CTL[n] (0x0003)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x01F	
4:3	Skip	00b	
2:0	Width	000b	

38.20.14.2.4 Data Low of GLGEN_GPIO_CTL[n] (0x0004 + 2*n, n=0...29)

38.20.14.2.5 Data High of GLGEN_GPIO_CTL[n] (0x0005 + 2*n, n=0...29)

38.20.14.3 GLGEN_LED_CTL (0x0040 - 0x0041)

38.20.14.3.1 Data Low of GLGEN_LED_CTL (0x0040)

38.20.14.3.2 Data High of GLGEN_LED_CTL (0x0041)

38.20.14.4 GLGEN_I2CPARAMS (0x0042 - 0x004C)

38.20.14.4.1 Starting Address Low at GLGEN_I2CPARAMS[n] (0x0042)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLGEN_I2CPARAMS	0x1AC	
3:0	Type	0x2	

38.20.14.4.2 Starting Address High at GLGEN_I2CPARAMS[n] (0x0043)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLGEN_I2CPARAMS	0x0088	

38.20.14.4.3 Attributes at GLGEN_I2CPARAMS[n] (0x0044)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x004	
4:3	Skip	00b	
2:0	Width	000b	

38.20.14.4.4 Data Low of GLGEN_I2CPARAMS[n] (0x0045 + 2*n, n=0...3)

38.20.14.4.5 Data High of GLGEN_I2CPARAMS[n] (0x0046 + 2*n, n=0...3)

38.20.14.5 GLGEN_MDIO_I2C_SEL (0x004D - 0x0057)

38.20.14.5.1 Starting Address Low at GLGEN_MDIO_I2C_SEL[n] (0x004D)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLGEN_MDIO_I2C_SEL	0x1C0	
3:0	Type	0x2	

38.20.14.5.2 Starting Address High at GLGEN_MDIO_I2C_SEL[n] (0x004E)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLGEN_MDIO_I2C_SEL	0x0088	

38.20.14.5.3 Attributes at GLGEN_MDIO_I2C_SEL[n] (0x004F)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x008	
4:3	Skip	00b	
2:0	Width	000b	

38.20.14.5.4 Data Low of GLGEN_MDIO_I2C_SEL[n] (0x0050 + 2*n, n=0...3)

38.20.14.5.5 Data High of GLGEN_MDIO_I2C_SEL[n] (0x0051 + 2*n, n=0...3)

38.20.14.6 GLGEN_MDIO_CTRL (0x0058 - 0x005F)

38.20.14.6.1 Data Low of GLGEN_MDIO_CTRL[n] (0x0058 + 2*n, n=0...3)

38.20.14.6.2 Data High of GLGEN_MDIO_CTRL[n] (0x0059 + 2*n, n=0...3)

38.20.14.7 GL_MNG_HWARB_CTRL (0x0060 - 0x0063)

38.20.14.7.1 Address Low at GL_MNG_HWARB_CTRL (0x0060)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GL_MNG_HWARB_CTRL	0x130	
3:0	Type	0x1	

38.20.14.7.2 Address High at GL_MNG_HWARB_CTRL (0x0061)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GL_MNG_HWARB_CTRL	0x00B6	

38.20.14.7.3 Data Low of GL_MNG_HWARB_CTRL (0x0062)

38.20.14.7.4 Data High of GL_MNG_HWARB_CTRL (0x0063)

38.20.14.8 PFGEN_PORTNUM_CAR (0x0064 - 0x0086)

38.20.14.8.1 Starting Address Low at PFGEN_PORTNUM_CAR[PF] (0x0064 + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PFGEN_PORTNUM_CAR, for PF[0]	0x000	

Bits	Field Name	NVM Image Value	Description
3:0	Type	0x2	

38.20.14.8.2 Starting Address High at PFGEN_PORTNUM_CAR[PF] (0x0065 + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PFGEN_PORTNUM_CAR, for PF[0]	0x00B8	

38.20.14.8.3 Attributes at PFGEN_PORTNUM_CAR[PF] (0x0066 + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x010	
4:3	Skip	00b	
2:0	Width	000b	

38.20.14.8.4 Data Low of PFGEN_PORTNUM_CAR[PF] (0x0067 + 2*PF, PF=0...15)

38.20.14.8.5 Data High of PFGEN_PORTNUM_CAR[PF] (0x0068 + 2*PF, PF=0...15)

38.20.14.9 PFPM_APM (0x0087 - 0x00A9)

38.20.14.9.1 Starting Address Low at PFPM_APM[PF] (0x0087 + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PFPM_APM, for PF[0]	0x080	
3:0	Type	0x2	

38.20.14.9.2 Starting Address High at PFPM_APM[PF] (0x0088 + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PFPM_APM, for PF[0]	0x00B8	

38.20.14.9.3 Attributes at PFPM_APM[PF] (0x0089 + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x010	
4:3	Skip	00b	
2:0	Width	000b	

38.20.14.9.4 Data Low of PFPM_APM[PF] (0x008A + 2*PF, PF=0...15)

38.20.14.9.5 Data High of PFPM_APM[PF] (0x008B + 2*PF, PF=0...15)

38.20.14.10 PRTGEN_CNF (0x00AA - 0x00B4)

38.20.14.10.1 Starting Address Low at PRTGEN_CNF[PRT] (0x00AA + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTGEN_CNF, for PRT[0]	0x120	
3:0	Type	0x2	

38.20.14.10.2 Starting Address High at PRTGEN_CNF[PRT] (0x00AB + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTGEN_CNF, for PRT[0]	0x00B8	

38.20.14.10.3 Attributes at PRTGEN_CNF[PRT] (0x00AC + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x004	
4:3	Skip	00b	
2:0	Width	000b	

38.20.14.10.4 Data Low of PRTGEN_CNF[PRT] (0x00AD + 2*PRT, PRT=0...3)

38.20.14.10.5 Data High of PRTGEN_CNF[PRT] (0x00AE + 2*PRT, PRT=0...3)

38.20.14.11 PRTPM_GC (0x00B5 - 0x00BF)

38.20.14.11.1 Starting Address Low at PRTPM_GC[PRT] (0x00B5 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTPM_GC, for PRT[0]	0x140	
3:0	Type	0x2	

38.20.14.11.2 Starting Address High at PRTPM_GC[PRT] (0x00B6 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTPM_GC, for PRT[0]	0x00B8	

38.20.14.11.3Attributes at PRTPM_GC[PRT] (0x00B7 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x004	
4:3	Skip	00b	
2:0	Width	000b	

38.20.14.11.4Data Low of PRTPM_GC[PRT] (0x00B8 + 2*PRT, PRT=0...3)

38.20.14.11.5Data High of PRTPM_GC[PRT] (0x00B9 + 2*PRT, PRT=0...3)

38.20.14.12PRTGEN_CNF2 (0x00C0 - 0x00CA)

38.20.14.12.1Starting Address Low at PRTGEN_CNF2[PRT] (0x00C0 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTGEN_CNF2, for PRT[0]	0x160	
3:0	Type	0x2	

38.20.14.12.2Starting Address High at PRTGEN_CNF2[PRT] (0x00C1 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTGEN_CNF2, for PRT[0]	0x00B8	

38.20.14.12.3Attributes at PRTGEN_CNF2[PRT] (0x00C2 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x004	
4:3	Skip	00b	
2:0	Width	000b	

38.20.14.12.4Data Low of PRTGEN_CNF2[PRT] (0x00C3 + 2*PRT, PRT=0...3)

38.20.14.12.5Data High of PRTGEN_CNF2[PRT] (0x00C4 + 2*PRT, PRT=0...3)

38.20.14.13GLGEN_CLKSTAT (0x00CB - 00CE)

38.20.14.13.1Address Low at GLGEN_CLKSTAT (0x00CB)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLGEN_CLKSTAT	0xB8184	
3:0	Type	0x1	

38.20.14.13.2Address High at GLGEN_CLKSTAT (0x00CC)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLGEN_CLKSTAT		

38.20.14.13.3Data Low of GLGEN_CLKSTAT (0x00CD)

38.20.14.13.4Data High of GLGEN_CLKSTAT (0x00CE)

38.20.14.14PFPCI_FUNC (0x00D7 - 00F9)

38.20.14.14.1Starting Address Low at PFPCI_FUNC[PF] (0x00D7 + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PFPCI_FUNC, for PF[0]	0xBE200	
3:0	Type	0x2	

38.20.14.14.2Starting Address High at PFPCI_FUNC[PF] (0x00D8 + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PFPCI_FUNC, for PF[0]		

38.20.14.14.3Attributes at PFPCI_FUNC[PF] (0x00D9 + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x10	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.14.14.4Data Low of PFPCI_FUNC[PF] (0x00DA + 2*PF, PF=0...15)

38.20.14.14.5Data High of PFPCI_FUNC[PF] (0x00DB + 2*PF, PF=0...15)

38.20.14.15GLPCI_CNF (0x00FA - 00FD)

38.20.14.15.1Address Low at GLPCI_CNF (0x00FA)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLPCI_CNF	0xBE4C0	
3:0	Type	0x1	

38.20.14.15.2Address High at GLPCI_CNF (0x00FB)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLPCI_CNF		

38.20.14.15.3Data Low of GLPCI_CNF (0x00FC)

38.20.14.15.4Data High of GLPCI_CNF (0x00FD)

38.20.15 CORER Registers Auto-load Module Section Summary Table

Default setup to registers and internal memories that load on CORER events.

Word Offset	Description	Reference
0x0000	Module Length	2555
0x0001 - 0023	NVM contents for PFGEN_PORTMDIO_NUM	2556
0x002C - 0036	NVM contents for PRTDCB_TDPUC	2556
0x0037 - 0049	NVM contents for GL_SWT_L2TAGTXIB	2557
0x004A - 004B	NVM contents for GLLAN_TSOMSK_F	2557
0x004C - 004D	NVM contents for GLLAN_TSOMSK_M	2557
0x004E - 004F	NVM contents for GLLAN_TSOMSK_L	2557
0x0050 - 0054	NVM contents for GLLAN_TCTL_1	2557
0x0055 - 0056	NVM contents for GL_MDCK_TDAT	2558
0x0057 - 0069	NVM contents for GL_SWT_L2TAGRXEB	2558
0x006E - 0090	NVM contents for PFPM_WUC	2559
0x0091 - 009B	NVM contents for PRTDCB_GENC	2559
0x009C - 009F	NVM contents for GLDCB_GENC	2560
0x00A0 - 00AA	NVM contents for PRTDCB_TFLLPC	2560
0x00AB - 00B5	NVM contents for PRTDCB_TDPMC	2560
0x00B6 - 00C0	NVM contents for PRTDCB_TFPFCC	2561
0x00C5 - 00CF	NVM contents for PRTDCB_TCPMC	2562
0x00D0 - 00DA	NVM contents for PRTDCB_TCPFCPC	2562
0x00DB - 00E5	NVM contents for PRTDCB_TCPFCTCC	2563
0x00EE - 00F8	NVM contents for PRTRPB_SLW	2563
0x00F9 - 0103	NVM contents for PRTRPB_SPS	2564

Word Offset	Description	Reference
0x0104 - 0108	NVM contents for GLRPB_PHW	2564
0x0109 - 010A	NVM contents for GLRPB_PLW	2565
0x010B - 0115	NVM contents for PRTDCB_TCLLPC	2565
0x0122 - 0126	NVM contents for GLSCD_CREDITSPERQUANTA	2566
0x012F - 0151	NVM contents for GLHMC_SDPART	2566
0x0152 - 0174	NVM contents for GLHMC_PFPESDPART	2567
0x0179 - 017C	NVM contents for GLHMC_PEPFFIRSTSD	2567
0x017D - 0181	NVM contents for GLLAN_TCTL_0	2568
0x0182 - 0183	NVM contents for GL_MDCK_TCMD	2568
0x0184 - 0188	NVM contents for GLTLAN_MAX_TCBCMD	2568
0x0195 - 01EC	NVM contents for PRTDCB_RETSTCC	2569

0x01F8 - 0202	NVM contents for PRTDCB_RETSC	2570
0x0203 - 0207	NVM contents for GLDCB_RSPMC	2571
0x020E - 0212	NVM contents for GLLAN_RCTL_1	2571
0x0215 - 0237	NVM contents for GLLAN_PF_RECIPE	2572
0x0238 - 025A	NVM contents for PFLAN_QALLOC	2572
0x025B - 027D	NVM contents for PFGEN_PORTNUM	2573
0x027E - 02A0	NVM contents for PF_VT_PFALLOC	2573
0x02A5 - 02C7	NVM contents for GLANL_L2ULP	2574
0x02DA - 02E4	NVM contents for PRT_L2TAGSEN	2574
0x02E5 - 0307	NVM contents for PFQF_FDALLOC	2575
0x0308 - 0312	NVM contents for PRT_SWT_SCBI	2575
0x0313 - 031D	NVM contents for PRTQF_CTL_0	2576
0x032E - 0331	NVM contents for GLQF_CTL	2577
0x034A - 0354	NVM contents for PRT_SWR_PM_THR	2577
0x0355 - 0358	NVM contents for GLQF_FDEVICTFLAG	2578

38.20.15.1 Module Length (0x0000)

Bits	Field Name	NVM Image Value	Description
15:0	Module Length		Length in: 2 Bytes unit - 1 First Section -> Word: CORER Registers Auto-load Module -> Module Length Last Section -> Word: CORER Registers Auto-load Module -> ANA_MERGE Data

38.20.15.2 PFGEN_PORTMDIO_NUM (0x0001 - 0023)

38.20.15.2.1 Starting Address Low at PFGEN_PORTMDIO_NUM[PF] (0x0001 + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PFGEN_PORTMDIO_NUM, for PF[0]	0x3F100	
3:0	Type	0x2	

38.20.15.2.2 Starting Address High at PFGEN_PORTMDIO_NUM[PF] (0x0002 + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PFGEN_PORTMDIO_NUM, for PF[0]		

38.20.15.2.3 Attributes at PFGEN_PORTMDIO_NUM[PF] (0x0003 + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x10	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.2.4 Data Low of PFGEN_PORTMDIO_NUM[PF] (0x0004 + 2*PF, PF=0...15)

38.20.15.2.5 Data High of PFGEN_PORTMDIO_NUM[PF] (0x0005 + 2*PF, PF=0...15)

38.20.15.3 PRTDCB_TDPUC (0x002C - 0036)

38.20.15.3.1 Starting Address Low at PRTDCB_TDPUC[PRT] (0x002C + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTDCB_TDPUC, for PRT[0]	0x44100	
3:0	Type	0x2	

38.20.15.3.2 Starting Address High at PRTDCB_TDPUC[PRT] (0x002D + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTDCB_TDPUC, for PRT[0]		

38.20.15.3.3 Attributes at PRTDCB_TDPUC[PRT] (0x002E + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x4	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.4 GL_SWT_L2TAGTXIB (0x0037 - 0049)

38.20.15.4.1 Starting Address Low at GL_SWT_L2TAGTXIB[n] (0x0037)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GL_SWT_L2TAGTXIB	0x442B8	
3:0	Type	0x2	

38.20.15.4.2 Starting Address High at GL_SWT_L2TAGTXIB[n] (0x0038)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GL_SWT_L2TAGTXIB		

38.20.15.4.3 Attributes at GL_SWT_L2TAGTXIB[n] (0x0039)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0xB	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.5 GLLAN_TSOMSK_F (0x004A - 004B)

38.20.15.5.1 Data Low of GLLAN_TSOMSK_F (0x004A)

38.20.15.5.2 Data High of GLLAN_TSOMSK_F (0x004B)

38.20.15.6 GLLAN_TSOMSK_M (0x004C - 004D)

38.20.15.6.1 Data Low of GLLAN_TSOMSK_M - 0x004C

38.20.15.6.2 Data High of GLLAN_TSOMSK_M - 0x004D

38.20.15.7 GLLAN_TSOMSK_L (0x004E - 004F)

38.20.15.7.1 Data Low of GLLAN_TSOMSK_L (0x004E)

38.20.15.7.2 Data High of GLLAN_TSOMSK_L (0x004F)

38.20.15.8 GLLAN_TCTL_1 (0x0050 - 0054)

38.20.15.8.1 Starting Address Low at GLLAN_TCTL_1 (0x0050)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLLAN_TCTL_1	0x442F0	
3:0	Type	0x2	

38.20.15.8.2 Starting Address High at GLLAN_TCTL_1 (0x0051)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLLAN_TCTL_1		

38.20.15.8.3 Attributes at GLLAN_TCTL_1 (0x0052)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x2	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.9 GL_MDCK_TDAT - (0x0055 - 0056)

38.20.15.9.1 Data Low of GL_MDCK_TDAT - 0x0055

38.20.15.9.2 Data High of GL_MDCK_TDAT - 0x0056

38.20.15.10 GL_SWT_L2TAGRXEB (0x0057 - 0069)

38.20.15.10.1 Starting Address Low at GL_SWT_L2TAGRXEB[n] (0x0057)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GL_SWT_L2TAGRXEB	0x51000	
3:0	Type	0x2	

38.20.15.10.2 Starting Address High at GL_SWT_L2TAGRXEB[n] (0x0058)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GL_SWT_L2TAGRXEB		

38.20.15.10.3 Attributes at GL_SWT_L2TAGRXEB[n] (0x0059)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x8	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.11PFPM_WUC (0x006E - 0090)

38.20.15.11.1Starting Address Low at PFPM_WUC[PF] (0x006E + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PFPM_WUC, for PF[0]	0x6B200	
3:0	Type	0x2	

38.20.15.11.2Starting Address High at PFPM_WUC[PF] (0x006F + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PFPM_WUC, for PF[0]		

38.20.15.11.3Attributes at PFPM_WUC[PF] (0x0070 + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x10	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.11.4Data Low of PFPM_WUC[PF] (0x0071 + 2*PF, PF=0...15)

38.20.15.11.5Data High of PFPM_WUC[PF] (0x0072 + 2*PF, PF=0...15)

38.20.15.12PRTDCB_GENC (0x0091 - 009B)

38.20.15.12.1Starting Address Low at PRTDCB_GENC[PRT] (0x0091 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTDCB_GENC, for PRT[0]	0x83000	
3:0	Type	0x2	

38.20.15.12.2Starting Address High at PRTDCB_GENC[PRT] (0x0092 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTDCB_GENC, for PRT[0]		

38.20.15.12.3Attributes at PRTDCB_GENC[PRT] (0x0093 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x4	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.12.4Data Low of PRTDCB_GENC[PRT] (0x0094 + 2*PRT, PRT=0...3)

38.20.15.12.5Data High of PRTDCB_GENC[PRT] (0x0095 + 2*PRT, PRT=0...3)

38.20.15.13GLDCB_GENC (0x009C - 009F)

38.20.15.13.1Address Low at GLDCB_GENC (0x009C)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLDCB_GENC	0x83044	
3:0	Type	0x1	

38.20.15.13.2Address High at GLDCB_GENC (0x009D)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLDCB_GENC		

38.20.15.13.3Data Low of GLDCB_GENC (0x009E)

38.20.15.13.4Data High of GLDCB_GENC (0x009F)

38.20.15.14PRTDCB_TFLLPC (0x00A0 - 00AA)

38.20.15.14.1Starting Address Low at PRTDCB_TFLLPC[PRT] (0x00A0 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTDCB_TFLLPC, for PRT[0]	0x98000	
3:0	Type	0x2	

38.20.15.14.2Starting Address High at PRTDCB_TFLLPC[PRT] (0x00A1 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTDCB_TFLLPC, for PRT[0]		

38.20.15.14.3Attributes at PRTDCB_TFLLPC[PRT] (0x00A2 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x4	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.15PRTDCB_TDPMC (0x00AB - 00B5)

38.20.15.15.1Starting Address Low at PRTDCB_TDPMC[PRT] (0x00AB + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTDCB_TDPMC, for PRT[0]	0xA0180	
3:0	Type	0x2	

38.20.15.15.2Starting Address High at PRTDCB_TDPMC[PRT] (0x00AC + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTDCB_TDPMC, for PRT[0]		

38.20.15.15.3Attributes at PRTDCB_TDPMC[PRT] (0x00AD + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x4	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.15.4Data Low of PRTDCB_TDPMC[PRT] (0x00AE + 2*PRT, PRT=0...3)

38.20.15.15.5Data High of PRTDCB_TDPMC[PRT] (0x00AF + 2*PRT, PRT=0...3)

38.20.15.16PRTDCB_TFPFCC (0x00B6 - 00C0)

38.20.15.16.1Starting Address Low at PRTDCB_TFPFCC[PRT] (0x00B6 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTDCB_TFPFCC, for PRT[0]	0xA01A0	
3:0	Type	0x2	

38.20.15.16.2Starting Address High at PRTDCB_TFPFCC[PRT] (0x00B7 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTDCB_TFPFCC, for PRT[0]		

38.20.15.16.3Attributes at PRTDCB_TFPFCC[PRT] (0x00B8 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x4	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.17PRTDCB_TCPMC (0x00C5 - 00CF)

38.20.15.17.1Starting Address Low at PRTDCB_TCPMC[PRT] (0x00C5 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTDCB_TCPMC, for PRT[0]	0xA21A0	
3:0	Type	0x2	

38.20.15.17.2Starting Address High at PRTDCB_TCPMC[PRT] (0x00C6 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTDCB_TCPMC, for PRT[0]		

38.20.15.17.3Attributes at PRTDCB_TCPMC[PRT] (0x00C7 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x4	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.17.4Data Low of PRTDCB_TCPMC[PRT] (0x00C8 + 2*PRT, PRT=0...3)

38.20.15.17.5Data High of PRTDCB_TCPMC[PRT] (0x00C9 + 2*PRT, PRT=0...3)

38.20.15.18PRTDCB_TCPFCPC (0x00D0 - 00DA)

38.20.15.18.1Starting Address Low at PRTDCB_TCPFCPC[PRT] (0x00D0 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTDCB_TCPFCPC, for PRT[0]	0xA21C0	
3:0	Type	0x2	

38.20.15.18.2Starting Address High at PRTDCB_TCPFCPC[PRT] (0x00D1 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTDCB_TCPFCPC, for PRT[0]		

38.20.15.18.3Attributes at PRTDCB_TCPFCPC[PRT] (0x00D2 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x4	
4:3	Skip	0x0	

Bits	Field Name	NVM Image Value	Description
2:0	Width	0x0	

38.20.15.19PRTDCB_TCPFCTCC (0x00DB - 00E5)

38.20.15.19.1Starting Address Low at PRTDCB_TCPFCTCC[PRT] (0x00DB + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTDCB_TCPFCTCC, for PRT[0]	0xA21E0	
3:0	Type	0x2	

38.20.15.19.2Starting Address High at PRTDCB_TCPFCTCC[PRT] (0x00DC + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTDCB_TCPFCTCC, for PRT[0]		

38.20.15.19.3Attributes at PRTDCB_TCPFCTCC[PRT] (0x00DD + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x4	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.20PRTRPB_SLW (0x00EE - 00F8)

38.20.15.20.1Starting Address Low at PRTRPB_SLW[PRT] (0x00EE + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTRPB_SLW, for PRT[0]	0xAC6A0	
3:0	Type	0x2	

38.20.15.20.2Starting Address High at PRTRPB_SLW[PRT] (0x00EF + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTRPB_SLW, for PRT[0]		

38.20.15.20.3Attributes at PRTRPB_SLW[PRT] (0x00F0 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x4	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.20.4Data Low of PRTRPB_SLW[PRT] (0x00F1 + 2*PRT, PRT=0...3)

38.20.15.20.5Data High of PRTRPB_SLW[PRT] (0x00F2 + 2*PRT, PRT=0...3)

38.20.15.21PRTRPB_SPS (0x00F9 - 0103)

38.20.15.21.1Starting Address Low at PRTRPB_SPS[PRT] (0x00F9 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTRPB_SPS, for PRT[0]	0xAC7C0	
3:0	Type	0x2	

38.20.15.21.2Starting Address High at PRTRPB_SPS[PRT] (0x00FA + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTRPB_SPS, for PRT[0]		

38.20.15.21.3Attributes at PRTRPB_SPS[PRT] (0x00FB + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x4	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.21.4Data Low of PRTRPB_SPS[PRT] (0x00FC + 2*PRT, PRT=0...3)

38.20.15.21.5Data High of PRTRPB_SPS[PRT] (0x00FD + 2*PRT, PRT=0...3)

38.20.15.22GLRPB_PHW (0x0104 - 0108)

38.20.15.22.1Starting Address Low at GLRPB_PHW (0x0104)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLRPB_PHW	0xAC844	
3:0	Type	0x2	

38.20.15.22.2Starting Address High at GLRPB_PHW (0x0105)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLRPB_PHW		

38.20.15.22.3Attributes at GLRPB_PHW (0x0106)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x2	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.22.4Data Low of GLRPB_PHW (0x0107)

38.20.15.22.5Data High of GLRPB_PHW (0x0108)

38.20.15.23GLRPB_PLW (0x0109 - 010A)

38.20.15.23.1Data Low of GLRPB_PLW - 0x0109

38.20.15.23.2Data High of GLRPB_PLW - 0x010A

38.20.15.24PRTDCB_TCLLPC (0x010B - 0115)

38.20.15.24.1Starting Address Low at PRTDCB_TCLLPC[PRT] (0x010B + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTDCB_TCLLPC, for PRT[0]	0xAE000	
3:0	Type	0x2	

38.20.15.24.2Starting Address High at PRTDCB_TCLLPC[PRT] (0x010C + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTDCB_TCLLPC, for PRT[0]		

38.20.15.24.3Attributes at PRTDCB_TCLLPC[PRT] (0x010D + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x4	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.25GLSCD_CREDITSPERQUANTA (0x0122 - 0126)

38.20.15.25.1Starting Address Low at GLSCD_CREDITSPERQUANTA (0x0122)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLSCD_CREDITSPERQUANTA	0xB2144	
3:0	Type	0x2	

38.20.15.25.2Starting Address High at GLSCD_CREDITSPERQUANTA (0x0123)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLSCD_CREDITSPERQUANTA		

38.20.15.25.3Attributes at GLSCD_CREDITSPERQUANTA (0x0124)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x3	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.26GLHMC_SDPART (0x012F - 0151)

38.20.15.26.1Starting Address Low at GLHMC_SDPART[n] (0x012F)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLHMC_SDPART	0xC0800	
3:0	Type	0x2	

38.20.15.26.2Starting Address High at GLHMC_SDPART[n] (0x0130)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLHMC_SDPART		

38.20.15.26.3Attributes at GLHMC_SDPART[n] (0x0131)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x10	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.26.4Data Low of GLHMC_SDPART[n] (0x0132 + 2*n, n=0...15)

38.20.15.26.5Data High of GLHMC_SDPART[n] (0x0133 + 2*n, n=0...15)

38.20.15.27GLHMC_PFPESDPART (0x0152 - 0174)

38.20.15.27.1Starting Address Low at GLHMC_PFPESDPART[n] (0x0152)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLHMC_PFPESDPART	0xC0880	
3:0	Type	0x2	

38.20.15.27.2Starting Address High at GLHMC_PFPESDPART[n] (0x0153)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLHMC_PFPESDPART		

38.20.15.27.3Attributes at GLHMC_PFPESDPART[n] (0x0154)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x10	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.27.4Data Low of GLHMC_PFPESDPART[n] (0x0155 + 2*n, n=0...15)

38.20.15.27.5Data High of GLHMC_PFPESDPART[n] (0x0156 + 2*n, n=0...15)

38.20.15.28GLHMC_PEPFFIRSTSD (0x0179 - 017C)

38.20.15.28.1Address Low at GLHMC_PEPFFIRSTSD (0x0179)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLHMC_PEPFFIRSTSD	0xC20E4	
3:0	Type	0x1	

38.20.15.28.2Address High at GLHMC_PEPFFIRSTSD (0x017A)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLHMC_PEPFFIRSTSD		

38.20.15.28.3Data Low of GLHMC_PEPFFIRSTSD (0x017B)

38.20.15.28.4Data High of GLHMC_PEPFFIRSTSD (0x017C)

38.20.15.29GLLAN_TCTL_0 (0x017D - 0181)

38.20.15.29.1Starting Address Low at GLLAN_TCTL_0 (0x017D)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLLAN_TCTL_0	0xE6488	
3:0	Type	0x2	

38.20.15.29.2Starting Address High at GLLAN_TCTL_0 (0x017E)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLLAN_TCTL_0		

38.20.15.29.3Attributes at GLLAN_TCTL_0 (0x017F)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x2	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.30GL_MDCK_TCMD - (0x0182 - 0183)

38.20.15.30.1Data Low of GL_MDCK_TCMD - 0x0182

38.20.15.30.2Data High of GL_MDCK_TCMD - 0x0183

38.20.15.31GLTLAN_MAX_TCBCMD (0x0184 - 0188)

38.20.15.31.1Starting Address Low at GLTLAN_MAX_TCBCMD (0x0184)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLTLAN_MAX_TCBCMD	0xE64D4	
3:0	Type	0x2	

38.20.15.31.2Starting Address High at GLTLAN_MAX_TCBCMD (0x0185)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLTLAN_MAX_TCBCMD		

38.20.15.31.3Attributes at GLTLAN_MAX_TCBCMD (0x0186)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x3	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.32PRTDCB_RETSTCC (0x0195 - 01EC)

38.20.15.32.1Starting Address Low at PRTDCB_RETSTCC[n,PRT] (0x0195 + 11*n, n=0...7)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTDCB_RETSTCC, for PRT[0]	0x122180	
3:0	Type	0x2	

38.20.15.32.2Starting Address High at PRTDCB_RETSTCC[n,PRT] (0x0196 + 11*n, n=0...7)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTDCB_RETSTCC, for PRT[0]		

38.20.15.32.3Attributes at PRTDCB_RETSTCC[n,PRT] (0x0197 + 11*n, n=0...7)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x4	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.32.4Data Low of PRTDCB_RETSTCC[n,PRT] (0x0198 + 11*n + 2*PRT, n=0...7, PRT=0...3)

38.20.15.32.5Data High of PRTDCB_RETSTCC[n,PRT] (0x0199 + 11*n + 2*PRT, n=0...7, PRT=0...3)

38.20.15.33PRTDCB_RPPMC (0x01ED - 01F7)

38.20.15.33.1Starting Address Low at PRTDCB_RPPMC[PRT] (0x01ED + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTDCB_RPPMC, for PRT[0]	0x1223A0	
3:0	Type	0x2	

38.20.15.33.2Starting Address High at PRTDCB_RPPMC[PRT] (0x01EE + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTDCB_RPPMC, for PRT[0]		

38.20.15.33.3Attributes at PRTDCB_RPPMC[PRT] (0x01EF + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x4	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.33.4Data High of PRTDCB_RPPMC[PRT] (0x01F1 + 2*PRT, PRT=0...3)

38.20.15.34PRTDCB_RETSC (0x01F8 - 0202)

38.20.15.34.1Starting Address Low at PRTDCB_RETSC[PRT] (0x01F8 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTDCB_RETSC, for PRT[0]	0x1223E0	
3:0	Type	0x2	

38.20.15.34.2Starting Address High at PRTDCB_RETSC[PRT] (0x01F9 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTDCB_RETSC, for PRT[0]		

38.20.15.34.3Attributes at PRTDCB_RETSC[PRT] (0x01FA + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x4	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.34.4Data Low of PRTDCB_RETSC[PRT] (0x01FB + 2*PRT, PRT=0...3)

38.20.15.34.5Data High of PRTDCB_RETSC[PRT] (0x01FC + 2*PRT, PRT=0...3)

38.20.15.35GLDCB_RSPMC (0x0203 - 0207)

38.20.15.35.1Starting Address Low at GLDCB_RSPMC (0x0203)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLDCB_RSPMC	0x122604	
3:0	Type	0x2	

38.20.15.35.2Starting Address High at GLDCB_RSPMC (0x0204)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLDCB_RSPMC		

38.20.15.35.3Attributes at GLDCB_RSPMC (0x0205)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x4	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.36GLLAN_RCTL_1 (0x020E - 0212)

38.20.15.36.1Starting Address Low at GLLAN_RCTL_1 (0x020E)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLLAN_RCTL_1	0x12A504	
3:0	Type	0x2	

38.20.15.36.2Starting Address High at GLLAN_RCTL_1 (0x020F)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLLAN_RCTL_1		

38.20.15.36.3Attributes at GLLAN_RCTL_1 (0x0210)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x2	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.37GLLAN_PF_RECIPE (0x0215 - 0237)

38.20.15.37.1Starting Address Low at GLLAN_PF_RECIPE[n] (0x0215)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLLAN_PF_RECIPE	0x12A5E0	
3:0	Type	0x2	

38.20.15.37.2Starting Address High at GLLAN_PF_RECIPE[n] (0x0216)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLLAN_PF_RECIPE		

38.20.15.37.3Attributes at GLLAN_PF_RECIPE[n] (0x0217)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x10	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.38PFLAN_QALLOC (0x0238 - 025A)

38.20.15.38.1Starting Address Low at PFLAN_QALLOC[PF] (0x0238 + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PFLAN_QALLOC, for PF[0]	0x1C0400	
3:0	Type	0x2	

38.20.15.38.2Starting Address High at PFLAN_QALLOC[PF] (0x0239 + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PFLAN_QALLOC, for PF[0]		

38.20.15.38.3Attributes at PFLAN_QALLOC[PF] (0x023A + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x10	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.38.4Data Low of PFLAN_QALLOC[PF] (0x023B + 2*PF, PF=0...15)

38.20.15.38.5Data High of PFLAN_QALLOC[PF] (0x023C + 2*PF, PF=0...15)

38.20.15.39PFGEN_PORTNUM (0x025B - 027D)

38.20.15.39.1Starting Address Low at PFGEN_PORTNUM[PF] (0x025B + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PFGEN_PORTNUM, for PF[0]	0x1C0480	
3:0	Type	0x2	

38.20.15.39.2Starting Address High at PFGEN_PORTNUM[PF] (0x025C + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PFGEN_PORTNUM, for PF[0]		

38.20.15.39.3Attributes at PFGEN_PORTNUM[PF] (0x025D + 2*PF, PF=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x10	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.39.4Data Low of PFGEN_PORTNUM[PF] (0x025E + 2*PF, PF=0...15)

38.20.15.44PRT_SWT_SCBI (0x0308 - 0312)

38.20.15.44.1Starting Address Low at PRT_SWT_SCBI[PRT] (0x0308 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRT_SWT_SCBI, for PRT[0]	0x256D60	
3:0	Type	0x2	

38.20.15.44.2Starting Address High at PRT_SWT_SCBI[PRT] (0x0309 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRT_SWT_SCBI, for PRT[0]		

38.20.15.44.3Attributes at PRT_SWT_SCBI[PRT] (0x030A + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x4	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.45PRTQF_CTL_0 (0x0313 - 031D)

38.20.15.45.1Starting Address Low at PRTQF_CTL_0[PRT] (0x0313 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTQF_CTL_0, for PRT[0]	0x256E60	
3:0	Type	0x2	

38.20.15.45.2Starting Address High at PRTQF_CTL_0[PRT] (0x0314 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTQF_CTL_0, for PRT[0]		

38.20.15.45.3Attributes at PRTQF_CTL_0[PRT] (0x0315 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x4	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.45.4Data Low of PRTQF_CTL_0[PRT] (0x0316 + 2*PRT, PRT=0...3)

38.20.15.45.5Data High of PRTQF_CTL_0[PRT] (0x0317 + 2*PRT, PRT=0...3)

38.20.15.46GLQF_CTL (0x032E - 0331)

38.20.15.46.1Address Low at GLQF_CTL (0x032E)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLQF_CTL	0x269BA4	
3:0	Type	0x1	

38.20.15.46.2Address High at GLQF_CTL (0x032F)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLQF_CTL		

38.20.15.46.3Data Low of GLQF_CTL 0x0330)

38.20.15.46.4Data High of GLQF_CTL (0x0331)

38.20.15.47PRT_SWR_PM_THR (0x034A - 0354)

38.20.15.47.1Starting Address Low at PRT_SWR_PM_THR[PRT] (0x034A + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRT_SWR_PM_THR, for PRT[0]	0x26CD00	
3:0	Type	0x2	

38.20.15.47.2Starting Address High at PRT_SWR_PM_THR[PRT] (0x034B + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRT_SWR_PM_THR, for PRT[0]		

38.20.15.47.3Attributes at PRT_SWR_PM_THR[PRT] (0x034C + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x4	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.15.48GLQF_FDEVICTFLAG (0x0355 - 0358)

38.20.15.48.1Address Low at GLQF_FDEVICTFLAG (0x0355)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLQF_FDEVICTFLAG	0x270380	
3:0	Type	0x1	

38.20.15.48.2Address High at GLQF_FDEVICTFLAG (0x0356)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLQF_FDEVICTFLAG		

38.20.15.48.3Data Low of GLQF_FDEVICTFLAG (0x0357)

38.20.15.48.4Data High of GLQF_FDEVICTFLAG (0x0358)

38.20.16 GLOBR Registers Auto-Load Module Section Summary Table

Default setup to registers that load on GLOBR events.

Word Offset	Description	Page
0x0000	Module Length	2578
0x000C - 0x0016	NVM Contents for PRTGL_SAL	2579
0x0017 - 0x0021	NVM Contents for PRTGL_SAH	2579
0x0022 - 0x002C	NVM Contents for PRTDCB_MFLCN	2580
0x002D - 0x0037	NVM Contents for PRTTSYN_CTL0	2580
0x0038 - 0x003C	Reserved	
0x003D - 0x003E	Reserved	
0x003F - 0x0049	Reserved	
0x004A - 0x0054	Reserved	
0x0055 - 0x0080	NVM Contents for PRTDCB_FCTTVN	2581
0x0081 - 0x008B	NVM Contents for PRTDCB_FCRTV	2582
0x008C - 0x0096	NVM Contents for PRTDCB_FCCFG	2582

38.20.16.1 Module Length (0x0000)

Bits	Field Name	NVM Image Value	Description
15:0	Module Length		Length in: 2 Bytes unit - 1. First Section -> Word: GLOBR Registers Auto-Load Module -> Module Length Last Section -> Word: GLOBR Registers Auto-Load Module -> Starting Address Low at PRTDCB_FCCFG

38.20.16.2 PRTGL_SAL (0x000C - 0x0016)

38.20.16.2.1 Starting Address Low at PRTGL_SAL[PRT] (0x000C + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTGL_SAL, for PRT[0]	0x120	
3:0	Type	0x2	

38.20.16.2.2 Starting Address High at PRTGL_SAL[PRT] (0x000D + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTGL_SAL, for PRT[0]	0x01E2	

38.20.16.2.3 Attributes at PRTGL_SAL[PRT] (0x000E + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x004	
4:3	Skip	00b	
2:0	Width	000b	

38.20.16.2.4 Data Low of PRTGL_SAL[PRT] (0x000F + 2*PRT, PRT=0...3)

38.20.16.2.5 Data High of PRTGL_SAL[PRT] (0x0010 + 2*PRT, PRT=0...3)

38.20.16.3 PRTGL_SAH (0x0017 - 0x0021)

38.20.16.3.1 Starting Address Low at PRTGL_SAH[PRT] (0x0017 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTGL_SAH, for PRT[0]	0x140	
3:0	Type	0x2	

38.20.16.3.2 Starting Address High at PRTGL_SAH[PRT] (0x0018 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTGL_SAH, for PRT[0]	0x01E2	

38.20.16.3.3 Attributes at PRTGL_SAH[PRT] (0x0019 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x004	
4:3	Skip	00b	

Bits	Field Name	NVM Image Value	Description
2:0	Width	000b	

38.20.16.3.4 Data Low of PRTGL_SAH[PRT] (0x001A + 2*PRT, PRT=0...3)

38.20.16.3.5 Data High of PRTGL_SAH[PRT] (0x001B + 2*PRT, PRT=0...3)

38.20.16.4 PRTDCB_MFLCN (0x0022 - 0x002C)

38.20.16.4.1 Starting Address Low at PRTDCB_MFLCN[PRT] (0x0022 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTDCB_MFLCN, for PRT[0]	0x400	
3:0	Type	0x2	

38.20.16.4.2 Starting Address High at PRTDCB_MFLCN[PRT] (0x0023 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTDCB_MFLCN, for PRT[0]	0x01E2	

38.20.16.4.3 Attributes at PRTDCB_MFLCN[PRT] (0x0024 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x004	
4:3	Skip	00b	
2:0	Width	000b	

38.20.16.4.4 Data Low of PRTDCB_MFLCN[PRT] (0x0025 + 2*PRT, PRT=0...3)

38.20.16.4.5 Data High of PRTDCB_MFLCN[PRT] (0x0026 + 2*PRT, PRT=0...3)

38.20.16.5 PRTTSYN_CTL0 (0x002D - 0x0037)

38.20.16.5.1 Starting Address Low at PRTTSYN_CTL0[PRT] (0x002D + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTTSYN_CTL0 for PRT[0]	0x1E4200	
3:0	Type	0x2	

38.20.16.5.2 Starting Address High at PRTTSYN_CTL0[PRT] (0x002E+ 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTTSYN_CTL0 for PRT[0]		

38.20.16.5.3 Attributes at PRTTSYN_CTL0[PRT] (0x002F + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x4	
4:3	Skip	0x0	
2:0	Width	0x0	

38.20.16.5.4 Data Low of PRTTSYN_CTL0[PRT] (0x0030 + 2*PRT, PRT=0...3)

38.20.16.5.5 Data High of PRTTSYN_CTL0[PRT] (0x0031 + 2*PRT, PRT=0...3)

38.20.16.6 PRTDCB_FCTTVN (0x0055 - 0x0080)

38.20.16.6.1 Starting Address Low at PRTDCB_FCTTVN[n,PRT] (0x0055 + 11*n, n=0...3)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTDCB_FCTTVN, for PRT[0]	0x1E4580	
3:0	Type	0x2	

38.20.16.6.2 Starting Address High at PRTDCB_FCTTVN[n,PRT] (0x0056 + 11*n, n=0...3)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTDCB_FCTTVN, for PRT[0]		

38.20.16.6.3 Attributes at PRTDCB_FCTTVN[n,PRT] (0x0057 + 11*n, n=0...3)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x004	
4:3	Skip	00b	
2:0	Width	000b	

38.20.16.6.4 Data Low of PRTDCB_FCTTVN[n,PRT] (0x0058 + 11*n + 2*PRT, n=0...3, PRT=0...3)

38.20.16.6.5 Data High of PRTDCB_FCTTVN[n,PRT] (0x0059 + 11*n + 2*PRT, n=0...3, PRT=0...3)

38.20.16.7 PRTDCB_FCRTV (0x0081 - 0x008B)

38.20.16.7.1 Starting Address Low at PRTDCB_FCRTV[PRT] (0x0081 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	PRTDCB_FCRTV, for PRT[0]	0x1E4600	
3:0	Type	0x2	

38.20.16.7.2 Starting Address High at PRTDCB_FCRTV[PRT] (0x0082 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTDCB_FCRTV, for PRT[0]		

38.20.16.7.3 Attributes at PRTDCB_FCRTV[PRT] (0x0083 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x004	
4:3	Skip	00b	
2:0	Width	000b	

38.20.16.7.4 Data Low of PRTDCB_FCRTV[PRT] (0x0084 + 2*PRT, PRT=0...3)

38.20.16.7.5 Data High of PRTDCB_FCRTV[PRT] (0x0085 + 2*PRT, PRT=0...3)

38.20.16.8 PRTDCB_FCCFG (0x008C - 0096)

38.20.16.8.1 Starting Address Low at PRTDCB_FCCFG[PRT] (0x008C + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTDCB_FCCFG, for PRT[0]	0x1E4640	
3:0	Type	0x2	

38.20.16.8.2 Starting Address High at PRTDCB_FCCFG[PRT] (0x008D + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTDCB_FCCFG, for PRT[0]		

38.20.16.8.3 Attributes at PRTDCB_FCCFG[PRT] (0x008E + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x004	
4:3	Skip	00b	
2:0	Width	000b	

38.20.16.8.4 Data Low of PRTDCB_FCCFG[PRT] (0x008F + 2*PRT, PRT=0...3)

38.20.16.8.5 Data High of PRTDCB_FCCFG[PRT] (0x0090 + 2*PRT, PRT=0...3)

38.20.17 PE CORER Registers Section Summary Table

Default setup to registers and internal memories that load on CORER events for PE.

Word Offset	Description	Page
0x0000	Module Length	2583
0x0011 - 0x0015	NVM Contents for GLPE_RUPM_GCTL	2584
0x0016 - 0x0017	NVM Contents for GLPE_DUAL40_RUPM	
0x0018 - 0x0022	NVM Contents for PRTPE_RUPM_THRES	2584
0x0023 - 0x002D	NVM Contents for PRTPE_RUPM_CTL	2585
0x002E - 0x0038	NVM Contents for PRTPE_RUPM_PFCPC	2586
0x0039 - 0x0043	NVM Contents for PRTPE_RUPM_PFCTCC	2586
0x0044 - 0x0048	NVM Contents for GLPE_RUPM_PUSHPOOL	2587
0x0049 - 0x004A	NVM Contents for GLPE_RUPM_FLRPOOL	2587
0x004B - 0x004C	NVM Contents for GLPE_RUPM_CQPPOOL	2587
0x004D - 0x004E	NVM Contents for GLPE_RUPM_PTXPOLL	2588
0x004F - 0x0059	NVM Contents for PRTDCB_TCPMC_RLPM	2588
0x005A - 0x0064	NVM Contents for PRTDCB_TCPFCPC_RLPM	2588
0x0065 - 0x006F	NVM Contents for PRTDCB_TCPFCTCC_RLPM	2589
0x0070 - 0x0074	NVM Contents for GLDCB_TGENC_RLPM	2590

38.20.17.1 Module Length (0x0000)

Bits	Field Name	NVM Image Value	Description
15:0	Module Length		Length in: 2 Bytes unit - 1. First Section -> Word: PE CORER Registers -> Module Length Last Section -> Word: PE CORER Registers -> Data Low of GLGEN_DUAL40_RLPM

38.20.17.2 GLPE_RUPM_GCTL (0x0011 - 0x0015)

38.20.17.2.1 Starting Address Low at GLPE_RUPM_GCTL (0x0011)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLPE_RUPM_GCTL	0xDA00	
3:0	Type	0x2	

38.20.17.2.2 Starting Address High at GLPE_RUPM_GCTL (0x0012)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLPE_RUPM_GCTL		

38.20.17.2.3 Attributes at GLPE_RUPM_GCTL (0x0013)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x002	
4:3	Skip	00b	
2:0	Width	000b	

38.20.17.2.4 Data Low of GLPE_RUPM_GCTL (0x0014)

38.20.17.2.5 Data High of GLPE_RUPM_GCTL (0x0015)

38.20.17.3 PRTPE_RUPM_THRES (0x0018 - 0022)

38.20.17.3.1 Starting Address Low at PRTPE_RUPM_THRES[PRT] (0x0018 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTPE_RUPM_THRES, for PRT[0]	0xDA20	
3:0	Type	0x2	

38.20.17.3.2 Starting Address High at PRTPE_RUPM_THRES[PRT] (0x0019 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTPE_RUPM_THRES, for PRT[0]		

38.20.17.3.3 Attributes at PRTPE_RUPM_THRES[PRT] (0x001A + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x004	
4:3	Skip	00b	
2:0	Width	000b	

38.20.17.3.4 Data Low of PRTPE_RUPM_THRES[PRT] (0x001B + 2*PRT, PRT=0...3)

38.20.17.3.5 Data High of PRTPE_RUPM_THRES[PRT] (0x001C + 2*PRT, PRT=0...3)

38.20.17.4 PRTPE_RUPM_CTL (0x0023 - 002D)

38.20.17.4.1 Starting Address Low at PRTPE_RUPM_CTL[PRT] (0x0023 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTPE_RUPM_CTL, for PRT[0]	0xDA40	
3:0	Type	0x2	

38.20.17.4.2 Starting Address High at PRTPE_RUPM_CTL[PRT] (0x0024 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTPE_RUPM_CTL, for PRT[0]		

38.20.17.4.3 Attributes at PRTPE_RUPM_CTL[PRT] (0x0025 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x004	
4:3	Skip	00b	
2:0	Width	000b	

38.20.17.4.4 Data Low of PRTPE_RUPM_CTL[PRT] (0x0026 + 2*PRT, PRT=0...3)

38.20.17.4.5 Data High of PRTPE_RUPM_CTL[PRT] (0x0027 + 2*PRT, PRT=0...3)

38.20.17.5 PRTPE_RUPM_PFCPC (0x002E - 0038)

38.20.17.5.1 Starting Address Low at PRTPE_RUPM_PFCPC[PRT] (0x002E + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTPE_RUPM_PFCPC, for PRT[0]	0xDA80	
3:0	Type	0x2	

38.20.17.5.2 Starting Address High at PRTPE_RUPM_PFCPC[PRT] (0x002F + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTPE_RUPM_PFCPC, for PRT[0]		

38.20.17.5.3 Attributes at PRTPE_RUPM_PFCPC[PRT] (0x0030 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x004	
4:3	Skip	00b	
2:0	Width	000b	

38.20.17.5.4 Data Low of PRTPE_RUPM_PFCPC[PRT] (0x0031 + 2*PRT, PRT=0...3)

38.20.17.5.5 Data High of PRTPE_RUPM_PFCPC[PRT] (0x0032 + 2*PRT, PRT=0...3)

38.20.17.6 PRTPE_RUPM_PFCTCC (0x0039 - 0043)

38.20.17.6.1 Starting Address Low at PRTPE_RUPM_PFCTCC[PRT] (0x0039 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTPE_RUPM_PFCTCC, for PRT[0]	0xDA80	
3:0	Type	0x2	

38.20.17.6.2 Starting Address High at PRTPE_RUPM_PFCTCC[PRT] (0x003A + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTPE_RUPM_PFCTCC, for PRT[0]		

38.20.17.6.3 Attributes at PRTPE_RUPM_PFCTCC[PRT] (0x003B + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x004	
4:3	Skip	00b	
2:0	Width	000b	

38.20.17.6.4 Data Low of PRTPE_RUPM_PFCTCC[PRT] (0x003C + 2*PRT, PRT=0...3)

38.20.17.6.5 Data High of PRTPE_RUPM_PFCTCC[PRT] (0x003D + 2*PRT, PRT=0...3)

38.20.17.7 GLPE_RUPM_PUSHPOOL (0x0044 - 0048)

38.20.17.7.1 Starting Address Low at GLPE_RUPM_PUSHPOOL (0x0044)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLPE_RUPM_PUSHPOOL	0xDAC0	
3:0	Type	0x2	

38.20.17.7.2 Starting Address High at GLPE_RUPM_PUSHPOOL (0x0045)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLPE_RUPM_PUSHPOOL		

38.20.17.7.3 Attributes at GLPE_RUPM_PUSHPOOL (0x0046)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x004	
4:3	Skip	00b	
2:0	Width	000b	

38.20.17.7.4 Data Low of GLPE_RUPM_PUSHPOOL (0x0047)

38.20.17.7.5 Data High of GLPE_RUPM_PUSHPOOL (0x0048)

38.20.17.8 GLPE_RUPM_FLRPOOL (0x0049 - 004A)

38.20.17.8.1 Data Low of GLPE_RUPM_FLRPOOL (0x0049)

38.20.17.8.2 Data High of GLPE_RUPM_FLRPOOL (0x004A)

38.20.17.9 GLPE_RUPM_PTXPOOL (0x004B - 004C)

38.20.17.9.1 Data Low of GLPE_RUPM_PTXPOOL (0x004B)

38.20.17.9.2 Data High of GLPE_RUPM_PTXPOOL (0x004C)

38.20.17.10GLPE_RUPM_CQPPOOL (0x004D - 004E)

38.20.17.10.1Data Low of GLPE_RUPM_CQPPOOL (0x004D)

38.20.17.10.2Data High of GLPE_RUPM_CQPPOOL (0x004F)

38.20.17.11PRTDCB_TCPMC_RLPM (0x004F - 0x0059)

38.20.17.11.1Starting Address Low at PRTDCB_TCPMC_RLPM[PRT] (0x004F + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTDCB_TCPMC_RLPM, for PRT[0]	0x1F1A0	
3:0	Type	0x2	

38.20.17.11.2Starting Address High at PRTDCB_TCPMC_RLPM[PRT] (0x00502 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTDCB_TCPMC_RLPM, for PRT[0]		

38.20.17.11.3Attributes at PRTDCB_TCPMC_RLPM[PRT] (0x0051 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x004	
4:3	Skip	00b	
2:0	Width	000b	

38.20.17.11.4Data Low of PRTDCB_TCPMC_RLPM[PRT] (0x0052 + 2*PRT, PRT=0...3)

38.20.17.11.5Data High of PRTDCB_TCPMC_RLPM[PRT] (0x0053 + 2*PRT, PRT=0...3)

38.20.17.12PRTDCB_TCPFCPC_RLPM (0x005A - 0x0064)

38.20.17.12.1Starting Address Low at PRTDCB_TCPFCPC_RLPM[PRT] (0x005A + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTDCB_TCPFCPC_RLPM, for PRT[0]	0x1F1C0	
3:0	Type	0x2	

38.20.17.12.2Starting Address High at PRTDCB_TCPFCPC_RLPM[PRT] (0x005B + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTDCB_TCPFCPC_RLPM, for PRT[0]	0x001F	

38.20.17.12.3Attributes at PRTDCB_TCPFCPC_RLPM[PRT] (0x005C + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x004	
4:3	Skip	00b	
2:0	Width	000b	

38.20.17.13PRTDCB_TCPFCTCC_RLPM (0x0065 - 0x006F)

38.20.17.13.1Starting Address Low at PRTDCB_TCPFCTCC_RLPM[PRT] (0x0065 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of PRTDCB_TCPFCTCC_RLPM, for PRT[0]	0x1F1E0	
3:0	Type	0x2	

38.20.17.13.2Starting Address High at PRTDCB_TCPFCTCC_RLPM[PRT] (0x0066 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of PRTDCB_TCPFCTCC_RLPM, for PRT[0]		

38.20.17.13.3Attributes at PRTDCB_TCPFCTCC_RLPM[PRT] (0x0067 + 2*PRT, PRT=0)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x004	
4:3	Skip	00b	
2:0	Width	000b	

38.20.17.14GLDCB_TGENC_RLPM (0x0070 - 0x0074)

38.20.17.14.1Starting Address Low at GLDCB_TGENC_RLPM (0x0070)

Bits	Field Name	NVM Image Value	Description
15:4	Low Address Bits of GLDCB_TGENC_RLPM	0x1F200	
3:0	Type	0x2	

38.20.17.14.2Starting Address High at GLDCB_TGENC_RLPM (0x0071)

Bits	Field Name	NVM Image Value	Description
15:0	High Address Bits of GLDCB_TGENC_RLPM	0x001F	

38.20.17.14.3Attributes at GLDCB_TGENC_RLPM (0x0072)

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x002	
4:3	Skip	00b	
2:0	Width	000b	

38.20.18 POR CORER Registers Section Summary Table

Default setup to registers and internal memories that load on CORER events that follow POR.

Word Offset	Description	Page
0x0000	Module Length	2590

38.20.18.1 Module Length (0x0000)

Bits	Field Name	NVM Image Value	Description
15:0	Module Length		Length in: 2-byte units - 1 First Section -> Word: POR CORER Registers -> Module Length Last Section -> Word: POR CORER Registers -> Module Length

38.20.19 EMP SR Settings Module Header Section Summary Table

This section contains the modes of operation of the EMP that must be stored in the shadow RAM.

Word Offset	Description	Page
0x0000	Section Header	2592
0x0001	SMBus Slave Addresses	2592
0x0002	SMBus Slave Addresses 2	2592
0x0003	OEM Capabilities	2592
0x0004	Reserved	
0x0005	SR PF Allocations Pointer	2592
0x0006	Max PF and VF Per Port	2593
0x0007	PF LAN Device ID	2593
0x0008	Reserved	
0x0009	PF iSCSI Device ID	2593
0x000A	PF RDMA Device ID	2593
0x000B	VF LAN Device ID	2593
0x000C	Reserved	
0x000D	VF iSCSI Device ID	2593
0x000E	VF RDMA Device Id	2593
0x000F	PF LAN Subsystem ID	2594
0x0010	Reserved	
0x0011	PF iSCSI Subsystem ID	2594
0x0012	PF RDMA Subsystem ID	2594
0x0013	VF LAN Subsystem ID	2594
0x0014	Reserved	
0x0015	VF iSCSI Subsystem ID	2594
0x0016	VF RDMA Subsystem ID	2594
0x0017	MNG MAC Address Pointer	2594
0x0018	PF MAC Address Pointer	2595
0x0019	PHY Capability LAN 0 Pointer	2595
0x001A	PHY Capability LAN 1 Pointer	2595
0x001B	PHY Capability LAN 2 Pointer	2595
0x001C	PHY Capability LAN 3 Pointer	2595
0x001D + 1*n, n=0...7	PFGEN_STATE	2595
0x0025	EXT to INT PHY Mapping LAN 0 Pointer	2596
0x0026	EXT to INT PHY Mapping LAN 1 Pointer	2596
0x0027	EXT to INT PHY Mapping LAN 2 Pointer	2596
0x0028	EXT to INT PHY Mapping LAN 3 Pointer	2596
0x0029	Reserved	
0x002A	Features Enable	2596
0x002B	OCP Configuration Word 0	2597
0x002C	OCP Configuration Word 1	2598
0x002D	OCP Configuration Word 2	2599

Word Offset	Description	Page
0x002E	OCP Signature Word 0	2599
0x002F	OCP Signature Word 1	2599
0x0030	OCP Signature Word 2	2599
0x0031	Current Settings Pointer	2599

38.20.19.1 Section Header (0x0000)

Bits	Field Name	NVM Image Value	Description
15:0	Block Length		Length in: 2 Bytes unit - 1. First Section -> Word: EMP SR Settings Module Header -> Section Header Last Section -> Word: EMP SR Settings Module Header -> Current Settings Pointer Section length in words.

38.20.19.2 SMBus Slave Addresses (0x0001)

Bits	Field Name	NVM Image Value	Description
15:9	SMBus 1 Slave Address	0x4A	Dual address mode only.
8	Reserved	0b	Reserved.
7:1	SMBus 0 Slave Address	0x49	
0	Reserved	0b	Reserved.

38.20.19.3 SMBus Slave Addresses 2 (0x0002)

Bits	Field Name	NVM Image Value	Description
15:9	SMBus 3 Slave Addresses	0x4C	
8	Reserved	0b	Reserved.
7:1	SMBus 2 Slave Addresses	0x4B	
0	Reserved	0b	Reserved.

38.20.19.4 OEM Capabilities (0x0003)

Defines the OEM technologies supported in this device.

Bits	Field Name	NVM Image Value	Description
15:0	Reserved	0x0000	Reserved.

38.20.19.5 SR PF Allocations Pointer (0x0005)

Bits	Field Name	NVM Image Value	Description
15:0	PF Allocations Pointer	0xFFFF	Points to the SR PF Allocations section. For more detail on the SR PF Allocations inner structure, see Section 38.20.21.

38.20.19.6 Max PF and VF per Port (0x0006)

Bits	Field Name	NVM Image Value	Description
15:8	Max VF Per PF	0x80	Max number of VFs allocated to a PF.
7:3	Reserved	0x00	Reserved.
2:0	Max PF Per Port	010b	Max PF Per Port. 000b = 1 PF per port. All other values are reserved.

38.20.19.7 PF LAN Device ID (0x0007)

Bits	Field Name	NVM Image Value	Description
15:0	PF LAN Device ID	0x37CC	

38.20.19.8 PF iSCSI Device ID (0x0009)

Bits	Field Name	NVM Image Value	Description
15:0	PF iSCSI	0x37CC	

38.20.19.9 PF RDMA Device ID (0x000A)

Bits	Field Name	NVM Image Value	Description
15:0	PF RDMADevice ID	0x37CC	

38.20.19.10VF LAN Device ID (0x000B)

Bits	Field Name	NVM Image Value	Description
15:0	VF LAN Device ID	0x37CD	

38.20.19.11VF iSCSI Device ID (0x000D)

Bits	Field Name	NVM Image Value	Description
15:0	VF iSCSI Device ID	0x37CD	

38.20.19.12VF RDMA Device ID (0x000E)

Bits	Field Name	NVM Image Value	Description
15:0	VF RDMA Device ID	0x37CD	

38.20.19.13PF LAN Subsystem ID (0x000F)

Bits	Field Name	NVM Image Value	Description
15:0	PF LAN Subsystem ID	0x0	

38.20.19.14PF iSCSI Subsystem ID (0x0011)

Bits	Field Name	NVM Image Value	Description
15:0	PF iSCSI Subsystem ID	0x0	

38.20.19.15PF RDMA Subsystem ID (0x0012)

Bits	Field Name	NVM Image Value	Description
15:0	PF RDMA Subsystem ID	0x0	

38.20.19.16VF LAN Subsystem ID (0x0013)

Bits	Field Name	NVM Image Value	Description
15:0	VF LAN Subsystem ID	0x0	

38.20.19.17VF iSCSI Subsystem ID (0x0015)

Bits	Field Name	NVM Image Value	Description
15:0	VF iSCSI Subsystem ID	0x0	

38.20.19.18VF RDMA Subsystem ID (0x0016)

Bits	Field Name	NVM Image Value	Description
15:0	VF RDMA Subsystem ID	0x0	

38.20.19.19VF MNG MAC Address Pointer (0x0017)

Bits	Field Name	NVM Image Value	Description
15:0	MNG MAC Address pointer	0xFFFF	Points to the MNG MAC Address section. For more detail on the MNG MAC Address inner structure, see Section 38.20.22.

38.20.19.20PF MAC Address Pointer (0x0018)

Bits	Field Name	NVM Image Value	Description
15:0	PF MAC Address pointer	0xFFFF	Points to the PF MAC Address section. For more detail on the PF MAC Address inner structure, see Section 38.20.23.

38.20.19.21PHY Capability LAN 0 Pointer (0x0019)

Bits	Field Name	NVM Image Value	Description
15:0	PHY	0xFFFF	Points to the PHY Capability Data Structure 0 section. For more detail on the PHY Capability Data Structure 0 inner structure, see Section 38.20.24.

38.20.19.22PHY Capability LAN 1 Pointer (0x001A)

Bits	Field Name	NVM Image Value	Description
15:0	PHY	0xFFFF	Points to the PHY Capability Data Structure 1 section. For more detail on the PHY Capability Data Structure 1 inner structure, see Section 38.20.24.

38.20.19.23PHY Capability LAN 2 Pointer (0x001B)

Bits	Field Name	NVM Image Value	Description
15:0	PHY	0xFFFF	Points to the PHY Capability Data Structure 2 section. For more detail on the PHY Capability Data Structure 2 inner structure, see Section 38.20.24.

38.20.19.24PHY Capability LAN 3 Pointer (0x001C)

Bits	Field Name	NVM Image Value	Description
15:0	PHY	0xFFFF	Points to the PHY Capability Data Structure 3 section. For more detail on the PHY Capability Data Structure 3 inner structure, see Section 38.20.24.

38.20.19.25PFGEN_STATE[n] (0x001D + 1*n, n=0...7)

Bits	Field Name	NVM Image Value	Description
15:12	Reserved	0x0	Reserved.
11	PFGEN_STATE[1 + 2*n].PFSCEN	0b	
10	PFGEN_STATE[1 + 2*n].PFLINKEN	1b	
9	PFGEN_STATE[1 + 2*n].PFFCEN	0b	
8	PFGEN_STATE[1 + 2*n].PFPEEN	0b	
7:4	Reserved	0x0	Reserved.
3	PFGEN_STATE[0 + 2*n].PFSCEN	0b	
2	PFGEN_STATE[0 + 2*n].PFLINKEN	1b	

Bits	Field Name	NVM Image Value	Description
1	PFGEN_STATE[0 + 2*n].PFFCEN	0b	
0	PFGEN_STATE[0 + 2*n].PFPEEN	0b	

38.20.19.26EXT to INT PHY Mapping LAN 0 Pointer (0x0025)

Bits	Field Name	NVM Image Value	Description
15:0	LAN 0 Pointer	0xFFFF	Points to the External to Internal PHY Mapping 0 section. For more detail on the External to Internal PHY Mapping 0 inner structure, see Section 38.20.24.

38.20.19.27EXT to INT PHY Mapping LAN 1 Pointer (0x0026)

Bits	Field Name	NVM Image Value	Description
15:0	LAN 1 Pointer	0xFFFF	Points to the External to Internal PHY Mapping 1 section. For more detail on the External to Internal PHY Mapping 1 inner structure, see Section 38.20.24.

38.20.19.28EXT to INT PHY Mapping LAN 2 Pointer (0x0027)

Bits	Field Name	NVM Image Value	Description
15:0	LAN 2 Pointer	0xFFFF	Points to the External to Internal PHY Mapping 2 section. For more detail on the External to Internal PHY Mapping 2 inner structure, see Section 38.20.24.

38.20.19.29EXT to INT PHY Mapping LAN 3 Pointer (0x0028)

Bits	Field Name	NVM Image Value	Description
15:0	LAN 3 Pointer	0xFFFF	Points to the External to Internal PHY Mapping 3 section. For more detail on the External to Internal PHY Mapping 3 inner structure, see Section 38.20.24.

38.20.19.30Features Enable (0x002A)

Bits	Field Name	NVM Image Value	Description
15:14	Reserved	0x0	Reserved
13	PXE Mode No-drop Policy Supported	0x0	The value indicates if the PXE mode no-drop policy is supported. 0b = No support. 1b = PXE mode no-drop is supported. This mode can be enabled by the Configure No-Drop Policy AQ command. ***Note:*** This field is preserved by Intel NVM update tool.
12	Channel Identifier	0x0	Defines the Ether-type of the channel identifier used to differentiate channels within a port extender. Valid values are: 0x0 = S-tag 0x1 = VLAN ***Note:*** This field is preserved by Intel NVM update tool.

Bits	Field Name	NVM Image Value	Description
11:9	Switching mode	0x0	Reserved
8	Proxy Enabled For Port 3	0x1	If cleared, the proxy functionality embedded in the EMP is disabled on port 3. It could be re-enabled on this port only by resetting this bit to 1b and performing an EMPR cycle. Valid values are: 0x0 = Disabled. 0x1 = Enabled. ***Note:*** This field is preserved by Intel NVM update tool.
7	Proxy Enabled For Port 2	0x1	If cleared, the proxy functionality embedded in the EMP is disabled on port 2. It could be re-enabled on this port only by resetting this bit to 1b and performing an EMPR cycle. Valid values are: 0x0 = Disabled. 0x1 = Enabled. ***Note:*** This field is preserved by Intel NVM update tool.
6	Proxy Enabled For Port 1	0x1	If cleared, the proxy functionality embedded in the EMP is disabled on port 1. It could be re-enabled on this port only by resetting this bit to 1b and performing an EMPR cycle. Valid values are: 0x0 = Disabled. 0x1 = Enabled. ***Note:*** This field is preserved by Intel NVM update tool.
5	Proxy Enabled For Port 0	0x1	If cleared, the proxy functionality embedded in the EMP is disabled on port 0. It could be re-enabled on this port only by resetting this bit to 1b and performing an EMPR cycle. Valid values are: 0x0 = Disabled. 0x1 = Enabled. ***Note:*** This field is preserved by Intel NVM update tool.
4	FW WoL Enable 10G	0x0	If set, enables firmware WoL for 10 GbE link, ***Note:*** This field is preserved by Intel NVM update tool.
3	FW WoL Enable 1G	0x0	If set, enables firmware WoL for 1 GbE link, ***Note:*** This field is preserved by Intel NVM update tool.
2	Reserved	0x1	Reserved
1	EVB Protocols Enabled	0x1	If set, filtering according to IEEE 802.1QBg specification is enabled. Valid values are: 0x0 = Disabled. 0x1 = Enabled. ***Note:*** This field is preserved by Intel NVM update tool.
0	VEB Statistics Disable	0x0	When cleared (default) VEB statistics are enabled. When set, VEB statistics are disabled. This field is preserved by Intel NVM update tool.

38.20.19.31OCP Configuration Word 0 (0x002B)

Bits	Field Name	NVM Image Value	Description
15	OCP Enable	0b	If set, the OCP connector is part of the board.
14:12	Number of Ports	0x4	Number of physical ports in the system.
11:9	Port #3 OCP Connection	0x3	0x0 = OCP port 0 is connected to port 3. 0x1 = OCP port 1 is connected to port 3. 0x2 = OCP port 2 is connected to port 3. 0x3 = OCP port 3 is connected to port 3. 0x7 = No OCP port is connected to port 3. Other values are reserved.

Bits	Field Name	NVM Image Value	Description
8:6	Port #2 OCP Connection	0x2	0x0 = OCP port 0 is connected to port 2. 0x1 = OCP port 1 is connected to port 2. 0x2 = OCP port 2 is connected to port 2. 0x3 = OCP port 3 is connected to port 2. 0x7 = No OCP port is connected to port 2. Other values are reserved.
5:3	Port #1 OCP Connection	0x1	0x0 = OCP port 0 is connected to port 1. 0x1 = OCP port 1 is connected to port 1. 0x2 = OCP port 2 is connected to port 1. 0x3 = OCP port 3 is connected to port 1. 0x7 = No OCP port is connected to port 1. Other values are reserved.
2:0	Port 0 OCP Connection	0x0	0x0 = OCP port 0 is connected to port 0. 0x1 = OCP port 1 is connected to port 0. 0x2 = OCP port 2 is connected to port 0. 0x3 = OCP port 3 is connected to port 0. 0x7 = No OCP port is connected to port 0. Other values are reserved.

38.20.19.32OCP Configuration Word 1 (0x002C)

Bits	Field Name	NVM Image Value	Description
15:14	Reserved	0x0	Reserved
13:11	I2C First Auto-Detect Port	0x1	Defines the first I^2C port used for auto detect of the OCP card type. 000b = I^2C 0. 001b = I^2C 1. 010b = I^2C 2. 011b = I^2C 3. Other values are reserved. ***Note:*** This port should be configured to work in I^2C in GLGEN_MDIO_I2C_SEL. If it is not, the auto-detect flow is aborted. Should be set to the last port of the OCP card.
10:8	I2C Second Auto-Detect Port	0x3	Defines the first I^2C port used for auto detect of the OCP card type. 000b = I^2C 0. 001b = I^2C 1. 010b = I^2C 2. 011b = I^2C 3. Other values are reserved. ***Note:*** This port should be configured to work in I^2C in GLGEN_MDIO_I2C_SEL. If it is not, the auto-detect flow is aborted. Should be set to the last port of the OCP card.
7:0	I2C Second Auto-Detect Address	0xA8	Defines the I^2C address used for auto detect of the OCP card type.

38.20.19.33OCP Configuration word 2 (0x002D)

Bits	Field Name	NVM Image Value	Description
15:12	Port 3 Function Super-feature ID	0x3	LSB nibble for super feature ID of function associated with port 3.
11:8	Port 2 Function Super-feature ID	0x2	LSB nibble for super feature ID of function associated with port 2.
7:4	Port 1 Function Super-feature ID	0x1	LSB nibble for super feature ID of function associated with port 1.
3:0	Port 0 Function Super-feature ID	0x0	LSB nibble for super feature ID of function associated with port 0.

38.20.19.34OCP Signature Word 0 (0x002E)

Bits	Field Name	NVM Image Value	Description
15:0	OCP Signature Word 0	0x4F43	

38.20.19.35OCP Signature Word 1 (0x002F)

Bits	Field Name	NVM Image Value	Description
15:0	OCP Signature Word 1	0x505F	

38.20.19.36OCP Signature Word 2 (0x0030)

Bits	Field Name	NVM Image Value	Description
15:0	OCP Signature Word 2	0x0000	

38.20.20 Current Settings Section

Defines status of the LLDP agent. Each LAN port has independent status.

Word Offset	Description	Reference
0x0000	Section Length	2600
0x0001	Current Factory LLDP Admin Status	2600

38.20.20.1 Section Length - 0x0000

Bits	Field Name	Default NVM Value	Description
15:0	Section Length		Length in words of the section covered by CRC.

38.20.20.2 Current Factory LLDP Admin Status - 0x0001

Bits	Field Name	Default NVM Value	Description
15:12	Port 3	0xF	Defines status of LLDP agent. Applies to LAN Port 3.
11:8	Port 2	0xF	Defines status of LLDP agent. Applies to LAN Port 2.
7:4	Port 1	0xF	Defines status of LLDP agent. Applies to LAN Port 1.
3:0	Port 0	0xF	Defines status of LLDP agent. Applies to LAN Port 0.

38.20.21 SR PF Allocations Section Summary Table

This section contains the allocation of resources per PF that must be stored in the shadow RAM.

Word Offset	Description	Page
0x0000	Section Header	2600
0x0001 + 11*n, n=0...15	PF Flags	2601
0x0002 + 11*n, n=0...15	PF BW	2601
0x0003 + 11*n, n=0...15	PF Allocations - VSI and VEB	2601
0x0004 + 11*n, n=0...15	PF Allocations - MACs	2601
0x0005 + 11*n, n=0...15	PF Allocations - Outer Tags	2602
0x0006 + 11*n, n=0...15	Reserved	
0x0007 + 11*n, n=0...15	PF Allocations - Inner MACs	2602
0x0008 + 11*n, n=0...15	PF Allocations - IPs	2602
0x0009 + 11*n, n=0...15	PF Allocations - Stats	2602
0x000A + 11*n, n=0...15	PF Allocations - Mirror Rules	2603
0x000B + 11*n, n=0...15	PF Allocations - Queue Sets	2603

38.20.21.1 Section Header (0x0000)

Bits	Field Name	NVM Image Value	Description
15:0	Block Length		Length in: 2 Bytes unit - 1. First Section -> Word: SR PF Allocations -> Section Header Last Section -> Word: SR PF Allocations -> PF Allocations - Queue Sets Section length in words.

38.20.21.2 PF Flags[n] (0x0001 + 11*n, n=0...15)

Bits	Field Name	NVM Image Value	Description
15:13	Reserved	0x0	Reserved.
2	Multi_Qset	0b	***Note:*** This field is preserved by the Intel NVM update tool.
1	Reserved	0b	Reserved
0	Load PF MAC Address	1b	Defines if the LAN MAC address of the PF should be added to the filtering table. If this bit is set, only packets that pass the MAC (and if needed, the S-tag) are forwarded to the PF.

38.20.21.3 PF BW[n] (0x0002 + 11*n, n=0...15)

Bits	Field Name	NVM Image Value	Description
15:8	PF Max BW	0x64	Contains the maximum TX bandwidth allocation of the specified partition expressed in percent of the maximum physical port link speed. The percent value ranges from 0 to 100.
7:0	PF Min BW	0x00	Contains the minimum TX bandwidth allocation of the specified partition expressed in percent of the maximum physical port link speed. The percent value ranges from 0 to 100.

38.20.21.4 PF Allocations - VSI and VEB[n] (0x0003 + 11*n, n=0...15)

Defines the allocation of VSIs and VEBs to each PF.

Bits	Field Name	NVM Image Value	Description
15:10	VEBs	0x00	Defines the number of VEBs guaranteed to this PF. A value of zero means no VEBs are guaranteed to this PF.
9:0	VSIs	0x000	Defines the number of VSIs guaranteed to this PF. A value of zero means no VSIs are guaranteed to this PF.

38.20.21.5 PF Allocations - MACs[n] (0x0004 + 11*n, n=0...15)

Defines the allocation of MACs to each PF.

Bits	Field Name	NVM Image Value	Description
15:11	Reserved	0x00	Reserved.
10:0	MACs	0x000	Defines the number of MACs guaranteed to this PF. A value of zero means no MACs are guaranteed to this PF.

38.20.21.6 PF Allocations - Outer Tags[n] (0x0005 + 11*n, n=0...15)

Defines the allocation of S-tags/inner VLANs/outer VLANs to each PF. The type of resource allocated depends on the switching table configuration.

Bits	Field Name	NVM Image Value	Description
15:10	Reserved	0x00	Reserved.
9:0	S-tags/Outer VLANs	0x000	Defines the number of outer tags guaranteed to this PF. A value of zero means no tags are guaranteed to this PF. The tags allocated by this field depends on the image used: 1. For EVB image - indicates the number of S-tags allocated to the PF. 2. For Cloud images - N/A. 3. For CPM image - indicates the number of outer VLANs allocated to the PF.

38.20.21.7 PF Allocations - Inner MACs[n] (0x0007 + 11*n, n=0...15)

Defines the allocation of inner MACs to each PF. Relevant only for cloud images.

Bits	Field Name	NVM Image Value	Description
15:11	Reserved	0x00	Reserved.
10:0	Inner MACs	0x000	Defines the number of inner MACs guaranteed to this PF. A value of zero means no inner MACs are guaranteed to this PF.

38.20.21.8 PF Allocations - IPs[n] (0x0008 + 11*n, n=0...15)

Defines the allocation of IP to each PF. Relevant only for cloud images.

Bits	Field Name	NVM Image Value	Description
15:11	Reserved	0x00	Reserved.
10:0	IPs	0x000	Defines the number of IP addresses guaranteed to this PF. A value of zero means no IP addresses are guaranteed to this PF.

38.20.21.9 PF Allocations - Stats[n] (0x0009 + 11*n, n=0...15)

Defines the allocation of statistics pools to each PF.

Bits	Field Name	NVM Image Value	Description
15:14	Reserved	00b	Reserved.
13:7	SMONPRIOSTATS Pools	0x00	Defines the number of smonPrioStats statistics pools guaranteed to this PF. A value of zero means no pools are guaranteed to this PF.
6:0	SMONVLANSTATS Pools	0x00	Defines the number of smonVlanStats statistics pools guaranteed to this PF. A value of zero means no pools are guaranteed to this PF.

38.20.21.10PF Allocations - Mirror Rules[n] (0x000A + 11*n, n=0...15)

Defines the allocation of mirror rules to each PF.

Bits	Field Name	NVM Image Value	Description
15:7	Reserved	0x000	Reserved.
6:0	Mirror Rules	0x00	Defines the number of mirror rules pools guaranteed to this PF. A value of zero means no rules are guaranteed to this PF.

38.20.21.11PF Allocations - Queue Sets[n] (0x000B + 11*n, n=0...15)

Defines the allocation of Tx queue sets to each PF.

Bits	Field Name	NVM Image Value	Description
15:12	Reserved	0x0	Reserved.
11:0	Queue Sets	0x000	Defines the number of queue sets guaranteed to this PF. A value of zero means no queue sets are guaranteed to this PF.

38.20.22 MNG MAC Address Section Summary Table

Word Offset	Description	Page
0x0000	Section Header	2603
0x0001 + 3*n, n=0...15	LAN Ethernet MAC Address (LSB) MMAL	2604
0x0002 + 3*n, n=0...15	LAN Ethernet MAC Address (Mid) MMAL	2604
0x0003 + 3*n, n=0...15	LAN Ethernet MAC Address (MSB) MMAH	2604

38.20.22.1 Section Header (0x0000)

Bits	Field Name	NVM Image Value	Description
15:0	Block Length		Length in: 2 Bytes unit - 1. First Section -> Word: MNG MAC Address -> Section Header Last Section -> Word: MNG MAC Address -> LAN Ethernet MAC Address (MSB) MMAH Section length in words.

38.20.22.2 LAN Ethernet MAC Address (LSB) MMAL[n] (0x0001 + 3*n, n=0...15)

This word is loaded by firmware to the 16 LS bits of the MMAL[0-3] register of port n.

The index = 4*Port# + MAC#.

It is used as the MAC address when dedicated MAC address mode is used in legacy SMBus.

This is a per-device, per-port value allocated by manufacturing.

Bits	Field Name	NVM Image Value	Description
15:8	Ethernet MAC Address, Byte 1	0xFF	
7:0	Ethernet MAC Address, Byte 0	0xFF	

38.20.22.3 LAN Ethernet MAC Address (MID) MMAL[n] (0x0002 + 3*n, n=0...15)

This word is loaded by firmware to the 16 MS bits of the MMAL[0-3] register.

The index = 4*Port# + MAC#.

It is used as the MAC address when dedicated MAC address mode is used in legacy SMBus.

This is a per-device per-port value allocated by manufacturing.

Bits	Field Name	NVM Image Value	Description
15:8	Ethernet MAC Address, Byte 3	0xFF	
7:0	Ethernet MAC Address, Byte 2	0xFF	

38.20.22.4 LAN Ethernet MAC Address (MSB) MMAH[n] (0x0003 + 3*n, n=0...15)

This word is loaded by firmware to the MMAH[0-3] register.

The index = 4*Port# + MAC#.

It is used as the MAC address when dedicated MAC address mode is used in legacy SMBus.

This is a per-device per-port value allocated by manufacturing.

Bits	Field Name	NVM Image Value	Description
15:8	Ethernet MAC Address, Byte 5	0xFF	
7:0	Ethernet MAC Address, Byte 4	0xFF	

38.20.23 PF MAC Address Section Summary Table

Word Offset	Description	Page
0x0000	Section Header	2605
0x0001 + 4*n, n=0...15	PFPM_SAL0	2605
0x0002 + 4*n, n=0...15	PFPM_SAL1	2605
0x0003 + 4*n, n=0...15	PFPM_SAH0	2606
0x0004 + 4*n, n=0...15	PFPM_SAH1	2606

38.20.23.1 Section Header (0x0000)

Bits	Field Name	NVM Image Value	Description
15:0	Block Length		Length in: 2 Bytes unit - 1. First Section -> Word: PF MAC Address -> Section Header Last Section -> Word: PF MAC Address -> PFPM_SAH1 Section length in words.

38.20.23.2 PFPM_SAL0[n] (0x0001 + 4*n, n=0...15)

This word is loaded by firmware to the appropriate PRTPM_SAL register, bytes [1,0]. One MAC address per enabled PF. This is a per-device, per-enabled PF value allocated by manufacturing.

Bits	Field Name	NVM Image Value	Description
15:0	PFPM_SAL0	0x0000	See respective bits in the PRTPM_SAL register.

38.20.23.3 PFPM_SAL1[n] (0x0002 + 4*n, n=0...15)

This register is loaded by firmware to the appropriate PRTPM_SAL register, bytes [3:2]. One MAC address per enabled PF. This is a per-device, per-enabled PF value allocated by manufacturing.

Bits	Field Name	NVM Image Value	Description
15:0	PFPM_SAL1	0x0000	See respective bits in the PRTPM_SAL register.

38.20.23.4 PFPM_SAH0[n] (0x0003 + 4*n, n=0...15)

This register is loaded by firmware to the appropriate PRTPM_SAH register, bytes [1,0]. One MAC address per enabled PF. This is a per-device, per-enabled PF value allocated by manufacturing.

Bits	Field Name	NVM Image Value	Description
15:0	PFPM_SAH0	0x0000	See respective bits in the PRTPM_SAH register.

38.20.23.5 PFPM_SAH1[n] (0x0004 + 4*n, n=0...15)

This register is loaded by firmware to the appropriate PRTPM_SAH register, bytes [3:2]. One MAC address per enabled PF. This is a per-device, per-enabled PF value allocated by manufacturing.

Bits	Field Name	NVM Image Value	Description
15:0	PFPM_SAH1	0x0000	See respective bits in the PRTPM_SAH register.

38.20.24 PHY Capability Data Structure 0 Section Summary Table

The PHY capabilities data structure contains all the parameters to control the internal and external PHY operation. For example, interface type and mode, etc.

Note that the data structure is repeated per port.

Word Offset	Description	Page
0x0000	Section Length	2607
0x0001	INT-EXT PHY Select	2607
0x0002	Internal PHY Type	2607
0x0003	External PHY Type	2608
0x0004	PHY ID 0	2608
0x0005	PHY ID 1	2609
0x0006	Module Type 0	2609
0x0007	Module Type 1	2610
0x0008	PHY Capabilities Misc0	2610
0x0009	PHY Capabilities Misc1	2611
0x000A	Reserved	
0x000B	PHY capabilities Misc2	2611
0x000C	Re-timer and PCA Address	2612

38.20.24.1 Section Length (0x0000)

The length of the section in words. Note that section length does not include a count for the section length word.

Bits	Field Name	NVM Image Value	Description
15:0	Section Length		Length in: 2 Bytes unit - 1. First Section -> Word: PHY Capability Data Structure 0 -> Section Length Last Section -> Word: PHY Capability Data Structure 0 -> Re-timer and PCA Address

38.20.24.2 INT-EXT PHY Select (0x0001)

Bits	Field Name	NVM Image Value	Description
15:7	Reserved	0x0	Reserved.
6	Use Retimer	0x0	Valid values are: 0x0 = Disabled. 0x1 = Enabled.
5	Enable 1G LPLU	0x0	Valid values are: 0x0 = Disabled. 0x1 = Enabled.
4	Reserved	0x0	Reserved.
3:0	Int_Ext PHY	0x0	Valid values are: 0x0 = Internal PHY only. 0x1 = External 10GBASE-T PHY. 0x2 = External SFP+ module. 0x3 = External QSFP+ module. 0x4 = Reserved All other values are reserved.

38.20.24.3 Internal PHY Type (0x0002)

This parameter is used by firmware to determine the various internal PHY types to be supported on the port. The device might support multiple PHY types on the same port.

One of the PHY types might be enabled due to the result of auto-negotiation, or manually set by the firmware when auto-negotiation is disabled or not used. One bit per PHY type.

Note: 10GBASE-CR1 configuration is not an IEEE standard. However, this configuration could be enabled with switches supporting CR4 to obtain 4x10 Gb/s over QSFP+ module.

Bits	Field Name	NVM Image Value	Description
15:12	Reserved	0x0	Reserved.
11	10GBASE-CR1	0b	Used with 4x10 Gb/s QSFP+ breakout direct attach or optical cables.
10:8	Reserved	0b	
7	SFI	0b	
6	Reserved	0b	Reserved.

Bits	Field Name	NVM Image Value	Description
5	XAUI	0x0	
4	Reserved	0x0	Reserved
3	10GBASE-KR	1b	
2	Reserved	0b	Reserved.
1	1000BASE-KX	0b	
0	Reserved	0b	Reserved

38.20.24.4 External PHY Type (0x0003)

This parameter is used by firmware to determine the various external PHY types to be supported on the port. The device might support multiple PHY types on the same port.

One of the PHY types might be enabled due to the result of auto-negotiation or manually set by the firmware when auto-negotiation is disabled or not used. One bit per PHY type.

Bits	Field Name	NVM Image Value	Description
15:11	Reserved	0x0	Reserved.
10:8	Reserved	0b	Reserved.
7	10GBASE-CR1	0b	4x10 GbE QSFP+ CR over direct attach copper and breakout.
6	10GBASE-SFP+	0b	
5	10GBASE-LR	0b	
4	10GBASE-SR	0b	
3	10GBASE-T	0b	
2	1000BASE-T	0b	
1:0	Reserved	0b	Reserved.

38.20.24.5 PHY ID 0 (0x0004)

This parameter is used by firmware to verify the 10GBASE-T PHY-ID connected on the port.

The format of the PHY ID is defined in IEEE Std 802.3 and contains OUI, manufacturers model number, and revision number of the PHY.

Bits	Field Name	NVM Image Value	Description
15:8	PHY ID Byte1	0x00	
7:0	PHY ID Byte0	0x00	

38.20.24.6 PHY ID 1 (0x0005)

This parameter is used by firmware to verify the 10GBASE-T PHY-ID connected on the port.

The format of the PHY ID is defined in IEEE Std 802.3 and contains OUI, manufacturers model number, and revision number of the PHY.

Bits	Field Name	NVM Image Value	Description
15:8	PHY ID Byte3	0x00	
7:0	PHY ID Byte2	0x00	

38.20.24.7 Module Type 0 (0x0006)

This parameter is used by firmware to find out the module type on the port when connected to external modules. For example, the 10 GbE controller might be connected to an SFP+ or QSFP+ optical or direct attached copper modules. The format of the module type returns the ID and extended ID fields as defined in the SFP+ or QSFP+ specifications.

Bits	Field Name	NVM Image Value	Description
15:8	10G Compliance Code	0x00	SFF standard defines an 8-byte field used to indicate the electrical or optical support modes. These are bit-significant indicators that define the electronic or optical interfaces that are supported by the transceiver. At least one bit must be set in this field. SFP standard defines this field in bytes 3-10 of the standard address space. SFP standard defines this field in bytes 131-138 of the standard address space. For 10 GbE SFP+ modules this byte is decoded as follows: Bit[0] = SFP+ Cu passive. Bit[1] = SFP+ Cu active. Bits[3:2] = Reserved. Bits[7:4] = Decoded according to the SFP+ 10 GbE compliance codes (byte 3): Bit[4] = 10GBASE-SR. Bit[5] = 10GBASE-LR. Bit[6] = 10GBASE-LRM. Bit[7] = 10GBASE-ER.
7:0	Module Identifier	0x3	Defined by SFP+ (Addr 0xA0, Byte 0) or QSFP+ (Addr 128, page 0) specifications. 0x3 = SFP. 0xD = QSFP+. All other values are reserved.

38.20.24.8 Module Type 1 (0x0007)

This parameter is used by firmware to find out the module type on the port when connected to external modules. For example, the 10 GbE controller might be connected to an SFP+ or QSFP+ optical or direct attached copper modules. The format of the module type returns the ID and extended ID fields as defined in the SFP+ or QSFP+ specifications.

Bits	Field Name	NVM Image Value	Description
15:10	Reserved	0x00	Reserved.
9:8	Pause Ability Default	0x0	This parameter is used by the firmware to control the default setting for IEEE 802.3x PAUSE ability of the port. This default is also advertised if auto-negotiation is enabled. Bit 8: Set to 1b to enable IEEE 802.3x Tx link pause ability, or set to 0b to disable pause ability. Bit 9: Set to 1 to enable IEEE 802.3x Rx link pause ability, or set to 0b to disable pause ability. ***Note:*** This field is preserved by Intel NVM update tool.
7:0	1G Compliance Code	0x00	SFF standard defines an 8-byte field used to indicate the electrical or optical support modes. These are bit significant indicators that define the electronic or optical interfaces that are supported by the transceiver. At least one bit must be set in this field. SFP standard defines this field in byte 3-10 of the standard address space. SFP standard defines this field in byte 131-138 of the standard address space. 1 GbE compliance codes are in SFP byte 6. 1 GbE compliance codes are in QSFP byte 134.

38.20.24.9 PHY Capabilities Misc0 (0x0008)

Bits	Field Name	NVM Image Value	Description
15:14	Reserved	0x0	Reserved.
13	Enable 1G SFP 1GBASE-T	0b	When set to 1b, enables 1GBASE-T link through SFP.
12	Disable Link Management FW	0b	When set to 1b, link management firmware is disabled.
11	Enable Module Qualification	0b	When, set to 1b, module qualification process is enabled.
10	Low Power Ability	1b	Certain external PHYs connected to the port may have the ability to support low power mode. Setting the PHY in Low power mode affects normal operation. 0 = Otherwise. 1 = PHY supports low power ability.
9:8	Pause Ability	0x3	Used by the firmware to configure or advertise the IEEE 802.3x PAUSE ability of the port. Bit 0.0 = Set to 1b to enable IEEE 802.3x Tx link pause ability, or set to 0b to disable pause ability. Bit 0.1 = Set to 1b to enable IEEE 802.3x Rx link pause ability, or set to 0b to disable pause ability. ***Note:*** The Link Flow Control (LFC or Link Pause) is enabled through pause ability bits during PHY auto-negotiation and the PFC is enabled through DCBX protocol. The LFC and PFC features are mutually exclusive. So the management should disable link pause on links where PFC should be enabled.

Bits	Field Name	NVM Image Value	Description
7:0	Link Speed	0x8	Used by firmware to configure or advertise various link speeds supported on the port. The device may have the ability to support multiple link speeds on the same port. One of the link speeds may be enabled due to the result of auto-negotiation or manually set by FW when auto-negotiation is disabled or not used. Link Rate Supported on port: Bit 0.0 = Reserved Bit 0.1 = Reserved Bit 0.2 = 1 Gb/s Bit 0.3 = 10 Gb/s Bit 0.4 = Reserved Bit 0.5 = Reserved All other values are reserved. Must be zero.

38.20.24.10PHY Capabilities Misc1 (0x0009)

Bits	Field Name	NVM Image Value	Description
15:8	Multi-Speed Module Timeout	0x64	Configurable number of ms to wait for link establishment when running the multi-speed module flow. ***Note:*** This field is preserved by Intel NVM update tool.
7:0	Reserved	0x40	Reserved

38.20.24.11PHY Capabilities Misc2 (0x000B)

Bits	Field Name	NVM Image Value	Description
15:11	Reserved	0x0	Reserved
10	Reset Method	0x1	Should be set the same for all ports connected to the external PHY. Valid values are: 0x0 = Port expander. 0x1 = SDP.
9:8	Reserved	0x0	Reserved
7:6	External PHY Channel	0x0	The channel # used to configure this port. Valid only if INT-EXT PHY Select word bit 6 (user re-timer) is set for this port.
5:4	External PHY I^2C Connection	0x0	I^2C used to access the external PHY. Valid only if INT-EXT PHY Select word bit 6 (user re-timer) is set for this port.
3	External_-PHY_GPIO_po-larty_1G_LED	0x0	Valid values are: 0x0 = Active low. 0x1 = Active high.
2	External_-PHY_GPIO_en-able_1G_LED	0x0	Valid values are: 0x0 = Disabled. 0x1 = Enabled.
1	Reserved	0x1	Reserved

Bits	Field Name	NVM Image Value	Description
0	Default Low Power Ability	0x0	This is the default value that the system operates in. It has a different meaning for BASE-T and QSFP. For BASE-T, this is ignored if NVM loaded <Low Power Ability> = high power, further this field should be set to high power mode for link to come up at power up. For QSFP+, this is ignored if NVM loaded <Low Power Ability> = low power, further when this field is set to low power mode and a high power QSFP+ module is used then link would not come up until the software device driver changes power mode to high power. 1b = Low Power Mode 0b = High Power Mode ***Note:*** This field is preserved by the Intel NVM update tool.

38.20.24.12Re-Timer and PCA Address (0x000C)

Bits	Field Name	NVM Image Value	Description
15:8	PCA Address	0xDE	Should be set the same for all ports connected to the external PHY.
7:0	Re-timer Address	0xBE	

38.20.25 Feature Configuration Section Summary Table

NVM adaptive feature configuration.

Word Offset	Description	Reference

38.20.26 Immediate Values Section Summary Table

Required for NVM update with existing NUP.

Word Offset	Description	Reference

38.20.27 External-to-Internal PHY Mapping 0 Section Summary Table

This section provides the internal PHY mode to be selected for each external PHY/ module counter part.

The 10 GbE controller provides multiple PHY interface for connecting different types of external PHYs and optical or copper modules. The end user can plug-in different types of modules into the SFP+ or QSFP+ connectors and choose from several connectivity options when using external PHYs. For example, a 10GBASE-T PHY could use a KR connection to connect to the 10 GbE controller.

Firmware has to read the PHY or module ID and choose the appropriate interface to operate with that external module. Furthermore, when working with an external 10GBASE-T PHY, auto-negotiation might result in several speed modes.

Word Offset	Description	Page
0x0000	Section Length	2613
0x0001	Mapping Word0	2613
0x0002	Reserved	

38.20.27.1 Section Length (0x0000)

The length of the section in words. Note that section length does not include a count for the section length word.

Bits	Field Name	NVM Image Value	Description
15:0	Section Length		Length in: 2 Bytes unit - 1. First Section -> Word: External to Internal PHY Mapping 0 -> Section Length Last Section -> Word: External to Internal PHY Mapping 0 -> Mapping Word 0

38.20.27.2 Mapping Word0 (0x0001)

Bits	Field Name	NVM Image Value	Description
15:14	10GBASE-CR1	0x2	Internal interface for 10GBASE-CR1 external module. 00b = Reserved 01b = CR1 (This option may be used for 4x10Gb/s with QSFP+ modules) All other values are reserved.
13:12	10GBASE-SFP+Cu	00b	Internal interface for 10GBASE-SFP+Cu external module. 00b = Reserved 01b = SFI All other values are reserved.
11:10	10GBASE-LR	00b	Internal interface for 10GBASE-LR external module. 00b = Reserved (this option may be used with external SFI PHY) 01b = SFI All other values are reserved.
9:8	10GBASE-SR	00b	Internal interface for 10GBASE-SR external module. 00b = Reserved (this option may be used with external SFI PHY) 01b = SFI All other values are reserved.
7:6	10GBASE-T	0x1	Internal interface for 10GBASE-TX external PHY. 00b = Reserved 01b = 10GBASE-KR All other values are reserved.
5:4	1000BASE-T	00b	Internal interface for 1000BASE-T external PHY. All values are reserved.
3:0	Reserved	0x0	Reserved.

38.20.28 Internal PHY Configuration Override Section Summary Table

Includes static configurations of the internal PHY registers for PLL lock.

Word Offset	Description	Reference

0x0003	LCB Data	2627

38.20.30.1 LCB Attributes (0x0002)

Part of a Type 4 structure to load the PCIe LCB unit.

Bits	Field Name	NVM Image Value	Description
15:5	Length	0x060	
4:3	Skip	00b	
2:0	Reserved	000b	Reserved.

38.20.30.2 LCB Data (0x0003)

Raw data module length: 256 words.

Part of a Type 4 structure to load the PCIe LCB unit.

38.20.31 Auto-generated Pointers Module Section Summary Table

Pointers to Type 1/2 words used by EMP and software.

Word Offset	Description	Page
0x7D80	Module Length	2629
0x7D81	Pointer to PFPM_APM Section	2629
0x7D82	Pointer to PFPM_APM Offset	2629
0x7D83	Pointer to PRTPM_GC Section	2629
0x7D84	Pointer to PRTPM_GC Offset	2630

38.20.31.1 Module Length (0x7D80)

Bits	Field Name	NVM Image Value	Description
15:0	Module Length		Length in: 2 Bytes unit - 1. First Section -> Word: Auto Generated Pointers Module -> Module Length Last Section -> Word: Auto Generated Pointers Module -> Pointer to PRTGEN_CNF offset

38.20.31.2 Pointer to PFPM_APM Section (0x7D81)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PFPM_APM Section	0x0000	

38.20.31.3 Pointer to PFPM_APM Offset (0x7D82)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PFPM_APM Offset	0x0089	

38.20.31.4 Pointer to PRTPM_GC Section (0x7D83)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to PRTPM_GC Section		

38.20.31.5 Pointer to PRTPM_GC Offset (0x7D84)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PRTPM_GC Offset	0x00B7	

38.20.31.6 Pointer to GLGEN_STAT Section (0x7D85)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to GLGEN_STAT Section	0x0000	

38.20.31.7 Pointer to GLGEN_STAT Offset (0x7D86)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to GLGEN_STAT Offset	0x0002	

38.20.31.8 Pointer to GLPCI_SERL Section (0x7D87)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to GLPCI_SERL Section	0x0000	

38.20.31.9 Pointer to GLPCI_SERL Offset (0x7D88)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to GLPCI_SERL Offset	0x00DF	

38.20.31.10Pointer to GLPCI_SERH Section (0x7D89)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to GLPCI_SERH Section		

38.20.31.11Pointer to GLPCI_SERH Offset (0x7D8A)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to GLPCI_SERH Offset	0x00E1	

38.20.31.12Pointer to PRTGL_SAL Section (0x7D8B)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PRTGL_SAL Section	0x0000	

38.20.31.13Pointer to PRTGL_SAL Offset (0x7D8C)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PRTGL_SAL Offset	0x0057	

38.20.31.14Pointer to PRTGL_SAH Section (0x7D8D)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to PRTGL_SAH Section		

38.20.31.15Pointer to PRTGL_SAH Offset (0x7D8E)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PRTGL_SAH Offset	0x0062	

38.20.31.16Pointer to GLPCI_CAPSUP Section (0x7D8F)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to GLPCI_CAPSUP Section		

38.20.31.17Pointer to GLPCI_CAPSUP Offset (0x7D90)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to GLPCI_CAPSUP Offset	0x00E8	

38.20.31.18Pointer to PRTDCB_MFLCN Section (0x7D91)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to PRTDCB_MFLCN Section		

38.20.31.19Pointer to PRTDCB_MFLCN Offset (0x7D92)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PRTDCB_MFLCN Offset	0x006D	

38.20.31.20Pointer to PRTDCB_FCCFG Section (0x7D93)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to PRTDCB_FCCFG Section		

38.20.31.21Pointer to PRTDCB_FCCFG Offset (0x7D94)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PRTDCB_FCCFG Offset	0x01D7	

38.20.31.22Pointer to PFGEN_PORTNUM Section (0x7D95)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PFGEN_PORTNUM Section	0x0000	

38.20.31.23Pointer to PFGEN_PORTNUM Offset (0x7D96)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PFGEN_PORTNUM Offset	0x0295	

38.20.31.24Pointer to PFPCI_FUNC2 Section (0x7D97)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to PFPCI_FUNC2 Section		

38.20.31.25Pointer to PFPCI_FUNC2 Offset (0x7D98)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PFPCI_FUNC2 Offset	0x006C	

38.20.31.26Pointer to PFPCI_CLASS Section (0x7D99)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to PFPCI_CLASS Section		

38.20.31.27Pointer to PFPCI_CLASS Offset (0x7D9A)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PFPCI_CLASS Offset	0x00B2	

38.20.31.28Pointer to PF_VT_PFALLOC_PCIE Section (0x7D9B)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to PF_VT_PFALLOC_PCIE Section		

38.20.31.29Pointer to PF_VT_PFALLOC_PCIE Offset (0x7D9C)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PF_VT_PFALLOC_PCIE Offset	0x008F	

38.20.31.30Pointer to PF_VT_PFALLOC Section (0x7D9D)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to PF_VT_PFALLOC Section		

38.20.31.31Pointer to PF_VT_PFALLOC Offset (0x7D9E)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PF_VT_PFALLOC Offset	0x02B8	

38.20.31.32Pointer to GLGEN_PCIFCNCNT Section (0x7D9F)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to GLGEN_PCIFCNCNT Section		

38.20.31.33Pointer to GLGEN_PCIFCNCNT Offset (0x7DA0)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to GLGEN_PCIFCNCNT Offset	0x0100	

38.20.31.34Pointer to GLPCI_REVID Section (0x7DA1)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to GLPCI_REVID Section		

38.20.31.35Pointer to GLPCI_REVID Offset (0x7DA2)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to GLPCI_REVID Offset	0x00EE	

38.20.31.36Pointer to PFPCI_DEVID Section (0x7DA3)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to PFPCI_DEVID Section		

38.20.31.37Pointer to PFPCI_DEVID Offset (0x7DA4)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PFPCI_DEVID Offset	0x0026	

38.20.31.38Pointer to GLPCI_SUBVENID Section (0x7DA5)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to GLPCI_SUBVENID Section		

38.20.31.39Pointer to GLPCI_SUBVENID Offset (0x7DA6)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to GLPCI_SUBVENID Offset	0x00D9	

38.20.31.40Pointer to PFPCI_SUBSYSID Section (0x7DA7)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to PFPCI_SUBSYSID Section		

38.20.31.41Pointer to PFPCI_SUBSYSID Offset (0x7DA8)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PFPCI_SUBSYSID Offset	0x0049	

38.20.31.42Pointer to GLPCI_VENDORID Section (0x7DA9)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to GLPCI_VENDORID Section		

38.20.31.43Pointer to GLPCI_VENDORID Offset (0x7DAA)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to GLPCI_VENDORID Offset	0x00FC	

38.20.31.44Pointer to GLPCI_CNF2 Section (0x7DAB)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to GLPCI_CNF2 Section		

38.20.31.45Pointer to GLPCI_CNF2 Offset (0x7DAC)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to GLPCI_CNF2 Offset	0x00DD	

38.20.31.46Pointer to PFPCI_FUNC Section (0x7DAD)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to PFPCI_FUNC Section		

38.20.31.47Pointer to PFPCI_FUNC Offset (0x7DAE)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PFPCI_FUNC Offset	0x00E3	

38.20.31.48Pointer to GLGEN_PCIFCNCNT Section (0x7D9F)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to GLGEN_PCIFCNCNT section		

38.20.31.49Pointer to GLGEN_PCIFCNCNT Offset (0x7DA0)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to GLGEN_PCIFCNCNT offset	0x100	

38.20.31.50Pointer to GLPCI_REVID Section (0x7DA1)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to GLPCI_REVID section		

38.20.31.51Pointer to GLPCI_REVID Offset (0x7DA2)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to GLPCI_REVID offset	0xEE	

38.20.31.52Pointer to PFPCI_DEVID Section (0x7DA3)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to PFPCI_DEVID section		

38.20.31.53Pointer to PFPCI_DEVID Offset (0x7DA4)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PFPCI_DEVID offset	0x26	

38.20.31.54Pointer to GLPCI_SUBVENID Section (0x7DA5)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to GLPCI_SUBVENID section		

38.20.31.55Pointer to GLPCI_SUBVENID Offset (0x7DA6)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to GLPCI_SUBVENID offset	0xD9	

38.20.31.56Pointer to PFPCI_SUBSYSID Section (0x7DA7)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to PFPCI_SUBSYSID section		

38.20.31.57Pointer to PFPCI_SUBSYSID Offset (0x7DA8)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PFPCI_SUBSYSID offset	0x49	

38.20.31.58Pointer to GLPCI_VENDORID Section (0x7DA9)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to GLPCI_VENDORID section		

38.20.31.59Pointer to GLPCI_VENDORID Offset (0x7DAA)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to GLPCI_VENDORID offset	0xFC	

38.20.31.60Pointer to GLPCI_CNF2 Section (0x7DAB)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to GLPCI_CNF2 section		

38.20.31.61Pointer to GLPCI_CNF2 Offset (0x7DAC)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to GLPCI_CNF2 offset	0xDD	

38.20.31.62Pointer to PFPCI_FUNC Section (0x7DAD)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to PFPCI_FUNC section		

38.20.31.63Pointer to PFPCI_FUNC Offset (0x7DAE)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PFPCI_FUNC offset	0xE0	

38.20.31.64Pointer to PFPCI_CNF Section (0x7DAF)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to PFPCI_CNF section		

38.20.31.65Pointer to PFPCI_CNF Offset (0x7DB0)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PFPCI_CNF offset	0x3	

38.20.31.66Pointer to GLPCI_CAPCTRL Section (0x7DB1)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to GLPCI_CAPCTRL section		

38.20.31.67Pointer to GLPCI_CAPCTRL Offset (0x7DB2)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to GLPCI_CAPCTRL offset	0xE6	

38.20.31.68Pointer to GLGEN_GPIO_CTL Section (0x7DB3)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to GLGEN_GPIO_CTL section		

38.20.31.69Pointer to GLGEN_GPIO_CTL Offset (0x7DB4)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to GLGEN_GPIO_CTL offset	0x3	

38.20.31.70Pointer to GLGEN_LED_CTL Section (0x7DB5)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to GLGEN_LED_CTL section		

38.20.31.71Pointer to GLGEN_LED_CTL Offset (0x7DB6)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to GLGEN_LED_CTL offset	0x3F	

38.20.31.72Pointer to PFGEN_PORTNUM_CAR Section (0x7DB7)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to PFGEN_PORTNUM_CAR section		

38.20.31.73Pointer to PFGEN_PORTNUM_CAR Offset (0x7DB8)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PFGEN_PORTNUM_CAR offset	0x66	

38.20.31.74Pointer to PFGEN_PORTMDIO_NUM Section (0x7DB9)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to PFGEN_PORTMDIO_NUM section		

38.20.31.75Pointer to PFGEN_PORTMDIO_NUM Offset (0x7DBA)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PFGEN_PORTMDIO_NUM offset	0x3	

38.20.31.76Pointer to PRTTSYN_CTL0 Section (0x7DBB)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to PRTTSYN_CTL0 section		

38.20.31.77Pointer to PRTTSYN_CTL0 Offset (0x7DBC)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PRTTSYN_CTL0 offset	0x2F	

38.20.31.78Pointer to PRTGEN_CNF Section (0x7DBF)

Bits	Field Name	NVM Image Value	Description
15:0	Cloned pointer to PRTGEN_CNF section		

38.20.31.79 Pointer to PRTGEN_CNF Offset (0x7DC0)

Bits	Field Name	NVM Image Value	Description
15:0	Pointer to PRTGEN_CNF Offset	0xAC	

38.20.32 EMP Global Module Section Summary Table

This section contains two sub-sections:

1. Vendor specific settings: Settings for external PHY or modules. This part has a proprietary format to enable advanced, vendor-specific PHY settings. These settings are loaded into the external devices via the MDIO/I^2C interface.
2. List of qualified modules: Parameter list of up to 16 modules. Per-module list holds OUI, revision, and version numbers.

Word Offset	Description	Page
0x13000	Section Length	2641
0x13001	Number of Qualified Modules	2642
0x13002 + 12*n, n=0...15	Module OUI Bytes 0-1	2642
0x13003 + 12*n, n=0...15	Module OUI Byte 2	2642
0x13004 + 12*n, n=0...15	Vendor Part Number Bytes 0-1	2642
0x13005 + 12*n, n=0...15	Vendor Part Number Bytes 2-3	2643
0x13006 + 12*n, n=0...15	Vendor Part Number Bytes 4-5	2643
0x13007 + 12*n, n=0...15	Vendor Part Number Bytes 6-7	2643
0x13008 + 12*n, n=0...15	Vendor Part Number Bytes 8-9	2643
0x13009 + 12*n, n=0...15	Vendor Part Number Bytes 10-11	2644
0x1300A + 12*n, n=0...15	Vendor Part Number Bytes 12-13	2644
0x1300B + 12*n, n=0...15	Vendor Part Number Bytes 14-15	2644
0x1300C + 12*n, n=0...15	Module Revision Number Bytes 0-1	2644
0x1300D + 12*n, n=0...15	Module Revision Number Bytes 2-3	2645
0x130C2	LESM Global Configurations	2645
0x130C3	LESM AN73 + PD State Configurations	2645
0x130C4	LESM 10G-KX4 State Configurations	2645
0x130C5	LESM 1G-KX State Configurations	2646
0x130C6	CRC8	2646

38.20.32.1 Section Length (0x13000)

The length of the section in words. Note that section length does not include a count for the section length word.

Bits	Field Name	NVM Image Value	Description
15:0	Section Length		Length in words of the section covered by CRC

38.20.32.2 Number of Qualified Modules (0x13001)

Number of valid entries (0 through 15) in the qualified modules' list.

Bits	Field Name	NVM Image Value	Description
15:0	Number of Qualified Modules	0x0010	

38.20.32.3 Module OUI Bytes 0-1[n] (0x13002 + 12*n, n=0...15)

OUI of qualified external modules.

SFP+: Address 0xA0, Byte 3-5

QSFP+: Address 133:131 page 0

Bits	Field Name	NVM Image Value	Description
15:8	Byte 1	0x00	
7:0	Byte 0	0x00	

38.20.32.4 Module OUI Byte 2[n] (0x13003 + 12*n, n=0...15)

OUI of qualified external modules.

SFP+: Address 0xA0, Byte 3-5

QSFP+: Address 133:131 page 0

Bits	Field Name	NVM Image Value	Description
15:8	Reserved	0x00	Reserved.
7:0	Byte 0	0x00	

38.20.32.5 Vendor Part Number Bytes 0-1[n] (0x13004 + 12*n, n=0...15)

Vendor Part Number of qualified external modules.

SFP+: Address 0xA0 Bytes 55:40

QSFP+: Address 183:168 page 0

Bits	Field Name	NVM Image Value	Description
15:8	Byte1	0x00	
7:0	Byte0	0x00	

38.20.32.6 Vendor Part Number Bytes 2-3[n] (0x13005 + 12*n, n=0...15)

Vendor Part Number of qualified external modules.

SFP+: Address 0xA0 Bytes 55:40

QSFP+: Address 183:168 page 0

Bits	Field Name	NVM Image Value	Description

38.20.33 Manageability Module Header Section Summary Table

This section contains parameters related to the manageability functionality such as connection type and others. It also points to subsections configuring the filters and the sideband interfaces.

Word Offset	Description	Page
0x14000	Section Length	2647
0x14001	Common Manageability Parameters	2647
0x14002	Common Manageability Parameters 2	2647
0x14003	Pass Through LAN 0 Configuration Pointer	2648
0x14004	Pass Through LAN 1 Configuration Pointer	2648
0x14005	Pass Through LAN 2 Configuration Pointer	2648
0x14006	Pass Through LAN 3 Configuration Pointer	2648
0x14007	Sideband Configuration Pointer	2648
0x14008	Flexible TCO Filter Configuration Pointer	2649
0x14009	Traffic Types Parameters	2649
0x1400A	OEM Structure Pointer	2650
0x1400B	CRC8	2650

38.20.33.1 Section Length (0x14000)

The length of the section in words. Note that section length does not include a count for the section length word.

Bits	Field Name	NVM Image Value	Description
15:0	Section Length		Length in words of the section covered by CRC.

38.20.33.2 Common manageability parameters (0x14001)

Bits	Field Name	NVM Image Value	Description
15:11	Reserved	0x00	Reserved.
10:8	Manageability Mode	010b	Manageability Mode. 000b = None 010b = Pass through (PT) mode
7:5	Reserved	000b	Reserved.
4	Force TCO Reset Disable	1b	If cleared, allows the BMC to do a Global reset of the device using the Force TCO SMBus or NC-SI commands 0 = Enable Force TCO reset. 1 = Disable Force TCO reset.
3	Reserved	0b	Reserved.
2	OS2BMC Capable	1b	OS2BMC Capable. 0 = Disabled 1 = Enabled
1:0	Reserved	00b	Reserved.

38.20.33.3 Common Manageability Parameters 2 (0x14002)

Bits	Field Name	NVM Image Value	Description
15:12	Reserved	0x0	Reserved.
11	Multi-Drop NC-SI	1b	Multi-Drop NC-SI. 0 = Point-to-point 1 = Multi-drop
10	Reserved	0b	Reserved.
9	EMP_LINK_ON	0b	Copy of the PRTPM_GC.EMP_LINK_ON bit for EMP use. 0 = Disable 1 = Enable
8:4	Reserved	0x00	Reserved.
3	LAN3_FTCO_ISOL_DIS	1b	Allow isolation of port 3 per BMC request. 0 = Enabled 1 = Disabled
2	LAN2_FTCO_ISOL_DIS	1b	Allow isolation of port 2 per BMC request. 0 = Enabled 1 = Disabled
1	LAN1_FTCO_ISOL_DIS	1b	Allow isolation of port 1 per BMC request. 0 = Enabled 1 = Disabled

Bits	Field Name	NVM Image Value	Description
0	LAN0_FTCO_ISOL_DIS	1b	Allow isolation of port 0 per BMC request. 0 = Enabled 1 = Disabled

38.20.33.4 Pass Through LAN 0 Configuration Pointer (0x14003)

Bits	Field Name	NVM Image Value	Description
15:0	Pass Through LAN 0 Configuration Pointer	0xFFFF	Points to the Pass Through Control Words Structure 0 section. For more detail on the Pass Through Control Words Structure 0 inner structure, see Section 38.21.

38.20.33.5 Pass Through LAN 1 Configuration Pointer (0x14004)

Bits	Field Name	NVM Image Value	Description
15:0	Pass Through LAN 1 Configuration Pointer	0xFFFF	Points to the Pass Through Control Words Structure 1 section. For more detail on the Pass Through Control Words Structure 1 inner structure, see Section 38.21.

38.20.33.6 Pass Through LAN 2 Configuration Pointer (0x14005)

Bits	Field Name	NVM Image Value	Description
15:0	Pass Through LAN 2 Configuration Pointer	0xFFFF	Points to the Pass Through Control Words Structure 2 section. For more detail on the Pass Through Control Words Structure 2 inner structure, see Section 38.21.

38.20.33.7 Pass Through LAN 3 Configuration Pointer (0x14006)

Bits	Field Name	NVM Image Value	Description
15:0	Pass Through LAN 3 Configuration Pointer	0xFFFF	Points to the Pass Through Control Words Structure 3 section. For more detail on the Pass Through Control Words Structure 3 inner structure, see Section 38.21.

38.20.33.8 Sideband Configuration Pointer (0x14007)

This module is 28 bytes long and must be mapped in the first valid 4 KB sector of the Flash.

Bits	Field Name	NVM Image Value	Description
15:0	Sideband Configuration Pointer	0xFFFF	Points to the Sideband Configuration Structure section. For more detail on the Sideband Configuration Structure inner structure, see Section 38.20.35.

38.20.33.9 Flexible TCO Filter Configuration Pointer (0x14008)

This section loads all of the flexible filters, The control + mask + filter data are repeatable as the number of filters. Section length in offset 0 is for all filters.

Bits	Field Name	NVM Image Value	Description
15:0	Flexible TCO Filter Configuration Pointer	0xFFFF	Points to the Flexible TCO Filter Configuration Structure section.

38.20.33.10Traffic Types Parameters (0x14009)

Bits	Field Name	NVM Image Value	Description
15:14	Reserved	00b	Reserved.
13:12	Port 3 traffic types	01b	Defines which type of traffic can flow to and from primary BMC connection on port 3. The traffic types defined by this field are enabled by the Manageability Mode field and the OS2BMC Capable bit in the Common Manageability Parameters 1 NVM word (see Section 38.20.33.2). 00b = Reserved. 01b = Network to BMC traffic only. 10b = OS2BMC traffic only. 11b = Both Network to BMC traffic and OS2BMC traffic.
11:10	Reserved	00b	Reserved.
9:8	Port 2 traffic types	01b	Defines which type of traffic can flow to and from primary BMC connection on port 2. The traffic types defined by this field are enabled by the Manageability Mode field and the OS2BMC Capable bit in the Common Manageability Parameters 1 NVM word (see Section 38.20.33.2). 00b = Reserved. 01b = Network to BMC traffic only. 10b = OS2BMC traffic only. 11b = Both Network to BMC traffic and OS2BMC traffic.
7:6	Reserved	00b	Reserved.
5:4	Port 1 traffic types	01b	Defines which type of traffic can flow to and from primary BMC connection on port 1 (see Section 38.20.33.2). The traffic types defined by this field are enabled by the Manageability Mode field and the OS2BMC Capable bit in the Common Manageability Parameters 1 NVM word. 00b = Reserved. 01b = Network to BMC traffic only. 10b = OS2BMC traffic only. 11b = Both Network to BMC traffic and OS2BMC traffic.
3:2	Reserved	00b	Reserved.
1:0	Port 0 traffic types	01b	Defines which type of traffic can flow to and from primary BMC connection on port 0. The traffic types defined by this field are enabled by the Manageability Mode field and the OS2BMC Capable bit in the Common Manageability Parameters 1 NVM word (see Section 38.20.33.2). 00b = Reserved. 01b = Network to BMC traffic only. 10b = OS2BMC traffic only. 11b = Both Network to BMC traffic and OS2BMC traffic.

38.20.33.11OEM Structure Pointer (0x1400A)

Bits	Field Name	NVM Image Value	Description
15:0	OEM Structure Pointer	0xFFFF	Points to the OEM section.

38.20.33.12CRC8 (0x1400B)

Bits	Field Name	NVM Image Value	Description
15	CRC Field Used	1b	CRC Field Used. 0 = CRC not used. 1 = CRC used.
14:8	Reserved	0x00	Reserved.
7:0	CRC8		CRC-8-CCITT: Start Section -> Word: Manageability Module Header -> Section Length End Section -> Word: Manageability Module Header -> OEM Structure Pointer

38.20.34 Flexible TCO Filter Configuration Structure Section Summary Table

This section contains the setting of the manageability flex filters for all the ports. Its format is described in the manageability section, in the flexible TCO filter configuration subsection.

Word Offset	Description	Page
0x0000	Section Length	2650
0x0001	Flexible Filter Data	2651
0x0002	CRC8	2651

38.20.34.1 Section Length (0x0000)

The length of the section in words. Note that section length does not include a count for the section length word.

Bits	Field Name	NVM Image Value	Description
15:0	Section Length		Length in: 2 Bytes unit - 1. First Section -> Word: Flexible TCO Filter Configuration Structure -> Section Length Last Section -> Word: Flexible TCO Filter Configuration Structure -> CRC8

38.20.34.2 Flexible Filter Data (0x0001)

Raw data module length: variable.

Flexible Filter Data.

38.20.34.3 CRC8 (0x0002)

Bits	Field Name	NVM Image Value	Description
15	CRC Field Used	1b	CRC Field Used 0 = CRC not used. 1 = CRC used.
14:8	Reserved	0x00	Reserved.
7:0	CRC8		CRC-8-CCITT: Start Section -> Word: Flexible TCO Filter Configuration Structure -> Section Length End Section -> Word: Flexible TCO Filter Configuration Structure -> Flexible Filter Data

38.20.35 Sideband Configuration Structure Section Summary Table

This section describes the setting of the different pass through interfaces (SMBus, NC-SI and MCTP).

Word Offset	Description	Page
0x0000	Section Length	2652
0x0001	SMBus Maximum Fragment Size	2652
0x0002	SMBus Notification Timeout and Flags	2652
0x0003	NC-SI Configuration 1	2653
0x0004	NC-SI Configuration 2	2653
0x0005	NC-SI Flow Control XOFF	2653
0x0006	NC-SI Flow Control XON	2654
0x0007	NC-SI HW Arbitration Configuration	2654
0x0008 - 0x000C	Reserved	
0x000D	OEM IANA	2654
0x000E	NC-SI over MCTP Message Types	2654
0x000F	NC-SI over MCTP Configuration	2654
0x0010	MCTP Rate Limiter Config 1	2655
0x0011	MCTP Rate Limiter Config 2	2655
0x0012	NC-SI Channel to Port Mapping	2655
0x0013	CRC8	2656

38.20.35.1 Section Length (0x0000)

The length of the section in words. Note that section length does not include a count for the section length word.

Bits	Field Name	NVM Image Value	Description
15:0	Section Length		Length in words of the section covered by CRC.

38.20.35.2 SMBus Maximum Fragment Size (0x0001)

Bits	Field Name	NVM Image Value	Description
15:0	Fragment size	0x0020	SMBus Maximum Fragment Size (bytes) Supported range is between 32 and 240 bytes. ***Note:*** In MCTP mode, this value should be set to 0x45 (64 bytes payload + 5 bytes of MCTP header).

38.20.35.3 SMBus Notification Timeout and Flags (0x0002)

Bits	Field Name	NVM Image Value	Description
15:8	SMBus Notification Timeout (ms)	0xFF	
7:6	SMBus Connection Speed	00b	SMBus Connection Speed 00b = Standard SMBus connection. 01b = 400 Kb/s fast I^2C. 10b = 1 Mb/s fast+ I^2C. 11b = Reserved.
5	SMBus Block Read command	0b	SMBus Block Read Command 0 = Block read command is 0xC0. 1 = Block read command is 0xD0.
4	Reserved	0b	Reserved.
3	Enable Fairness Arbitration	1b	MCTP Over SMBus Feature 0 = Disabled fairness arbitration. 1 = Enabled fairness arbitration.
2	Disable SMBus ARP Functionality	0b	Disable SMBus ARP Functionality 0 = SMBus ARP enabled. 1 = SMBus ARP disabled.
1	SMBus ARP PEC	1b	SMBus ARP PEC Should be set in MCTP modes. 0 = Disable SMBus ARP PEC. 1 = Enable SMBus ARP PEC.
0	SMBus Transaction PEC	0b	SMBus Transactions PEC Should be set in MCTP modes. 0 = Disable PEC — PEC is not added to master write or slave read transactions. A slave write transaction with PEC is dropped. 1 = Enable PEC — PEC is added for master SMBus write transactions. A PEC is added to slave read transactions and can be received in slave write transactions.

38.20.35.4 NC-SI Configuration 1 (0x0003)

Bits	Field Name	NVM Image Value	Description
15	Reserved	0b	Reserved.
14	Flow Control	0b	Flow Control 0 = NC-SI flow control disable. 1 = NC-SI flow control enable.
13:10	Reserved	0x0	Reserved.
9	NC-SI HW Arbitration Enable	0b	NC-SI Hardware Arbitration Enable 0 = Not supported. 1 = Supported.
8	Reserved	1b	Reserved.
7:5	Package ID	000b	Meaningful only when bit 15 of NC-SI Configuration 2 word (offset 0x07) is cleared.
4:0	Reserved	0x00	Reserved. Must be zero

38.20.35.5 NC-SI Configuration 2 (0x0004)

Bits	Field Name	NVM Image Value	Description
15	Read NC-SI Package ID	0b	Read NC-SI Package ID from: 0 = NVM, NC-SI Configuration 1 word bits 7:5 (offset 0x06). 1 = Reserved
14:10	Reserved	0x00	Reserved.
9:4	Reserved	0x01	Reserved.
3:0	Max XOFF Renewal	0x3	NC-SI Flow Control MAX XOFF Renewal (# of XOFF renewals allowed) 0x0 = Disabled. Unlimited number of XOFF frames can be sent. 0x1 = Up to 2 consecutive XOFFs frames can be sent by the device. 0x2 = Up to 3 consecutive XOFFs frames can be sent by the device. . . . 0xF = Up to 16 consecutive XOFFs frames can be sent by the device.

38.20.35.6 NC-SI Flow Control XOFF (0x0005)

Bits	Field Name	NVM Image Value	Description
15:0	XOFF Threshold	0x12B8	Tx buffer watermark for sending a XOFF NC-SI flow control packet in bytes. The XOFF Threshold value refers to the occupied space in the buffer. ***Notes:*** 1. Field relevant for NC-SI operation mode only. 2. To support a maximum packet size of 1.5 KB, the value programmed assuming a Tx buffer size of 8 KB value of field should be 0x12B8 (4,792 bytes).

38.20.35.7 NC-SI Flow Control XON (0x0006)

Bits	Field Name	NVM Image Value	Description
15:0	XON Threshold	0x1B48	Tx buffer water mark for sending a XON NC-SI flow control packet in bytes. The XON Threshold value refers to the available space in the TX buffer. ***Notes:*** 1. Field relevant for NC-SI operation mode only. 2. To support maximum packet size of 1.5 KB, the value programmed should be a positive value that equals: XOFF Threshold (refer to Section 6.5.5.7) + 1536 bytes. Assuming a TX Buffer size is 8 KB and the XOFF Threshold is 2,744 bytes value of field should be 0x1B48 (6,985 bytes).

38.20.35.8 NC-SI HW Arbitration Configuration (0x0007)

Bits	Field Name	NVM Image Value	Description
15:0	TOKEN Timeout	0xA000	NC-SI HW-Arbitration TOKEN Timeout (in NC-SI REF_CLK cycles - 20 ns). Setting value to 0 disables the timeout mechanism.

38.20.35.9 OEM IANA (0x000D)

Bits	Field Name	NVM Image Value	Description
15:0	OEM IANA	0x0000	If not zero and not 0x157, the device accepts additional OEM commands with this IANA number. These commands are accepted only if the OEM NVM Structure Pointer is valid. The set of commands accepted depends on the IANA value in this field. The regular Intel OEM commands are accepted only with IANA 0x157.

38.20.35.10NC-SI Over MCTP Message Types (0x000E)

Bits	Field Name	NVM Image Value	Description
15:8	NC-SI Control Message Type	0x02	Defines the MCTP message type used to identify NC-SI control packets.
7:0	NC-SI Pass Through Message Type	0x03	Defines the MCTP message type used to identify NC-SI pass through packets.

38.20.35.11NC-SI Over MCTP Configuration (0x000F)

Bits	Field Name	NVM Image Value	Description
15:7	Reserved	0x000	Reserved.
6	Simplified MCTP	0b	If set, only SOM and EOM bits are used for the reassembly process. Relevant only in SMBus mode
5	Disable ACLs	0b	If set, the ACLs on the PCIe VDMs are disabled.
4:0	Reserved	0x00	Reserved.

38.20.35.12MCTP Rate Limiter Config 1 (0x0010)

MCTP rate limiter configuration for first channel.

Bits	Field Name	NVM Image Value	Description
15:0	MCTP Rate	0x3E80	Defines the number of cycles between accesses of the MCTP send client to the memory arbiter. Current value assumes a clock of 125 MHz and a bus width of 128 bits. This value provides a bit rate of 1 Mb/s.

38.20.35.13MCTP Rate Limiter Config 2 (0x0011)

MCTP rate limiter configuration for first channel.

Bits	Field Name	NVM Image Value	Description
15	Decision Point	0b	Defines if, when credits are available, a full MCTP message is sent or a single VDM is sent. 0 = Per VDM. 1 = Per packet.
14:0	MCTP Max Credits	0x0005	Defines the maximum number of 16-byte credit that can be accumulated. These credits include the VDM header line (one line for each 64-byte VDM).

38.20.35.14NC-SI Channel to Port Mapping (0x0012)

Defines the mapping of NC-SI channels to Physical ports.

Note: The list of channel IDs must starts at zero and be consecutive.

Bits	Field Name	NVM Image Value	Description
15	Table Valid	0b	Table Valid 0 = Table invalid — Use default algorithm described in Channel ID mapping section. 1 = Table valid — Use the mapping defined in this word.
14:13	Port #3 channel ID	00b	
12	Port #3 Channel Enable	1b	Port #3 Channel Enable 0 = Disabled. 1 = Enabled.
11	Reserved	0b	Reserved.
10:9	Port #2 channel ID	00b	
8	Port #2 Channel Enable	1b	Port #2 Channel Enable 0 = Disabled. 1 = Enabled.
7	Reserved	0b	Reserved.
6:5	Port #1 channel ID	00b	
4	Port #1 Channel Enable	1b	Port #1 Channel Enable 0 = Disabled. 1 = Enabled.
3	Reserved	0b	Reserved.
2:1	Port #0 channel ID	00b	

Bits	Field Name	NVM Image Value	Description
0	Port #0 Channel Enable	1b	Port #0 Channel Enable 0 = Disabled. 1 = Enabled.

38.20.35.15CRC8 (0x0013)

Bits	Field Name	NVM Image Value	Description
15	CRC Field Used	1b	CRC Field Used 0 = CRC not used. 1 = CRC used.
14:8	Reserved	0x00	Reserved.
7:0	CRC8		CRC-8-CCITT: Start Section -> Word: Sideband Configuration Structure -> Section Length End Section -> Word: Sideband Configuration Structure -> NC-SI Channel to Port Mapping

38.20.36 OEM Section Summary Table

This section is the header of the OEM-specific data identifying the OEM for which this data is defined.

Word Offset	Description	Page
0x0000	Section Length	2656
0x0001	OEM Header	2656
0x0002 - 0x0005	Reserved	
0x0006	CRC8	2657

38.20.36.1 Section Length (0x0000)

The length of the section in words. Note that section length does not include a count for the section length word.

Bits	Field Name	NVM Image Value	Description
15:0	Section Length		Length in: 2 Bytes unit - 1. First Section -> Word: OEM Section -> Section Length Last Section -> Word: OEM Section -> CRC8

38.20.36.2 OEM Header (0x0001)

Bits	Field Name	NVM Image Value	Description
15:0	OEM Identifier	0x02A2	Identify the OEM for which this section is defined. Should be equal to the OEM IANA value.

38.20.36.3 CRC8 (0x0006)

Bits	Field Name	NVM Image Value	Description
15	CRC Field Used	1b	CRC Field Used. 0 = CRC not used. 1 = CRC used.
14:8	Reserved	0x00	Reserved.
7:0	CRC8		CRC-8-CCITT: Start Section -> Word: OEM Section -> Section Length End Section -> Word: OEM Section -> CEM Flags

38.20.37 EMP Settings Module Header Section Summary Table

This section contains the modes of operation of the EMP.

Word Offset	Description	Page
0x15000	Section Length	2657
0x15001	Common Firmware Parameters	2657
0x15002	Reserved	
0x15003	Features Enable	2658
0x15004	Reserved	
0x15005	Reserved	2658
0x15006	LLDP Configuration Pointer	2658
0x15007 - 0x1500A	Reserved	
0x1500B	LLDP TLVs Pointer	2658
0x1500C	CRC8	2658

38.20.37.1 Section Length (0x15000)

The length of the section in words. Note that section length does not include a count for the section length word.

Bits	Field Name	NVM Image Value	Description
15:0	Section Length		Length in words of the section covered by CRC.

38.20.37.2 Common Firmware Parameters (0x15001)

Bits	Field Name	NVM Image Value	Description
15:10	Reserved	0x5	Reserved.
9	PF reset on queue overflow	0b	PF Reset On Queue Overflow 0 = Disabled. 1 = Enabled.
8:0	Reserved	0x3	Reserved.

38.20.37.3 Features Enable (0x15003)

Describes support for various features.

Bits	Field Name	NVM Image Value	Description
15:12	Reserved	0x0	Reserved.
11:9	Switching Mode	000b	Switching mode in NVM. 000b = EVB switching 802.1Qbg/801.1BR switching. All other values are reserved.
8:1	Reserved	0x0	1 = reserved
4:1	Reserved	0x0	Reserved.
0	EVB Protocols Enabled	1b	If set, filtering according to IEEE 802.1QBg and 802.1BR specs is enabled. 0 = Disabled. 1 = Enabled.

38.20.37.4 LLDP Configuration Pointer (0x15006)

Bits	Field Name	NVM Image Value	Description
15:0	LLDP configuration pointer	0xFFFF	Points to the LLDP Configuration section.

38.20.37.5 LLDP TLVs Pointer (0x1500B)

Pointer to a set of fixed-structure TLVs used by the EMP.

Bits	Field Name	NVM Image Value	Description
15:0	LLDP TLVs Pointer	0xFFFF	Pointer to a set of fixed-structure TLVs used by the EMP. Points to the LLDP OEM TLVs section.

38.20.37.6 CRC8 (0x1500C)

Bits	Field Name	NVM Image Value	Description
15	CRC Field Used	1b	CRC Field Used 0 = CRC not used. 1 = CRC used.
14:8	Reserved	0x00	Reserved.
7:0	CRC8		CRC-8-CCITT: Start Section -> Word: EMP Settings Module Header -> Section Length End Section -> Word: EMP Settings Module Header -> LLDP TLVs pointer

38.20.38 LLDP Configuration Section Summary Table

Default settings to the embedded LLDP agent.

Word Offset	Description	Page
0x0000	Section Length	2659
0x0001	LLDP Admin Status (Factory)	2659
0x0002	msgFastTx	2660
0x0003	msgTxInterval	2660
0x0004	LLDP Tx Parameters	2660
0x0005	LLDP Initialization Timers	2660
0x0006	ENDLESS_XOFF_THRESH	2660
0x0007	DCBX Mode	2661
0x0008	Current Factory LLDP Admin Status	2661
0x0009	CRC8	2661

38.20.38.1 Section Length (0x0000)

The length of the section in words. Note that section length does not include a count for the section length word.

Bits	Field Name	NVM Image Value	Description
15:0	Section Length		Length in words of the section covered by CRC.

38.20.38.2 LLDP Admin Status-Factory (0x0001)

Defines status of LLDP agent. Each LAN port has independent status.

3: Both receive and transmit enabled.
2: LLDP is configured for transmits only.
1: LLDP is configured for receives only.
0: LLDP agent is disabled.

Bits	Field Name	NVM Image Value	Description
15:12	Port 3	0x3	Defines status of LLDP agent. Applies to LAN Port 3.
11:8	Port 2	0x3	Defines status of LLDP agent. Applies to LAN Port 2.
7:4	Port 1	0x3	Defines status of LLDP agent. Applies to LAN Port 1.
3:0	Port 0	0x3	Defines status of LLDP agent. Applies to LAN Port 0.

38.20.38.3 msgFastTx (0x0002)

Bits	Field Name	NVM Image Value	Description
15:0	msgFastTx	0x0001	Time interval in timer ticks (seconds) between PDU transmits during fast transmits period.

38.20.38.4 msgTxInterval (0x0003)

Bits	Field Name	NVM Image Value	Description
15:0	msgTxInterval	0x001E	Time in timer ticks (seconds) between transmissions during normal transmission.

38.20.38.5 LLDP Tx Parameters (0x0004)

Bits	Field Name	NVM Image Value	Description
15:8	txCreditMax	0x05	Determines maximum number of LLDPDUs that can be sent per second.
7:0	msgTxHold	0x04	Used as a multiplier of *msgTxInterval* to determine the txTTL that is carried in the LLDP frames.

38.20.38.6 LLDP Initialization Timers (0x0005)

Timers used by LLDP agent during initialization and when to reinitialize. All times are in seconds.

Bits	Field Name	NVM Image Value	Description
15:8	reinitDelay	0x02	This parameter indicates the amount of delay, in seconds, from when adminStatus becomes disabled until re-initialization is attempted.
7:0	txFastInit	0x04	This variable is used as the initial value for the txFast variable. This value determines the number of LLDPDUs that are transmitted during a fast transmission period.

38.20.38.7 ENDLESS_XOFF_THRESH (0x0006)

Bits	Field Name	NVM Image Value	Description
15:0	ENDLESS_XOFF_THRESH	0x0A	Defines a time limit the firmware waits for XOFF condition during PFR flow. The time is defined in 1 ms units. A possible default setting is 10 ms.

38.20.38.8 DCBX Mode (0x0007)

Defines per-PORT DCBX mode. Note that each port could be configured independently regardless of the other ports configurations.

0: No DCBX is supported.

1: IEEE DCBX only.

2: CEE DCBX only.

3: Auto-select, starting in IEEE (default).

Bits	Field Name	NVM Image Value	Description
15:12	DCBX Port[3]	0x3	Port[3] DCBX mode
11:8	DCBX Port[2]	0x3	Port[2] DCBX mode
7:4	DCBX Port[1]	0x3	Port[1] DCBX mode
3:0	DCBX Port[0]	0x3	Port[0] DCBX mode

38.20.38.9 Current Factory LLDP Admin Status - 0x0008

Defines the status of each LLDP agent. Each LAN port has independent status.

0xF = Value is invalid, use factory LLDP Admin Status.

0x3 = Both receive and transmit enabled.

0x2 = LLDP is configured for transmits only.

0x1 = LLDP is configured for receives only.

0x0 = LLDP agent is disabled.

Bits	Field Name	NVM Image Value	Description
15:12	Port 3	0xF	Defines status of the LLDP agent. Applies to LAN Port 3.
11:8	Port 2	0xF	Defines status of the LLDP agent. Applies to LAN Port 2.
7:4	Port 1	0xF	Defines status of the LLDP agent. Applies to LAN Port 1.
3:0	Port 0	0xF	Defines status of the LLDP agent. Applies to LAN Port 0.

38.20.38.10CRC8 (0x0009)

Bits	Field Name	NVM Image Value	Description
15	CRC Field Used	1b	CRC Field Used 0 = CRC not used. 1 = CRC used.
14:8	Reserved	0x00	Reserved.
7:0	CRC8		CRC-8-CCITT: Start Section -> Word: LLDP Configuration -> Section Length End Section -> Word: LLDP Configuration -> Current Factory LLDP Admin Status

38.20.39 PHY_0 pre-PLL Section Summary Table

Includes static configurations of the internal PHY registers for PLL lock.

38.21.1 Receive Classification Filters

38.21.1.1 Introduction

This section describes the receive classification filters that direct inbound packets to a processing engine or cluster out of the following: LAN engine and RDMA engine (also named as Protocol Engine or PE). The filters also define a specific queue or a context within the selected engine. All the filters described in this section relate to filtering within a specific VSI which is defined by the switch filters.

The classification filters and other header processing units in the device inspect the first 480 bytes of the received packets. If the identified headers exceed 480 bytes, they are reported as an unidentified L2 packet type with no offloads other than Ethernet CRC. They are also handled this way by the classification filters.

38.21.1.1.1 Association with a Packet Engine

The general rule is that a frame is tested to be PE types. If the frame is neither, it is considered to be a LAN frame. The PE protocol uses the services of the LAN engine for certain frames. Such frames are forwarded to the LAN engine.

- Filtering to the PE or LAN is based on a set of rules defined in Section 38.21.3.8.1 and a set of the following filters: APBVT L4 port table (described in Section 38.21.3.8.2) and PE quad-hash filter (described in Section 38.21.3.8.3).

38.21.1.1.2 Receive Classification Filters Priority and Usage

Received traffic goes through a set of filters that determine the destination of each received frame. The receive classification filters operate on frames received from the network as well as frames forwarded by the internal switch from a local port (VSI). If a frame is replicated by the internal switch, each replica goes independently through the filters.

The programming interface of the filters are described in the following sections.

The following filters operate on received frames listed in priority ordering. A frame can match multiple filters. If multiple filters define the same action, then the higher priority enabled matched filter takes precedence. If a frame does not match any of the filters below (with a queue action), the frame is directed to the default queue (queue zero of the VSI).

- PE quad-hash filters — see Section 38.21.3.8.3
- Ether-type — see Section 38.21.3.4
- Flow Director (FD)
- MAC/VLAN — see Section 38.21.3.4
- Hash filters (including RSS) — see Section 38.21.3.6

Note: In proper programming, the following filters are expected to be mutually exclusive. Meaning, the same packet is not expected to match more than one of them: PE Quad hash filter, Ether-type filter and FD filter.

The PE quad hash filter are enabled per VSI by the VSIQF_CTL registers. The Hash filter is enabled per function per packet type by the PFQF_HENA for the PFs and the VFQF_HENA for the VFs. The Ether-type filter, MAC/VLAN filter and FD filter are enabled per PF and its VFs by the PFQF_CTL_0 registers.

The Table 38-124 lists the typical use cases of the classification filters and its programming option per function.

Table 38-124.Classification filters per PF/VF

VSI	MAC/VLAN, S-Tag and Cloud Switch Filters	Ether-type	PE Quad Hash	Flow Director (FD)	Hash
Main Usage	VMDq1	Control Port / L2 Protocols	RDMA	Flex Filters[1]	Load Balance
Programming exposed to the PF	Yes	Yes	Yes [a]	Yes	Yes
Programming exposed to the VF	No	No	Yes [a]	No	No
1.					

Notes:

1. There are two main usages for FD filters: software driver controlled filters for ATR and user/operating system controlled filters.

Once a frame matches a filter, the filter provides one or more actions to be performed on the frame. Listed below are those actions enabled by the filters while Table 38-125 lists which of these actions are enabled per filter type:

- Accept / reject — A decision whether the frame is dropped by the hardware or posted to the device engines for its processing and optionally posted to host memory.
- LAN / PE — A decision whether the frame is posted to LAN or PE engines.
- Receive queue — Associate the frame to a queue index within the VSI space.

- Context ID — Match the frame to a context ID associated with the flow (PE QPN).
- Increment statistical counter — Increment the statistical counters associated with the filter.
- Software field (filter ID) — Filter ID provided at filter programming and reported back with the matched received packets.
- Packet Bytes — Post bytes from the packet to the receive descriptor. Bytes that should be reported in the receive descriptor can be taken from the *Flexible Bytes* in the field vector.

Table 38-125 lists the type of actions possible by each filter type.

Table 38-125.Filter actions by filter type

Action	MAC / VLAN / Ether-type / S-Tag / Cloud Switch Filters	PE Quad Hash	Flow Director	Hash
LAN/PE	LAN	PE	LAN	LAN
Receive Queue index / Context ID	Queue index within the VSI	QPN + LAN queue index within the VSI	Queue index within the VSI	Queue index within the TC range of queues
Accept / Reject			Yes	
Increment Stat Counter (one of 512 GLQF_PCNT)			Yes	
Report Filter ID		QPN	Filter ID	Hash signature
Report selected bytes from the receive packet			Programmable 4 or 8 bytes	

38.21.1.1.3 Receive Queue Index

As indicated in the previous section, one of the filter's action is the packet classification to LAN queues. The LAN queue index defined by the classification filters is a relative index within a specific VSI that is defined by the embedded switch. Assuming a classification filters defines a queue index 'n' then:

- VSI that is defined by the VSILAN_QTABLE (VSILAN_QBASE.VSIQTABLE_ENA = 1b). The queue index in the PF space equals to: VSILAN_QTABLE[n/2].QINDEX_0 for even 'n' and VSILAN_QTABLE[(n-1)/2].QINDEX_1 for odd 'n'.
- VSI that is defined by the VSILAN_QBASE (VSILAN_QBASE.VSIQTABLE_ENA = 0b. The queue index in the PF space equals to VSILAN_QBASE.VSIBASE + 'n'.
- VF queues — The mapping of the previous queue indexes to relative indexes in the VF space is not a direct mapping. The mapping is defined by the queue indexes in the PF space that are programmed in the VSILAN_QTABLE and the VPLAN_QTABLE registers. For example, assuming a VF with 4 queues in a single VSI with the following settings: VPLAN_QTABLE[0:3]=A,B,C,D (while A...D are the queue indexes in the PF space); VSILAN_QTABLE[0].QINDEX_0,QINDEX_1 = C,D and VSILAN_QTABLE[1].QINDEX_0,QINDEX_1=A,B. Then receiving a packet to queue 0 of the VSI is mapped to queue C in the PF space which is queue index 2 in the VF space.

The hash filter is a little bit more complex, while the queue index is a relative index within a specific range of queues (usually related to a TC) of a VSI. See Section 38.21.3.6.

Following are some exception rules for the receive queue index:

- If a frame does not match any of the classification filters (with a queue action), the frame is directed to the default queue (queue zero of the VSI).
- If the packet has a MAC error (reflected by the RXE flag in the receive descriptor), the packet is directed to the default queue (queue zero of the VSI that is defined by the PRT_SBPVSI register). Note that a packet with MAC error is posted to the host only if enabled by the SBP flag in the PRT_SBPVSI register.
- The receive queue index that defines an invalid queue causes the dropping of the matched received packets. Such packets are counted by the GLV_REPC counter of the VSI.
- The following sub-bullets list the cases on which a queue index is considered as invalid:
  - A VSI that is defined by VSILAN_QTABLE is limited to 16 queues, which is the size of this table. Therefore, a queue index that equals or is larger than 16 is considered invalid.
  - The queues in a VSI that is defined by VSILAN_QTABLE are enabled by the QINDEX_0 and QINDEX_1 parameters. A queue index that points to a VSILAN_QTABLE entry with a value of 0x7FF is considered invalid.
  - A VSI that is defined by VSILAN_QBASE.VSIBASE is limited only by the PF queue space. A queue index that exceeds the PF space is considered invalid.

38.21.1.1.4 Initialization

This section lists all registers associated with the classification filters directly or indirectly and its required initialization. Note that some of the text in this section might not be clear, lacking a complete description of the registers. This description is given in the following sections as well as in the Programming Interface chapter. The initialization sequence should be executed in the following order shown. Also described in the sub-sections that follow:

- Function Private Memory Allocation
- Queue Allocation
- Static Classification Filters Registers
- Dynamic Classification Filters Registers

Function private memory allocation

The PE quad hash filters are stored in the Function Private Memory (FPM) while part of them are fetched to the on-chip cache. These registers should be initialized per PF prior to any settings of the LAN queues and before any enablement of the PE filters.

Queue allocation

The LAN queue should be allocated before packets are directed to these queues. If this is not done, the packets are dropped.

PE quad hash filters as well as TCP port filters should be programmed before matched packets are expected. Receiving packets with non-matched filters are directed to the LAN queues of the function. The same rule applies for the DDP context table.

Static classification filters registers

Table 38-126.Static Classification Filters Registers Initialization

Register	Initialization Comments
PRTQF_CTL_0	Symmetric hash enablement is loaded from the NVM.
GLQF_CTL	Global classification parameters are loaded from the NVM.
VSIQF_CTL	Filtering enablement per VSI is programmed by the Add/Update VSI admin commands.
PFQF_CTL_0, PFQF_CTL_2	PF classification parameters should be initialized before the PE and DDP contexts programming.
VPQF_CTL	VF PE and DDP filters parameters should be initialized after the PFQF_CTL_0 register of the PF and before the VF enablement and the PE and DDP contexts programming.
GLQF_SWAP and GLQF_HSYM	Swap registers and symmetric hash registers are loaded from the NVM.
GLQF_NETKEY_PIT	The UDP network key structure is programmed by the Set Network Key Structure admin commands before any of the Add Tunneling UDP admin command are initiated.
PRTQF_FLX_PIT	The field vector registers related to the flexible payload are either loaded from the NVM or programmed by the PFs at driver initialization time.
PRTQF_FD_MSK	Mask registers for the input set of the flexible payload for the FD filter is loaded from the NVM or programmed by the PFs at driver initialization time.
VSIQF_TCREGION	The queue regions for 8 x TCs are programmed by the Add/Update VSI admin commands.
PFQF_FDALLOC	FD filter table allocation to PFs is loaded from the NVM.

Dynamic classification filters registers

Table 38-127.Dynamic Classification Filters Registers Initialization

Register	Initialization Comments
PFQF_HENA and VFQF_HENA	PCTYPE enablement for the Hash filters are programmed by the function (PF or VF) at run time.
PFQF_HREGION and VFQF_HREGION	Override the TC queue regions for specific PCTYPEs registers are programmed by the function (PF or VF) at run time.
PFQF_HKEY, PFQF_HLUT, VFQF_HKEY and VSIQF_HLUT	The hash key and LUT registers are programmed by the function (PF or VF) at run time.
GLQF_APBVT	The TCP port number table is programmed internally at run time by the PE.

38.21.1.2 Packet Types and Input Set

The 10 GbE controller parses the first 480 bytes of the received packets. The hardware identifies the protocol layers upon which packet classification types (PCTYPEs) are defined. The supported PCTYPEs are listed in the Table 38-128. For flow director, a second PCTYPE is derived from the original PCTYPE according to Table 38-129. The fields used for the classification filters (named as input set) are defined per filter per PCTYPE as listed in Table 38-128. The table lists a shared column for the input set of the FD filter and PE quad hash. The following section describes which PCTYPEs are relevant to each filter. See Section 38.21.3.8.3 for PE quad hash input set.

Table 38-128.Packet Classifier Types and its Input Sets (Sheet 1 of 2)

PCTYPE	PCTYPE Description	Hash Input Set	FD Input Set[1]

46	Frag IPv6	46
47	Reserved	47
L2 Packet Types		
52 ... 62	Reserved for future use	52 ... 62
63	L2 Payload	63

Notes:

1. The FDPCTYPE uses the inputs from the original PCTYPE configuration (GLQF_PTYPE and GLQF_PTYPE_ENA) and to input-set and mask selection (PRTQF_FD_INSET, PRTQF_FD_MSK, GLQF_FD_MSK), so the translation should be to a valid PCTYPE in the original list.

38.21.1.3 Filter's Input Set

The input set is defined per filter type as follows:

- Layer 2 filters that are used by the switch logic. These include: MAC filters; VLAN filters; S-Tag and Ether-type. The input set for these filters is defined in the Internal Switch chapter.
- PE APBVT. This is a non flexible filter and its input set is the destination TCP/UDP port number.
- The input set for the FD filter is flexible. Its input set for the 64 global PCTYPEs has two components:
  - A pre-defined byte stream is listed in Table 38-128.
  - A flexible input set defined by the PRTQF_FD_FLXINSET registers. A PRTQF_FD_FLXINSET register 'n' matches PCTYPE 'n' while each bit 'i' in the 8 bit INSET field in these registers enables word 'i' in the flexible field vector. If only a portion of a 16 bit word is required for the input set, the non-relevant bits can be masked out by the PRTQF_FD_MSK registers.
- The input set for the hash filter for the 64 global PCTYPEs is listed in Table 38-128.
- The input set for the PE quad hash filter for the 8 PE PCTYPEs is listed in Table 38-141 (programmed by the GLQF_PE_INSET registers that are loaded from the NVM).

38.21.1.4 Flexible Payload

The 10 GbE controller supports a flexible payload of 8 words (16 bytes) that are extracted from the payload of the packet. These 8 words can be extracted from up to 3 offsets within the payload. Payload is defined as follows:

- If a packet is identified as a L2 packet, payload is anything after the last Ether-type.
- If a packet is identified as a L3 packet, payload is anything after the inner identified L3 header.
- If a packet is identified as a L4 packet, payload is anything after the inner identified L4 header.

The flexible payload is stored in a field vector. This vector can be used by the FD filter as described in the following sections.

The 10 GbE controller parses the packets to protocol layers. For each protocol layer (Layers 2...4), Fort Park enables filtering on flexible payload that are defined by the GLQF_ORT[33:35] registers and the PRTQF_FLX_PIT registers. The GLQF_ORT[33:35] registers are loaded from the NVM and the PRTQF_FLX_PIT registers can be either loaded from the NVM or programmed by the PF at driver initialization time. The programming of the GLQF_ORT[33:35] registers are listed in Table 38-130. The programming of the PRTQF_FLX_PIT registers is listed in Table 38-131.

Register Initialization — All the registers related to flexible payload should be initialized before enabling the transmit and receive queues: PRTQF_FLX_PIT, PRTQF_FD_FLXINSET and PRTQF_FD_MSK registers.

Table 38-130.Flexible Payload (GLOQF_ORT[33:35] Registers)

Protocol Layer
L2 payload (starts after the last Ether-type[1]). The L2 payload is active only if L3 protocol is not found. The L2 payload is directed to the field vector by the PRTQF_FLX_PIT[0:2] registers. These are indicated by the GLQF_ORT[33] register. The GLQF_ORT[33] registers loaded from the NVM with the following values: FLX_PAYLOAD = 1b; PIT_INDX = 0x0; FIELD_CNT = 0x3
L3 payload (starts after the inner identified L3 header). The L3 payload is active only if L4 protocol is not found. Supported L3 protocols are: IPv4 (including any optional headers) and IPv6 (including all supported extension headers). The L3 payload is directed to the field vector by the PRTQF_FLX_PIT[3:5] registers. These are indicated by the GLQF_ORT[34] register. The GLQF_ORT[34] register is loaded from the NVM with the following values: FLX_PAYLOAD = 1b; PIT_INDX = 0x3; FIELD_CNT = 0x3
L4 payload (starts after the inner identified L4 header). Supported L4 protocols are: UDP, TCP, SCTP, ICMP, ICMPv6. The L4 payload is directed to the field vector by the PRTQF_FLX_PIT[6:8] registers. These are indicated by the GLQF_ORT[35] register. The GLQF_ORT[35] register is loaded from the NVM with the following values: FLX_PAYLOAD = 1b; PIT_INDX = 0x6; FIELD_CNT = 0x3

Notes:

1. An ARP packet is a special case on which the payload starts after the entire ARP header.

38.21.1.4.1 PRTQF_FLX_PIT Programming

As previously indicated, the PRTQF_FLX_PIT registers map the protocol layers payload (protocol layers = L2, L3, L4) to the field vector. During normal operation only one protocol layers payload is meaningful so the entire flexible payload in the field vector is available for each of them. The fields of the PRTQF_FLX_PIT registers are described in the Programming Interface chapter.

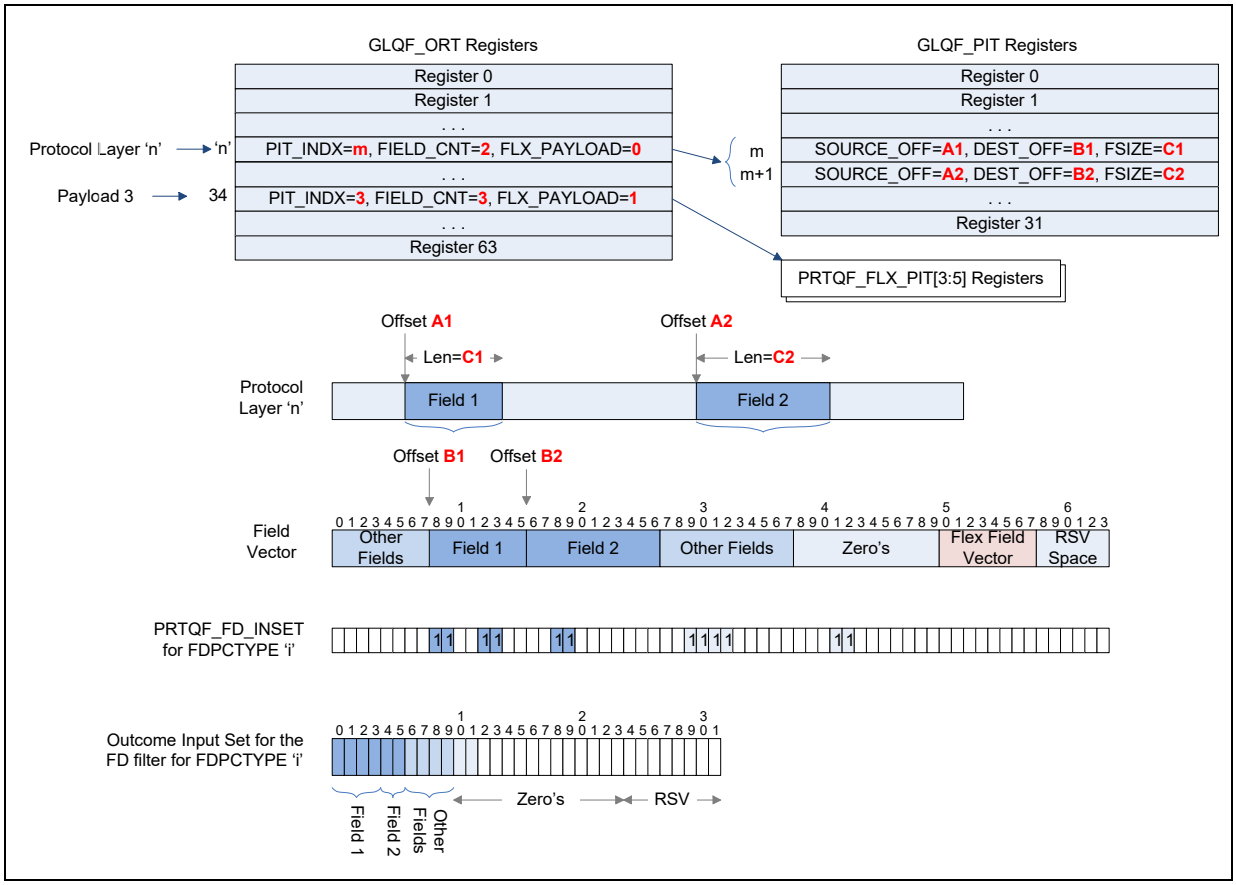
Table 38-131.PRTQF_FLX_PIT Registers' Field

Field	Description
SOURCE_OFF	Source word offset in the mapped protocol layer starting from its beginning. Setting source offset rules: • The SOURCE_OFF plus FSIZE should not exceed byte 480 of the packet. • Must be programmed in ascending order: Current Offset >= previous offset + previous FSIZE. • The previous rule applies for all entries, including non-used ones.
DEST_OFF	Destination word offset in the field vector. The destination offset can be set to 50...57 matching offset 0...7 in the flexible field vector, respectively. While DEST_OFF plus FSIZE must not be greater than 58. For non-used registers the DEST_OFF must be set to 0x63 (outside the range for active entries).
FSIZE	Field size defined in word units. For non-used registers the FSIZE must be set to 0x1.

38.21.2 Protocol Layers Filter's Fields and Packet Classifier Types

The 10 GbE controller parses the first 480 bytes of the received packets. The hardware identifies the protocol layers in this range and constructs a field vector used for all the filters. Each filter uses a different input set taken from the shared field vector. The protocol layers; field vector; filter fields as well as the input set are defined in the following subsections. The fields extracted from the protocol layers to the field vector are pre-defined. It is programmed by the GLQF_ORT and GLQF_PIT registers as well as the PRTQF_FLX_PIT registers. The default setting of the GLQF_ORT and GLQF_PIT registers loaded from the NVM is described in the sections that follow. The input set is defined per-filter per-packet classifier type as shown in the following sections. See Figure 38-1 for an input set example of the FD filter and the registers used to construct the input set.

Figure 38-1. Input Set Example for an FD Filter



38.21.3 ORT PIT Register Settings

This section defines the default hardware and NVM setting of the GLQF_ORT and GLQF_PIT registers.

Table 38-132.GLQF_ORT Register Settings (Sheet 1 of 2)

38.21.3.1 Protocol Layers (Type Rule Bus)

Protocol layers are portions of the packet that are associated with specific protocols as listed in the Table 38-134. The protocol layers table includes L2 layers (like LLDP), L3 protocols (like IP header), L3 protocols (like TCP header) and extracted flags from the packet (like IP fragmentation indication and TCP URG). The protocol layers and the flags are used to construct the field vector and define packet types as explained in the proceeding sections.

Table 38-134.Protocol Layers Table (Type Rule Bus) (Sheet 1 of 2)

Indx	Protocol Layer	Indx	Protocol Layer
0	L2 payload for ETYPE = 0x88F7[1]	32	Inner cloud MAC without VLAN
1	L2 payload for ETYPE = 0x8914 (FIP packet)[1]	33	L2 Payload
2	VXLAN / VXLAN-GPE key (Key 0)	34	L3 Payload
3	Geneve key (Key 1)	35	L4 Payload
4	L2 payload for ETYPE = 0x88CC (LLDP) [1]	36	L2 header 0 - PreL2 header
5	L2 payload for ETYPE = ECP ETyp (1)	37	L2 header 1 - MAC Addresses
6	Place holder for Generic UDP tunneling (key 2)	38	L2 header 2 - Reserved
7	NSH ETYPE = 0x894F	39	L2 header 3 - S-Tag
8	L2 payload for ETYPE = 0x888E (IEEE 802.1X)[1]	40	L2 header 4 - External VLAN (in the outer MAC header in case of MAC in UDP or MAC in GRE packets)
9	L2 payload for ETYPE = 0x0806 (ARP)[1]	41	L2 header 5 - VLAN (Inner one in case of double VLANs. Both are in the outer MAC header in case of MAC in UDP or MAC in GRE packets)
10	GRE key[1]	42	L2 header 6 - CTS
11	Reserved	43	L2 header 7 - Top MPLS Header
12	IPv4 layer (inner IPv4 in case of tunneling)	44	L2 header 8 - Reserved
13	IPv6 layer (inner IPv6 in case of tunneling)	45	L2 header 9 - Reserved
14	Reserved	46	Reserved
15	GRE no Key (1)	47	Reserved
16	Teredo protocol layer	48	IP header is fragmented
17	TCP protocol layer	49	Inner IPv4 header includes IP options
18	UDP protocol layer	50	TCP header includes options

Table 38-134.Protocol Layers Table (Type Rule Bus) (Sheet 2 of 2)

Indx	Protocol Layer	Indx	Protocol Layer
19	SCTP protocol layer	51	Reserved
20	ICMP protocol layer	52	External IPv4 layer
21	Reserved	53	External IPv6 layer
22	Reserved	54	Reserved
23	ICMPv6 protocol layer	55	TCP SYN flag
24	IPv6 Extension protocol layer(s) other than destination/ routing (in case of tunneling it is an 'OR' function of the inner and outer headers)	56	Reserved
25	IPv6 Extensions destination/routing (in case of tunneling it is an 'OR' function of the inner and outer headers)	57	OAM flag in VxLAN-GPE header
26	FC RDY or RD/WR Request (R_CTL = 0x05 or 0x06)	58	OAM flag in Geneve header
27	FC Data (_RCTL = 0x01)	59	Reserved
28	FC VFT Header	60	Reserved for flexible flag
29	FC RSP (R_CTL = 0x07)	61	Unicast Destination MAC Address indication
30	FC other	62	Multicast Destination MAC Address indication
31	Inner Cloud MAC + VLAN	63	Broadcast Destination MAC Address indication (multiplexed with last EtherType internally)

Notes:

1. With tunneled packets, these flags indicate the existence of matched protocol layers in the outer L2 header.

38.21.3.2 Filter Field

Filter field is a consecutive byte stream extracted from a protocol layer to an internal field vector that might be used for the packet classification. A field size can be up to 30 bytes defined in 2-byte granularity.

38.21.3.3 Field Vector

The field vector is a 128-byte string composed of multiple fields that are extracted from identified protocol layers of the packet. The field vector is initialized to zero before it is filled by received packet fields. Out of the 128 bytes of the field vector only the first 116 bytes are available for packet's fields while the other bytes are reserved for internal parameters. Among these parameters are the function ID, VSI index, identified protocol layers and protocol flags. Table 38-135 shows the fields that are extracted from the packets (according to the device setting in the default NVM image). The fields are posted to the field vector in a mixed big/little endian ordering while the first byte on the wire is posted in the MS byte of the first word number of the field. For example, the first byte on the wire of the destination MAC address (the MS byte) is posted to high byte of word number 0 in the field vector. Note that mutual exclusive protocol layers can share the same space in the field vector (like TCP and UDP).

In general, mutually exclusive protocol layers can share the same words in the field vector (like TCP and UDP). In some special cases it might make sense to share the same words in the filter for non mutually exclusive protocol layers. In such a case, the most recent detected protocol layer would step over previous protocols layer's words that are defined in the same location in the field vector.

Table 38-135.Default Field Vector Table

Word Num	Protocol Layers			
	L2 Protocol Layers			
0:2	Destination MAC Address (in outer or single L2 header)			
3:5	Source MAC Address (in outer or single L2 header)			
6	Reserved	S-Tag	Reserved	
7		-		VLAN Tag (in the inner L2 header) see Table 38-136
8	Inner or single VLAN Tag (in outer or single L2 header) see Table 38-136			
	L3 Protocol Layers			
	Inner or single IPv4	Inner or single IPv6		ARP
9	First two word of the IPv4 Header (Version + TOS + length)	First 4 words of the IPv6 Header (up to including the Hop Limit)		Hardware type ... Sender IP address (first 28 bytes of the header)
10				
11:12	TTL+ Protocol word, Header checksum			
13:14	IPv4 source address	IPv6 Source address		
15:20	0x00			
21:22	destination IP address	IPv6 Destination address		
23:26	0x00		0x00	0x00
27:28	0x00		0x00	0x00
	L4 Protocol Layers			
	TCP	UDP	SCTP	ICMPv6
29:30	First 16 bytes of the TCP Header	First 8 bytes of the UDP Header	First 8 bytes of the SCTP Header	Words 0, 1 of the header
31:32				0x00
33:36		0x00	0x00	
37:38	0x00	0x00	0x00	
	Tunneling Layers and Flexible Payload + Last EtherType			
	Non Tunneled	IP in IP Tunneling	UDP Tunneling	GRE Tunneling
39:41	0x00	0x00	Destination MAC Address (in the Inner L2 header). Relevant only for MAC in UDP or MAC in GRE.	
42:43	0x00	0x00	Tunneling UDP Source and Destination Port numbers	GRE ver and Protocol Type
44:45	0x00	0x00	Tunneling UDP Keys	GRE Key
46	0x00	0x00	Geneve / VXLAN Version (word 0 of the header)	
46:48	0x00	0x00		0x00
49	Last EtherType (in case of tunneled packets it is the last EtherType in the outer L2 header)			
50:57	Flexible Payload programmed by the PRTQF_FLX_PIT and GLQF_ORT[33:35] registers	Outer or single destination IP address Note that if this field is required then the Flexible payload must not be enabled or else the flexible payload will override this field.		
	Other Internal Fields			
58:63				

Table 38-136.Detailed L2 Tags in the Field Vector (Assuming all L2 Tags are VLANs)

Description	Word 7: VLAN Tag (in the inner L2 header)	Word 8: Inner or single VLAN Tag (in outer or single L2 header)
Non-tunneled received packet with a Single VLAN	X	VLAN
Non-tunneled receive packet with double VLANs	X	Inner VLAN
Tunneled received packet with a single VLAN in the outer L2 header and no VLAN in the inner L2 header	X	VLAN in the outer L2 header
Tunneled received packet with double VLAN in the outer L2 header and no VLAN in the inner L2 header	X	Inner VLAN in the outer L2 header
Tunneled received packet with a single VLAN in the outer L2 header and VLAN in the inner L2 header	VLAN in the inner L2 header	VLAN in the outer L2 header
Tunneled received packet with double VLAN in the outer L2 header and VLAN in the inner L2 header	VLAN in the inner L2 header	Inner VLAN in the outer L2 header

38.21.3.4 Layer 2 Classification Filter

The 10 GbE controller supports L2 filters (MAC / VLAN / L2 EtherType) in the embedded switch. These filters act on the following layers: S-Tag; MAC address; VLAN and EtherType. These filters define a VSI and can define also a unique LAN queue within that VSI. The LAN queue is enabled by the *ToQueue* flag and the queue is defined by the queue number for each filter. These parameters are programmed by admin commands. The filters can be defined as the second or fifth priority filters for receive queue classification as follows:

Table 38-137.Second or Fifth Priority Filters for Receive Queue Classification

Priority #	Filters defined by the following Admin command(s)
2	Add Control Packet Filter
5	Add MAC, VLAN pair; Add S-tag; Add Cloud Filters

Design limitation — Packet match to multiple L2 filters with active *ToQueue* flag that direct the packet to different queues is out of scope. Prioritization between the L2 filters in this case is defined by internal micro architecture rules that are not exposed. Therefore, software cannot rely on a specific arbitration and should avoid such cases for deterministic response.

The EtherType filter and MAC/VLAN filter affect on queue routing are enabled per PF and its VFs by the PFQF_CTL_0 registers.

38.21.3.5 Tunneling Fields

The 10 GbE controller supports tunneled packet formats including tunneled IP address, UDP Teredo, MAC in UDP, IP in GRE and MAC in GRE. These tunneling packets are supported for transmit and receive data processing offloads. When it comes to packet classification, it is based only on the encapsulated packet (exactly the same as non tunneled packets). Following are the supported tunneled packets:

IP Tunneling

For a non-tunneled IP packet, there is only one IP header that is used for the packet classification. For tunneling, The inner IP header is used for packet classification while the outer IP header is used for the switch filters.

Teredo

Teredo are supported protocol layers for the classification filtering. See Section 38.21.3.5.1 for more details. Teredo support is mutually exclusive with MAC in UDP and GRE tunneling.

MAC in UDP

MAC in a UDP packet is identified by the destination UDP port number. The UDP ports used for MAC in UDP are programmed by the same admin commands as the Teredo UDP ports as described in Section 38.21.3.5.1. Classification to receive queues is based on the encapsulated packet according to its structure. MAC in UDP support is mutually exclusive with Teredo and GRE tunneling.

GRE Tunneling

GRE tunneling is identified by the last EtherType in the outer L2 header. IP in GRE or MAC in GRE are identified by the *Protocol Type* field in the GRE header. MAC in UDP support is mutually exclusive with Teredo and MAC in UDP.

The previous excerpt states that packets are classified to receive queues based on the encapsulated packet fields. Packets with Geneve header or VXLAN-GPE with an active OAM flag are the exception to this rule. These packets are identified as unique PCTYPEs as listed in Table 38-128. Such packets with an active OAM flag can be directed to receive queue zero of the VSI (default queue) if programmed by software. In order to get this functionality, the 10 GbE controller should not process these packets by the hash and FD filters. Software can do so by disabling the OAM PCTYPEs in the xxQF_HENA registers of the function (affecting the hash filter) and disabling the OAM PCTYPEs in the GLQF_FDENA registers (affecting the FD filter) for the device.

38.21.3.5.1 Unique UDP Port Filters

There are some destination UDP port numbers that have unique meaning. These ports include 1588 packet identification and Teredo tunneling. The 10 GbE controller supports the following port numbers:

- Two global port numbers for 1588 equal to 319 and 320.
- A Tunneling UDP table with 16 global port numbers for Teredo tunneling or MAC in UDP tunneling that are programmed at run time by admin commands described later in this section. The tunneling UDP port numbers should not be one of the values reserved for 1588 and should not be set to 0x0000 or 0xFFFF.

Note that the 10 GbE controller does not process (offload) the checksum field in the tunneling UDP header.

The tunneling UDP table is a global resource available for all PFs on a first come first served policy. This table defines the port number and the tunneling type as listed in Table 38-139. The PFs can add an entry or delete an entry by admin commands. Any add or remove command is acknowledged by a completion command that provides a status of the requested action and an updated status of the table resources.

A table entry is added by the first PF that program it. Any additional PF that programs the same UDP port number just register to the existing entry. Once a table entry is programmed, it affects received packets for all PFs on all LAN ports (regardless of which PFs are registered to that UDP port number).

The admin commands used to program the tunneling headers are listed in Table 38-138 and detailed in the following sub-sections:

Table 38-138.Tunneling UDP Admin Commands

Name	Opcode	Ref	Admin Command Type
Add Tunneling UDP	0x0B00	Section 38.21.3.10.1	Direct
Remove Tunneling UDP	0x0B01	Section 38.21.3.10.2	Direct

Table 38-139.Supported Tunneling Types

Tunneling Type	Tunneling UDP Protocol Type"	Fixed Header Length [bytes]	Variable header Length	Network Key
Teredo	0x10 (next protocol is IP)	0x8	No	No
VXLAN	0x00 (next protocol is MAC)	0x10	No	Yes, see Section , "Network Key Structure of Tunneling Header"
Geneve	0x01 (next protocol is the optional Geneve header length)	0x10	Defined by bits 5:0 in byte 0x8 in the header	Yes, see Section , "Network Key Structure of Tunneling Header"
Place holder for Generic MAC in UDP	0x02 (next protocol is MAC)	Not Defined Yet	No	Yes, see Section , "Network Key Structure of Tunneling Header"
Reserved	Else	n/a	n/a	n/a

Network Key Structure of Tunneling Header

There are 4 global network keys, shared for all LAN ports. The network keys are used to identify a cloud tenant. The 10 GbE controller supports a programmable structure for these network keys that can be programmed by the PFs, using the Program Network Key Structure admin command. In NVGRE and Geneve headers, it is defined as a 3-byte field at a pre-defined offset in the header. The matched network key structure parameters for the supported tunneling headers are listed in Table 38-140:

Table 38-140.Network Key Structure of Tunneling Header

Key Index	Tunneling Header	Key Offset	Key Length
0	VXLAN	12	3
1	Geneve	12	3
2	Place holder for generic MAC in UDP	offset 1: 8 <= Offset 1 < 32 offset 2: 8 + Offset 1 + Length 1<= Offset 2 < 64 - Length 2	0 <= Length 1, Length 2 <= 6 (*) Length 1 + Length 2 <= 10 (*) (*) assuming word aligned keys
3	NVGRE	4	3

38.21.3.6 Hash Filter

The hash filter is a mechanism to statistically distribute received packets into several receive queues. Software allocates the queues among the different processors, therefore sharing the load of packet processing among several processors. One of the most common use cases of hash filters is the RSS hash defined by Microsoft* and used widely by other operating systems as well. Other generic hash functions are used by embedded systems as well. The hash filter directs the received packets to queue index within a region of queues of the VSI as shown in Figure 38-2. Following are some terms relating the hash filter.

Packet Classifier Type

The PCTYPE is the lowest index PCTYPE that is enabled for the function. The PCTYPE's are enabled for the hash filter by the PFQF_HENA registers for the PFs and by the VFQF_HENA registers for the VFs. See Table 38-128 for the PCTYPE's and its priority order.

Input Set

The input set for the hash filter is listed in the Table 38-128.

Hash Function

The 32- bit hash function is based on Toeplitz algorithm or simple XOR scheme as explained in Section 38.21.3.9. The hash can be calculated on the packet's fields as is or can be symmetric hash as explained in Section 38.21.3.9.2. The hash signature is reported in the receive descriptor if the space is not taken by other filters. The hash is calculated only on the input set words. Masked bits within the input set words are replaced by zero's for the hash calculation.

Queue Index LUT

The queue index look up table (LUT) gets the LS bits of the hash output and provides a queue index within a region. There are per PF lookup tables (PFQF_HLUT) that can be accessed using the 7 or 9 LS bits of the hash output having either 128 or 512 entries, respectively (as defined by the *HASHLUTSIZE* field in the PFQF_CTL_0 register). Each entry in these LUTs defines receive queues in the range of 0 to 127. In

addition a per VSI LUT is defined (VSIQF_HLUT). The LUT in each VSI gets the 6 LS bits of the hash output having 64 entries while each entry defines receive queues in the range of 0 to 15. For each VSI, the PF device driver can define whether it use the PF LUT or the VSI LUT using the RSS_LUT field in the Add VSI command.

Receive Queue Regions

The VSIs support 8 regions of receive queues that are aimed mainly for the TCs. The TC regions are defined per VSI by the VSIQF_TCREGION register. The region sizes (defined by the TC_SIZE fields) can be any of the following values: 1, 2, 4, 8, 16, 32, or 64 as long as the total number of queues do not exceed the VSI allocation. These regions starts at the offset defined by the TC_OFFSET parameter. According to the region size, the 'n' LS bits of the queue index from the LUT are enabled. The hash filter defines the queue index within the queue region of the VSI. The queue region is defined by the TC or the PCTYPE as programmed by the *OVERRIDE_ENA* and *Region* fields in the PFQF_HREGION registers for the PFs and VFQF_HREGION registers for the VFs (see Figure 38-2).

VSI Queue Index

The outcome VSI queue index is shown using the following expressions:

LUT_OUT + VSIQF_TCREGION.TC_OFFSET, while...

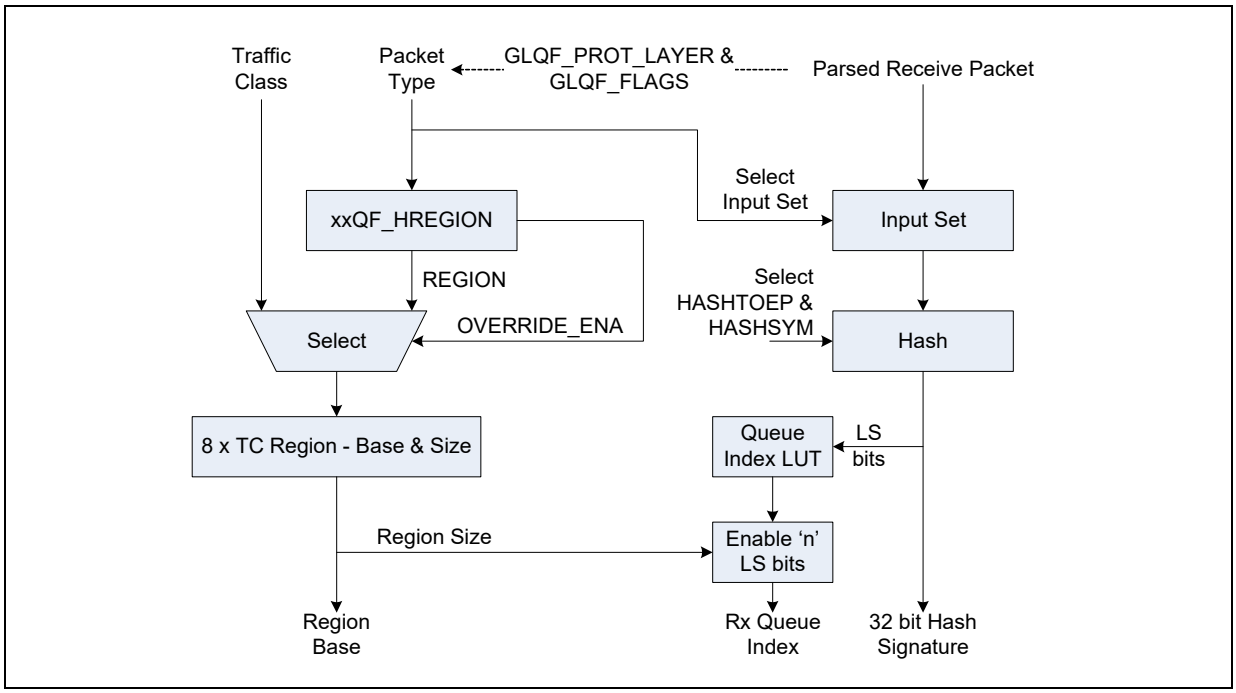
LUT_OUT = (VSIQF_TCREGION->TC_SIZE) LS bits of the QF_LUT

QF_LUT = PFQF_HLUT[9 LS bits of the packet hash] or VSIQF_HLUT[6 LS bits of the packet hash] according to VSIQF_CTL.RSS_LUT_TYPE.

Outcome Queue Index

Mapping the VSI queue index to the PF index space is done by the VSILAN_QTABLE or VSILAN_QBASE.

Figure 38-2. RSS Block Diagram



38.21.3.6.1 Comments for the Init Section

Dynamic setting options (expected at run time):

- VSIQF_TCREGION registers per VSI that define the hash region sizes (should be dynamic b/c of the dynamic LQP allocation)
- PFQF_HLUT registers and VSIQF_HLUT registers per function.

38.21.3.7 Flow Director Filter

The Flow Director (FD) filter is aimed to match specific flow or flows with some action. The FD filter is based on an exact match of the selected tuples named as input set for filtering purposes. The FD filter is composed of the following components.

Filter Enable Option

The FD filtering is enabled by the following parameters: filtering is enabled per PF and its VFs by the PFQF_CTL_0 registers.

Programming

FD filter programming is done by the flow director programming descriptor followed by packet structure that contains the filter fields as shown in Figure 38-3. Failed programming and removal of filter entries are reported by the programming status descriptor. The packet that is used to program the filter can be optionally transmitted depending on the dummy flag in the transmit data descriptor. Note also that the packet used for the programming can be a single packet or part of a TSO. Removing a single filter is done by the same programming descriptor.

Filter programming is possible only from transmit queues that are enabled by the FDENA flag in the transmit queue context. Setting the FDENA flag is

expected only for the PF queues. The PF can program a filter for any of its own VSIs or to VSIs that belong to its VFs. The target VSI for the matched packets is defined by the DEST_VSI parameter in the filter programing descriptor. The PF is permitted to program a FD filter only if the FD filter is enabled by the FD_ENA flag in the PFQF_CTL_0 register. When using the PCTYPE in the FD programming descriptor, the software is permitted to set it only to those values enabled by the GLQF_FDENA registers. When the PCTYPE in the FD programming descriptor is not used (FD_AUTO_PCTYPE flag in the GLQF_CTL is set), the software is unaware of the PCTYPE. Programmed filters with unsupported PCTYPE by the GLQF_FDENA registers won't match any received packets.

The PCTYPE in the FD programming descriptor is translated using the GLQF_FD_PCTYPE table before the filter is programmed.

The *Source* and *Destination* fields in the transmitted packet are presented in a reversed order with respect to the expected received packets. During filter programming time, the hardware swap these fields.

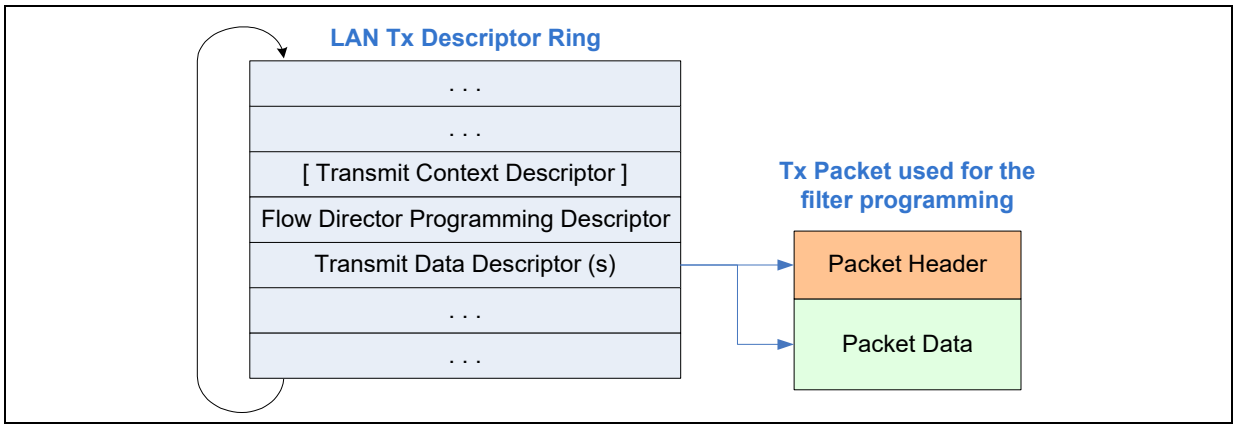
Attempt to re-program an existing filter entry updates the filters parameters.

At programming time the filter can be added on the expense of the guaranteed space or the best effort space of the function as explained in Section 38.21.3.7.1. In those cases, it is required to know up front that a filter programming is accepted by hardware. Software should track its guaranteed space by reading the *GUARANT_CNT* in the *PFQF_FDSTAT* register.

Software-based Removal

In some cases software might need to clear the FD table. Setting the *CLEARFDTABLE* flag in the *PFQF_CTL_1* register, all entries of the PF are invalidated from the FD table. This action can be done during normal transmission and reception. Note that this action might take some time. Software should poll the FD filter counters of the PF in the *PFQF_FDSTAT* register until it is cleared as an indication that the clear all PF entries sequence completed.

Figure 38-3. Flow Director Filter Programming



Hardware-based Removal

Filters might be removed by the device automatically when a transmit or receive packet indicating a TCP flow is closing is detected. These packets are identified by a RST or FIN flag being set. The device removes the filter matching packets for which the PCTYPE bit is set in the GLQF_FDEVICTENA registers and at least one of the flags enabled in GLQF_FDEVICTFLAG.TXFLAG_ENA or GLQF_FDEVICTFLAG.RXFLAG_ENA is set.

In order to define a filter as a candidate for removal by RST or FIN, the *ATR* bit in the *CMD* field (quad word 1, bit 14) in the filter programming descriptor must be set. This allows some differentiation between ATR filters and regular flow director filters managed by software. GLQF_FDEVICTENA relates to the PCTYPEs before GLQF_FD_PCTYPE translation.

Note: The eviction can occur even if the filter is overridden by a PE filter.

Eviction occurs only if the evicting packet is sent or received via the VSI declared in the *DEST_VSI* field when the filter was programmed.

Packet Classifier Type

All PCTYPEs described in Table 38-128 and translated as listed in Table 38-129 are supported for the FD filter.

Input Sets

As opposed to all other filters, the input sets for the FD filter are defined per-port enabling different input set for the flexible payload layers (by the PRTQF_FD_FLXINSET registers). The masking options for the flexible payload protocol layers are defined per-port by the PRTQF_FD_MSK registers. These registers can be loaded from the NVM or programmed by software at init time. Table 38-128 lists the default setting that address the standard protocol layers.

FD Filter Entry Context

Each filter entry consists of 64 bytes. As previously indicated, the input set can be defined as large as 48 bytes while the other 16 bytes are reserved for the filter action, table management parameters and fields that are compared against the received packet:

— PCTYPE and the DEST_VSI that are provided in the FD filter programming descriptor.

- The programming PF index.
- The QINDEX; FLEXOFF; STAT_CNT; FDID; DEST; FD_STATUS.

Filter Match Criteria

A packet matches a filter entry if the following conditions are met:

(1) The target VSI equals to the programmed DEST_VSI.

(2) The identified PCTYPE equals to the programmed PCTYPE.

(3) The received packet pattern matches the programmed one (the relevant fields for the PCTYPE as defined by the FD input set in Table 38-128).

Note that the device checks concurrently for packet match by the FD filter and the PE quad-hash filter. If a packet matches both filters, the action is made by the PE quad-hash filter. Still, the matched FD statistic counters are incremented (GLQF_PCNT).

Filter Action

The filter action is programmed as part of the filter programming command. The actions enabled for the FD filter are listed in Table 38-125. The filter action is taken when the packet matches the filter entry.

FD Table Size

The 10 GbE controller supports 8 KB x 64 KB filters. Out of these bytes, only 48 bytes can be used for the input set.

Hash and Buckets

The FD table is organized in buckets. The number of buckets equals to 16 KB (twice the number of supported filters). Each bucket might be: empty; include a single filter entry; or multiple filter entries. These buckets are managed autonomously by hardware.

38.21.3.7.1 FD Table Allocation

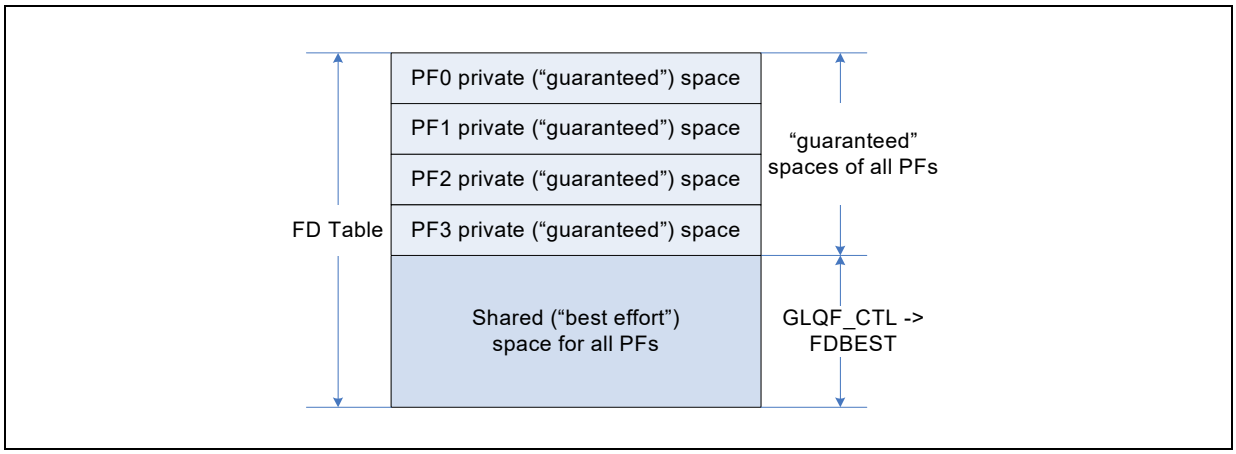
The FD table is a shared resource for all functions. The allocation between the PFs is loaded from the NVM to the PFQF_FDALLOC registers per PF. The FD supports 2 kinds of allocated spaces per PF: guaranteed space and best effort space. Each PF gets a private space, which is a guaranteed number of entries in the FD table (defined by the FDALLOC parameter). The sum of the guaranteed spaces of all PFs must be smaller than or equal to the size of the FD table. If the sum of the FDALLOC parameters is smaller than the size of the FD table, the rest of the space can be used by all function as best effort. The FDBEST parameter in the PFQF_FDALLOC registers define the permitted use of the best effort space by each PF. The total size of the best effort space is defined by a global FDBEST in the GLQF_CTL register (loaded from the NVM). This parameter must not exceed the size of the FD table minus the sum of the FDALLOC parameters of all PFs.

Note: The maximum value of the global FDBEST parameter in the GLQF_CTL register can be set to 8 KB minus 32. In order to make use of all 8 KB filter entries, at least one of the PF's FDALLOC parameters should be larger than zero.

At filter programming, hardware tries both spaces: guaranteed and best effort. Priority between usage of these spaces is set by the PROGPRIO flag in the global GLQF_CTL register. At filter invalidation, the budget is gained back to either the guaranteed space or the best effort space according to a priority setting by the INVALPRIO flag in the global GLQF_CTL register.

Software can track the FD table population (best effort space as well as the guaranteed space). The GLQF_FDCNT_0 reports the total number of filter entries in the entire FD table while the PFQF_FDSTAT reports the number of filter entries used by the PF.

Figure 38-4. Flow Director Table Allocation (Example for 4 x PFs: PF0 ... PF3)



38.21.3.7.2 Statistic Counters

The FD filter might count packets by dedicated GLQF_PCNT counters. A filter can be associated to any of the GLQF_PCNT counters allocated to the PF by setting the CNT_ENA flag and the CNT_INDEX field in the filter programming descriptor. The statistics counters are allocated statically to the PFs according to the PCNT_ALLOC setting in the GLQF_CTL register, as follows:

PCNT_ALLOC Setting	Enabled PFs	GLQF_PCNT counters Per PF	GLQF_PCNT Index Range Per PF	Physical GLQF_PCNT Index In The Device Space
000b	Any number	Flexible	0 ... 511	All 9 bits of the index provided at filter programming. Allocation to PFs should be handled by software. Possible ways to address it is by NVM setting readable to software or any sideband messages between the PFs, which are outside the scope of this document.
100b	PF0 and PF1	256 = 512 / 2	0 ... 255	MS bit of the index is the LS bit of the PF index. 8 LS bits of the index equals the 8 LS bits of the filter index provided at filter programming.
101b	PF0 ... PF3	128 = 512 / 4	0 ... 127	2 MS bits of the index are the 2 LS bit of the PF index. 7 LS bits of the index equals the 7 LS bits of the filter index provided at filter programming.
110b	PF0 ... PF7	64 = 512 / 8	0 ... 63	3 MS bits of the index are the 3 LS bit of the PF index. 6 LS bits of the index equals the 6 LS bits of the filter index provided at filter programming.
111b	PF0 ... PF15	32 = 512 / 16	0 ... 31	4 MS bits of the index are the 4 LS bit of the PF index. 5 LS bits of the index equals the 5 LS bits of the filter index provided at filter programming.

- Should be programmed only if the VSI associated to this filter is enabled to lookup for such packets in the queueing option section of the Add VSI admin command. Hardware does not enforce this.
- VFs should not be enabled before a hash region is allocated to all the filters it is enabled for (VPQF_CTL).

38.21.3.8 Protocol Engine (PE) filters

Filtering to PE is based on a set of rules and filters described in the sections that follow.

38.21.3.8.1 Packet Enablement for the PE

Packets that meet all the following conditions are directed to the PE. Packets that fail criteria 1 through 3 are not candidates for the quad hash filter. Packets that do not meet all the following criteria are directed to the LAN engine's queues.

- Criteria 1: Generic validity
  - The target VSI supports the PE quad hash filter by the PExxx_ENA flags PETCP_ENA flag in the VSIQF_CTL[n] register for the VSI.
  - IP and L4 checksum verification.
    - Case 1 - Received packets from the network: The packet does not have any errors (parsing errors, IP checksum, L4 checksum, etc.).
    - Case 2 - Loopback packets for which the hardware calculated the transmit checksums are candidates for the PE quad hash filter.

Note: Loopback transmit packets for which checksum offload was not requested (checksum done in software) is not a candidate for the quad hash filter, as there is no mechanism to validate the checksum.

  - The packet matches any of the packet types that are candidates for the PE as listed in Table 38-141 (TCP over IPv4 and IPv6).
  - The packet does not have any IPv4 options or IPv6 extension headers and is not fragmented.
  - If The packet is TCP then it is MAC unicast.
  - If the packet is UDP then the packet is not fragmented.
- Criteria 2: If the packet is unicast and matching to the Accelerated Port Bit Vector table (APBVT).
- Criteria 3: Matching to the PE quad hash filter.

Packets that are posted to the LAN engine are directed to queues according to the decision tree.

38.21.3.8.2 APBVT

The L4 destination port number is compared against an internal APBVT (GLQF_APBVT registers). The 10 GbE controller includes a 64 KB x 1-bit vector for the entire device (all 4 LAN ports). An active bit in the table means that the port number is enabled by one (or more) functions. Programming the table is done by the PE interface.

38.21.3.8.3 PE Quad Hash Filter

The quad hash filter is aimed to match specific flows with the PE. The 10 GbE controller maintains some of the quad hash filter in internal cache while the other filters are stored in host memory (FPM). The number of quad hash filters per function is a function of the number of RDMA and UDA flows supported by that function. The quad hash filter is composed of the following components:

Filter Enable Option

The PE quad hash filters are enabled per VSI by the VSIQF_CTL registers.

Packet Classifier Type

The following PCTYPEs are supported by the PE filters: TCP/IPv4; TCP/IPv6; UDP/IPv4; UDP/IPv6. These PCTYPEs are enabled by the PETCP_ENA, PEUUDP_ENA and PEMUDP_ENA flags in the VSIQF_CTL register per VSI. The PCTYPEs for the PE quad hash filter are defined globally by the GLQF_PETYPE registers listed in the Table 38-141.

Cache

Internal cache that can hold up to 1 KB filters. This cache is shared between the PE quad hash filter. In order to minimize access to the host memory in case of cache miss, the PE quad hash filter includes two pre-filters previously described: (1) IP address filters (see Section 38.21.3.8.2); (2) L4 port filter (see Section 38.21.3.8.2).

Input Sets

The input set is defined per PCTYPE by the GLQF_PE_INSET[n] registers. The only validated input set of these registers is listed in Table 38-141.

Table 38-141.PE Quad Hash Input Set

Index 'n'	GLQF_PETYPE[n]	PCTYPE	Input Set (all MSK registers are set to zero)
0	PCTYPE_INDEX = 32 PCTYPE_ENA = 1	TCP/IPv4 with SYN flag and ACK flag clear	Destination MAC address, innermost or only VLAN tag (if present), destination IP address and destination port.
1	PCTYPE_INDEX = 42 PCTYPE_ENA = 1	TCP/IPv6 with SYN flag and ACK flag clear	Destination MAC address, innermost or only VLAN tag (if present), destination IP address and destination port.
2	PCTYPE_INDEX = 33 PCTYPE_ENA = 1	TCP/IPv4 with/no SYN flag or SYN flag with ACK flag set	Destination MAC address, innermost or only VLAN tag (if present), source and destination IP addresses TCP ports.
3	PCTYPE_INDEX = 43 PCTYPE_ENA = 1	TCP/IPv6 with/no SYN flag or SYN flag with ACK flag set	Destination MAC address, innermost or only VLAN tag (if present), source and destination IP addresses TCP ports.

Filter Match Criteria

A packet matches a filter entry if the following conditions are met:

(1) The target function (PF/VF) equals to the function that programmed the filter. If VM, use PF for the filter function type.

(2) The identified PCTYPE equals to the programmed PCTYPE. (3) The received packet pattern matches the relevant input set (as listed in Table 38-141).

Filter Action

The filter provides a hit/miss indication. In the case of hit, the packet is a candidate to the PE. The packet type (PTYPE) and the matched quad hash filter index (QPN) are reported together with the packet. The following cases miss the PE quad hash filters and the packets are posted to the LAN queues according to the other classification filters.

Table 38-142.Packet Types that Miss the PE Quad Hash Filter

Packet Type	Reporting In The LAN Queue
All packet types with any error.	Detected errors.
Unicast packets that miss the APBVT.	LAN packet with no indications from the PE filters.
Non TCP/UDP packets.	
Multicast TCP or fragmented IP.	
Packet with IPv4 options or IPv6 extension headers.	

Quad Hash Context Table

The 10 GbE controller supports up to 256 KB quad hash contexts for the entire device. The PFs can define a smaller (DMA) context table for its usage and its VFs by the *PEDSIZE* parameters in the *PFQF_CTL_2* register and *VPQF_CTL* register, respectively. At filter programming time, software defines a unique context index. The hardware accepts the context programming only if it is defined within the boundaries of the context table size.

Hash and Buckets

The PE quad hash table is organized in buckets. The number of supported buckets is set per function by the *PEHSIZE* parameter in the *PFQF_CTL_2* and *VPQF_CTL* registers for the PFs and VFs, respectively. The bucket space and additional space for buckets that have multiple entries is shown in the Figure 38-5. The bucket is defined by a hash function on the input set for the filter. The hash function is based on Toeplitz algorithm using a global key defined by the *GLQF_HKEY* registers. The concept is similar to the FD while the filter objects are in host memory as shown in Figure 38-6. Note that software must clear (write all zero's) to the bucket space in host memory before enabling the table usage.

FPM Size Limitation

The total number of PE QP contexts for the PF and its VFs are defined by *PEDSIZE* in the *PFQF_CTL_2* registers and *VPQF_CTL* registers, respectively. This number should not exceed the FPM allocation defined by the *GLHMC_PEQPCNT* registers for the PFs and *GLHMC_VFPEQPCNT* registers for the VFs. In addition, the total number of PE quad hash filters for the PF and its VFs is defined by *PEHSIZE* + *PEDSIZE* in the *PFQF_CTL_2* registers and *VPQF_CTL* registers, respectively. This number should not exceed the FPM allocation defined by the *GLHMC_PEHTCNT* registers for the PFs and *GLHMC_VFPEHTCNT* registers for the VFs. Intel recommends to keep a minimal ratio of *PEHSIZE = 4 * PEDSIZE* to achieve reasonable performance.

Filter Search

The packet type is identified, its tuples are extracted and the hash is calculated. If the packet type matches the PE criteria and the packet passes the APBVT criteria it is a candidate for the quad hash filter. A matched filter is searched in the cache. If the filter is not in the cache, hardware fetches the filter from the host memory space of the relevant function at the location indicated by the calculated hash. In case of an exact match, then the process completes and the filter is kept in the cache. In case of a miss, the next filter in the same bucket is fetched to hardware repeating the previous step until the end of the bucket or a matched filter is found. If a matched filter is not found, it is considered a miss and the relevant tuples of the packet are stored in the cache. Even if the packet misses the PE context filter, its tuples are stored in the cache.

Figure 38-5. Buckets and Collided Filter Entries Space

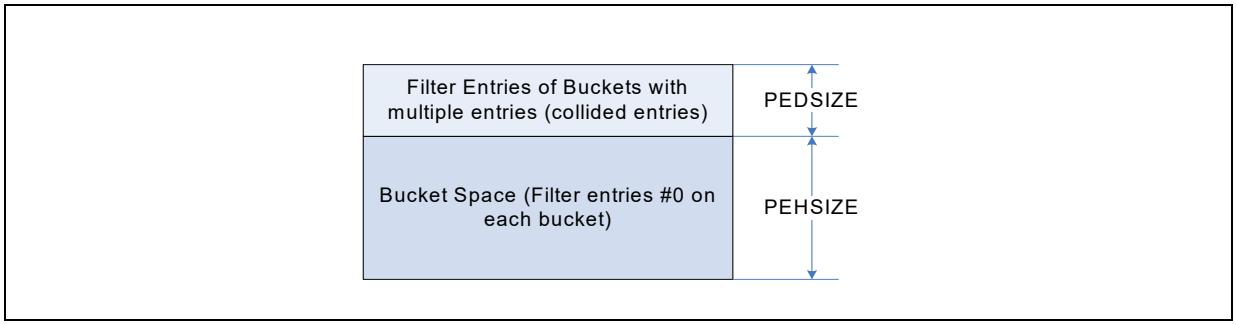


Figure 38-6. Quad Hash Filter

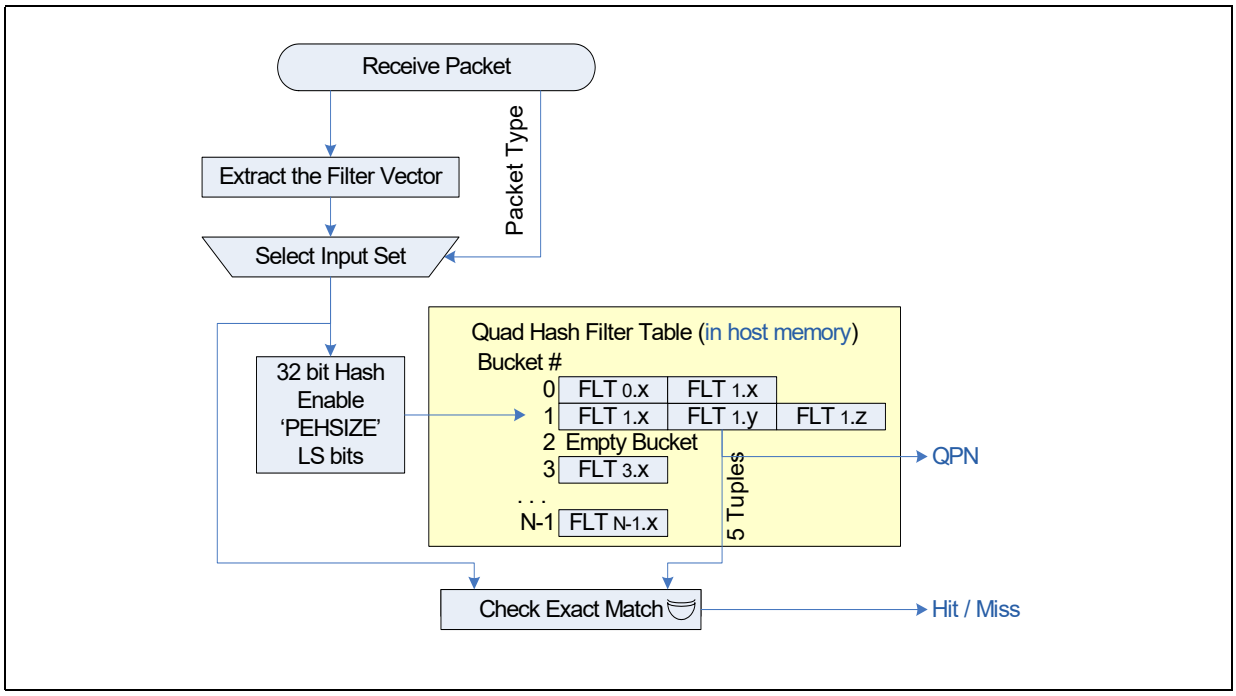

Filter Programming

- A filter can be added or removed from the quad hash filter table only by the PE using an internal PE-to-filter interface. As part of the filter programming parameters, the PE indicates quad hash filter ID (QPN). It is the PE responsibility to provide unique QPN for each filter per function.
- The *Source* and *Destination* fields in the field vector should be programmed in the ordering of the received packet.
- The PF software is expected to initialize (set to zero) the entire space in the FPM assigned for the PE quad hash filter table. This step should be part of the software device driver initialization flow. The initialized FPM provides an indication to hardware that the table is empty.
- Note that a filter should be programmed only if the VSI associated to this filter is enabled to lookup for such packets in the *Queueing Option* section of the *Add VSI* admin command. Hardware does not enforce this.

Performance

Hardware is able to sustain line rate when the PE filters are in the cache. If the filter is not in the cache some latencies is added to the processing in order to fetch the context from the host memory. If the latency of fetching a filter is larger than 1.8 µs, performance is affected as well. The 10 GbE controller reports the total number of buckets of a function in the xxQF_PECNT_0 registers. This counter provides an indication for the PE filter table distribution rather than exact indication of the hardware performance. The hardware performance depends also on the average packet length and the rate of hitting the cache vs. long vs. short buckets. Still, when LONGBCNT exceeds some threshold, a PF software might chose to initialize the filter and restart while increasing the number of buckets for the filter. The PE table counts each packet positioning in its bucket at reception time. Processed PF packets by the PE filter at a position shorter or equal than MAXPEBLEN is counted by PFQF_PECNT_2.HITSBCNT.

Packets at position longer than MAXPEBLEN are counted by PFQF_PECNT_3.HITLBCNT and also reported by a PELONGB flag in the packet status to the PE and the receive descriptor.

Comments for the Init Section

The following parameters can be modified only when the quad hash filter is disabled for the function by all *PExxx_ENA* flags in the matched *VSIQF_CTL* register(s).

- The number of quad hash table buckets — *PEHSIZE* field in the *PFQF_CTL_2* or *VPQF_CTL* registers for the PF or VF, respectively.

VFs should not be enabled before a hash region is allocated to all the filters it is enabled for (*VPQF_CTL*).

Dynamic setting options (expected at run time).

- VF reset and VFLR as well as PF reset and FLR:
  - PE firmware removes the relevant APBVT entries.

38.21.3.9 Hash Functions

The 10 GbE controller supports several hash functions to be used by the various filters:

Microsoft* Toeplitz-based hash vs. simple hash. These hash methods are explained in the following sub-sections. Selection between the two schemes is controlled by the global GLQF_CTL register, as follows:

- HTOEP controls the scheme used by the hash filters for all PCTYPE's
- Symmetric hash (explained in Section 38.21.3.9.2)

The following notation is used to describe the hash functions:

- Ordering is little endian in both bytes and bits. For example, the IP address 161.142.100.80 translates into 0xa18e6450.
- A ^ denotes bit-wise XOR operation of same-width vectors.
- @x-y denotes bytes x through y (including both of them) of the incoming packet, where byte 0 is the first byte of the IP header. In other words, we consider all byte-offsets as offsets into a packet where the framing layer header has been stripped out. Therefore, the source IPv4 address is referred to as @12-15, while the destination v4 address is referred to as @16-19.
- @x-y, @v-w denotes concatenation of bytes x-y, followed by bytes v-w, preserving the order in which they occurred in the packet.

38.21.3.9.1 Microsoft Toeplitz-based Hash

This hash uses a random secret key of 416 bits (52 bytes). The key is defined per VSI by the VSIQF_HKEY registers. The algorithm works by examining each bit of the hash input from left to right. Our nomenclature defines left and right for a byte-array as follows: Given an array K with k bytes, our nomenclature assumes that the array is laid out as follows: K[0] K[1] K[2] … K[k-1]

While K[0] is the left-most byte, and the MSB of K[0] is the left-most bit. K[k-1] is the right-most byte, and the LSB of K[k-1] is the right-most bit.

```
ComputeHash(input[], N)

    For input[] of length N bytes (8N bits) and a random secret key K of 416 bits
```

```
    Result = 0;

    For each bit b in input[] {

        if (b == 1) then Result ^= (left-most 32 bits of K);

        shift K left 1 bit position; // cyclic shift while the right-most bit of K
gets the left-most bit of K

    }

    return Result;
```

Pseudo-code examples

The following four pseudo-code examples are intended to help clarify exactly how the hash is performed in four cases, IPv4 with and without ability to parse the L4 header, and IPv6 with and without a L4 header.

Table 38-143.Examples of Input Fields for the Hash Function

Packet Type	Hash Input	Hash Result
IPv4 with TCP or UDP	SourceAddress, DestinationAddress, SourcePort, DestinationPort: Input[12] = @12-15, @16-19, @20-21, @22-23	Result = ComputeHash(Input, 12)
IPv4 without L4	SourceAddress, DestinationAddress: Input[12] = @12-15, @16-19	Result = ComputeHash(Input, 8)
IPv6 with TCP or UDP	SourceAddress, DestinationAddress, SourcePort, DestinationPort: Input[12] = @8-23, @24-39, @40-41, @42-43	Result = ComputeHash(Input, 36)
IPv6 without L4	SourceAddress, DestinationAddress: Input[12] = @8-23, @24-39	Result = ComputeHash(Input, 32)

RSS verification suite

This section provides a verification suite used to validate that the hash function is computed according to Microsoft nomenclature.

Assume that the random key byte-stream is:

```
0x6d, 0x5a, 0x56, 0xda, 0x25, 0x5b, 0x0e, 0xc2,
0x41, 0x67, 0x25, 0x3d, 0x43, 0xa3, 0x8f, 0xb0,
0xd0, 0xca, 0x2b, 0xcb, 0xae, 0x7b, 0x30, 0xb4,
0x77, 0xcb, 0x2d, 0xa3, 0x80, 0x30, 0xf2, 0x0c,
0x6a, 0x42, 0xb7, 0x3b, 0xbe, 0xac, 0x01, 0xfa
```

Table 38-144.IPv4

Destination Address / Port	Source Address / Port	IPv4 only	IPv4 with TCP
161.142.100.80 / 1766	66.9.149.187 / 2794	0x323e8fc2	0x51ccc178
65.69.140.83 / 4739	199.92.111.2 / 14230	0xd718262a	0xc626b0ea
12.22.207.184 / 38024	24.19.198.95 / 12898	0xd2d0a5de	0x5c2b394a
209.142.163.6 / 2217	38.27.205.30 / 48228	0x82989176	0xafc7327f
202.188.127.2 / 1303	153.39.163.191 / 44251	0x5d1809c5	0x10e828a2

The IPv6 address tuples are only for verification purposes, and may not make sense as a tuple.

Table 38-145.IPv6

Destination Address / Port	Source Address / Port	IPv6 only	IPv6 with TCP
3ffe:2501:200:3::1 / 1766	3ffe:2501:200:1fff::7 / 2794	0x2cc18cd5	0x40207d3d
ff02::1 / 4739	3ffe:501:8::260:97ff:fe40:efab / 14230	0x0f0c461c	0xdde51bbf
fe80::200:f8ff:fe21:67cf / 38024	3ffe:1900:4545:3:200:f8ff:fe21:67cf / 44251	0x4b61e985	0x02d1feef

Simple Hash

Simple hash is an alternative hash function that trades runtime for effectiveness. It is provided for applications that recompute the hash in software and wish a lighter version of the hash function. Simple hash provides a more skewed distribution vs. the Microsoft hash. It is enabled only for the hash filter by the HTOEP flag in the global GLQF_CTL register.

Simple hash is performed by partitioning the sequence of input bits into 32-bit entities and XOR those to generate a 32-bit output.

```
ComputeSimpleHash(input[], N)

    For input[] of length N bytes (8N bits)

    Result = 0;

    For each DWord (32 bits) in input[] {

        Result ^= (left-most 32 bits of input);

        shift input left 32 bit position;

    }

return Result;
```

The input[] vector is padded by 0 to 3 bytes of zero's making it whole number of Dwords. In those cases that the hash function is used as an address to a lookup table smaller or equal then 64 KB entries, the 16 MS bits of the results are XORed with the 16 LS bits creating a 16 bit output. If the hash function is used as an address to a lookup table smaller or equal than 256 entries, the 4 bytes of the previous results are XORed together creating an 8 bit output.

38.21.3.9.2 Symmetric Hash

A symmetric hash provides the same value if its respective source and destination fields are swapped. For example, suppose that the hash is done on the frame source and destination IP addresses. A symmetric hash guarantees that: **hash(src IP, dst IP) = hash(dst IP, src IP)**.

The motivation behind symmetric hash is to route frame between two addresses to the same queue independent of the direction of transmission.

The symmetric hash is useful for field pairs like the IP addresses, L4 port numbers, MAC addresses, FC_IDs and FC exchange IDs. The field pairs are defined globally per packet type by the GLQF_SWAP registers. The symmetric hash is obtained by replacing the original source and destination fields by a XOR value of these fields before calculating the hash.

Symmetric hash is enabled per PCTYPE by the GLQF_HSYM and per port by the HSYM_ENA flag in the PRTQF_CTL_0 register.

Symmetric Hash Example for IPv4 with TCP

Non-symmetric input vector is: Input[12] = @12-15, @16-19, @20-21, @22-23.

Symmetric input vector is: Input[12] = @12-15 ^ @16-19, @12-15 ^ @16-19, @20-21 ^ @22-23, @20-21 ^ @22-23.

38.21.3.10 Rx filter Admin Queue Commands

38.21.3.10.1 Add Tunneling UDP (0x0B00)

Add the Tunneling UDP admin command (listed in Table 38-146) is used to define a tunneling UDP filter. It defines the tunneling UDP port number and its header size, associating the filter to the PF that initiated the Add command. The device response to this command is as follows:

- If the requested UDP port is already defined for the PF then report a completion with an EEXIST error code.
- If the requested UDP port is already defined with a different tunneling UDP protocol type, then report a completion with EMODE error code.
- If the requested UDP port is already defined with matched parameters for other PF(s) then update the filter entry:
  - Set the matched PF flag of the filter
  - Report back a successful programming completion
- If the requested UDP port does not exist then add a new filter entry:
  - Search for a free entry. If there is no free entry in the table then report completion with "ENOSPC" error code.
  - Add the entry to the table:
    - Set the matched PF flag of the filter
    - Report back a successful programming completion

Table 38-146.Add Tunneling UDP Command (Opcode: 0x0B00) (Sheet 1 of 2)

Name	Bytes.Bits	Value	Remarks
Flags	0-1		
Opcode	2-3	0x0B00	Command opcodes.
Datalen	4-5	0x00	N/A (reserved zero).
Return Value/ VFID	6-7	0x00	N/A (reserved zero).
Cookie High	8-11	Cookie	Opaque value, is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value, is copied by firmware into the completion of this command.
UDP Port	16-17		A 16-bit value of the UDP port number to be added (while byte 17 is the MS byte, which is first on the wire). Note that a zero value is a reserved value and should not be used by this command.
Reserved	18		Reserved.
Reserved	19		Reserved.
Reserved	20		Reserved.

Table 38-146.Add Tunneling UDP Command (Opcode: 0x0B00) (Sheet 2 of 2)

Name	Bytes.Bits	Value	Remarks
Tunneling UDP Protocol Type	21		Tunneling UDP type should be programmed as follows: 0x00 = For VXLAN key. 0x01 = For Geneve key (next protocol is the optional Geneve header length). 0x02 = Reserved option for MAC in UDP tunneling. 0x10 = For Teredo. 0x11 = For VXLAN-GPE (next protocol is defined in the header) Else = Reserved.
Reserved	22-31		Reserved.

Table 38-147.Completion for the Add Tunneling UDP Command (Opcode: 0x0B00)

Name	Bytes.Bits	Value	Remarks
Flags	0-1		
Opcode	2-3	0x0800	Command opcode
Datalen	4-5	0x00	N/A
Return value/VFID	6-7		Some comments on specific errors: No Error = No error. EEXIST = Add filter rejected because it already exist. ENOSPC = Add filter rejected because of no space. EMODE = Add filter rejected because the filter parameters in the add Tunneling UDP command do not match the programmed parameters in an existing filter with the same UDP port.
Cookie High	8-11	Cookie	Opaque value, is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value, is copied by firmware into the completion of this command.
UDP Port	16-17		A 16-bit value of the UDP port number that was added.
Filter Entry Index	18		Index of the added tunneling UDP filter (0 to 15). This index is assigned by the device to be used by the PF to remove the filter.
Multiple PFs	19		This field equals to 0x1 when other PF(s) own the same filter entry and equals to 0x0 otherwise.
Total Filters	20		Total number of Tunneling UDP filters used by all PFs after the completion of the Add Filter command.
Reserved	21-31		Reserved.

38.21.3.10.2 Remove Tunneling UDP (0x0B01)

The remove Tunneling UDP admin command (listed in Table 38-149) is used to delete a tunneling UDP filter from the table. The device response to this command as follows:

- If the requested filter (defined by the filter entry index) is not owned by the PF then report an ENOENT error code.
- Else, (the requested filter to be removed is owned by the PF), clear an internal flag that associates the filter entry with the PF and report back successful filter removal completion.
  - If the filter is not associated with any PFs then set the *Entry Free* flag in the reported completion status.

Table 38-148.Remove Tunneling UDP Port Command (Opcode: 0x0B01)

Name	Bytes.Bits	Value	Remarks
Flags	0-1		
Opcode	2-3	0x0B01	Command opcodes.
Datalen	4-5	0x00	N/A (reserved zero).
Return Value/ VFID	6-7	0x00	N/A (reserved zero).
Cookie High	8-11	Cookie	Opaque value, is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value, is copied by firmware into the completion of this command.
Reserved	16-17		Reserved, zero.
Tunneling UDP Filter Index	18.0:3		Filter entry index to be removed (0 to 15).
Reserved	18.4-31		Reserved, zero.

Table 38-149.Completion for Remove Tunneling UDP Command (Opcode: 0x0B01)

Name	Bytes.Bits	Value	Remarks
Flags	0-1		
Opcode	2-3	0x801	Command opcode.
Datalen	4-5	0x00	N/A
Return Value/ VFID	6-7		Some comments on specific errors: No Error = No error. ENOENT = Remove filter rejected because no matched entry was found.
Cookie High	8-11	Cookie	Opaque value, is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value, is copied by firmware into the completion of this command.
UDP Port	16-17		A 16-bit value of the UDP port number.
Filter Entry Index	18		The index of the requested filter entry to be removed (between 0 to 15).
Multiple PFs	19		This field equals to 0x1 when other PF(s) still own the same filter entry and equals to 0x0 otherwise.
Total Filters	20		Total number of tunneling UDP filters used by all PFs after the completion of the remove filter command.
Reserved	21-31		Reserved, zero.

Set RSS Key (0x0B02)

This command is used to set the RSS key of a VSI. It can be used by a PF or a VF for VSIs assigned to it.

Table 38-150.Set RSS Key Command (Opcode: 0x0B02) (Sheet 1 of 2)

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0B02	Command opcode.
Datalen	4-5	0x34	Length of buffer. Should be equal to 0x34 (hash key size).
Return Value/ VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value, is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value, is copied by firmware into the completion of this command.

Table 38-150.Set RSS Key Command (Opcode: 0x0B02) (Sheet 2 of 2)

Name	Bytes.Bits	Value	Remarks
VSI#	16-17	0x0	Bit 15 = Valid VSI#. Must always be set. Ignored by firmware. Bit 14:9 = Reserved. Bit 8:0 = VSI number
Reserved	20-23	0x0	Reserved.
Data Address High	24-27		Address of buffer.
Data Address Low	28-31		

The command buffer of this command contains the RSS key to set.

Offset	Content
0x0 - x027	Standard RSS key.
0x28 - 0x33	Extended hash key. Must be zero for regular RSS.

Table 38-151.Set RSS Key Response (Opcode: 0x0B02)

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0B02	Command opcode.
Datalen	4-5	0x0	No return buffer.
Return Value/ VFID	6-7		Return value. The following error values can be returned: ENOENT = If not a valid VSI. EACCES = If the VSI is not owned by this PF/VF.
Cookie High	8-11	Cookie	Opaque value, is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value, is copied by firmware into the completion of this command.
Reserved	16-23		Reserved.
Data Address High	24-27		Address of buffer.
Data Address Low	28-31		

38.21.3.10.3Set RSS LUT (0x0B03)

This command is used to set the RSS LUT of a VSI. It can be used by a PF or a VF for VSIs assigned to it.

Table 38-152.Set RSS LUT Command (Opcode: 0x0B03) (Sheet 1 of 2)

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0B03	Command opcode.
Datalen	4-5	64/128/512	Length of buffer (should be equal to 0x).
Return Value/ VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value, is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value, is copied by firmware into the completion of this command.
VSI#	16-17		Bit 15 = Valid VSI# (must be set if table type = VSI, ignored by firmware otherwise. Bit 14:9 = Reserved. Bit 8:0 = VSI number.

Table 38-152.Set RSS LUT Command (Opcode: 0x0B03) (Sheet 2 of 2)

Name	Bytes.Bits	Value	Remarks
Command Flags	18-19		Table type: 0 = VSI 1 = PF. Only a PF can set this bit. 15:1 = Reserved.
Reserved	20-23	0x0	Reserved.
Data Address High	24-27		Address of buffer.
Data Address Low	28-31		

The command buffer of this command contains the LUT to set.

Offset	Content
0x0 - LUT size	LUT content must match the format of the VSIQF_HLUT or PFQF_HLUT registers. VSI LUT = Must be 64 bytes. PF LUT = must be 512 bytes or 128 bytes. If the buffer size is set to 128 bytes only the first 128 bytes of the LUT are set.

Table 38-153.Set RSS LUT Response (Opcode: 0x0B03)

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0B03	Command opcode.
Datalen	4-5	0x0	No return buffer.
Return Value/ VFID	6-7		Return value. The following error values can be returned: ENOENT = If not a valid VSI. EACCES = If the VSI is not owned by this PF/VF.
Cookie High	8-11	Cookie	Opaque value, is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value, is copied by firmware into the completion of this command.
Reserved	16-23		Reserved.

Table 38-155.Get RSS Key Response (Opcode: 0x0B04)

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0B04	Command opcode.
Datalen	4-5	0x0	0x34.
Return Value/ VFID	6-7		Return value. The following error values can be returned: ENOENT = If not a valid VSI. EACCES = If the VSI is not owned by this PF/VF.
Cookie High	8-11	Cookie	Opaque value, is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value, is copied by firmware into the completion of this command.
Reserved	16-23		Reserved.
Data Address High	24-27		Address of buffer.
Data Address Low	28-31		

The response buffer of this command contains the RSS key currently set.

Offset	Content
0x0 - x027	Standard RSS key.
0x28 - 0x33	Extended hash key (must be zero for regular RSS).

38.21.3.10.5Get RSS LUT (0x0B05)

This command is used to get the RSS LUT of a VSI. It can be used by a PF or a VF for VSIs assigned to it. A PF can query the RSS LUT of its VFs.

Table 38-156.Get RSS LUT Command (Opcode: 0x0B05) (Sheet 1 of 2)

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0B02	Command opcode.
Datalen	4-5	64/512	Length of buffer. Should be equal to 512 or more for a PF table or 64 or more for a VSI table.
Return Value/ VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value, is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value, is copied by firmware into the completion of this command.
VSI#	16-17		Bit 15: Valid VSI# (Must be set if table type = VSI. Ignored by firmware otherwise). Bit 14:10 = Reserved. Bit 9:0 = SEID number of the VSI.

Table 38-156.Get RSS LUT Command (Opcode: 0x0B05) (Sheet 2 of 2)

Name	Bytes.Bits	Value	Remarks
Command Flags	18-19		Table type: 0 = VSI 1 = PF. Only a PF can set this bit. 15:1 = Reserved.
Reserved	20-23	0x0	Reserved.
Data Address High	24-27		Address of buffer.
Data Address Low	28-31		

Table 38-157.Get RSS LUT Response (Opcode: 0x0B05)

Name	Bytes.Bits	Value	Remarks
Flags	0-1	0	
Opcode	2-3	0x0B05	Command opcode.
Datalen	4-5	0x0	No return buffer.
Return Value/ VFID	6-7		Return value. The following error values can be returned: ENOENT - If not a valid VSI. EACCES - If the VSI is not owned by this PF.
Cookie High	8-11	Cookie	Opaque value, is copied by firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value, is copied by firmware into the completion of this command.
Reserved	16-23		Reserved.
Data Address High	24-27		Address of buffer.
Data Address Low	28-31		

The response buffer contains the LUT currently set.

Offset	Content
0x0 = LUT Size	LUT content, as read from the VSIQF_HLUT or PFQF_HLUT registers. VSI LUT = 64 bytes. PF LUT = 512 bytes.

38.21.4 L2 Packet Processing

38.21.4.1 CRC Handling

38.21.4.1.1 Ethernet CRC Insertion

The 10 GbE controller calculates and inserts the Ethernet CRC for all packets transmitted to the network according to a per port setting configured by setting the *CRC Enable* bit of the Set MAC Config Admin Queue command.

38.21.4.1.2 Ethernet CRC Stripping

The 10 GbE controller checks the integrity of the Ethernet CRC and possibly strips it. On packets that are posted to LAN queues, The Ethernet CRC bytes are stripped according to setting of the *CRCStrip* flag in the target LAN queue context.

Packets that are routed to PE queue pairs are striped from the Ethernet CRC (with no setting option).

38.21.4.2 L2 Padding

Transmit packets to the network are padded with zeros to 60 bytes) guaranteeing that their length including the CRC is at least 64 bytes.

Receive packets to the host are padded as well. Packets are padded with zero guaranteeing that they are never shorter than 60 bytes if the following conditions are met:

- Received packet to host memory from the network with no CRC bytes (stripped by the device) and additional stripped fields (like VLAN) that their remaining length is shorter than 60 bytes.
- Loopback packets to host memory (VM to VM) with stripped fields (like VLAN) that their remaining length is shorter than 60 bytes.
- Same rules for packets destined to the EMP.

38.21.4.3 L2 Tag Handling

38.21.4.3.1 Overview

This section describes the generic mechanism used to handle L2 tags in the 10 GbE controller.

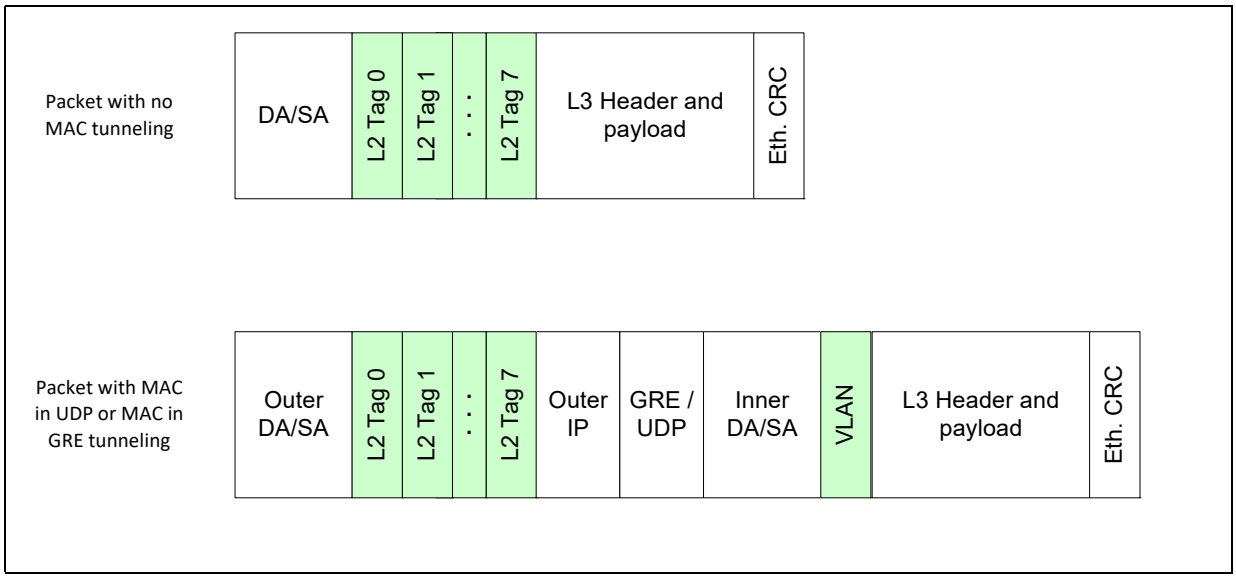
The 10 GbE controller supports up to 8 tags. In general, the text that follows applies to each tag independently.

The order these tags are expected in a packet is according to their index in the array listed in Table 38-161. Index 7 is the most inner L2 tag (closest to the L3 header) and index 0 is the most outer L2 tag (closest to the MAC address) as described in Figure 38-7.

Note: The following text refers to offloads provided by the device. A packet received from the network can have any number of tags, and a packet transmitted might have any number of tags added by software provided no offload is required.

See Section 38.21.4.3.4 for the programming interface to describe the supported tags and the way to handle them.

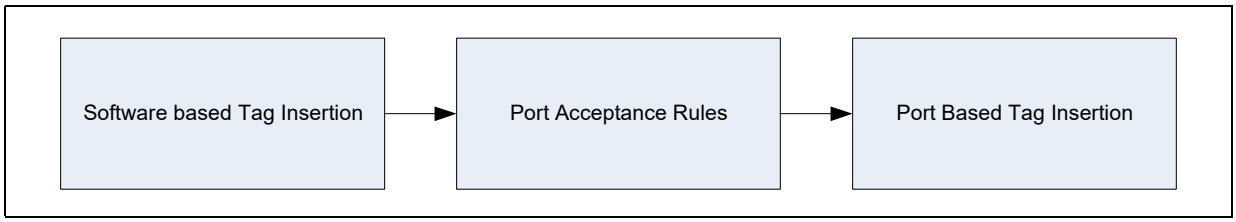
Figure 38-7. L2 Tags Order



38.21.4.3.2 Transmit Tag Handling

The transmit tag handling has three logical parts as described in Figure 38-8:

Figure 38-8. Transmit Tag Handling



Software-based tag insertion is described in Software-based Tag Insertion Rules. The port acceptance rules and port based tag insertion are described in Port (VSI) Based Tag Handling (Accept Rules).

Section 38.21.4.3.3 describes the receive tag handling and Section 38.21.4.3.4 describes the software interface used to manipulate the tags.

Software-based Tag Insertion Rules

Software can require to send packets with a different L2 tag, it might do so either directly through the data for all the tags or using the transmit descriptor for up to two tags.

The tags available for descriptor-based insertion are fixed by the device according to the mode of operation.

The type of the tag taken from the *L2TAG1* field in this descriptor when the *IL2TAG1* field is set is defined by the *VSI_L2TAGSTXVALID.L2TAG1INSERTID* field when *VSI_L2TAGSTXVALID.L2TAG1INSERTID_VALID* is set. If the type of the L2 tag requires more than 2 variable bytes, then additional bytes are taken from the *L2TAG2* field while the *L2TAG1* field is first on the wire. In this case, the *IL2TAG2* flag must be cleared.

The type of the tag taken from the *L2TAG2* field in this descriptor when the *IL2TAG2* field is set is defined by the *VSI_L2TAGSTXVALID.L2TAG2INSERTID* field when *VSI_L2TAGSTXVALID.L2TAG2INSERTID_VALID* is set.

After the tags are inserted, according to the software request, the rules per VSI described in Port (VSI) Based Tag Handling (Accept Rules) are applied to decide if the packet can be sent.

Single Tag Handling

Table 38-158 lists the tag insertion in different cases when each tag is identified by a different EtherType.

Table 38-158.Single Tag Handling

Tag in The Data Buffer	Tag In The Tx Descriptor	Software Requested Action
No	No	Do nothing (send untagged packet)
No	Yes	Insert Tag from the descriptor
Yes	No	Do Nothing (send packet with the tag from the buffer)
Yes	Yes	This is not a valid configuration and should not be used.

Note: Table 38-158 relates to the configuration of a single tag. The configuration of different tags is independent.

Double Tag Handling

If two tags uses the same EtherType (such as VLAN and double VLAN), there might be some cases where hardware might not be able to identify which of the two tags were inserted by the software device driver.

In this case, if only one tag is seen in the packet and no insertion was requested by the software device driver, it is assumed to be the outer of the two tags (in this case, the outer VLAN). Any further action (anti-spoof, UP translation, tag accept policy and port based tagging) interprets this tag according to this. For example, if anti-spoof is applied only to inner VLAN, a packet with a single VLAN is treated as a packet with no VLAN for anti-spoof. If a single tag is present in the buffer sent by the host, but the descriptor request insertion of one of the tags (like an outer VLAN), then it is assumed that the tag present in the buffer is the tag for which offload was not requested (in this case, the inner VLAN).

After the decision on the identity of each tag as previously described, the handling of each tag is as described in Single Tag Handling.

Port (VSI) Based Tag Handling (Accept Rules)

The previous section described how tags are inserted via the data buffer or the transmit descriptor. This section describes the rules applied per VSI to decide if the software request is acceptable. Table 38-159 lists the applied rule according to tag accept, tag insert and the tag presence in the packet for a specific tag.

Table 38-159.Port-Based Tag Handling (Transmit)

Tag Accept Mode	Tag Inserted By Driver?	Port-based Tag	Allowed Driver Behavior[1]	Action
Allow untagged only: VSI_TAR.ACCEPTTAGGED = 0b ACCEPTUNTAGGED = 1b	No	No	Yes	Send the packet as is.
	No	Yes	Yes	Tag inserted by the VSI.
	Yes - from descriptor	Yes	No	VSI's VLAN tag overrides software while keeping software priority.
	Yes - in packet	Yes	No	Drop packet.
	Yes	No	No	Drop packet.
	VLAN ID = 0[2]	No	Yes	Send the packet as is.
	VLAN ID = 0	Yes	Yes	VSI's VLAN tag overrides software while keeping software priority. This mode is supported only if a tag is inserted in the descriptor.
Allow tagged and untagged: VSI_TAR.ACCEPTTAGGED = 1b ACCEPTUNTAGGED = 1b)	X	Yes	Unexpected VSI setting	Undefined.
	X	No	Yes	Send the packet as is.
Allow tagged only: VSI_TAR.ACCEPTTAGGED = 1b ACCEPTUNTAGGED = 0b	X	Yes	Unexpected VSI setting	Undefined.
	No	No	No	Drop packet.
	Yes	No	Yes	Send the packet as is.
Accept nothing VSI_TAR.ACCEPTTAGGED = 0b ACCEPTUNTAGGED = 0b	X	X	X	Non-legal configuration.

Notes:

1. Unexpected VSI setting means that the combination of the tag accept mode and port-based tag should not be requested when creating a VSI.
2. If *GL_SWT_L2TAGCTRL.ISVLAN* is set (can be set only in one tag, the inner VLAN).

Port-based Tag Insertion Mechanism

After the packet that was sent by the software device driver was accepted, the 10 GbE controller might add up to three tags based on the VSI that sent the packets. Two of the added tags can have a variable part of up to 16 bits and one tag can have a variable part of up to 32 bits. The tags that are allowed to be port-based are determined via the *VSI_L2TAGSTXVALID.TIR[012]_INSERT* and *VSI_L2TAGSTXVALID.TIR[012]INSERTID* bits.

The tags for which port-based insertion is done are fixed by the device according to the mode of operation.

For tags up to 8 bytes (not including the EtherType), the entire tag can be inserted by hardware. Either as a request of the software via the descriptor as described in Software-based Tag Insertion Rules or as part of a port-based tag insertion.

Each tag might contain the following parts:

- The EtherType
- A fixed part
- A variable part (up to 16 or 32 bits)

The EtherType is taken from the *GL_SWT_L2TAGCTRL.ETHERTYPE* field.

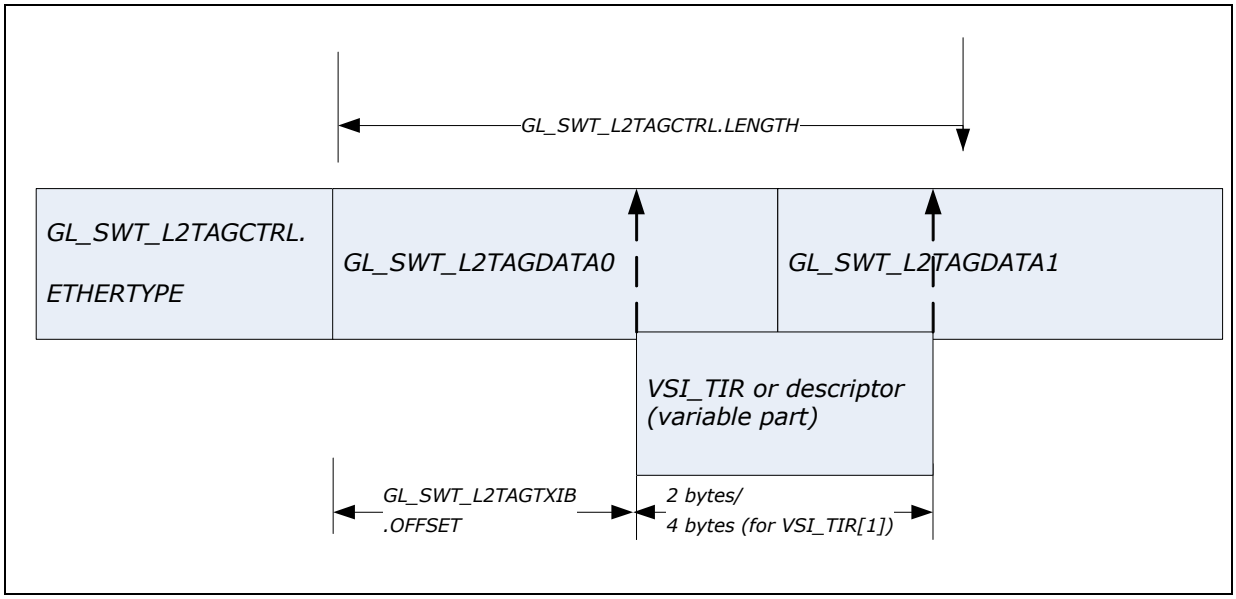
The fixed part is taken from the GL_SWT_L2TAGDATA0 and GL_SWT_L2TAGDATA1 register. The *GL_SWT_L2TAGCTRL.LENGTH* field indicates the length of the EtherType payload.

Note: The unused part of the fixed part and the word in which the variable part is inserted should be set to zero.

The variable part is extracted from the descriptor or from the VSI_TIR register. The *GL_SWT_L2TAGTXIB.OFFSET* and *GL_SWT_L2TAGTXIB.LENGTH* fields define the location and length of the variable part. Figure 38-9 shows the relationship between the different parameters.

The order of the tags inserted from the port-based tags is according to the order in the bit map. Thus, the first bit set uses the value from the VSI_TIR[0] register. The second bit set uses the value from the VSI_TIR[1] register. The third bit set uses the value from the VSI_TIR[2] register.

Figure 38-9. Tag Insertion



Queue-based tag insertion

For one of the tags, the 10 GbE controller might insert different port-based tags based on the queue from which the packet was sent. If the *ALT_VLAN* bit in the transmit queue context is set, the tag is taken from the alternate tag register; *VSI_TAIR* instead of being taken from *VSI_TIR.*

This capability is available for each VSI in the tag inserted to the *VSI_L2TAGSTXVALID.TIR0INSERTID* tag.

38.21.4.3.3 Received Tag Extraction Rules

The tag extraction from receive packets and insertion in the receive descriptor write back is controlled by the *VSI_TSR.STRIPTAG, VSI_TSR.SHOWTAG,* and *VSI_TSR.SHOWPRIONLY* bit fields. The options supported for each tag are:

- Do nothing
- Remove this tag from receive packets and do not insert into descriptor

- Remove this tag from receive packets and insert into descriptor
- Remove this tag from receive packets and insert only priority bits into descriptor

Up to two L2 tags can be extracted into the Rx descriptor. One of the tags can supply up to 32 bits of data, and the other tag can supply up to 16 bits of data (a total of three 16-bit words maximum). If more than one word needs to be extracted, then 32 bytes descriptors needs to be used (the *Dsize* flag in the receive queue context is set to 32B_Descriptor); otherwise, 16 bytes descriptors can be used (the *Dsize* flag is set to 16B_Descriptor).

The order of the tags extracted to the descriptor is according to the order in the *VSI_TSR.SHOWTAG* bit map and according to the *L2TSEL* field in the queue context. If the *L2TSEL* bit is cleared, the first bit set extracts the value to the *L2TAG1* field in the receive descriptor, the second bit set, extracts the value to the *L2TAG2* (2nd) and *L2TAG2* (1st) fields in the receive descriptor. If the *L2TSEL* bit is set, the first bit set extracts the value to the *L2TAG2* (2nd) and *L2TAG2* (1st) fields in the receive descriptor, the second bit set, extracts the value to the *L2TAG1* field in the receive descriptor.

Note: The *L2TAG2* (2nd) field is used only if *GL_SWT_L2TAGRXEB.LENGTH* is set to 10b or 11b (24 or 32 bits extracted part).

When removal from the packet of a tag is requested, the total L2 tag (determined by the *GL_SWT_L2TAGCTRL [7:0].LENGTH* field), including the EtherType is extracted from the packet.

If the *SHOWIV* bit is set in queue context, the inner VLAN value replaces the tag extracted to *L2TAG2*.

Caution: Extracting two tags should be used only if the software device driver knows which tags are expected in the packets.

The following table describes the content of the tags in the receive descriptor writeback in different cases assuming the first tag is an S-tag and the second tag is a VLAN.

Table 38-160.Tag Extraction Example (Sheet 1 of 2)

SHOWIV	L2TSEL	Packet			L2TAG1	L2TAG2 - 2nd	L2TAG2 - 1st
		S tag present	VLAN present	Inner VLAN present			
0	0	y	y	X	VLAN	S tag	0
		y	n		Not Valid	S tag	0
		n	y		Not Valid	VLAN	0
		n	n		Not Valid	Not Valid	Not Valid
	1	y	y		S tag	VLAN	0
		y	n		S tag	Not Valid	Not Valid
		n	y		VLAN	Not Valid	Not Valid
		n	n		Not Valid	Not Valid	Not Valid

Table 38-160.Tag Extraction Example (Sheet 2 of 2)

SHOWIV	L2TSEL	Packet			L2TAG1	L2TAG2 - 2nd	L2TAG2 - 1st
		S tag present	VLAN present	Inner VLAN present			
1	0	y	X	y	S tag	Inner VLAN	0
		y	X	n	Not Valid	S-tag	0
		n	y	y	Inner VLAN	VLAN	0
		n	y	n	Not Valid	VLAN	0
		n	n	y	Inner VLAN	Not Valid	Not Valid
		n	n	n	Not Valid	Not Valid	Not Valid
	1	y	y	y	S tag	Inner VLAN	0
		n	y	y	VLAN	Inner VLAN	0
		y	y	n	S tag	Not Valid	Not Valid
		n	y	n	VLAN	Not Valid	Not Valid
		y	n	y	S tag	Inner VLAN	0
		y	n	n	S tag	Not Valid	Not Valid
		n	n	y	Not Valid	Inner VLAN	0
		n	n	n	Not Valid	Not Valid	Not Valid

38.21.4.3.4 Tag Handling (Programming Interface)

This section describes the CSR interface available to control the L2 tags handling of the 10 GbE controller. The actual programming of these capabilities is either through an NVM image loading of the device-wide behavior, through port-wide commands such as the Set Port Parameters command for the port-wide behavior or through the Add VSI admin command for the per-VSI behavior.

The 10 GbE controller supports up to 8 types of programmable L2 tags. The types of L2 tags are defined in the NVM and in registers. For each tag the following parameters are defined:

Table 38-161.L2 Tag Control Registers - Global (Sheet 1 of 2)

Register	Field	Description
GL_SWT_L2TAGCTRL [7:0]	ETHERTYPE	The EtherType of the L2 tag.
	ISVLAN	Is this tag a VLAN tag? This information is used to define if priority tagging should be supported for this tag.
	INNERUP	If this bit is set, the UP remapping is done on this field. If this bit is set, then ISVLAN should also be set. If set in multiple tags, then the inner UP is taken from the first tag with this bit set in the packet.
	OUTERUP	If this bit is set, then this is the tag on which the inner-to-outer UP remapping is applied. Should be set only in one tag.
	LENGTH	The length of the L2 tag (not including the EtherType). The length can be 2, 4, 6 or 8 bytes.
	HAS_UP	Defines if this tag includes UP bits that should be used for UP to TC translation. The first such tag found in the packet is used for UP to TC translation.
PRT_L2TAGSEN	NONLAST_TAG	Indicates that there are more tags with the same EtherType expected.
GL_SWT_L2TAGTXIB [7:0]	OFFSET	Describes the offset in the header to which the variable data should be inserted (can be up to 8 bytes).

Table 38-161.L2 Tag Control Registers - Global (Sheet 2 of 2)

Register	Field	Description
GL_SWT_L2TAGDATA0[7:0] GL_SWT_L2TAGDATA1[7:0]	L2TAGDATA	The fixed part to insert in transmit packets.

Each port defines which tags to expect in packets sent and received through this port using the *PRT_L2TAGSEN.ENABLE* field.

Each VSI defines which of the 8 L2 tags are offloaded for its Tx and Rx traffic using the *VSI_L2TAGSTXVALID* and VSI_TSR registers. These registers define which receive tags and transmit tags to handle.

Each VSI can be configured with a different behavior for each of the tags. The possible behaviors relates to the type of tags the software device driver is allowed to insert in transmit packets, the type of tags inserted by the switch, the tags removed from received packets and the tags posted to the receive descriptor write back.

Table 38-162 lists the registers fields used to set the expected behavior for each tag.

Table 38-162.L2 Tag Control Registers - Per VSI

Register	Field	Description
VSI_L2TAGSTXVALID	L2TAG[12]INSERTID[1], L2TAG[12]INSERTID_VALID	Defines the tags for which descriptor-based insertion is supported. The ID is based on the L2 tags mapping listed in Table 38-163.
	TIR[012]INSERTID, TIR[012]_INSERT	Defines the tags for which port-based insertion is supported.
VSI_TAR[2]	ACCEPTTAGGED[n]	A bitmap describing if a packet with tag N is accepted.
	ACCEPTUNTAGGED[n]	A bitmap describing if a packet without tag N is accepted.[3,4]
VSI_TIR_n (n = 0..2)	PORT_TAG_ID	The tag to insert.
VSI_TAIR	PORT_TAG_ID	The alternate tag that can be used instead of VSI_TIR[0].
VSI_TSR	STRIPTAG[n] (n = 0..9)	Defines if the tag should be extracted from the packet.
	SHOWTAG[n] (n = 0..9)	Defines which of the tags should be extracted to the descriptor. Valid only if corresponding bit in STRIPTAG is set. The *SHOWPRIONLY* field defines which part of the tag to extract to the descriptor. At most two of these bits should be set. If more than two bits are set, only the two first are considered.
	SHOWPRIONLY[n] (n = 0..9)	A per-tag bitmap defining which part of the tags to extract to the descriptor. If set, only the priority bits are extracted; otherwise, the entire tag is used. Relevant only if the corresponding bit in SHOWTAG is set.

Notes:

1. In order to enable insertion of priority bits from a descriptor and the VLAN tag value from hardware as listed in Table 38-158. Note that the same ID should be used for L2TAG1INSERTID and TIR0INSERTID or L2TAG2INSERTID and TIR1INSERTID.
2. The tag number in this register relates to the 10 tags defined in Section 38.21.4.3.5.
3. If *GL_SWT_L2TAGCTRL.ISVLAN* is set, admits also priority-tagged packets (VLAN tag = 0b).
4. This bit should be set for all the tags not expected in the packet.

38.21.4.3.5 L2 Tags Configuration

This section describes the value to set in the different registers to implement the 10 GbE controller POR.

Table 38-163 lists the L2 tags that are currently defined.

Table 38-163.L2 Tags

Tag	Tag ID (In Table)	Tag ID In VSI_TAR And VSI_TSR Bitmaps
Reserved	0	2
S-tag	1	3
Outer VLAN	2	4
VLAN	3	5
Reserved		

Table 38-164 lists the configuration for each of the tags.

Table 38-164.L2 Headers Support

Register/Tag	Reserved	S-tag	Outer VLAN	VLAN	Reserved
Index	0	1	2	3	5-7
Global Configuration					
GL_SWT_L2TAGCTRL. ETHERTYPE		0x88A8[1]	0x8100	0x8100	0
GL_SWT_L2TAGCTRL. ISVLAN[2]		0	0	1	0
GL_SWT_L2TAGCTRL. NON_LAST_TAG	0	0	1	0	0
GL_SWT_L2TAGCTRL. INNERUP		0	0	1	0
GL_SWT_L2TAGCTRL. OUTERUP		1	0	0	0
GL_SWT_L2TAGCTRL. LONG		0	0	0	0
GL_SWT_L2TAGCTRL. HAS_UP		1	1	1	0
GL_SWT_L2TAGCTRL. LENGTH		2	2	2	0
GL_SWT_L2TAGTXIB. OFFSET		0	0	0	0
GL_SWT_L2TAGTXIB. LENGTH[3]		01b	01b	01b	0
GL_SWT_L2TAGRXEB. OFFSET		0	0	0	0
GL_SWT_L2TAGRXEB. LENGTH[3]		01b	01b	01b	0
GL_SWT_L2TAGDATA0, GL_SWT_L2TAGDATA1	All zeros.				
Per Port Configuration Controlled By Firmware					
PRT_L2TAGSEN.ENABLE		0/1	0/1[1]	1	0
Per VSI Configuration Controlled By Add VSI Command					
VSI_TSR. STRIPTAG		0/1[4]	0	0/1[5]	0
VSI_TSR.SHOWTAG		0/1	0	0/1[6]	
VSI_TSR.SHOWPRIONLY		0	0	0/1[7]	
VSI_TAR.ACCEPTTAGGED		0/1	1	0/1[8]	
VSI_TAR.ACCEPTUNTAGGED		1	1	0/1	

Notes:

1. If the *Channel Identifier* field in the features enable word in the EMP SR settings module header is set, the value of tag 1 is 0x8100 and tag 2 (outer VLAN) is not available.
2. The ISVLAN must be set on one tag and only on one tag (the inner VLAN).
3. 00b = 8 bits, 01b = 16 bits, 10b = 24 bits, 11b = 32 bits.
4. Should be set, unless cascaded PE VSI without offload.

5. Should be set if VSI is VLAN aware and VM requested VLAN extraction offload.
6. Should be set if VSI in non-VLAN aware but is DCB aware.
7. Should be set for VLAN aware VSIs.
8. Should be set if VSI must add VLAN.

Note: *PRT_L2TAGSEN.ENABLE* should not enable outer VLAN and S-tag concurrently.

38.21.4.4 VLAN Handling

This section describes the handling of IEEE 802.1Q VLAN tags based on the features previously described.

There can be up to two VLAN tags in the outer header of a packet identified as VLAN (tag index 3) and outer VLAN (tag index 2).

In addition, the tunneled header may also include a VLAN. The handling of the tunneled VLAN is described in Section 38.21.4.4.3.

Each port can be set to expect packets with outer VLAN using the Set Port Parameters admin command. When enabled, a packet with a single VLAN is treated as a packet with outer VLAN only; otherwise, a single VLAN in a packet is treated as inner VLAN.

In any case, the outer VLAN is not part of the forwarding decision and should be handled by the software device driver or by the MC both in transmit and receive. There is no offload of outer VLAN insertion or extraction.

The sections that follow describe the handling of the inner VLAN.

In UDP tunnels, an internal VLAN might also be present. The handling of this VLAN is described in Section 38.21.4.4.3.

See the section about UP translation in inner and outer VLAN for more detail.

38.21.4.4.1 Transmit Flow

This section describes the handling of VLAN as part of the flow of packets sent by the host, the MC or the EMP.

Tag Insertion

A VLAN tag can be inserted to the packets in three ways:

1. As part of the packet buffer.
2. As part of the transmit descriptor in the *L2TAG1* field if the *IL2TAG1* field is set.
3. By the device from the VSI context.

The two first options are enabled if the VSI is allowed to add a VLAN tag by the VLAN driver insertion mode in the Add VSI command. If a packet is sent with a VLAN tag from a VSI not allowed to add a tag, it is dropped.

Note: If the *IL2TAG_IL2H* field in the transmit context descriptor is set, *L2TAG1* represents the inner VLAN and regular VLAN insertion from the descriptor is not available. See Insertion of Tunneled VLAN from Descriptor for details on the inner tag insertion. Inner tag insertion is allowed irrespective of the VLAN configuration in the *Add VSI* command.

The third option is enabled by setting the *Insert PVID* in the same command. The tag to insert is defined in the *PVID+Default UP* field of the command.

Note: Setting both *Insert PVID* and VLAN driver insertion mode to enable software to insert VLAN is not allowed.

It is expected that MC traffic arrives with the right VLAN tagging.

VLAN Anti-Spoofing

After the packet is VLAN tagged by one of the previous methods, if the *Enable VLAN anti spoof* bit in the Add VSI command is set, it is compared to the ingress VLAN list and dropped if the inserted VLAN is not in the list.

VLAN Filtering

If the packet passed the previous stage, the VLAN tag is used as part of the forwarding process. It is compared to the MAC, VLAN filters added by the Add MAC, VLAN pair command to determine if the packet should be sent to a local address or should be sent to the network. It is also compared to the PRT_MNG_MAVTV filters as part of the manageability filtering to define if it should be sent to the MC.

38.21.4.4.2 Receive Flow

This section describes the handling of VLAN as part of the flow of packets received by the host, the MC or the EMP.

VLAN Filtering

When a packet is received from the network (or from the host) the VLAN tag is used as part of the forwarding process. It is compared to the MAC, VLAN filters added by the Add MAC, VLAN pair command and compared to the VLAN egress filtering set by the Add VLAN admin command to determine if the packet should be sent to a local VSI. It is also compared to the PRT_MNG_MAVTV filters as part of the manageability filtering to define if it should be sent to the MC.

VLAN Extraction

Before a packet is stored in the host memory the VLAN tag might be stripped and optionally stored in the receive descriptor. The action done is defined per VSI in the *VLAN and UP expose mode (Rx)* field in the Add VSI command. The possible actions are:

- Show VLAN and UP in descriptor (legacy behavior)
- Hide VLAN show UP in descriptor (VLAN ID exposed as 0)
- Hide VLAN and UP
- Do nothing (leave VLAN in packet)

If the VLAN or the UP are exposed in the descriptor then it shows in the *L2TAG1* field and the *L2TAG1P* flag is set. If L2TSEL bit is set, VLAN tag is extracted to the L2TAG2 (1st) field in the receive descriptor instead. In this case, 32 bytes descriptors must be used (*DSize* field in the receive queue context must be set).

Note: When a packet is sent to the MC the VLAN is kept in the packet.

38.21.4.4.3 VLAN in Tunnel Packets

During MAC in UDP and MAC in GRE encapsulations, a VLAN within the tunneled MAC header might also be present.

Insertion of Tunneled VLAN from Descriptor

The insertion of this tag is controlled via the *IL2TAG_IL2H* field in the transmit descriptor. When set, the L2TAG2 field in the context descriptor contains the tunneled VLAN. In this case, the values of *VSI_L2TAGSTXVALID.L2TAG2INSERTID* and *VSI_L2TAGSTXVALID.L2TAG2INSERTID_VALID* fields are ignored.

This mode is enabled irrespective of the VLAN configuration in the *Add VSI* command.

Extraction of Tunneled VLAN to Descriptor

The *SHOWIV* field in the receive queue context controls the extraction of an internal VLAN to the receive descriptor. If set, the tunneled VLAN is inserted in L2TAG2 (1st) field of the receive descriptor write back. If L2TSEL bit is cleared, the inner VLAN tag is extracted to the L2TAG1 field in the receive descriptor instead. When the SHOWIV field is set and L2TSEL bit is set, 32 bytes descriptors must be used (*DSize* field in the receive queue context must be set).

Tunneled VLAN in Pass Through Traffic

Tunneled VLAN is not offloaded (not inserted nor extracted) for MC pass-through traffic.

38.21.4.5 Port-Based VLAN

The 10 GbE controller supports a port-based VLAN feature by enabling any VSI to specify the default VLAN that it belongs to. The port-based VLAN association is done when a packet received on VSI is untagged or priority tagged and protocol VLAN association is not done. Port-based VLANs map packets received on a given VSI with the corresponding port-based VLAN identifier called PVID. The PVID list should be programmed with the port VLAN IDs for each VSI.

The port VLAN list is provided which is part of the VSI context. Table 38-165 lists the port VLAN parameters in the port VLAN list and the matching parameters in the Add VSI command.

Table 38-165.Port VLAN List and VSI Parameters (Sheet 1 of 2)

Port Based VLAN list	Add VSI parameter	Notes
VSI number	VSI Number	Returned by firmware in response.
PVID	PVID + Default UP	
Default UP		
Admit.1Q tagged only	VLAN driver insertion mode	
Admit untagged/Priority tagged only		
Admit all		
Ingress VLAN check enable	Enable VLAN anti spoof	
Insert PVID	Insert PVID	
Expose VID and UP of received packets	VLAN and UP expose mode (Rx)	
Expose UP only of received packets		
Do not expose VID or UP of received packets		

Table 38-165.Port VLAN List and VSI Parameters (Sheet 2 of 2)

Port Based VLAN list	Add VSI parameter	Notes
Ingress UP translation table	Ingress UP translation table	Refer to the Transmit Functionality section for more detail.
Egress UP translation table	Egress UP translation table	Refer to the Transmit Functionality section for more detail.

The switch should insert the PVID to the packet if the *Insert PVID* parameter is set for the VSI and replace the UP bits according to the algorithm described in the Transmit Functionality section.

Once the VLAN ID association is made, the packet forwarding is performed using the (VLAN, MAC) forwarding table and VLAN membership table.

38.21.4.6 S-tag Handling

This section describes the handling of IEEE 802.1Qbg S-tags based on the features previously described.

There can be up to one S-tag in a packet (tag index 1). The sections that follow describe the handling of the S-tag.

Note: The S-tag EtherType can be either 0x88A8 or 0x8100 according to the Channel Identifier field in the Features enable word in the EMP SR Settings Module Header (0x0 = 0x88A8, 0x1=0x8100).

38.21.4.6.1 Transmit Flow

This section describes the handling of S-tag as part of the flow of packets sent by the host, the MC or the EMP.

There is no anti-spoofing capability for S-tags.

Tag Insertion

An S-tag can be inserted to the packets in three ways:

1. As part of the packet buffer.
2. As part of the transmit descriptor in the *L2TAG2* field if the *IL2TAG2* field is set.
3. By the device from the VSI context.

The first two options are enabled if the VSI is allowed to add an S-tag by the clearing the *S-tag insert enable* field and setting the *Accept tag from host* field in the Add VSI command. If a packet is sent with an S-tag from a VSI not allowed to add a tag, it is dropped.

The third option is enabled by setting the *S-tag insert enable* in the same command. The tag to insert is defined in the *S-tag* field of the command.

Note: Setting both *S-tag insert enable* and *Accept tag from host* to enable software to insert VLAN is not allowed.

38.21.4.6.2 Receive Flow

This section describes the handling of S-tag as part of the flow of packets received by the host, the MC or the EMP.

S-tag Extraction

Before a packet is stored in the host memory the S-tag might be stripped and optionally stored in the receive descriptor. The action done is defined per VSI in the *S-tag extract mode* field in the Add VSI command. The possible actions are:

- Show S-tag and UP in descriptor (legacy behavior) — used for cascaded port virtualizer with offload.
- Hide S-tag and UP.
- Do nothing (leave S-tag in packet) — used for cascaded port virtualizer without offload.

If the S-tag is exposed in the descriptor then it shows in the *L2TAG2* field and the *L2TAG2P* flag is set. In this case, 32 bytes descriptors must be used (*DSize* field in the receive queue context must be set).

Note: If the *SHOWIV* field is set in the queue context, then the *L2TAG2* field is allocated for the inner VLAN of tunnel packet. In this case, the S-tag is never inserted in the descriptor.

38.21.5 User Priority Bits (802.1p) Handling

The UP bits are used to differentiate between multiple classes of traffic. The 10 GbE controller supports multiple use cases related to the handling of the UP bits:

1. An operating system that is not DCB/traffic type aware and uses a single TCID.
2. An operating system that is traffic type aware, but not DCB aware. It can distribute the traffic to different queues, but cannot tag them with the right UP. This case refers to LAN and iWARP flows. The operating system is not aware but the software device driver knows the difference and hence can assign the different types of traffic to different flows. There is no DCBX agent and hence the software device driver does not know the UP or TC for flows.
3. An un-trusted operating system that might set UP bits of TCs is not allowed to use.
4. An operating system that can use a single queue per TCID, but would like to use more UPs in order to gain from the differentiated QoS in the network.

The following sections describes the handling of UP bits in transmit and receive to support the previous use cases.

38.21.5.1 Transmit Functionality

Each transmit packet is assigned a UP, either by the software device driver or as part of the port VLAN table as described in Section 38.21.4.5.

This UP is translated using two different translation vectors.

The first vector is specific to a VSI and is part of the port VLAN table (*transmit UP translation table - VSI_TUPR*). This vector reflects the mapping of the user priorities as seen by the operating system to the user priorities as seen by the network.

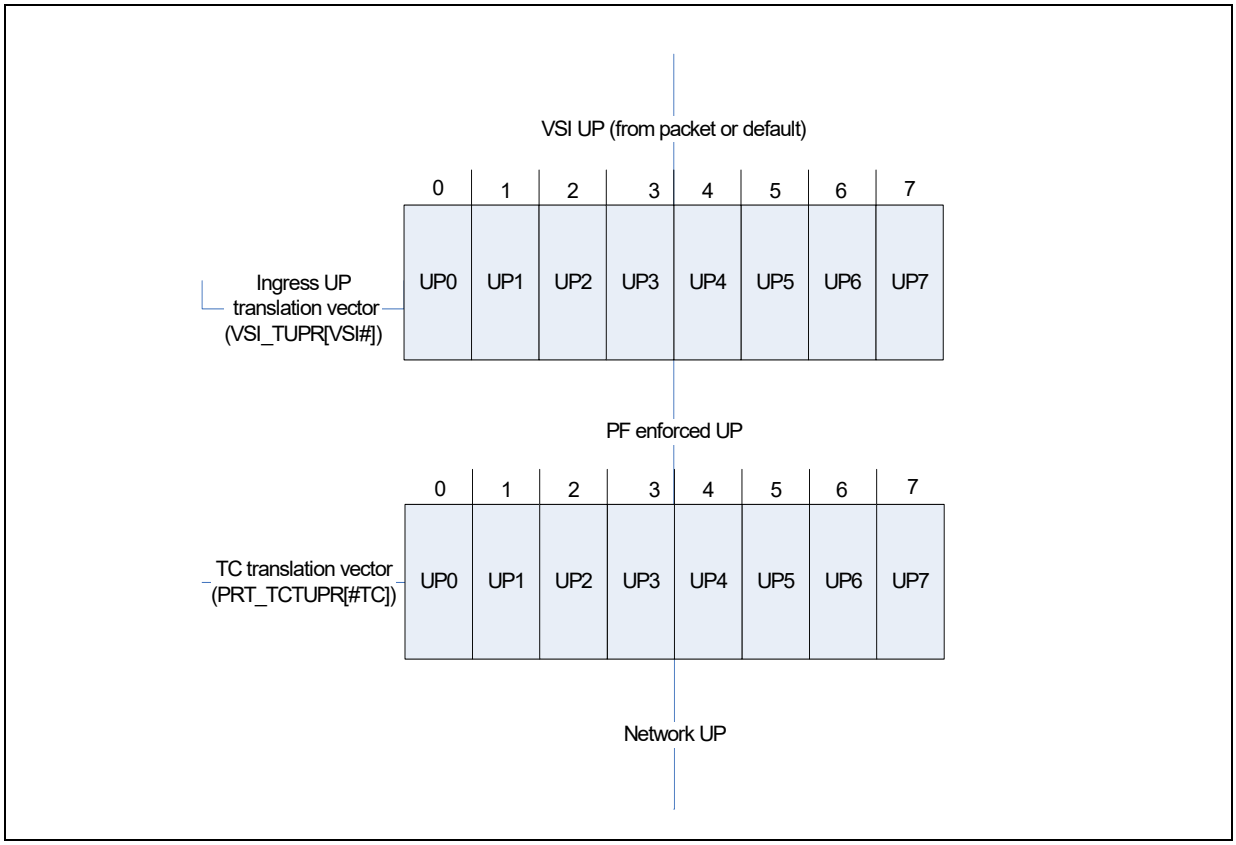
The second vector is specific to a TCID in a physical port. It translates the UP received from the previous translation to a UP matching the TCID to which the packet is associated. These vectors can be configured through the *PRT_TCTUPR* registers.

Note: There is no drop of packets due to a wrong 802.1p tagging, if a wrong tag is requested the tag is replaced. Thus, this functionality supports both UP anti-spoofing and port based UP.

Untagged packets are kept as is. No translation is done on them.

Figure 38-10 shows the algorithm.

Figure 38-10.Example: Non-VLAN Aware, Non-DCB Aware Operating System



Assume a VF that queues LAN traffic and iSCSI traffic to different queues, but is not VLAN aware. In this case, the packet is sent by the software device driver with no VLAN and the default UP set in the port based VLAN (such as 0) is the initial UP of the packet. In this case, the *Ingress UP translation vector* (*VSI_TUPR*) is not relevant and might be for example (0,1,2,3,4,5,6,7) or (0,0,0,0,0,0,0,0). The *TC translation vector* (*PRT_TCTUPR)* for LAN might be (0,1,2,0,0,0,0,0) and the TC table for storage might be (4,4,4,4,5,4,4,4). So a LAN packet goes out with a UP of 0, and a storage packet goes out with a UP of 4.

Example: Non-DCBx tagging operating system

Assume a VF that tags LAN high priority traffic with a UP of 4 and LAN low priority traffic with a UP of 3 and the storage traffic as UP 7. In this case, the VF translation table might be (0,1,2,0,2,4,4) and the TC tables as previously described. The low priority LAN goes out with a UP of 0, the high priority LAN with a UP of 2 and storage with a UP of 4.

The tag on which the transmit UP translation is done is identified by setting the *INNERUP* bit in the matching GL_SWT_L2TAGCTRL register.

The default mapping of both tables is identity mapping (for example, mapping a UP to itself). If UP translation is not needed these mappings should not be changed.

38.21.5.1.1 Transmit Outer Tag User Priority

The transmit outer tag user priority can be handled in three different ways:

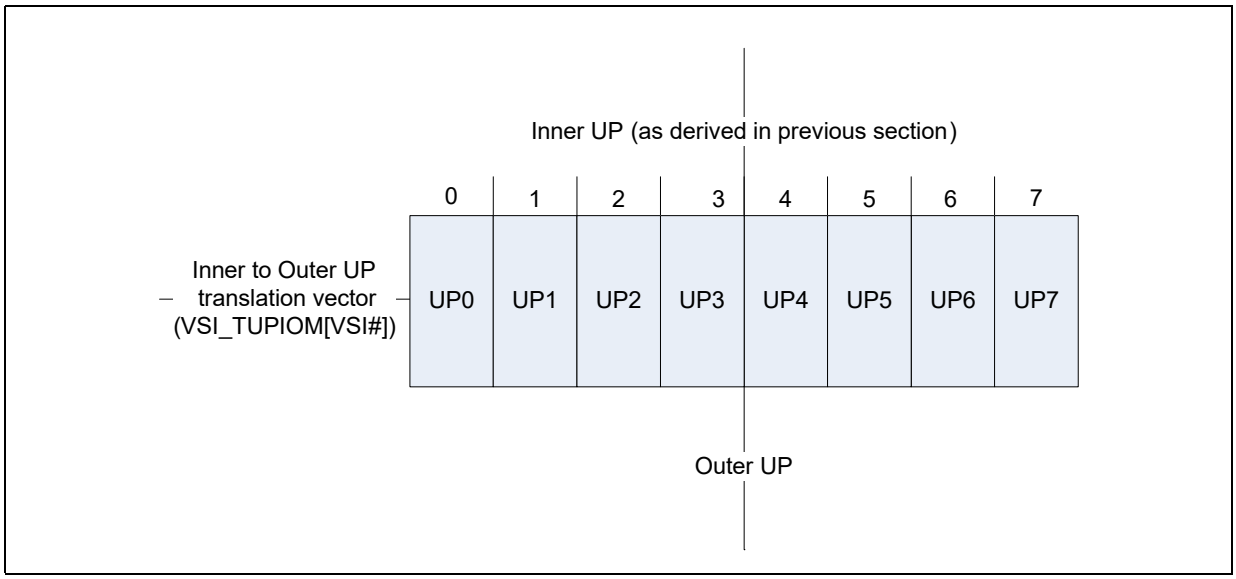
1. If the outer tag is received in the packet or the descriptor (for example, cascaded S-comp), the UP should be part of the packet sent by the software device driver or inserted from the descriptor.
2. If the outer tag is inserted by hardware then the UP might be either:
   a. The UP defined as part of the inserted tag in the VSI_TIR register.
   b. A translation of the regular VLAN UP as defined in the *VSI_TUPIOM* register.

If the outer tag is defined as *OuterUP* in the GL_SWT_L2TAGCTRL register, then the UP is based on the first tag for which the *InnerUP* field is set in the GL_SWT_L2TAGCTRL register (usually the VLAN tag) (option 2.b); otherwise, it is based on the default (option 2.a).

The tag to which translation is applied can be either S-tag or external VLAN.

Figure 38-11 describes the translation process.

Figure 38-11.Tx Inner-to-Outer UP Translation



38.21.5.2 Receive Functionality

38.21.5.2.1 VLAN UP Translation

The priority bits of inner VLAN tag in received packets might be remapped using the *Ingress UP translation table* in the *Add VSI* command. This means the operating system might get packets with 802.1p priority bits reflecting the local configuration and not the link configuration. By default (ingress UP translation section is not valid) the translation is one-to-one, meaning that the received UP is not translated.

38.21.5.2.2 VLAN UP Exposure to Software Device Driver

The exposure of the received UP to operating systems is defined by the awareness of the operating system controlling the VSI as follows:

1. For a monolithic operating system, VMM or for a guest operating system that is VLAN aware, the UP is exposed as part of the VLAN as requested by software device driver (either in the packet or in the descriptor).
2. If the guest operating system is DCB aware but not VLAN aware, it gets the priority bits as part of the receive descriptor in the VLAN tag field. The VLAN ID is zero, but the priority bits are valid.
3. A guest operating system that is not VLAN aware and not DCB aware does not get the user priority bits (UP) at all.

The configuration of the UP removal is part of the port VLAN configuration described in Section 38.21.4.5 and in the *Add VSI* command VLAN handling section.

38.21.6 Frame Formats

This section describes the packet formats supported by the device. It is structured by layers (L2, L3, and L4), providing the details per each layer. Packets that do not conform with the described formats are handled as L2 packets.

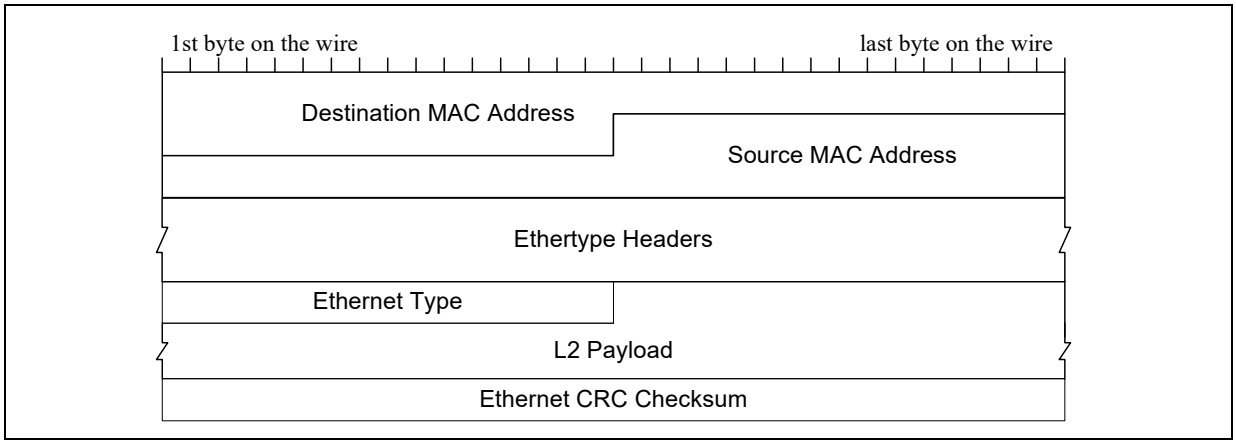
- The following restrictions apply on the lengths of parsed packets: The device parses headers in the first 480 bytes of the packet only. If the header (as defined in this section) extends beyond 510 bytes, the packet is handled as an L2 packet with a packet type of abort (0xFF).
- Each single header is limited to 255 bytes (unless restricted further in the text). If the header (as defined in this section) extends beyond 255 bytes, the packet is handled as an L2 packet with a packet type of abort (0xFF).
- Aborted packets by the parser are handled as L2 packets by the switch: VSI decision is made by the outer MAC, optional VLAN tag in the outer L2 header and an optional S-tag.

38.21.6.1 L2 Packet Formats

IEEE 802.3 and 802.3 SNAP packets are considered and treated as Layer 2 packets. The 10 GbE controller does not identify such packets explicitly in any way.

38.21.6.1.1 Standard L2 Packet Format

Figure 38-12.Standard L2 Frame Format



38.21.6.1.2 Serial EtherTypes (L2-tags)

Table 38-166 lists the supported EtherType headers. The order of EtherType headers in the L2 header are shown in Figure 38-12.

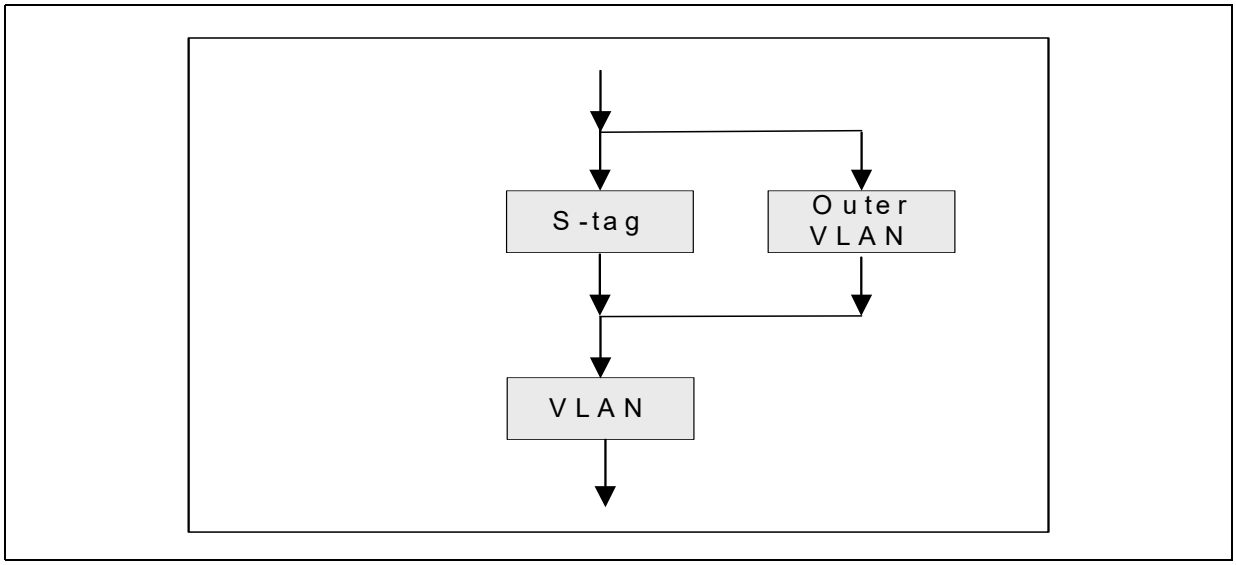
Table 38-166.List of Serial EtherType Headers

EtherType Header	Value	Length[1]	Defined In
802.1Q S-tag	0x88A8	2 words	IEEE 802.1Q clause 9.
Outer VLAN	Loaded from NVM (such as 0x8100, 0x9100, and 0x9200)	2 words	IEEE 802.1Q clause 9.
VLAN	0x8100	2 words	IEEE 802.1Q clause 9.

Notes:

1. EtherType headers are an integer number of words. Length includes the *Type* field.

Figure 38-13.Order of L2 EtherType Headers



38.21.6.1.3 Last EtherType (Upper Layer Protocol)

The Upper-layer Protocol (ULP) following the L2 header is identified by the *Ethernet Type* field (see Figure 38-12).

Table 38-167 lists the EtherTypes supported by the device along with their index value. A value of 00-00 means the entry is reserved.

Table 38-167.List of Ethernet Types (Sheet 1 of 2)

Index	Value	Purpose	Format of ULP
0	88-F7	IEEE 1588 (IEEE 802.1AS)	
1	89-14	Reserved	
2	00-00	Reserved	
3	00-00	Reserved	
4	88-CC	IEEE 802.1ab (LLDP)	IEEE P802.1AB specification.
5	89-40	Reserved	
6	00-00	Reserved	
7	88-47	Reserved	

Table 38-167.List of Ethernet Types (Sheet 2 of 2)

Index	Value	Purpose	Format of ULP
8	88-8E	IEEE 802.1X (Network Access Control)	N/A
9	08-06	ARP	See Section 38.21.6.2.6.
10	00-00	Reserved	
11	00-00	Reserved	
12	08-00	IPv4	See Section 38.21.6.2.1.
13	86-DD	IPv6	See Section 38.21.6.2.2.
14	89-06	Reserved	
15	00-00	Reserved	

38.21.6.1.4 MPLS Header(s)

The 10 GbE controller identifies MPLS headers. It skips these headers processing the rest of the packet and providing all stateless offloads, switch filtering and the classification filters. Table 38-168 lists which fields of the MPLS header are digested by the device and Figure 38-14 shows the structure of the MPLS header.

Packets with MPLS are only supported for LAN traffic. Not supported for RDMA offload.

Identification of Next Protocol

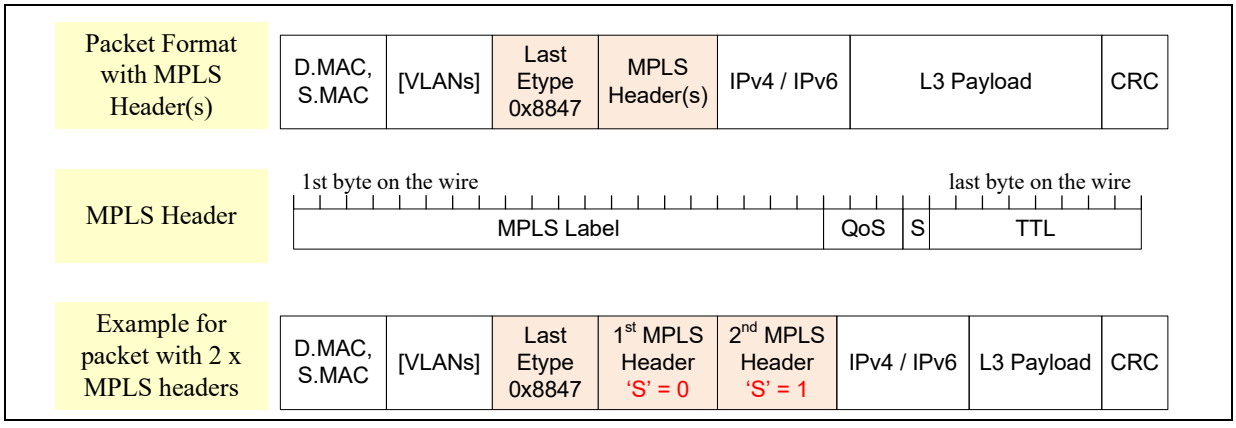
The 10 GbE controller supports IP after MPLS by evaluating the nibble (4 bits) immediately following the last MPLS tag.

- If it equals to 0x4 then the next protocol is identified as IPv4
- If it equals to 0x6 then the next protocol is identified as IPv6
- Else, packet is handled as L2 packet

Table 38-168.MPLS Header Structure

Bit Offset	Size [bits]	Field	Value	Action	Comment
0	20 bit	MPLS Label	Variable	Ignore	
20	3 bit	QoS and ECN	Variable	Ignore	
23	1 bit	S - Bottom of Stack	0 / 1	Check	Identify the last MPLS header when 'S' = 1b
24	8 bit	TTL	Variable	Ignore	

Figure 38-14.MPLS Header



38.21.6.1.5 LLDP Frame Format

The general structure of an LLDP packet is listed in Table 38-169.

Table 38-169.Structure of LLDP Frame

LLDP Header	
LLDP EtherType	LLDPDU

The LLDPDU contains an ordered sequence of three mandatory TLVs followed by zero or more optional TLVs plus an end of LLDPDU TLV, as listed in Table 38-170.

Table 38-170.Structure of LLDP PDU

Mandatory	Mandatory	Mandatory				Mandatory
Chassis ID TLV	Port ID TLV	Time to Live TLV	Optional TLV	...	Optional TLV	End of LLDPDU TLV

Each TLV has the structure shown in Figure 38-171.

Table 38-171.Structure of LLDP TLV

TLV Header		
7 bits	9 bits	0 <= n <= 511 octets.
TLV type	TLV information string length	TLV information string.

The basic format for organizationally specific TLVs is shown in Table 38-172.

Table 38-172.Structure of LLDP Organizationally Specific TLV

TLV Header		TLV information string - 0 <= n <= 511 octets		
7 bits	9 bits	3 octets	1 octet	0 <= n <= 507 octets
TLV type	TLV information string length	Organizationally Unique Identifier (OUI)	Organizationally defined subtype	

The following table lists the applicable organizationally specific TLVs:

Table 38-173.List of Organizationally Specific TLV

TLV	OUI Value	Subtype Value
DCBx	00-80-C2	09, 0A, 0B, 0C

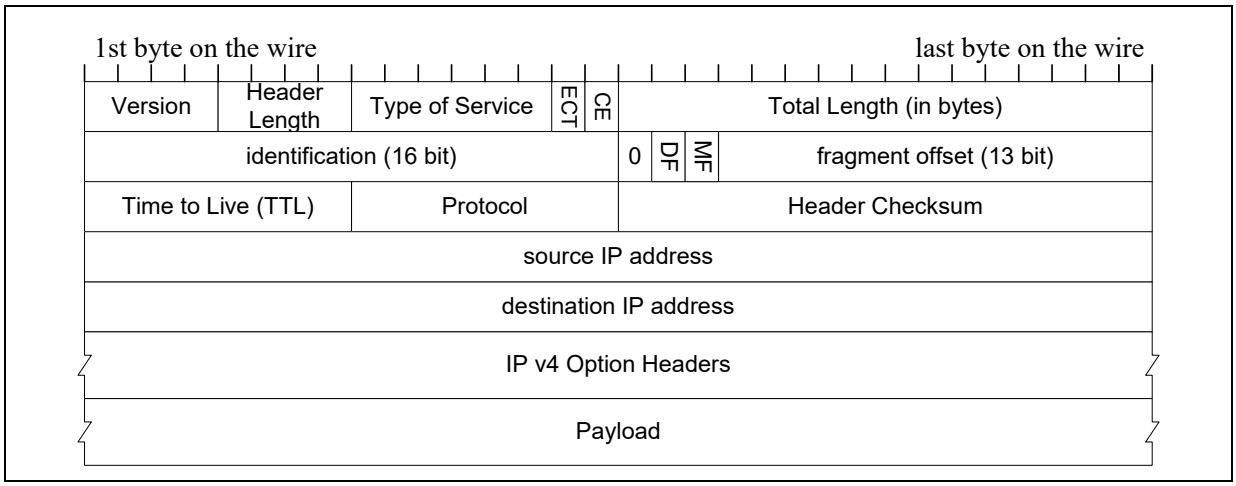
38.21.6.1.6 Other L2 Packets

Refer to the Magic and link control packets sections for more details.

38.21.6.2 L3 Packet Formats

38.21.6.2.1 IPv4 Datagram

Figure 38-15.IPv4 Datagram



Version — The *Version* field is set to 0x4 for IPv4 header.

Header Length — The length of the IP header defined in Dword units.

Type of Service — TOS (6 bits): The T*ype Of Service* field is used to indicate the quality of service with which this datagram is to be delivered by the internetwork routers.

IP Congestion Flags — CE, etc.

Total Length — The total length is the size of the IP datagram (IP header and payload) in byte units.

Identification — ID: The *Identification* field identifies a specific IP packet sent between a source and destination node. The sending host sets the *Identification* field's value, and the field is incremented for successive IP datagrams. The *Identification* field is used to identify multiple fragments of an original IP datagram.

Fragment Parameters — Fragment offset, *More Fragment*(s) flag and *Disable Fragmentatio*n flag.

Time to Live — TTL: The *TTL* field indicates the number of links that this IP datagram can travel before an IP router discards it.

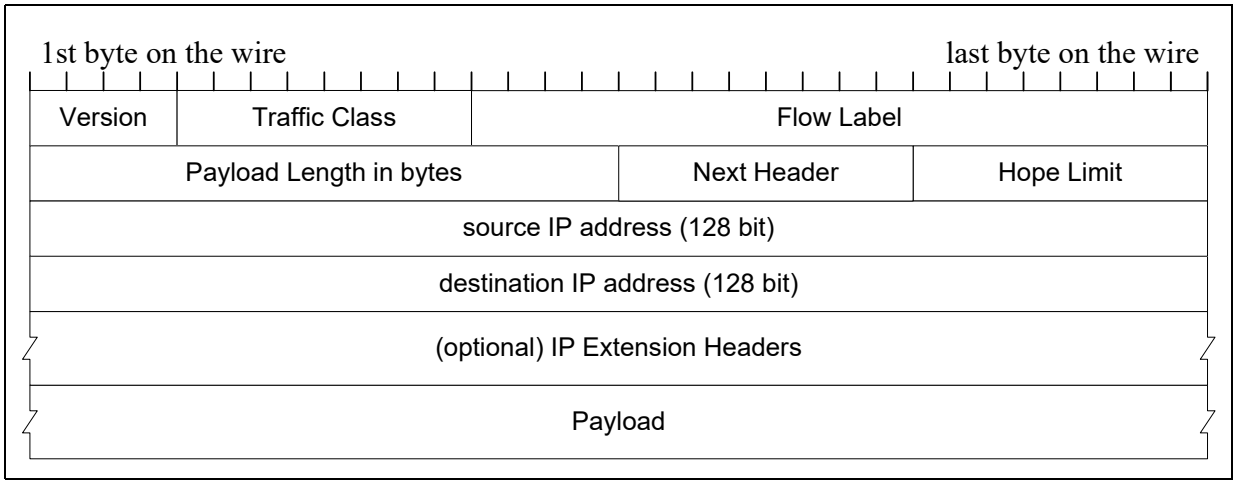
Protocol (next header) — The *Protocol* field indicates the next protocol encapsulated within the IP layer. See Section 38.21.6.2.3 for the list those protocols that can be offloaded by the 10 GbE controller.

Header Checksum — The *Checksum* field is a 16 bit one's complement of the one's complement sum of all 16 bit words in the IP header.

Source and Destination IP Addresses — 2- x 32-bit IP addresses.

38.21.6.2.2 IPv6 Datagram

Figure 38-16.IPv6 Datagram



- Version — The *Version* field is set to 0x6 for IPv6 header.
- Traffic Class and Flow Label — The TC and flow label are used for QOS support.
- Payload Length — The length of the IPv6 payload such as the rest of the packet following the IPv6 header, in byte units. Note that any IPv6 extension headers are considered part of the payload.
- Next Header (Protocol) — The *Next Header* field indicates the next protocol encapsulated within the IP layer. See Section 38.21.6.2.3 for the list those protocols that can be offloaded by the 10 GbE controller.
- Hope Limit (TTL) — The *Hope Limit* field indicates the number of links that this IP datagram can travel before an IP router discards it.
- Source and Destination IP Addresses — 2- x 128-bit IP addresses.

IPv6 Extension Headers

The IPv4 option headers that are included as part of the IP header are replaced in IPv6 by separate extension headers per option. Table 38-174 lists those most used IPv6 extension and their recommended ordering in the packet (shown in the figures that follow). The 10 GbE controller identifies these headers, skips them and then parses the rest of the packet for its processing (unless specified differently in Table 38-174).

Table 38-174.IPv6 Extension Headers and their Recommended Ordering (Sheet 1 of 2)

Header (Protocol)	Next Header Value	Header Length And Header Length Field Offset
Hop-by-Hop Options	0	Variable length field defined in 8-byte units excluding the first 8 bytes.
Destination Options	60	Variable length field defined in 8-byte units excluding the first 8 bytes. Can be located either at this location or before the mobility header.
Routing header	43	Variable length field defined in 8-byte units excluding the first 8 bytes.
Fragment header	44	Length is always 8 bytes. The 10 GbE controller does not continue to parse the rest of the packet.
Authentication header	51	Length Field Is At Byte 1. Define the header length minus 2 in 4-byte units. When this header is found, the 10 GbE controller does not continue to parse the rest of the packet. Applicable for IPv4 as well.

Table 38-174.IPv6 Extension Headers and their Recommended Ordering (Sheet 2 of 2)

Header (Protocol)	Next Header Value	Header Length And Header Length Field Offset
Encapsulating Security Payload	50	Length is 8 bytes plus variable length of initial value plus a trailer. When this header is found, the 10 GbE controller does not continue to parse the rest of the packet. Applicable to IPv4 as well.
Destination Options	60	Variable length field defined in 8-byte units excluding the first 8 bytes. Can be located either at this location or before the routing header.
Mobility Header	135	Variable length field defined in 8-byte units excluding the first 8 bytes.
No Next Header	59	When no next header type is found, the rest of the packet is not processed.

Figure 38-17.IPv6 Hop-by-hop Extension Header

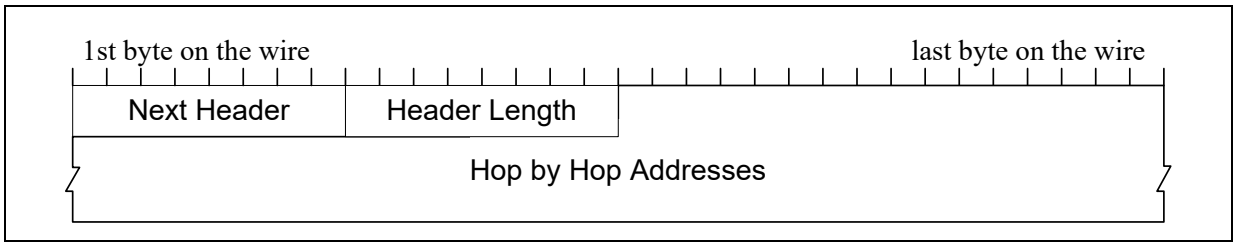


Figure 38-18.IPv6 Routing Header

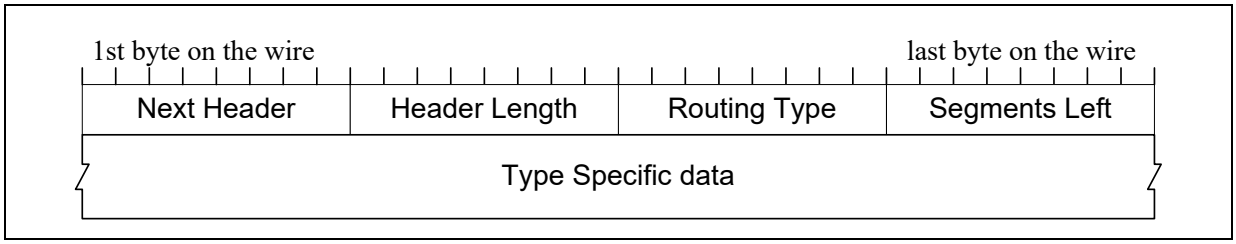

Figure 38-19.IPv6 Fragment Header

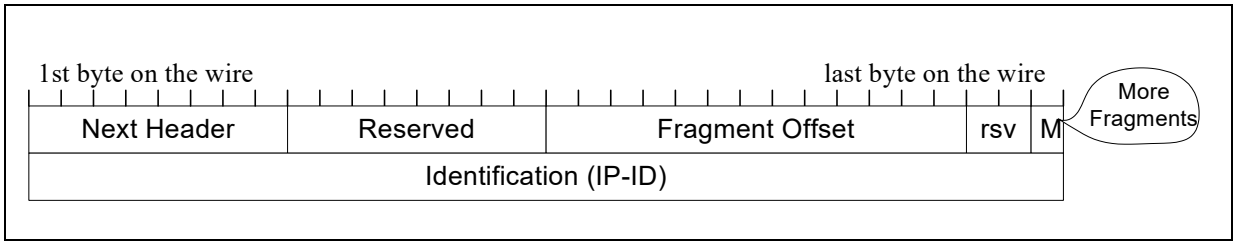

Figure 38-20.IPv6 Destination Options

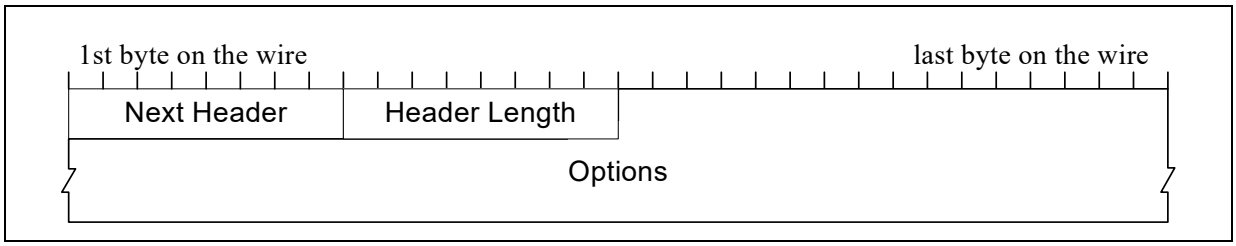

Figure 38-21.IPv6 Mobility Header

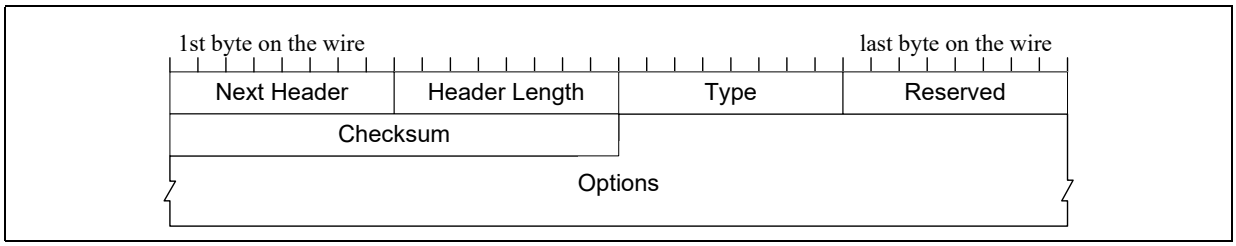

38.21.6.2.3 Protocol Headers (Next Header)

Table 38-175 lists the encoding of the *Next Header Type* field and information on determining each header type's length recognized by the 10 GbE controller according to the recommended ordering.

Table 38-175.Header Type Encoding and Lengths

Header (Protocol)	Next Header Value	Header Length And Header Length Field Offset
IPv4	4	Length field is at bits[7:4], defined in 4-byte units.
IPv6	41	Length is always 40 bytes.
Authentication	51	Length field is at byte 1, defines the header length minus 2 in 4-byte units.
Encapsulating Security Payload	50	Length is 8 bytes plus variable length of initial value plus a trailer.
TCP	6	Length field is at byte 12, bits [7:4], defined in 4-byte units.
UDP	17	Length is always 8 bytes.
ICMP	1	Length is always 8 bytes.
ICMPv6	58	Length is always 4 bytes.
SCTP	132	Length is always 12 bytes.
No Next Header	59	When no next header type is found, the rest of the packet is not processed.

38.21.6.2.4 ICMP Datagram

ICMP packets are used as part of the manageability filtering.

Table 38-176.ICMP Packet Format

	MSB..... . . . .LSB 31 24 First byte on the wire	MSB 23	LSB 16	MSB 15	LSB 8	MSB.. 7 Last byte on the wire	... . . LSB 0
0	Type	Code	ICMP Header Checksum				
4	Payload						

Table 38-177 lists the processing done to identify ICMP packets:

Table 38-177.IPv4 Packet Structure and Processing (Sheet 1 of 2)

Offset	# Of Bytes	Field	Value	Action	Comment
0	6	Destination Address		Compare	MAC header. Processed by main address filter.
6	6	Source Address		Skip	
12	T=(0/4)	Possible S-tag		Skip	
12 + T	S=(0/4)	Possible VLAN Tag		Compare	Processed by main address filter.

Table 38-177.IPv4 Packet Structure and Processing (Sheet 2 of 2)

Offset	# Of Bytes	Field	Value	Action	Comment
12 + T + S	2	Type	0x0800	Compare	IPv4
14 + T + S	1	Version/ HDR Length	0x4X	Compare	Check IPv4
15 + T + S	1	Type of Service	-	Ignore	
16 + T + S	2	Packet Length	-	Ignore	
18 + T + S	2	Identification	-	Ignore	
20 + T + S	2	Fragment Info	-	Ignore	
22 + T + S	1	Time To Live	-	Ignore	
23 + T + S	1	Protocol	0x1	Compare	ICMP
24 + T + S	2	Header Checksum	-	Ignore	
26 + T + S	4	Source IP Address	-	Ignore	
30 + T + S	4	Destination IP Address	-	Ignore	
34 + T + S	1	ICMP Type	-	Ignore	
35 + T + S	1	ICMP Code	-	Ignore	
36 + T + S	2	ICMP Header Checksum	-	Ignore	
38 + T + S	F	ICMP Payload	-	Ignore	

The 10 GbE controller does not parse the ICMP header and only detects the IP next protocol as ICMP.

38.21.6.2.5 ICMPv6 Datagram

ICMP packets are used as part of the manageability filtering and as part of proxying capabilities

Table 38-178.ICMPv6 Packet Format

	MSB..... . . . .LSB 31 24 First byte on the wire	MSB 23	LSB 16	MSB 15	LSB 8	MSB ... . . LSB 7 0 Last byte on the wire
0	Type	Code		ICMPv6 Header Checksum		
4	Payload					

The 10 GbE controller supports filtering of the following ICMPv6 packets.

Neighbor discovery packets:

1. 0x86 (134d) — Router Advertisement
2. 0x87 (135d) — Neighbor Solicitation
3. 0x88 (136d) — Neighbor Advertisement
4. 0x89 (137d) — Redirect

MLD packets:

1. 0x82 (130d) — MLD Query
2. 0x83 (131d) — MLDv1 Report
3. 0x84 (132d) — MLD Done
4. 0x8F (143d) — MLDv2 Report

Table 38-179 lists the processing done to identify ICMPv6 packets.

Table 38-179.ICMPv6 Packet Structure and Processing

Offset	# Of Bytes	Field	Value	Action	Comment
0	6	Destination Address		Compare	MAC header. Processed by main address filter.
6	6	Source Address		Skip	
12	T=(0/4/8)	Possible S-tag		Skip	
12 + T	S=(0/4)	Possible VLAN Tag		Compare	Processed by main address filter.
12 + T + S	2	Type	0x86DD	Compare	IPv6
14 + T + S	1	Version/ Priority	0x6X	Compare	Check IPv6.
15 + T + S	3	Flow Label		Ignore	
18 + T + S	2	Payload Length		Ignore	
20 + T + S	1	Next Header	IPv6 Next Header Types or 0x3A	Compare	0x3A - ICMPv6 header type.
21 + T + S	1	Hop Limit	0x1	Ignore	
22 + T + S	16	Source IP Address		Ignore	
38 + T + S	16	Destination IP Address		Ignore	
54 + T+ S	N	Possible IPv6 Next Headers		Ignore	
ICMPv6 Header					
54 + T + S + N	1	Type	0x82, 0x83, ox86, 0x87,0x88, 0x89 or 0x8F	Compare	MLD or neighbor discovery types.
55 + T + S + N	1	Code	0x0	Ignore	
56 + T + S + N	2	Checksum		Check	
58 + T +S + N	F	Message Body		Ignore	

38.21.6.2.6 ARP Packets

ARP packets are used as part of the manageability filtering.

Figure 38-22 and Table 38-180 show/list the ARP packets format and the processing of these packets.

Figure 38-22.ARP Packet Format

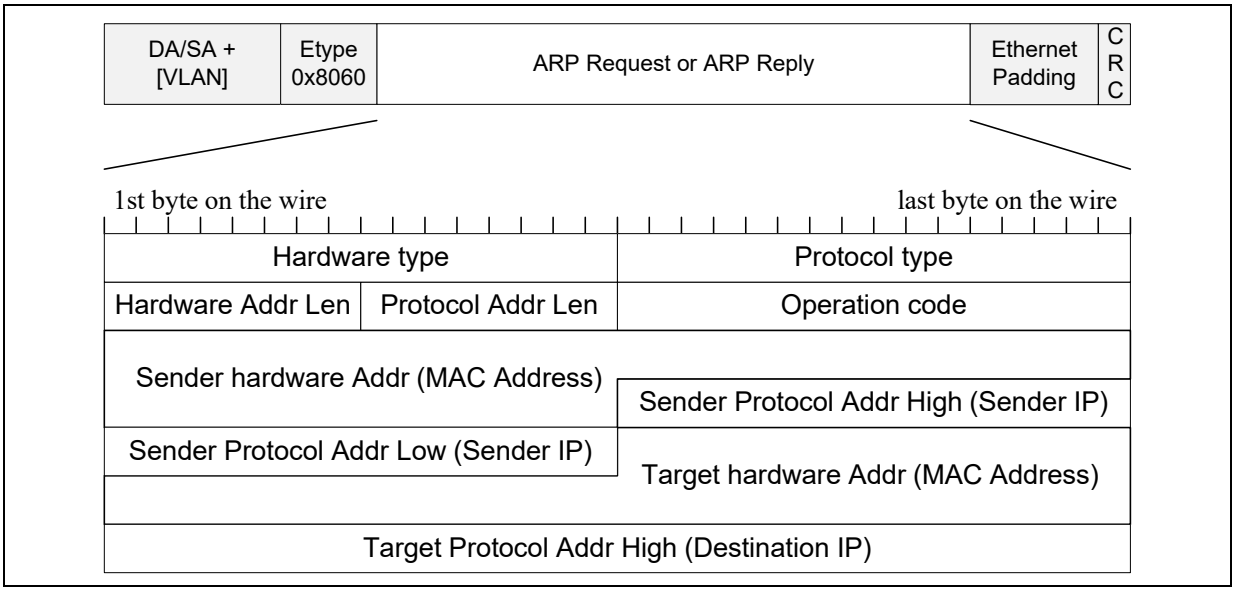

Table 38-180.ARP Packet Structure and Processing

Offset	# Of Bytes	Field	Value	Action	Comment
0	6	Destination Address		Compare	MAC header. Processed by main address filter.
6	6	Source Address		Skip	
12	T=(0/4/8)	Possible S-tag		Skip	
12 + T	S=(0/4)	Possible VLAN Tag		Compare	Processed by main address filter.
12+ T + S	2	Type	0x0806	Compare	ARP.
14 + T + S	2	Hardware Type	0x0001	Compare	Ethernet hardware type.
16 + T + S	2	Protocol Type	0x0800	Compare	IPv4 protocol.
18 + T + S	1	Hardware Size	0x06	Compare	MAC address size in bytes.
19 + T + S	1	Protocol Address Length	0x04	Compare	IPv4 address size in bytes.
20 + T + S	2	Operation	0x0001/ 0x0002	Compare	0x0001 = Request. 0x0002 = Response.
22 + T + S	6	Sender HW Address	-	Ignore	
28+ T + S	4	Sender IP Address	-	Ignore	
32 + T + S	6	Target HW Address	-	Ignore	
38 + T + S	4	Target IP Address	IP4AT	Compare	Use to decide of an IP match of ARP packets.

38.21.6.3 L4 Packet Formats

38.21.6.3.1 UDP Datagram

Figure 38-23.UDP Packet Format

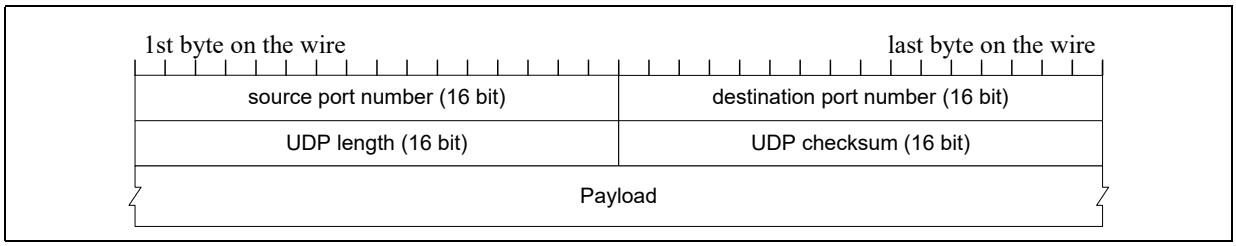

Figure 38-24.IPv4 Pseudo Header for TCP/UDP Checksum

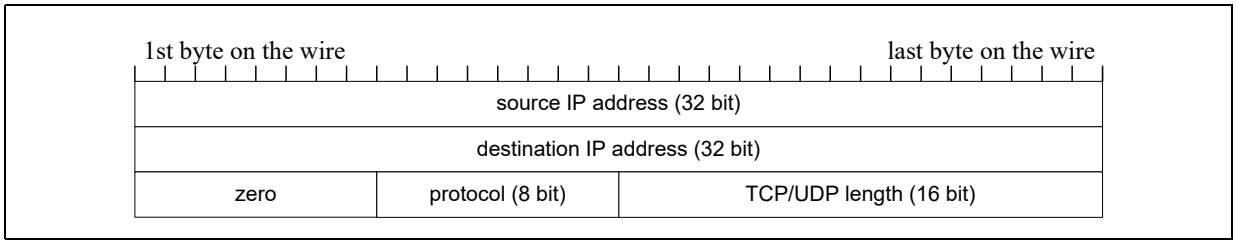

Figure 38-25.IPv6 Pseudo Header for TCP/UDP Checksum

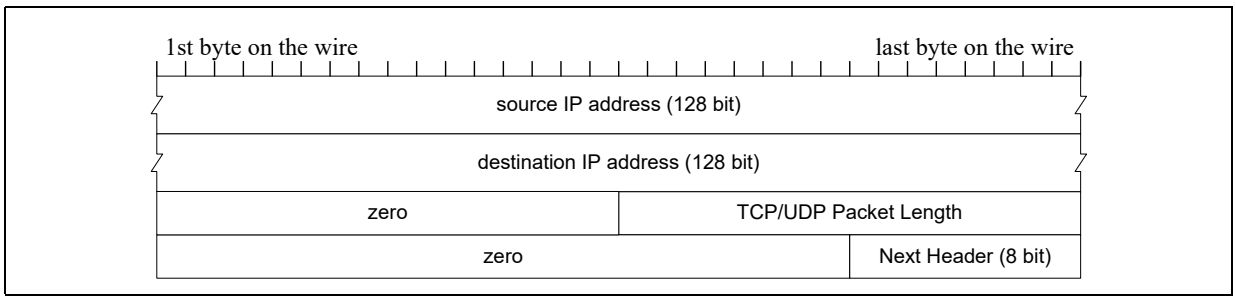
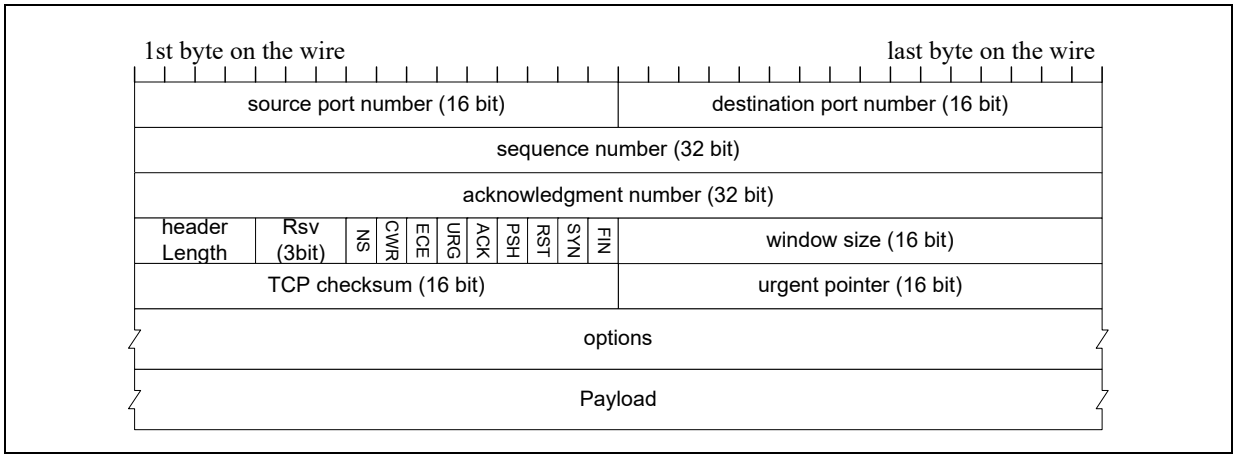


- Source and Destination Port Number — 16-bit port numbers.
- UDP Length — The length of the entire UDP datagram, including both *Header* and *Data* fields defined in byte units.
- UDP Checksum — An optional one's complement of the one's complement sum of all 16-bit words in the header and payload and a pseudo header shown in Figure 38-24 and Figure 38-25. On the transmit flow, the operating system stack provides the pseudo header checksum in the UDP checksum field when requesting from the NIC to offload the checksum calculation.

38.21.6.3.2 TCP Datagram

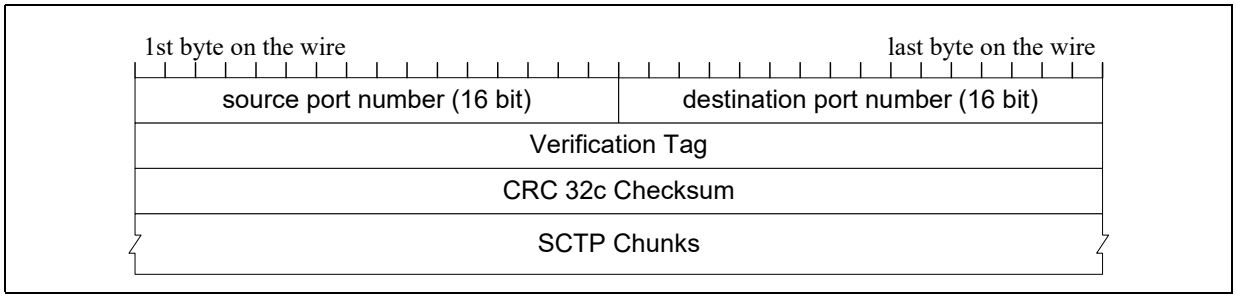
Figure 38-26.TCP Packet Format



- Source and Destination Port Number — 16-bit port numbers.
- Sequence Number — The sequence number of the first data octet in this segment (except when SYN is present). If SYN is present the sequence number is the Initial Sequence Number (ISN) and the first data octet is ISN+1.
- Acknowledge Sequence Number — If the ACK control bit is set this field contains the value of the next sequence number the sender of the segment is expecting to receive. Once a connection is established this is always sent.
- Window Size — The number of data octets beginning with the one indicated in the *Acknowledgment* field that the sender of this segment is willing to accept.
- TCP Flags (9 bits) — FIN, SYN, RST, PSH, ACK, URG, ECE, CWR, NS.
- Header Length (4bit) — The number of Dwords in the TCP header. This indicates where the data begins. The TCP header (including TCP options) is always an integral number of 32 bits long.
- Urgent Pointer — This field communicates the current value of the urgent pointer as a positive offset from the sequence number in this segment. The urgent pointer points to the sequence number of the octet following the urgent data. This field is only be interpreted in segments with the URG control bit set.
- TCP Checksum — The *Checksum* field a the 16-bit one's complement of the one's complement sum of all 16-bit words in the header and payload and the pseudo header shown in the Figure 38-24 and Figure 38-25. On the transmit flow, the operating system stack provides the pseudo header checksum in the TCP checksum field when requesting from the NIC to offload the checksum calculation.

38.21.6.3.3 SCTP Datagram

Figure 38-27.SCTP Packet Format

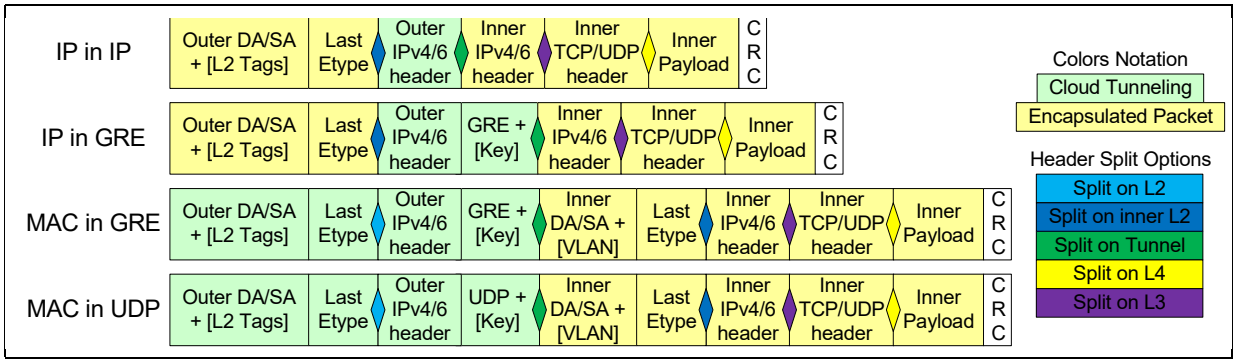


- Source and Destination Port Number — 16-bit port numbers.
- Verification Tag — 32-bit random value selected by each endpoint in an association during setup. It is used to discriminate between two successive associations as well as protection mechanism against blind attackers.
- CRC Integrity — CRC32c integrity checksum covering the entire SCTP packet (SCTP header and all chunks). The CRC32c is the same polynomial used for iSCSI as follows: 1 + x + x2 + x4 + x5 + x7 + x8 + x10 + x11 + x12 + x16 + x22 + x23 + x26 + x32. The CRC bytes are transmitted on the network in big endian ordering while the MS bytes is first on the wire.

38.21.6.4 Supported Tunneled Packet Formats

Supported tunneled packet formats are shown in Figure 38-28.

Figure 38-28.Tunneled Packet Formats



Processing of these packets is described in the LAN Engine chapter, Internal Switch chapter and Receive Classification Filters chapter.

38.21.6.4.1 IP and UDP Tunneling

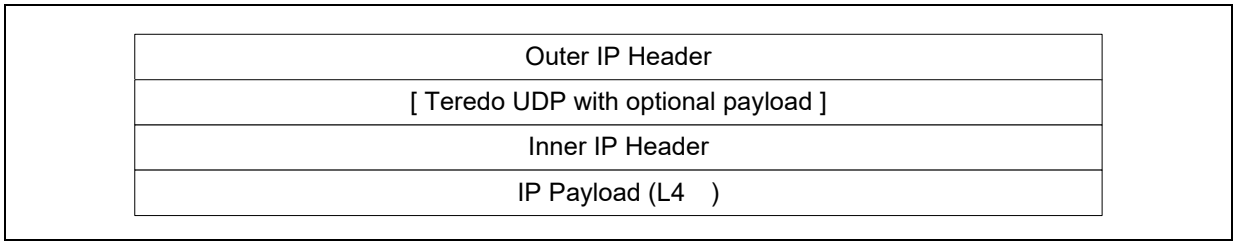
The 10 GbE controller supports the following tunneled packets:

- IPv4 — IPv4.
- IPv4 — IPv6.
- IPv6 — IPv4.
- IPv6 — IPv6.
- IP — UDP teredo - IP // The IP can be IPv4 or IPv6 as previously described.

The IP headers might have options (IPV4) or extended headers (IPv6) described in IPv6 Extension Headers.

UDP Teredo header is identified by its destination port number equals to one of 16 values. The 10 GbE controller does not provide checksum offload for the Teredo header with no reporting.

Figure 38-29.IP / Teredo Tunneling



38.21.6.4.2 GRE Header Version 0 (NVGRE)

1st byte on the wire								last byte on the wire
C	R	K	S	s	Recur	Flags	Version	Protocol Type
Checksum (Optional)								Offset (Optional)
Key (Optional) - Tenant Network ID (TNI)								Reserved
Sequence Number (Optional)								
Routing ::: (Optional)								

The GRE header is indicated by IP protocol equals to 47 (0x2F). The GRE headers supported by the 10 GbE controller can be 1, 2, 3 or 4 Dwords depending on the flags in the first byte.

- C (Checksum Present) — When set, it indicates that the *Checksum* field is present and contains valid information. If either the *Checksum Present* bit or the *Routing Present* bit are set, the *Checksum* and *Offset* fields are both present.
- R (Routing Present) — GRE header with routing header is not supported by the 10 GbE controller. If this flag is found active, the header is not recognized by the device.
- K (Key Present) — If set, then the *Key* field is present and contains valid information.
- S (Sequence Number) — If set, then the *Sequence Number* field is present and contains valid information. The 10 GbE controller ignores this flag other than an indication for the length of this header.
- s (Strict Source Route) — Intel recommends that this bit only be set if all of the routing information consists of strict source routes. The 10 GbE controller ignores this flag.
- Recur (Recursion Control) - 3 bits — Contains the number of additional encapsulations that are permitted. The 10 GbE controller supports only GRE header with no recursion headers (recursion control equals to zero).
- Version - 3 bits — GRE protocol version. Zero value identifies a GRE header version zero. The 10 GbE controller supports only zero value. Note that version 1 is used for PPP protocol.
- Protocol - 16 bits — Contains the protocol type of the payload packet. In general, the value is the Ethernet *Protocol Type* field for the packet. The following values are supported by the 10 GbE controller. Packet parsing that might have other protocol values is undefined.

  - — 0x0800 IPv4 header (indicates an IPv4 in GRE packet format)
  - — 0x86DD IPv6 header (indicates an IPv6 in GRE packet format)
  - — 0x6558 MAC header (indicates a MAC in GRE packet format)
  - — 0x894FNSH header (defined by the *NSH Protocol* field
- Checksum - 16 bits — Contains the IP (one's complement) checksum of the GRE header and the payload packet. This field is not processed by the 10 GbE controller.
- Offset - 16 bits — Indicates the byte offset from the start of the *Routing* field to the first byte of the active source route entry to be examined. This field is not processed by the 10 GbE controller.
- Key - 24 bits — Contains a number that was inserted by encapsulation. It might be used by the receiver to authenticate the source of the packet. The GRE key is used for VSI classification if enabled by the switch filters.
- Sequence Number - 32 bits — Contains a number that is inserted by encapsulation. It might be used by the receiver to establish the order in which packets have been transmitted from encapsulation to the receiver. This field is not processed by the 10 GbE controller.
- Routing - Variable length — This field is a list of SREs and is not supported by the 10 GbE controller.

38.21.6.4.3 UDP Plus its Optional Private Header

UDP Header	Optional UDP Private Header

- UDP Header — The UDP destination port number equals to one of 16 Teredo port numbers (also used for MAC in UDP tunneling).
- Private Header — The private UDP header includes any optional private content that could include a networking key. The length of the private header and the optional networking key are recognized by the device according to the UDP port number as programmed by the Add Teredo Port admin command.

VXLAN Header in UDP Format

VXLAN draft provides the structure of the optional private header previously described and used for VXLAN encapsulation as shown in Figure 38-30 and listed in Table 38-181.

Figure 38-30.VXLAN Header Structure

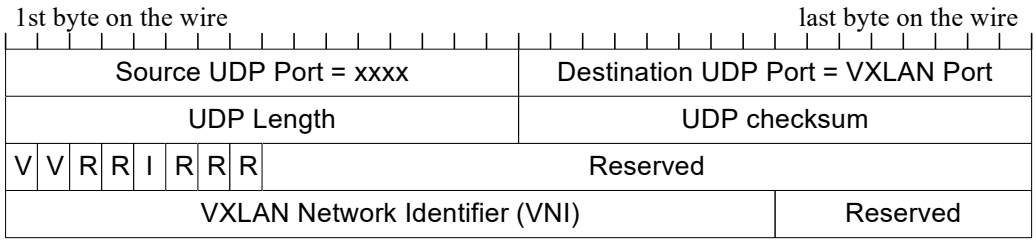


Table 38-181.VXLAN Header Structure

Offset (From The UDP Header)	Size (Byte)	Field	Value	Action	Comment
0	2	Source UDP Port	XXXX	Ignore	Source UDP port number could be any value.
2	2	Destination UDP Port	VXLAN Port	Compare	The reserved VXLAN port number is programmed by the Add Tunneling UDP admin command.
4	2	UDP Length	XXXX	Ignore	Length of the entire datagram including the UDP header.
6	2	UDP Checksum	XXXX	Ignore	Provide an indication if the checksum equals zero (such as no checksum).
8	1	Flags	0x08	Ignore	VV = version (expect zero). I = VNI valid indication.
9	3	Reserved	XXXX	Ignore	Reserved.
12	3	VXLAN Network Identifier	XXXX	Compare	Unique value per tenant.
15	1	Reserved	XX	Ignore	Reserved.

Geneve Header in UDP Format

Geneve draft (Geneve: Generic Network Virtualization Encapsulation draft-gross-geneve-00) provides the structure of the optional private header previously described used for Geneve encapsulation as listed in Table 38-182 and Table 38-183.

Table 38-182.Geneve Header Structure

1st byte on the wire					last byte on the wire
Source UDP Port = xxxx					Destination UDP Port = 0x6081
UDP Length					UDP Checksum
V	Opt Len	O	C	Reserved	Next Protocol
Virtual Network Identifier (VNI)					Reserved
Variable Length Options (defined by Opt Len)					

Table 38-183.Geneve Header Structure (Sheet 1 of 2)

Offset (From The UDP Header)	Size (Byte)	Field	Value	Action	Comment
0	2	Source UDP Port	XXXX	Ignore	Source UDP port number could be any value.
2	2	Destination UDP Port	6081	Compare	The reserved Geneve port number is programmed by the Add Tunneling UDP admin command.
4	2	UDP Length	XXXX	Ignore	Length of the entire datagram including the UDP header.
6	2	UDP checksum	XXXX	Check	Checksum integrity indication.
8.7 - 8.6	2 bits	V V (Version)	00b	Check[1]	
8.5 - 8.0	6 bit	Opt Len (Option Length)	Variable	Check[1]	Defines the length of the options fields in 4-byte units.
9.7	1 bit	O (OAM frame)	0b	Check	Rout the packet to queue zero of the VSI.
9.6	1 bit	C (Critical Options Present)	X	Ignore	Expected to be processed by the software stack.
9.5 - 9.0	6 bit	Reserved	X	Ignore	

Table 38-183.Geneve Header Structure (Sheet 2 of 2)

Offset (From The UDP Header)	Size (Byte)	Field	Value	Action	Comment
10	2	Next Protocol		Check	Next protocol that follows the Geneve header. The 10 GbE controller supports the following values: 0x6558 MAC header (MAC in Geneve). 0x0800 IPv4 header (IPv4 in Geneve). 0x86DD IPv6 header (IPv6 in Geneve). 0x894F NSH header (NSH in Geneve). If other values are found, the packet is identified as Geneve or payload.
12	3	VNI (Network Identifier)	Variable	Compare	Unique value per tenant.
15	1	Reserved	X	Ignore	
16	4 x Opt Len	Variable Length Options	XXXX	Ignore	The length of the *Options* field is defined by the Opt Len field in this header.

Notes:

1. If the total header length is larger than 256 or the version <> 0, the packet is handled as a simple L2 packet type.

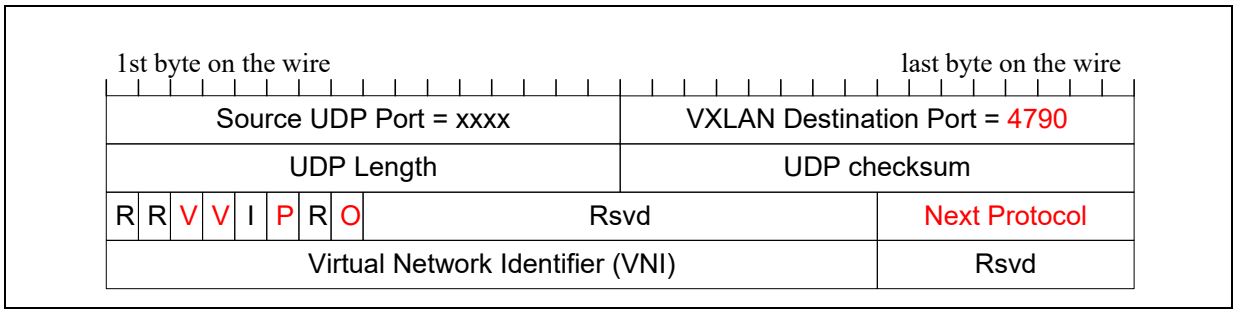
38.21.6.4.4 VXLAN-GPE Header in UDP Format

VXLAN-GPE draft provides the structure of the optional UDP private header previously described used for VXLAN-GPE encapsulation as listed in Table 38-184 and shown in Figure 38-31. The highlighted fields in red color are those fields that are changed in VXLAN-GPE compared to the original VXLAN header.

Table 38-184.VXLAN-GPE Header Structure (Additive Fields on Top of Original VXLAN)

Byte Offset (from the UDP Header)	Size	Field	Value	Action	Comment
2	2 byte	Destination UDP Port	4790	Compare	The reserved VXLAN-GPE port number is programmed by the Add Tunneling UDP Admin command with Tunneling UDP Protocol Type equals to VXLAN-GPE.
8.0	1 bit	O (OAM bit)	0 / 1	Compare	Packets with active OAM flag are identified as VXLAN-GPE-OAM PCTYPE and routed to Rx queue zero of the VSI.
8.2	1 bit	P (Next Protocol Field Valid)	0 / 1	Ignore	The next *Protocol* field is valid only when the *P* bit is set. The 10 GbE controller ignores this flag based on the assumption that if the *P* is cleared, then the *Next Protocol* field equals to zero.
8.3	1 bit	I (VNI Tag Present)	1	Ignore	VNI valid indication must be set in the header.
8.5 - 8.4	2 bits	Version Field	00	Compare	Parsing of packets with non-zero *Version* field is aborted. It is indicated by Abort PTYPE in the Rx descriptor and the switching decision is made by the MAC/VLAN headers.
11	1 byte	Next Protocol	XXXX	Compare	Next protocol that follows the VXLAN-GPE header. Product Name supports the following values: 0x0 or 0x3 = MAC in VXLAN-GPE. 0x1 = IPv4 in VXLAN-GPE. 0x2 = IPv6 in VXLAN-GPE. 0x4 = NSH in VXLAN-GPE. If other values are found, the packet is identified as VXLAN-GPE or payload.
12 - 14	3 bytes	Virtual Network Identifier	Variable	Compare	Unique value per tenant.

Figure 38-31.VXLAN-GPE Header Structure



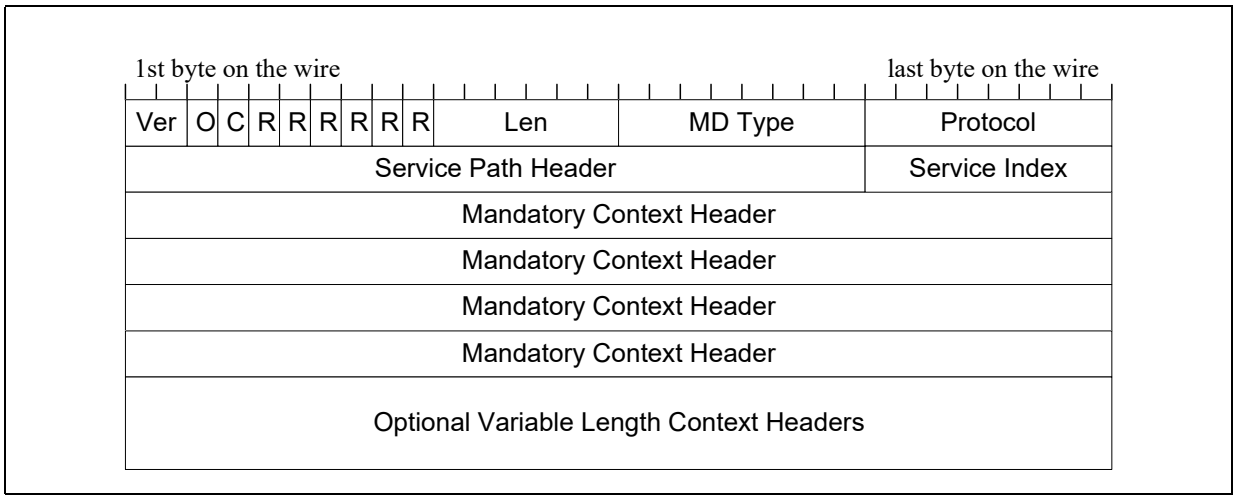
38.21.6.5 NSH Header

NSH is one of the optional Next Protocol in VXLAN-GPE or in GRE or as an L2 protocol (EType = 0x894F). The structure of the NSH header is shown in Table 38-184 and Figure 38-31.

Table 38-185.NSH Header Structure

Byte Offset	Size [byte]	Field	Value	Action	Comment
0.4	1 bit	C (Critical data flag)	0 / 1	Ignore	
0.5	1 bit	O (OAM Frame)	0 / 1	Compare	Packets with active OAM flag are identified as NSH-OAM PCTYPE and routed to Rx queue zero of the VSI.
0.7 - 0.6	2 bits	VV (NSH Version)	00b	Compare	Parsing of packets with non-zero *Version* field is aborted. It is indicated by abort PTYPE in the Rx descriptor and the switching decision is made by the MAC/VLAN headers.
1.5 - 1.0	6 bits	Length	XXXX	Process	Defines the length of the NSH header in 4-byte units.
2	1	MD Type (NSH Meta Data Type)	XXXX	Ignore	
3	1	Protocol	XXXX	Process	Next Protocol can be one of the following: 0x3 = MAC in NSH. 0x1 = IPv4 in NSH. 0x2 =IPv6 in NSH. If other values are found, the packet is identified as NSH or payload.
4 - 7	4	Service Path Header and Index	XXXX	Ignore	
8 - 23	16	Mandatory Context Header	XXXX	Ignore	
24	Variable	Optional Context Headers	XXXX	Ignore	Optional Variable Length Context Headers.

Figure 38-32.NSH Header Structure



38.21.6.5.1 NSH Header Encapsulation Options

The 10 GbE controller supports the following NSH encapsulation options as shown in Figure 38-28:

Native NSH over L2 (L2 EtherType = 0x894F); NSH over GRE and NSH over VXLAN-GPE

Note: NSH support should be considered only as NSH ready. It is enabled but not validated.

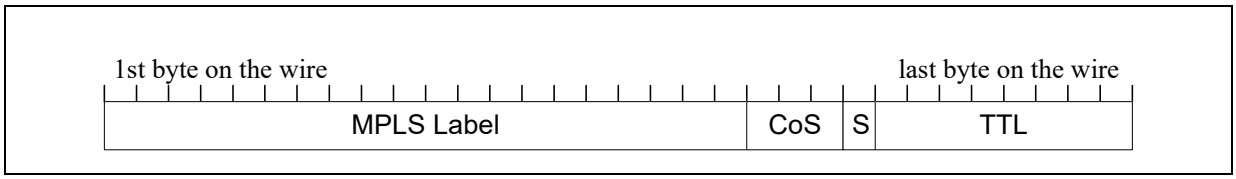
38.21.6.6 Unicast MPLS Header

Multi Protocol Layer Switching (MPLS) is a 2.5 protocol layer tag used to enable IP and non-IP packet routing. The 10 GbE controller ignores the content of the MPLS header and skips it to the L3 protocol layer. The 10 GbE controller supports stacked MPLS headers up to four headers. It identifies the next protocol by the value of its first byte. For IP headers, the first byte indicate if it is an IPv4 or IPv6. Any other value is interpreted as L2 payload. The structure of the MPLS header is listed in Table 38-186 and shown in Figure 38-33.

Table 38-186.MPLS Header Structure

Offset (relative to MPLS header)	Size	Field	Value	Action	Comment
-2	16	EtherType	0x8847	Compare	
0	20 bits	MPLS Label	XXXX	Ignore	
2.4	4 bits	CoS (Class of Service)	XXXX	Ignore	
2.7	1 bit	S (Stack)	0 / 1	Process	0 - Additional MPLS headers to follow 1 - Bottom of the Stack (last header)
3	8 bit	TTL (Time to Live)	XXXX	Ignore	

Figure 38-33.MPLS Header Structure



The following assumptions are taken while handling MPLS packets:

The 10 GbE controller only parses MPLS headers to be able to skip them. It does not use the MPLS header content for any filtering and does not provide any extract or insert offloads.

MPLS is not supported for RDMA packets.

The 10 GbE controller does not support line rate parsing for MPLS packets.

38.21.7 Internal Switch

38.21.7.1 Switch Concept

The 10 GbE controller includes a number of switch elements. Part of these elements are generic L2 switching elements and part are dedicated elements that can implement a specific functionality.

These elements are compatible to the IEEE P802.1Qbg specification. Section 38.21.7.2 describes the possible usage models of the switch as defined in these specifications. Section 38.21.7.3 describes the management protocol used to configure the switch.

The different elements are described in Section 38.21.7.4. Each switch can be connected to different ingress and egress ports in different configurations. The algorithm that defines which switch routes which packet is described in Section 38.21.7.13.

The switches can have VSIs connected through the PCIe interface, a physical port connected via the Ethernet interface and management ports either internal (EMP) or connected to a PCIe function.

VSIs contain a set of queues or flows and are characterized by an L2 identifier. After the packet is forwarded to a specific ingress port, an internal destination inside the port is selected such as LAN traffic (Section 38.21.1) and iWARP (Section 38.36.1).

In addition to forwarding services, the switch also supports some additional services as described in Section 38.21.7.10.

The switch is not a learning switch and it is managed by the host, The programming interface exposed to the operating system is that of a managed switch. Each switch element can be configured either via a driver running on a PF or via the EMP. When a driver programs the switch it uses admin commands processed by the EMP as described in Section 38.21.7.14.

The switch is built from a set of tables that can be allocated to different filtering resources and a set of other fixed resources (VSIs, VEBs, mirroring rules, etc.). The current resource allocation and the way to allocate them to PFs are described in Section 38.21.7.16.1.

38.21.7.2 Switches Configurations

The 10 GbE controller embedded switch can be used to offload the data plane functions of the virtual switching capability supported by many VMMs (bridging and switching are used synonymously in this document).

This section describes the logical models that can be represented by the switching elements. The actual switching elements definition can be found in Section 38.21.7.4.

The 10 GbE controller switch can be configured to operate in different modes as follows:

- Internal switching configurations — Virtual embedded bridging:
    - Software based switching in VMM
    - Hardware based switching for direct connected VMs
    - Local switching between VMs
- External switching configurations:
    - Virtual port aggregator where VM-to-VM switching is performed by an adjacent bridge.
    - Port virtualizer configuration where the VM-to-VM switching is performed by a controlling bridge that could be in the network edge or aggregation layers.

Note: A device might work either in port aggregator or in port virtualizer mode. The mode of operation should be the same for all the ports.

- Combination of internal and external switching configurations:
    - — Internal switching modes, software switching model or direct connect model, can coexist with one of the external switching modes, port aggregator or port virtualizer.

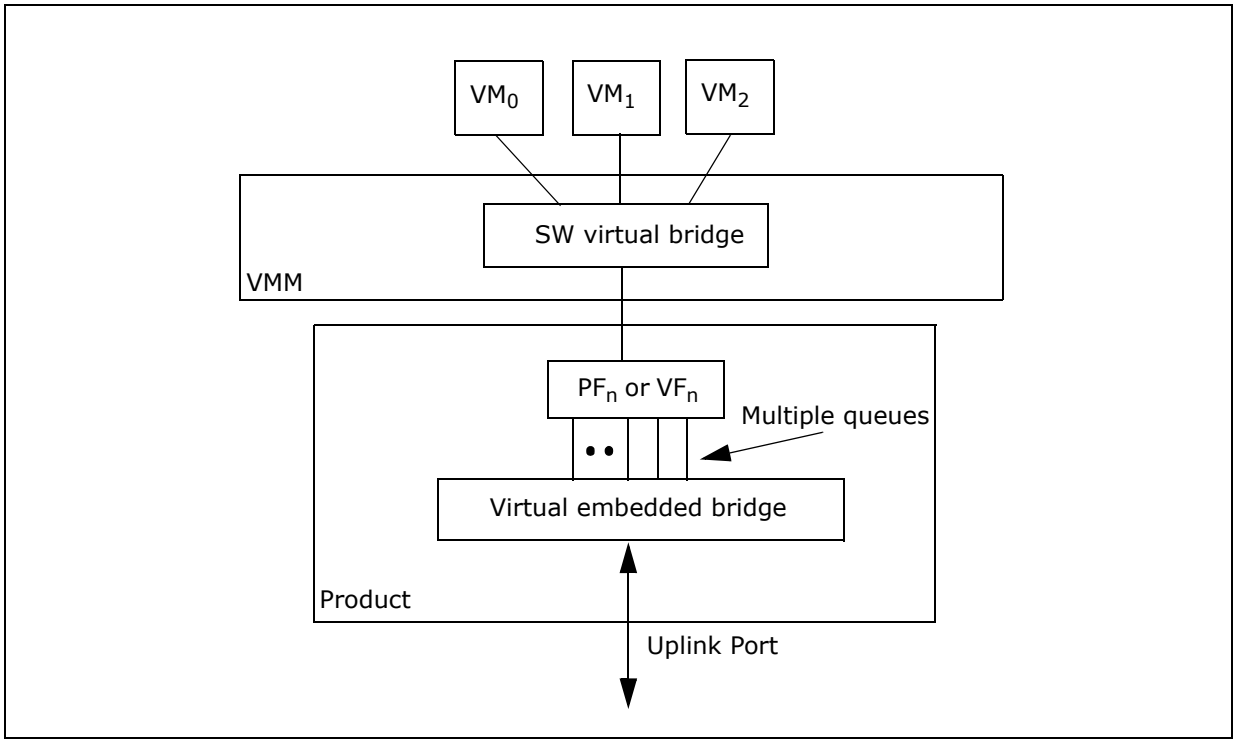
38.21.7.2.1 Internal Switch Configurations

In the internal switching mode, the 10 GbE controller switching element can be configured to offload data plane functions of the VMM-based software switches or can handle data plane switching functions for direct connected VMs (through SR-IOV or multiple PCI functions).

Hardware Offload of Software Virtual Embedded Bridges (VEBs)

The following figure shows the hardware offload of software-based switches.

Figure 38-34.Internal Switching Configuration — Software Virtual Embedded Bridging



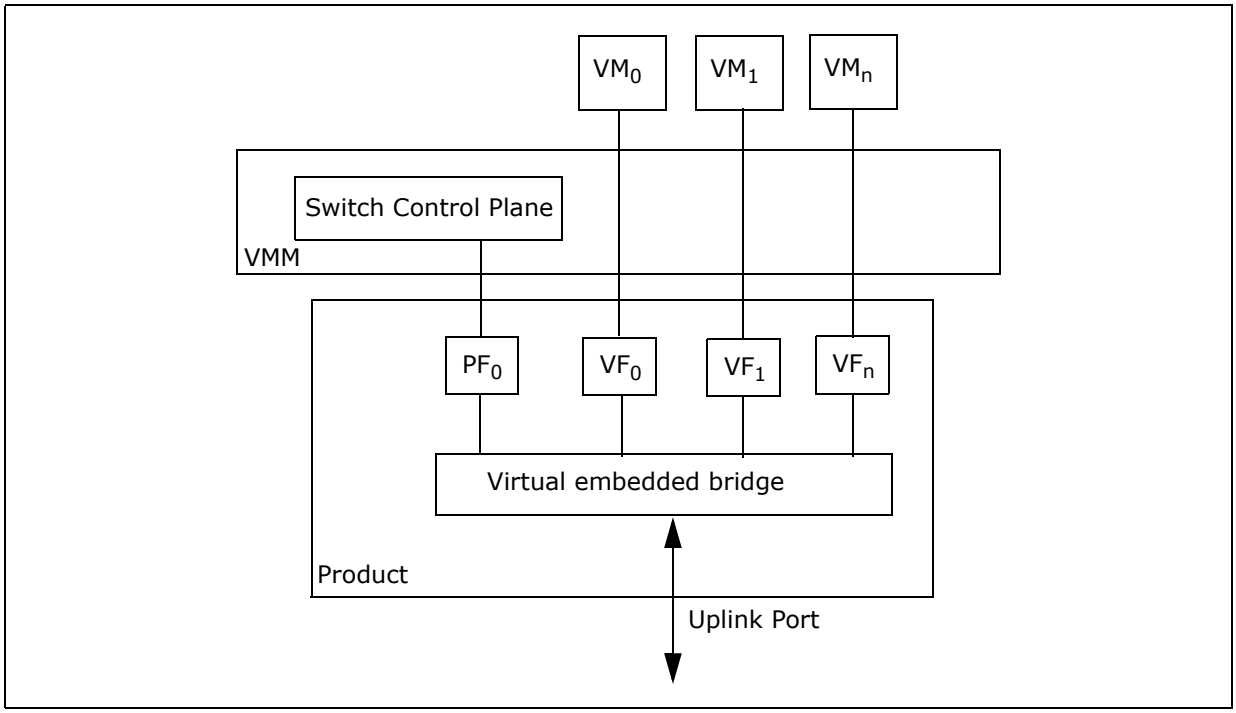
When the 10 GbE controller switching element is configured to operate in this mode, data plane functions such as the filtering and forwarding functions are offloaded to hardware. The switching element can also perform hardware replication of multicast and broadcast frames. In addition, the switch can perform VLAN offload functions and security functions such as MAC address spoofing. In this mode, multiple queues are assigned to the PCI function (PF or VF in case of SR-IOV). Each set of queues represents a VSI in the switching element. The uplink of the switch is connected to one of the external Ethernet MAC ports.

The entire control plane functionality is handled by the software switch in the VMM via a PF. The switch hardware is programmed by a set of switch APIs. The switch control plane software manages the switching elements forwarding database, VLAN membership, bandwidth assignment or other virtual port characteristics. Since the forwarding path is still through the software intermediary layer in the VMM, it is possible for the software switch to examine the packets or perform additional functions on the frames. For example, handling new protocol headers, collecting additional statistics etc.

VEB for Direct Connected VMs

The following figure shows the hardware switching of direct connected VMs.

Figure 38-35.Internal Switching Configuration — Hardware VEB



When the 10 GbE controller switching element is configured to operate in this mode, each of the VSIs are directly connected to PCIe functions (PFs or VFs) that are assigned to the VMs. The software layer is eliminated in the forwarding path hence the entire data plane functionality is handled by the hardware embedded switch. All the virtual switching functions such as VLAN membership, filtering and forwarding, bandwidth management, statistics etc., are handled in hardware.

The entire control plane functionality is handled by the switch management agent in the VMM. Control packets are forwarded to the control plane agent through a management port. The switch hardware is programmed by a set of switch APIs. The switch management software manages the switching elements forwarding database, VLAN membership, bandwidth assignment or other VSI characteristics. The switch management can monitor the traffic by accessing the statistics counters or can also monitor data traffic to VM by enabling mirroring functionality in the embedded switch.

Multiple virtual embedded switching elements can be instantiated in the 10 GbE controller. There can be only one virtual switching element per uplink port. If there are multiple switching elements on a single uplink port, then a multi-channel capable S-component needs to be configured on the uplink. See Service-VLAN Component (S-comp) for more detail. However, a virtual switching element can be configured without an uplink port for local switching between VMs. This is used for configuring internal networks.

38.21.7.2.2 External Switch Configurations

The 10 GbE controller supports external switching modes. In the external switching modes the virtual switching functionality including VM-to-VM, and VM to uplink forwarding is handled by external switches. This enables a single network management domain to manage both enterprise switches and virtual switching. The entire data plane functionality and the control plane functionality is handled by the external switch.

Two protocols are being defined by IEEE to enable virtual bridging in external switches, IEEE P802.1Qbg and IEEE P802.1BR. The 10 GbE controller supports both models. Note that the virtual port aggregator model is very similar to the embedded virtual switching model.

Virtual port Aggregator Model

The following figure shows a port aggregator configuration.

Figure 38-36.External Switching Configuration — Virtual Port Aggregator
