
Intel® C620 Series Chipset Platform Controller Hub

Datasheet

October 2019

Document Number: 336067-009US

Notice: The information here is subject to change without notice.

Intel technologies features and benefits depend on system configuration and may require enabled hardware, software, or service activation. Learn more at intel.com, or from the OEM or retailer.

No computer system can be absolutely secure. Intel does not assume any liability for lost or stolen data or systems or any damages resulting from such losses.

Intel disclaims all express and implied warranties, including without limitation, the implied warranties of merchantability, fitness for a particular purpose, and non-infringement, as well as any warranty arising from course of performance, course of dealing, or usage in trade.

You may not use or facilitate the use of this document in connection with any infringement or other legal analysis concerning Intel products described herein. You agree to grant Intel a non-exclusive, royalty-free license to any patent claim thereafter drafted which includes subject matter disclosed herein.

No license (express or implied, by estoppel or otherwise) to any intellectual property rights is granted by this document.

The products described may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

This document contains information on products, services and/or processes in development. All information provided here is subject to change without notice. Contact your Intel representative to obtain the latest Intel product specifications and roadmaps.

Intel® AMT should be used by a knowledgeable IT administrator and requires enabled systems, software, activation, and connection to a corporate network. Intel AMT functionality on mobile systems may be limited in some situations. Your results will depend on your specific implementation. Learn more by visiting Intel® Active Management Technology.

1 Introduction 34
- 1.1 About this Manual 34
- 1.2 Overview 34
- 1.3 PCH I/O Features and Capabilities 35
- 1.4 PCH Software and Firmware 35
- 1.5 PCH SKUs 36
- 1.6 PCH Markings 36

2 PCH Controller Device IDs 38
- 2.1 Device and Revision ID Table 38

3 Pin Straps 42

4 Electrical Characteristics 45
- 4.1 PCH Power Supply Range 45
- 4.2 General DC Characteristics 46
- 4.3 AC Characteristics 59
- 4.4 PCIe* 4.0 Clock RMS Jitter Measurement 76
- 4.5 Overshoot/Undershoot Guidelines 76
- 4.6 Single Ended I/O Initial Power Up 77
- 4.7 Power Sequencing and Reset Signal Timings 80

5 Power and Ground Signals 87

6 Flexible I/O 89
- 6.1 Acronyms 89
- 6.2 Overview 89
- 6.3 Description 89

7 Memory Mapping 91
- 7.1 Overview 91
- 7.2 Functional Description 91
- 7.3 Memory Map 95

8 PCH and System Clocks 98
- 8.1 Acronyms 98
- 8.2 Overview 98
- 8.3 Signal Descriptions 98
- 8.4 Clock Signal Planes and States 101
- 8.5 Clocking Overview 101
- 8.6 Clock Interfaces 101
- 8.7 Integrated Clock Controller FW Accessible Registers Summary 103

9 Power Management 117
- 9.1 Acronyms 117
- 9.2 References 117
- 9.3 Overview 117
- 9.4 Signal Description 117
- 9.5 Integrated Pull-ups and Pull-downs 120
- 9.6 I/O Signal Planes and States 120
- 9.7 Functional Description 121
- 9.8 Power Management Configuration Registers Summary 144
- 9.9 PMC I/O Based Registers Summary 159
- 9.10 PMC Memory Mapped Registers Summary 178

10 Direct Media Interface 211
- 10.1 Acronyms 211

10.2 References 211
10.3 Overview 211
10.4 Signal Description 211
10.5 Integrated Pull-Ups and Pull-Downs 211
10.6 I/O Signal Planes and States 211
10.7 Functional Description 212

11 System Management 213
11.1 Acronyms 213
11.2 Overview 213
11.3 Feature 213
11.4 SMBus TCO I/O Registers Summary 218

12 High Precision Event Timer 227
12.1 References 227
12.2 Overview 227
12.3 HPET Memory Mapped Registers Summary 231

13 Thermal Management 240
13.1 Acronyms 240
13.2 PCH Thermal Sensor 240
13.3 Thermal Reporting Configuration Registers Summary 242
13.4 Thermal Reporting Memory Mapped Registers Summary 259

14 8254 Timers 273
14.1 Overview 273
14.2 8254 Timer Registers Summary 275

15 Integrated High Definition Audio 281
15.1 Acronyms 281
15.2 References 281
15.3 Overview 281
15.4 Signal Description 281
15.5 Integrated Pull-Ups and Pull-Downs 282
15.6 I/O Signal Planes and States 282
15.7 Features 282
15.8 High Definition Audio (D31:F3) PCI Configuration Registers Summary 283

16 Processor Interface 320
16.1 Acronyms 320
16.2 Overview 320
16.3 Signal Description 320
16.4 Integrated Pull-Ups and Pull-Downs 320
16.5 I/O Signal Planes and States 320
16.6 Functional Description 321
16.7 Processor Interface Memory Registers Summary 322

17 Enhanced Serial Peripheral Interface 326
17.1 Acronyms 326
17.2 References 326
17.3 Overview 326
17.4 Signal Description 327
17.5 Integrated Pull-Ups and Pull-Downs 327
17.6 I/O Signal Planes and States 327
17.7 Functional Description 328
17.8 Enhanced SPI (eSPI) Configuration Registers Summary 335
17.9 eSPI PCR Registers Summary 353

18 General Purpose Input and Output 362
18.1 Acronyms 362

18.2 References 362
18.3 Overview Integrated Pull-Ups and Pull-Downs 362
18.4 Overview 362
18.5 Signal Description 363
18.6 GPIO Community 0 Registers Summary 372
18.7 GPIO Community 1 Registers Summary 647
18.8 GPIO Community 2 Registers Summary 897
18.9 GPIO Community 3 Registers Summary 947
18.10 GPIO Community 4 Registers Summary 997
18.11 GPIO Community 5 Registers Summary 1131

19 Gigabit Ethernet Controller 1386
19.1 Acronyms 1386
19.2 References 1386
19.3 Overview 1386
19.4 Signal Description 1386
19.5 Integrated Pull-Ups and Pull-Downs 1387
19.6 I/O Signal Planes and States 1387
19.7 Functional Description 1388
19.8 GbE Configuration Registers Summary 1392
19.9 GbE Memory Mapped I/O Registers Summary 1405

20 Interrupt Interface 1412
20.1 Acronyms 1412
20.2 References 1412
20.3 Overview 1412
20.4 Signal Description 1412
20.5 Integrated Pull-Ups and Pull-Downs 1412
20.6 I/O Signal Planes and States 1413
20.7 Functional Description 1413
20.8 Advanced Programmable Interrupt Controller (APIC) (D31:F0) 1422
20.9 Serial Interrupt 1424
20.10 Interrupt Registers Summary 1427
20.11 Interrupt PCR Registers Summary 1438
20.12 APIC Indirect Registers Summary 1450
20.13 Advanced Programmable Interrupt Controller (APIC) Registers Summary 1466

21 Low Pin Count 1468
21.1 Acronyms 1468
21.2 References 1468
21.3 Overview 1468
21.4 Signal Description 1469
21.5 Integrated Pull-ups and Pull-downs 1469
21.6 I/O Signal Planes and States 1469
21.7 Functional Description 1469
21.8 LPC Configuration Registers Summary 1472
21.9 LPC PCR Registers Summary 1488

22 PCI Express* 1490
22.1 Acronyms and Register Attributes/Modifiers 1490
22.2 References 1490
22.3 Overview 1490
22.4 PCIe Root Port 1491
22.5 PCIe Upstream Port 1499
22.6 PCIe Virtual Switch Ports 1505
22.7 PCI Express Root Port Configuration Registers Register Summary 1506
22.8 PCI Express NP16 Uplink Port Configuration Registers Register Summary 1564
22.9 PCI Express NP8 Uplink Port Configuration Registers Register Summary 1606

22.10 PCI Express Virtual Switch Port (VSP)[5:0] Configuration Registers Summary 1646

23 Real Time Clock 1686
23.1 Acronyms 1686
23.2 References 1686
23.3 Overview 1686
23.4 Signal Description 1686
23.5 Integrated Pull-Ups and Pull-Downs 1687
23.6 I/O Signal Planes and States 1687
23.7 Functional Description 1687
23.8 RTC Indexed Registers Summary 1690
23.9 RTC Configuration Registers Summary 1695

24 Serial ATA 1697
24.1 Acronyms 1697
24.2 References 1697
24.3 Overview 1697
24.4 Signal Description 1698
24.5 Integrated Pull-Ups and Pull-Downs 1705
24.6 I/O Signal Planes and States 1705
24.7 Functional Description 1706
24.8 SATA Port Registers 1714
24.9 SSATA Port Registers 1785

25 System Management Interface and SMLink 1852
25.1 Acronyms 1852
25.2 References 1852
25.3 Overview 1852
25.4 Signal Description 1852
25.5 Integrated Pull-Ups and Pull-Downs 1853
25.6 I/O Signal Planes and States 1853
25.7 Functional Description 1853
25.8 SMBus TCO I/O Registers Summary 1854

26 Host System Management Bus Controller 1863
26.1 Acronyms 1863
26.2 References 1863
26.3 Overview 1863
26.4 Signal Description 1863
26.5 Integrated Pull-ups and Pull-downs 1863
26.6 I/O Signal Planes and States 1864
26.7 Functional Description 1864
26.8 SMBus Configuration Registers Summary 1877
26.9 SMBus I/O and Memory Mapped I/O Registers Summary 1888
26.10 SMBus PCR Registers Summary 1902

27 Serial Peripheral Interface 1904
27.1 Acronyms 1904
27.2 References 1904
27.3 Overview 1904
27.4 Signal Description 1904
27.5 Integrated Pull-Ups and Pull-Downs 1905
27.6 I/O Signal Planes and States 1905
27.7 Functional Description 1905
27.8 SPI Configuration Registers Summary 1911
27.9 SPI Memory Mapped Registers Summary 1919
27.10 BIOS Flash Program Registers Summary 1960

28 Testability 1963

28.1 Acronyms....1963
28.2 References....1963
28.3 Overview....1963
28.4 Signal Description....1963
28.5 I/O Signal Planes and States....1964
28.6 Intel® Trace Hub (Intel® TH)....1964
28.7 Direct Connect Interface (DCI)....1965
28.8 Intel Trace Huh Configuration Registers Summary....1967

29 Universal Serial Bus....1978
29.1 Acronyms....1978
29.2 References....1978
29.3 Overview....1978
29.4 Signal Description....1978
29.5 Integrated Pull-Ups and Pull-Downs....1981
29.6 I/O Signal Planes and States....1981
29.7 Functional Description....1981
29.8 xHCI Configuration Registers Summary....1981
29.9 xHCI Memory Mapped Registers Summary....2009

30 Intel® Management Engine Interface (Intel® MEI) (D22:F0, D22:F1, and D22:F4)....2058
30.1 Intel Management Engine Interface Configuration Registers Summary....2058
30.2 Intel MEI MMIO Registers Summary....2077

31 IDE Redirect (IDE-R) (D22:F2)....2078
31.1 IDE Redirect PCI Configuration (D22:F2) Registers Summary....2078

32 Keyboard and Text (KT) (D22:F3)....2093
32.1 Serial Port for Remote Keyboard and Text (KT) (D22:F3) Registers Summary....2093
32.2 Keyboard and Text (KT) Additional Configuration Registers Summary....2106

33 Innovation Engine (IE)....2108
33.1 Acronyms....2108
33.2 References....2108
33.3 Overview....2108
33.4 Signal Description....2108
33.5 Integrated Pull-Ups and Pull-Downs....2109
33.6 I/O Signal Planes and States....2110
33.7 Functional Description....2111
33.8 Registers....2114

34 Fan Control....2116
34.1 Acronyms....2116
34.2 References....2116
34.3 Overview....2116
34.4 Signal Description....2116
34.5 Integrated Pull-ups and Pull-downs....2117
34.6 I/O Signal Planes and States....2117
34.7 Functional Description....2117

35 Enterprise Value Add....2118
35.1 Acronyms....2118
35.2 References....2118
35.3 Overview....2118
35.4 Functional Description....2118
35.5 MROM0 Configuration Registers Summary....2119
35.6 MROM1 Configuration Registers Summary....2135

36 Additional Configuration Registers....2150

36.1 FIA Configuration PCR Registers Summary 2150
36.2 DMI Configuration Registers Summary 2158
36.3 DCI Configuration Registers Summary 2185
36.4 PSF1 PCR Registers Summary 2187
36.5 PSF2 PCR Registers Summary 2198
36.6 PSF3 PCR Registers Summary 2201
36.7 PSF4 PCR Registers Summary 2222
36.8 I/O Trap Registers Summary 2223
36.9 P2SB Bridge 2233
36.10 PHY Tuning Registers 2258

37 Debug Registers 2261
37.1 Introduction 2261
37.2 Register Summary 2261

38 10 GbE Controller 2283
38.1 10 GbE Controller Overview 2283
38.2 Typical System Configurations 2285
38.3 High-Speed Signal Interface 2287
38.4 Sideband Signals 2288
38.5 Low-speed Sideband Signal Interface 2288
38.6 Host Interface 2291
38.7 Various Interfaces 2295
38.8 Features 2296
38.9 Overview Of Standards 2306
38.10 PCI-Express (PCIe) 2311
38.11 Link Management Topologies 2350
38.12 General Purpose I/O (GPIO) 2409
38.13 Initialization 2414
38.14 Device/Port/Function Configuration 2451
38.15 Shared Resource Management 2456
38.16 Power Management 2460
38.17 Network Interfaces Power Management 2466
38.18 Protocol Offload (Proxying) 2470
38.19 Non-Volatile Memory Map 2481
38.20 NVM General Summary Table 2503
38.21 Shared Resources 2709
38.22 Interrupts 2908
38.23 Virtualization 2917
38.24 Data Center Bridging (DCB) 2927
38.25 Transmit Scheduling 2963
38.26 Host Memory Cache (HMC) 3016
38.27 AQ 3036
38.28 Statistics 3056
38.29 LLDP Protocol 3062
38.30 LAN Engine 3084
38.31 LAN Transmit Data Path 3112
38.32 TimeSync (IEEE 1588 and 802.1AS) 3132
38.33 Software Timer 3142
38.34 Protocol Engine (PE) 3142
38.35 Features 3143
38.36 Functional Description 3145
38.37 System Manageability 3280
38.38 Programming Interface 3424
38.39 Device Registers - PF 3432
38.40 Device Registers - VF 3683
38.41 PCIe Programming Interface 3700

38.42 PCI Configuration Space 3701
38.43 Capabilities in PCI Configuration Space 3708
38.44 PCIe Extended Configuration Space 3730
38.45 Virtual Functions 3748
38.46 Reliability, Diagnostics and Testability 3757
38.47 Acronyms 3759

39 Intel® QuickAssist Technology (Intel® QAT) 3761
39.1 Acronyms 3761
39.2 References 3762
39.3 Overview 3762
39.4 Intel QuickAssist Technology Features 3762
39.5 Intel QuickAssist Integrated Accelerator 3763
39.6 Intel QuickAssist Technology and PCH Upstream Port Requirements 3766
39.7 Intel QuickAssist Technology Endpoint Only (EPO) Mode 3767
39.8 Intel QuickAssist Technology PCIe Endpoint Function 3768
39.9 Interrupts 3771
39.10 Endpoint Errors 3772
39.11 Error Handling with SR-IOV 3777
39.12 PCIe Endpoint Function 0 Registers (Intel QuickAssist Technology) - EndPoint (EP) Physical Function (PF) PCI Configuration Space 3778
39.13 PCIe Endpoint Function 0 Registers (Intel QuickAssist Technology) - EndPoint (EP) Virtual Function (VF) PCI Configuration Space 3837

40 PCH EndPoint Only (EPO) Mode 3870
40.1 Acronyms 3870
40.2 References 3870
40.3 PCH EndPoint Only (EPO) Mode Overview 3870
40.4 PCH Endpoint Only (EPO) Mode Features 3870
40.5 PCH EPO Mode Considerations 3871
40.6 EPO PCH - PCIe Uplink 3874

Figures

4-1 PCI Express Transmitter Eye 60
4-2 PCI Express Receiver Eye 61
4-3 Clock Timing 63
4-4 SMBus/SMLink Transaction 64
4-5 PCH Test Load 64
4-6 USB Rise and Fall Times 65
4-7 USB Jitter 66
4-8 USB EOP Width 66
4-9 SMBus/SMLink Timeout 68
4-10 Intel® High Definition Audio (Intel® HD Audio) Input and Output Timings 68
4-11 Valid Delay from Rising Clock Edge 69
4-12 Setup and Hold Times 69
4-13 Float Delay 69
4-14 Output Enable Delay 70
4-15 Valid Delay from Rising Clock Edge 70
4-16 Setup and Hold Times 70
4-17 Pulse Width 71
4-18 SPI Timings 73
4-19 eSPI Clock Timings 73
4-20 eSPI Command timings 73
4-21 eSPI DATA Timings 74
4-22 PM_SYNC Timings 74
4-23 NCSI Timings 75

4-24 Maximum Acceptable Overshoot/Undershoot Waveform 77
4-25 Intel® C620 Series Chipset Power Supply Ramp Order 78
4-26 SEIO Pulses on Power Up 79
4-27 Power-up Glitches on GPIOs with Pull-up Resistors 80
4-28 Power Ramp with DSX Support 80
4-29 Power Ramp Without DSX Support 81
4-30 SLP_S5# High to PLTRST# High 83
4-31 S0 to S5 84
4-32 Powerdown to DeepSX 85
4-33 Surprise Powerdown to G3 85
4-34 eSPI Reset 86
6-1 HSIO Muxing on the Intel® C620 Series Chipset 89
9-1 Conceptual Diagram of SLP_GbE# 138
9-2 ADR Flow 143
11-1 TCO Compatible Mode SMBus Configuration 215
11-2 Advanced TCO Mode 217
16-1 PM_SYNC protocol 321
17-1 Basic eSPI Protocol 328
17-2 eSPI Slave Request to PCH for PCH Temperature 333
17-3 PCH Response to eSPI Slave with PCH Temperature 333
17-4 eSPI Slave Request to PCH for PCH RTC Time 334
17-5 PCH Response to eSPI Slave with RTC Time 334
22-1 Generation of SERR# to Platform 1498
22-2 PCIe Uplink Configuration 1 1503
22-3 NP8 PCIe Uplink Configuration 2 1504
22-4 Virtual Switch Ports Block Diagram 1506
24-1 Flow for Port Enable/Device Present Bits 1709
24-2 Serial Data Transmitted Over the SGPIO Interface 1713
27-1 Flash Descriptor Regions 1908
28-1 Platform Setup with Intel Trace Hub 1965
28-2 Platform Setup with DCI Connection 1967
33-1 IE Block Diagram 2111
38-1 Typical Rack / Pedestal System Configuration 2285
38-2 Typical Blade System Dual-Redundant Star Configuration 2286
38-3 10 GbE Controller Interfaces 2287
38-4 Traffic Class (TC) and Virtual Channels (VC) 2316
38-5 Error Reporting Mechanism 2320
38-6 10 GbE Controller MAC Configuration 2332
38-7 Basic PHY/Module Connectivity 2343
38-8 MDIO Timing Sourced By the MAC 2344
38-9 MDIO Timing Sourced by the PHY 2344
38-10 Behavior of MDIO During TA Field of a Read Transaction 2347
38-11 Basic Example of Module Connectivity (1 of 2) 2351
38-12 Basic Example Of Module Connectivity 2351
38-13 Quad 10 GbE SFP+ 2353
38-14 Quad 10 GbE SFP+ with Re-Driver PHY 2354
38-15 Quad 10 GbE QSFP+ 2354
38-16 Quad 10GBASE-T/1000BASE-T 2355
38-17 PHY Auto-Detect Flow 2357
38-18 Sample Shared External Flash Illustration 2379
38-19 NVM Shadow RAM 2381
38-20 Flash High Level Map Diagram 2383
38-21 Initial State Before the NVM Update Command 2389
38-22 Final State After Completion of the NVM Update Command 2389
38-23 Sign and Verify Procedures For Authenticated NVM Modules 2396
38-24 Hierarchical Reset Tree 2415

38-25 PCI Reset Flow 2418
38-26 PFR Flow....2420
38-27 VF Reset (VFR) Flow....2423
38-28 Global Resets Flow....2426
38-29 Virtualized Device Driver Initialization Flow....2449
38-30 Power Management State Diagram....2461
38-31 Structure of a Flexible Functionality Module 2488
38-32 Structure of a Type 1 Module....2489
38-33 Structure of a Type 2 Module....2490
38-34 Structure of a Type 3 Module....2491
38-35 Access Through a Type 3 Module of 32-Bits Wide Data Elements 2492
38-36 Access Through a Type 3 Module of 64-Bits Wide Per Port Data Elements 2493
38-37 Structure of a Type 4 Module....2494
38-38 Access Through a Type 4 Module of 32-Bits Wide Data Elements 2495
38-39 Access Through a Type 4 Module of 64-Bits Wide Per Port Data Elements 2496
38-40 Shadow RAM Word Write Command 2502
38-41 CSR Write Command....2502
38-1 Input Set Example for an FD Filter 2718
38-2 RSS Block Diagram 2728
38-3 Flow Director Filter Programming 2730
38-4 Flow Director Table Allocation (Example for 4 x PFs: PF0 ... PF3)....2732
38-5 Buckets and Collided Filter Entries Space 2736
38-6 Quad Hash Filter....2737
38-7 L2 Tags Order 2749
38-8 Transmit Tag Handling....2749
38-9 Tag Insertion....2752
38-10 Example: Non-VLAN Aware, Non-DCB Aware Operating System 2762
38-11 Tx Inner-to-Outer UP Translation 2763
38-12 Standard L2 Frame Format....2764
38-13 Order of L2 EtherType Headers....2765
38-14 MPLS Header....2766
38-15 IPv4 Datagram 2768
38-16 IPv6 Datagram 2769
38-17 IPv6 Hop-by-hop Extension Header 2770
38-18 IPv6 Routing Header 2770
38-19 IPv6 Fragment Header....2770
38-20 IPv6 Destination Options....2770
38-21 IPv6 Mobility Header 2771
38-22 ARP Packet Format....2774
38-23 UDP Packet Format 2775
38-24 IPv4 Pseudo Header for TCP/UDP Checksum....2775
38-25 IPv6 Pseudo Header for TCP/UDP Checksum....2775
38-26 TCP Packet Format....2776
38-27 SCTP Packet Format....2777

4-20 Intel® High Definition Audio (Intel® HD Audio) Timing 68
4-21 LPC Timing 68
4-22 Miscellaneous Timings 70
4-23 SPI Timings (17 MHz) 71
4-24 SPI Timings (30 MHz) 71
4-25 SPI Timings (40 MHz) 72
4-26 eSPI Timing 74
4-27 PM_SYNC Timing 75
4-28 NCSI Timing 75
4-29 Overshoot/Undershoot Specifications 76
4-30 Power Ramp with DSX Support 80
4-31 Power Ramp Without DSX Support 82
4-32 SLP_S5# High to PLTRST# High 83
4-33 S0 to S5 84
4-34 Powerdown to DeepSX 85
4-35 Surprise Powerdown to G3 86
4-36 eSPI Reset from G3 86
7-1 PCI Devices and Functions 91
7-2 Fixed I/O Ranges Decoded by PCH 92
7-3 Variable I/O Decode Ranges 94
7-4 PCH Memory Decode Ranges (from CPU perspective) 95
7-5 SPI Mode Address Swapping 97
8-1 Clock Signal Planes and States 101
8-2 Summary of Integrated Clock Controller FW Accessible Registers 103
9-1 General Power States for Systems Using the PCH 122
9-2 State Transition Rules for the PCH 122
9-3 System Power Plane 123
9-4 Causes of SMI and SCI 124
9-5 Sleep Types 128
9-6 Causes of Wake Events 128

9-7 Transitions Due to Power Failure 130
9-8 Supported Deep Sx Policy Configurations..... 130
9-9 Deep Sx Wake Events..... 131
9-10 Transitions Due to Power Button 132
9-11 Write Only Registers with Read Paths in ALT Access Mode..... 135
9-12 PIC Reserved Bits Return Values 135
9-13 Register Write Accesses in ALT Access Mode 136
9-14 SUSPWRDNACK/SUSWARN#/GPP_A13 Pin Behavior 139
9-15 SUSPWRDNACK During Reset 139
9-16 Causes of Host and Global Resets..... 140
9-17 Summary of Power Management Configuration Registers..... 144
9-18 Summary of PMC I/O Based Registers..... 159
9-19 Summary of PMC Memory Mapped Registers..... 178
11-1 Event Transitions that Cause Messages 215
11-2 Summary of SMBus TCO I/O Registers..... 218
12-1 Legacy Replacement Routing 229
12-2 Summary of HPET Memory Mapped Registers..... 232
13-1 Summary of Thermal Reporting Configuration Registers 242
13-2 Summary of Thermal Reporting Memory Mapped Registers 259
14-1 Counter Operating Modes..... 274
14-2 Summary of 8254 Timer Registers..... 275
15-1 Integrated Pull-Ups and Pull-Downs 282
15-2 I/O Signal Planes and States..... 282
15-3 Summary of High Definition Audio (D31:F3) PCI Configuration Registers 283
16-1 Summary of Processor Interface Memory Registers..... 322
17-1 eSPI Channels and Supported Transactions..... 329
17-2 eSPI Virtual Wires (VW) 330
17-3 Summary of Enhanced SPI (eSPI) Configuration Registers 335
17-4 Summary of eSPI Additional Registers 353
18-1 GPIO Group Summary 363
18-2 General Purpose I/O Signals 363
18-3 Summary of GPIO Community 0 Registers..... 372
18-4 Summary of GPIO Community 1 Registers..... 647
18-5 Summary of GPIO Community 2 Registers..... 897
18-6 Summary of GPIO Community 3 Registers..... 947
18-7 Summary of GPIO Community 4 Registers..... 997
18-8 Summary of GPIO Community 5 Registers.....1131
19-1 GbE LAN Signals 1386
19-2 Integrated Pull-Ups and Pull-Downs 1387
19-3 Power Plane and States for Output Signals 1387
19-4 Power Plane and States for Input Signals.....1388
19-5 LAN Mode Support 1391
19-6 Summary of GbE Configuration Registers 1392
19-7 Summary of GbE Memory Mapped I/O Registers.....1405
20-1 Interrupt Options - 8259 Mode.....1414
20-2 Interrupt Options - APIC Mode 1414
20-3 Interrupt Logic Signals.....1415
20-4 Interrupt Controllers PIC 1416
20-5 Interrupt Status Registers 1417
20-6 Content of Interrupt Vector Byte 1417
20-7 APIC Interrupt Mapping1.....1422
20-8 Stop Frame Explanation 1425
20-9 Data Frame Format 1426
20-10 Summary of Interrupt Registers 1427
20-11 Summary of Interrupt PCR Registers.....1438
20-12 Summary of APIC Indirect Registers 1450

20-13 Summary of Advanced Programmable Interrupt Controller (APIC) Registers 1466
21-1 LPC Interface Diagram 1468
21-2 LPC Cycle Types Supported 1469
21-3 Start Field Bit Definitions 1470
21-4 Cycle Type Bit Definitions 1470
21-5 Transfer Size Bit Definition 1470
21-6 SYNC Bit Definition 1471
21-7 Summary of LPC Configuration Registers 1472
21-8 Summary of LPC PCR Registers 1488
22-1 Power Plane and States for PCI Express* Signals 1493
22-2 PCI Express Port Feature Details 1494
22-3 PCI Express Link Configurations Supported 1494
22-4 MSI Versus PCI IRQ Actions 1495
22-5 NPx16 Port 1500
22-6 NPx8 1501
22-7 PCI Express Link Configurations Supported 1502
22-8 Summary of PCI Express Port Configuration Registers 1506
22-9 Summary of PCI Express Port Configuration Registers 1564
22-10 Summary of PCI Express Port Configuration Registers 1606
22-11 Summary of PCI Express Port Configuration Registers 1646
23-1 RTC Crystal Requirements 1689
23-2 External Crystal Oscillator Requirements 1690
23-3 Summary of RTC Indexed Registers 1690
23-4 Summary of RTC Configuration Registers 1695
24-1 Summary of SATA Configuration Registers 1714
24-2 Summary of SATA ABAR Registers 1742
24-3 Summary of SATA AIDP Registers 1781
24-4 Summary of SATA MXTBA Registers 1782
24-5 Summary of SATA MXPBA Registers 1784
24-6 Summary of SATA Configuration Registers 1785
24-7 Summary of SSATA ABAR Registers 1813
24-8 Summary of SATA AIDP Registers 1846
24-9 Summary of SATA MXTBA Registers 1848
24-10 Summary of SATA MXPBA Registers 1851
25-1 Summary of SMBus TCO I/O Registers 1854
26-1 I^2C* Block Read 1867
26-2 Enable for SMBALERT# 1869
26-3 Enables for SMBus Slave Write and SMBus Host Events 1870
26-4 Enables for the Host Notify Command 1870
26-5 Slave Write Registers 1871
26-6 Command Types 1871
26-7 Slave Read Cycle Format 1872
26-8 Data Values for Slave Read Registers 1873
26-9 Host Notify Format 1875
26-10 Slave Read Cycle Format 1875
26-11 Data Values for Slave Read Registers 1876
26-12 Enables for SMBus Slave Write and SMBus Host Events 1877
26-13 Summary of SMBus Configuration Registers 1877
26-14 Summary of SMBus I/O and Memory Mapped I/O Registers 1888
26-15 Summary of SMBus PCR Registers 1902
27-1 SPI Flash Regions 1906
27-2 Region Size Versus Erase Granularity of Flash Components 1907
27-3 Region Access Control Table 1909
27-4 Summary of SPI Configuration Registers 1911
27-5 Summary of SPI Memory Mapped Registers 1919
27-6 Summary of BIOS Flash Program Registers 1960

28-1 Testability Signals 1963
28-2 Power Planes and States for PCH Testability Signals 1964
28-3 Summary of Intel Trace Huh Configuration Registers....1967
29-1 Summary of xHCI Configuration Registers 1981
29-2 Summary of xHCI Memory Mapped Registers 2009
30-1 Summary of Intel Management Engine Interface Configuration Registers 2058
30-2 Summary of Intel MEI MMIO Registers 2077
31-1 Summary of IDE Redirect PCI Configuration (D22:F2) Registers 2078
32-1 Summary of Serial Port for Remote Keyboard and Text (KT) (D22:F3) Registers 2093
32-2 Summary of Keyboard and Text (KT) Additional Configuration Registers 2106
33-1 IE Host Root Space Devices 2112
33-2 IE Root Space Devices 2112
33-3 IE Features 2113
35-1 Summary of xHCI Configuration Registers 2119
35-2 Summary of MROM1 Configuration Registers 2135
36-1 Summary of FIA Configuration Registers 2150
36-2 Summary of DMI Configuration Registers 2158
36-3 Summary of DCI Configuration Registers 2185
36-4 Summary of DCI PCR Registers 2186
36-5 Summary of PSF1 PCR Registers 2187
36-6 Summary of PSF2 PCR registers 2198
36-7 Summary of PSF3 PCR Registers 2201
36-8 Summary of PSF4 PCR registers 2222
36-9 Summary of I/O Trap Registers 2223
36-10 Private Configuration Space Register Target Port IDs 2233
36-11 Summary of Internal Configuration Registers 2235
36-12 Intel® C620 Series Chipset PCH SBREG_BAR and SBI Address Offset Details 2259
37-1 Summary of Debug Registers....2261
38-1 10 GbE LAN Configurations 2284
38-2 PCIe* Host Interface Features....2296
38-3 Link Layer Ethernet Port Features 2297
38-4 Performance On The Network vs. Packet Size 2297
38-5 Transmit And Receive Scheduling 2298
38-6 LAN Engine Features....2299
38-7 Protocol Engine iWARP RDMA Features 2300
38-8 Protocol Engine User Space Direct Access Features 2302
38-9 Internal Switching Features 2302
38-10 System Manageability Features 2303
38-11 Power Management Features 2303
38-12 General Features....2304
38-13 Standards Supported By the 10 GbE controller 2306
38-14 Messages In the 10 GbE controller (As a Receiver) 2315
38-15 Messages In the 10 GbE controller (As a Transmitter) 2315
38-16 Response and Reporting Of PCIe Error Events 2321
38-17 PCIe* Statistic Events Encoding 2325
38-18 Link And Physical Layer Performance Events 2327
38-19 XP PM Compare Low Bits Register (XPPMCL[1:0]) (0x3288, 0x328c) 2328
38-20 XP PM Compare Low Bits Register (XPPMDL[1:0]) (0x32e8, 0x32f0) 2328
38-21 XP PM Data High Bits Register (XPPMDH[1:0]) (0x32ec, 0x32f4) 2328
38-22 XP PM Response Control Register (XPPMR[1:0]) (0x3294, 0x3298) 2328
38-23 XP PM Resource Events Register (XPPMER[1:0]) (0x32AC, 0x32B0) 2329
38-24 Performance Monitor Local Control Register (XPPERFCON) (0x32C4) 2329
38-25 XP PM Data Low Bits Register (XPPMDL[1:0]) (0x3280, 0x3284) 2329
38-26 NPQ Control Register - NPQC (0x00000) 2330
38-27 NPQ Round-trip Delay 1 Register - NPQRTDLY1 (0x00030; RO) 2331
38-28 NPQ Round-trip Delay 2 Register - NPQRTDLY2 (0x00034; RO) 2331

38-29 Resolution Of The Latency Counters 2331
38-30 Mac Port And Possible Speed Configurations 2334
38-31 Mac Control Frame Format 2336
38-32 802.3x Link Flow Control Frame Formats 2336
38-33 PFC Packet Format 2337
38-34 Format Of Priority Enable Vector 2337
38-35 Transfer of PAUSE Packet to Host (DPF bit) in 10 Gb/s MAC 2339
38-36 Pacing Speeds At 10 Gb/s Link Speed 2341
38-37 MAC Error Counters 2342
38-38 Clause 22 Basic MDIO Frame Format 2345
38-39 Clause 45 Indirect Addressing MDIO Frame Format 2345
38-40 I^2C Read Transaction - Dummy Write 2349
38-41 I^2C Read Transaction - Word Read 2349
38-42 I^2C Read Transaction - Dummy Write 2349
38-43 I^2C Read Transaction - Byte Read 2350
38-44 I^2C Write Transaction - Word Write 2350
38-45 I^2C Write Transaction - Byte Write 2350
38-46 Example for SDP, MDIO and I^2C Ports Usage for SFP+ and QSFP+ Modules 2352
38-47 OCP Use Cases 2356
38-48 OCP NVM Content 2358
38-49 OCP NVM content 2358
38-50 OCP Cards IDs 2359
38-51 Link Configuration Admin Commands (0x06xx) 2362
38-52 Set PHY Config Command (opcode: 0x0601) 2362
38-53 Set PHY Config Command Data Structure 2363
38-54 Set PHY Config Command Response (Opcode: 0x0601) 2364
38-55 Set MAC Config Command (Opcode: 0x0603) 2365
38-56 Set MAC Config Command Data Structure 2365
38-57 Set MAC Config Command Response (Opcode: 0x0603) 2366
38-58 Restart AN Command (Opcode: 0x0605) 2366
38-59 Restart Auto-negotiation Command Response (Opcode: 0x0605) 2367
38-60 Get PHY Abilities Command (Opcode: 0x0600) 2367
38-61 Get PHY Abilities Command Response (Opcode: 0x0600) 2368
38-62 Get PHY Abilities Command Response Data Structure 2368
38-63 Get Link Status Command (Opcode: 0x0607) 2370
38-64 Get Link Status Response (Opcode: 0x0607) 2371
38-65 Get Link Status Response Data Structure 2372
38-66 Reported Link Events 2374
38-67 Set Event Mask Command (Opcode: 0x0613) 2375
38-68 Set Event Mask Command Response (Opcode: 0x0613) 2375
38-69 PF-to-physical Lane Mappings (Supported Configurations) 2376
38-70 Clients And Access Types to the NVM 2392
38-71 NVM Access Admin Commands And Events 2398
38-72 NVM Read Admin Command 2399
38-73 NVM Read Response 2399
38-74 NVM Erase Admin Command 2400
38-75 NVM Erase Response 2401
38-76 NVM Erase Completion (on ARQ) 2401
38-77 NVM Update Admin Command 2402
38-78 NVM Update Response 2403
38-79 NVM Update Completion (on ARQ) 2404
38-80 NVM Config Read Admin Command 2405
38-81 NVM Config Read Response 2406
38-82 NVM Config Write Admin Command (0x0705) 2406
38-83 NVM Config Write Response (0x0705) 2407
38-84 Feature Buffer For NVM Config Read /Write 2407

38-85 Immediate Buffer for NVM Config Read /Write....2408
38-86 Small Resource Structure....2408
38-87 Large Resource Structure....2408
38-88 VPD Structure....2408
38-89 GPIO Pin Configuration Registers....2410
38-90 LED Source Modes....2411
38-91 NVM Section Loaded by Reset Source Covered by GLNVM_ULD Register....2418
38-92 Per PF Alt RAM Content....2437
38-93 List of AQ Commands for the Alternate Structure....2439
38-94 Write Alternate - Direct Command....2439
38-95 Completion For The Write Alternate - Direct Command....2440
38-96 Write Alternate - Indirect Command....2440
38-97 Completion For The Write Alternate - Indirect Command....2441
38-98 Read Alternate - Direct Command....2441
38-99 Completion For The Read Alternate - Direct Command....2441
38-100 Supported Mechanism....2456
38-101 Used Mechanism....2457
38-102 Magic Packet Structure....2468
38-103 Set WoL Filter Command (Opcode: 0x0120)....2475
38-104 Buffer Content (for ACPI Filters)....2475
38-105 Set WoL Filter Response (Opcode: 0x0120)....2476
38-106 Get Wake Up Reason Command (Opcode: 0x0121)....2476
38-107 Get Wake Up Reason Response (Opcode: 0x0121)....2476
38-108 Set Proxying Configuration Command Table Entry....2477
38-109 Set Proxying Configuration Command Descriptor Fields....2477
38-110 Set Proxying Configuration Command Descriptor Fields....2478
38-111 Set Proxying Configuration Response Descriptor Fields....2478
38-112 Set NS Proxy Table Entry Command Descriptor Fields....2478
38-113 IPv6 NS Table Entry Command Structure....2479
38-114 Set NS Proxy Table Entry Response Descriptor Fields....2480
38-115 IPv6 NS Table Entry Response Structure....2480
38-116 Hierarchical NVM map....2481
38-117 NVM Header Map....2484
38-118 NVM Integrity Summary Table....2499
38-119 NVM Header of Modules Mapped to Shadow RAM....2500
38-120 Header of Authenticated NVM Modules....2500
38-121 RO Commands Section Format....2501
38-122 RO Commands Types....2502
38-123 NVM General Summary Table....2503
38-124 Classification filters per PF/VF....2710
38-125 Filter actions by filter type....2711
38-126 Static Classification Filters Registers Initialization....2713
38-127 Dynamic Classification Filters Registers Initialization....2713
38-128 Packet Classifier Types and its Input Sets....2713
38-129 Flow Director PCTYPE Translation....2714
38-130 Flexible Payload (GLOQF_ORT[33:35] Registers)....2716
38-131 PRTQF_FLX_PIT Registers' Field....2717
38-132 GLQF_ORT Register Settings....2718
38-133 GLQF_PIT Registers Settings from NVM....2719
38-134 Protocol Layers Table (Type Rule Bus)....2720
38-135 Default Field Vector Table....2722
38-136 Detailed L2 Tags in the Field Vector (Assuming all L2 Tags are VLANs)....2723
38-137 Second or Fifth Priority Filters for Receive Queue Classification....2723
38-138 Tunneling UDP Admin Commands....2725
38-139 Supported Tunneling Types....2725
38-140 Network Key Structure of Tunneling Header....2726

38-141 PE Quad Hash Input Set 2734
38-142 Packet Types that Miss the PE Quad Hash Filter 2735
38-143 Examples of Input Fields for the Hash Function 2739
38-144 IPv4 2739
38-145 IPv6 2740
38-146 Add Tunneling UDP Command (Opcode: 0x0B00) 2741
38-147 Completion for the Add Tunneling UDP Command (Opcode: 0x0B00) 2742
38-148 Remove Tunneling UDP Port Command (Opcode: 0x0B01) 2743
38-149 Completion for Remove Tunneling UDP Command (Opcode: 0x0B01) 2743
38-150 Set RSS Key Command (Opcode: 0x0B02) 2743
38-151 Set RSS Key Response (Opcode: 0x0B02) 2744
38-152 Set RSS LUT Command (Opcode: 0x0B03) 2744
38-153 Set RSS LUT Response (Opcode: 0x0B03) 2745
38-154 Get RSS Key Command (Opcode: 0x0B04) 2745
38-155 Get RSS Key Response (Opcode: 0x0B04) 2746
38-156 Get RSS LUT Command (Opcode: 0x0B05) 2746
38-157 Get RSS LUT Response (Opcode: 0x0B05) 2747
38-158 Single Tag Handling 2750
38-159 Port-Based Tag Handling (Transmit) 2751
38-160 Tag Extraction Example 2753
38-161 L2 Tag Control Registers - Global 2754
38-162 L2 Tag Control Registers - Per VSI 2755
38-163 L2 Tags 2756
38-164 L2 Headers Support 2756
38-165 Port VLAN List and VSI Parameters 2759
38-166 List of Serial EtherType Headers 2765
38-167 List of Ethernet Types 2765
38-168 MPLS Header Structure 2766
38-169 Structure of LLDP Frame 2767
38-170 Structure of LLDP PDU 2767
38-171 Structure of LLDP TLV 2767
38-172 Structure of LLDP Organizationally Specific TLV 2767
38-173 List of Organizationally Specific TLV 2767
38-174 IPv6 Extension Headers and their Recommended Ordering 2769
38-175 Header Type Encoding and Lengths 2771
38-176 ICMP Packet Format 2771
38-177 IPv4 Packet Structure and Processing 2771
38-178 ICMPv6 Packet Format 2772
38-179 ICMPv6 Packet Structure and Processing 2773
38-180 ARP Packet Structure and Processing 2774
38-181 VXLAN Header Structure 2780
38-182 Geneve Header Structure 2780
38-183 Geneve Header Structure 2780
38-184 VXLAN-GPE Header Structure (Additive Fields on Top of Original VXLAN) 2781
38-185 NSH Header Structure 2782
38-186 MPLS Header Structure 2783
38-187 S-tag Format 2800
38-188 VSI Context 2817
38-189 Port VLAN List and VSI Parameters 2820
38-190 Private VLAN Membership 2823
38-191 External Elements 2845
38-192 Internal Elements 2846
38-193 Switching Structure Representation 2846
38-194 Switching Structure Representation - Examples 2847
38-195 Switching Elements Resources 2852
38-196 Switching Rules Resources 2852

38-197 Initial Elements....2856
38-198 Switch Configuration Admin Commands (0x02xx)....2858
38-199 Get Switch Configuration Command (Opcode: 0x0200)....2861
38-200 Get Switch Configuration Response (Opcode: 0x0200)....2861
38-201 Get Switch Configuration Command Response Buffer....2862
38-202 Get Switch Configuration Command Response Header....2862
38-203 Get Switch Configuration (Switch Element)....2862
38-204 Add Statistics Command (Opcode: 0x0201)....2863
38-205 Add Statistics Response (Opcode: 0x0201)....2863
38-206 Remove Statistics Command (Opcode: 0x0202)....2864
38-207 Remove Statistics Response (Opcode: 0x0202)....2864
38-208 Set Port Parameters Command (Opcode: 0x0203)....2864
38-209 Set Port Parameters Response (Opcode: 0x0203)....2865
38-210 Get Switch Resources Allocation Command (Opcode: 0x0204)....2865
38-211 Get Switch Resources Response (Opcode: 0x0204)....2866
38-212 Return Buffer Structures for Resource Type Format....2866
38-213 Set Switch Configuration command (Opcode: 0x0205)....2867
38-214 Set Switch Configuration response (Opcode: 0x0205)....2867
38-215 Add VSI Command (Opcode: 0x0210)....2868
38-216 Add VSI Command Buffer....2869
38-217 Add VSI Response Buffer....2874
38-218 Add VSI Response (Opcode: 0x0210)....2874
38-219 Add VSI Recommended Settings....2875
38-220 Update VSI Command (Opcode: 0x0211)....2877
38-221 Update VSI Response (Opcode: 0x0211)....2877
38-222 Get VSI Parameters Response (Opcode: 0x0212)....2878
38-223 Get VSI Parameters Command (Opcode: 0x0212)....2878
38-224 Get VSI Parameters Response Buffer....2878
38-225 Add Port Virtualizer Command (Opcode: 0x0220)....2879
38-226 Add Port Virtualizer Response (Opcode: 0x0220)....2880
38-227 Update Port Virtualizer Command (Opcode: 0x0221)....2880
38-228 Update Port Virtualizer Response (Opcode: 0x0221)....2881
38-229 Get Port Virtualizer Command (Opcode: 0x0222)....2881
38-230 Get Port Virtualizer Response (Opcode: 0x0222)....2881
38-231 Add VEB Command (Opcode: 0x0230)....2882
38-232 Add VEB Response (Opcode: 0x0230)....2883
38-233 Get VEB Parameters Command (Opcode: 0x0232)....2883
38-234 Get VEB Parameters Response (Opcode: 0x0232)....2884
38-235 Delete Element Command (Opcode: 0x0243)....2884
38-236 Delete Element Response (Opcode: 0x0243)....2885
38-237 Add MAC, VLAN Pair Command (Opcode: 0x0250)....2885
38-238 MAC, VLAN Pairs to Add Detail....2886
38-239 Add MAC, VLAN Pair Response (Opcode: 0x0250)....2886
38-240 MAC, VLAN Pairs Allocation Detail....2887
38-241 Remove MAC, VLAN Pair Command (Opcode: 0x0251)....2887
38-242 Remove MAC, VLAN Pair Response (Opcode: 0x0251)....2888
38-243 MAC, VLAN Pairs to Remove Detail....2889
38-244 Response Buffer Results (MAC, VLAN Pairs Removal)....2889
38-245 Add VLAN Command (Opcode: 0x0252)....2889
38-246 Add VLAN Response (Opcode: 0x0252)....2890
38-247 Command Buffer - VLAN IDs to Add Detail....2891
38-248 Response Buffer - VLANs Allocation Detail....2891
38-249 Remove VLAN Command (Opcode: 0x0253)....2891
38-250 Command Buffer - VLAN Pairs to Remove Detail....2892
38-251 Remove VLAN Response (Opcode: 0x0253)....2892
38-252 Response Buffer - MAC, VLAN Pairs Removal Detail....2893

38-253 Set VSI Promiscuous Modes Command (Opcode: 0x0254) 2893
38-254 Set VSI Promiscuous Modes Response (Opcode: 0x0254) 2894
38-255 Add S-tag Command (Opcode: 0x0255) 2894
38-256 Add S-tag Response (Opcode: 0x0255) 2895
38-257 Remove S-tag Response (Opcode: 0x0256) 2896
38-258 Remove S-tag Command (Opcode: 0x0256) 2896
38-259 Update S-tag Command (Opcode: 0x0259) 2897
38-260 Update S-tag Response (Opcode: 0x0259) 2897
38-261 Add Control Packet Filter Command (Opcode: 0x025A) 2898
38-262 Add Control Packet Filter Response (Opcode: 0x025A) 2899
38-263 Remove Control Packet Filter Command (Opcode: 0x025B) 2899
38-264 Remove Control Packet Filter Response (Opcode: 0x025B) 2900
38-265 Add Cloud Filters Command (Opcode: 0x025C) 2900
38-266 Add Cloud Filters Response (Opcode: 0x025C) 2901
38-267 Add Cloud Filters - Command Buffer 2901
38-268 Add Cloud Filters - Response Buffer 2903
38-269 Remove Cloud Filters Command (Opcode: 0x025D) 2903
38-270 Remove Cloud Filters Response (Opcode: 0x025D) 2903
38-271 Remove Cloud Filters - Response Buffer 2904
38-272 Clear All WoL Switch Filters Command (Opcode: 0x0025E) 2904
38-273 Clear All WoL Switch Filters Response (Opcode: 0x025E) 2904
38-274 Add Mirror Rule Command (Opcode: 0x0260) 2905
38-275 Add Mirror Rule Command Buffer 2906
38-276 Add Mirror Rule Response (Opcode: 0x0260) 2906
38-277 Delete Mirror Rule Command (Opcode: 0x0261) 2906
38-278 Delete Mirror Rule - Command Buffer 2907
38-279 Delete Mirror Rule Response (Opcode: 0x0261) 2907
38-280 MSI-X Vector Allocation per Function 2908
38-281 Other Interrupt Causes of the PFs 2913
38-282 Other interrupt causes of the VFs 2913
38-283 Product Name Versus the 82599 Virtualization Support 2922
38-284 Virtualization Features Enablement 2923
38-285 Data Checks on Fetches for Tx Data 2924
38-286 Tx Descriptor Validity Checks 2924
38-287 Rx Data Fetch Checks 2925
38-288 VF Resource Allocation 2926
38-289 Example #1: 1 No-drop TC + 3 Drop TCs 2943
38-290 Example #2: 2 No-drop TCs + 3 Drop TCs 2943
38-291 Example #3: 8 No-drop TCs 2944
38-292 Example #4: 4 No-drop TCs + 2 Drop TCs 2944
38-293 Local DCBX Managed Objects 2955
38-294 PFC Managed Objects 2956
38-295 Changes in DCB Registers Made via NVM Settings When Port Operated at Different Link Speed 2960
38-296 PFC Ignore Response 2960
38-297 PFC Ignore Command 2961
38-298 DCB Updated Response 2962
38-299 DCB Updated Command 2962
38-300 LAN Queue Overflow Event 2962
38-301 10 GbE Ethernet Controller bandwidth Management Attributes 2965
38-302 Scheduler Configuration Admin Queue Commands 2976
38-303 Transmit Scheduler Admin Queue Completion Errors 2980
38-304 Configure VSI Bandwidth Limit Command Fields 2981
38-305 Configure VSI Bandwidth Limits per Traffic Type Command Fields 2982
38-306 Configure VSI Bandwidth Limit per Traffic Type Command Buffer 2983
38-307 Configure VSI Bandwidth Limit per Traffic Type Completion Buffer 2984

38-308 Configure VSI Bandwidth Allocation per Traffic Type Command Fields....2985
38-309 Configure VSI Bandwidth Allocation per Traffic Type Command Buffer....2985
38-310 Configure VSI Bandwidth Allocation per Traffic Type Completion Buffer....2986
38-311 Configure Switching Component Bandwidth Limit Command Fields....2987
38-312 Configure Physical Port ETS Command Fields....2988
38-313 Configure Physical Port ETS Command Buffer....2988
38-314 Suspend Port's Tx Traffic....2989
38-315 Resume PF Traffic....2990
38-316 Configure Switching Component Bandwidth Limits per Traffic Type Command Fields....2991
38-317 Configure Switching Component Bandwidth Limit per Traffic Type Command Buffer....2991
38-318 Configure Switching Component Bandwidth Allocation per Traffic Type Command Fields....2993
38-319 Configure Switching Component Bandwidth Allocation per Traffic Type Command Buffer....2993
38-320 Query VSI Bandwidth Configuration Command Fields....2994
38-321 Query VSI Configuration Completion Buffer....2994
38-322 Query VSI Bandwidth Allocation per Traffic Type Command Fields....2995
38-323 Query VSI Bandwidth Allocation per Traffic Type Completion Buffer....2996
38-324 Query Switching Component Configuration Command Fields....2997
38-325 Query Switching Component Configuration Completion Buffer....2997
38-326 Query Physical Port ETS Configuration Command Fields....2998
38-327 Query Physical Port ETS/SLA Completion Buffer....2998
38-328 Query Switching Component Bandwidth Allocation per Traffic Type Command Fields....3000
38-329 Query Switching Component Bandwidth Allocation per Traffic Type Completion Buffer....3000
38-330 Scheduler Configuration Summary....3002
38-331 ETS-Based Scheme-relative Bandwidth Calculation Example....3014
38-332 HMC Objects....3016
38-333 HMC page descriptor format....3020
38-334 10 GbE Controller HMC Resource Profiles....3024
38-335 Default HMC Profile Examples....3025
38-336 Initial 10 GbE Controller Host Memory Cache Partitioning per PF....3025
38-337 Example SR-IOV VF Primary Profile Resource Partitioning per FPM....3026
38-338 SR-IOV Even Distribution Profile Resource Partitioning Per FPM....3027
38-339 FPM Object Registers....3028
38-340 FPM Object Order and Alignment....3029
38-341 HMC Errors....3034
38-342 Admin Queue Descriptor Structure (in LE 32 Order)....3037
38-343 Admin Descriptor Field descriptions....3038
38-344 AQ Registers....3038
38-345 Receive Queue Element - Initial Values....3040
38-346 Direct Admin Command Structure....3041
38-347 Direct Command Completion Event Template....3042
38-348 Indirect Command Template....3042
38-349 Indirect Command Completion....3043
38-350 Commands Allowed for VF Firmware Admin Queues....3044
38-351 Non-Completion Events....3044
38-352 Admin Queue Return Value Fields....3045
38-353 Admin Queue Return Values and Error Codes....3045
38-354 opcode groups....3046
38-355 Generic Commands....3046
38-356 Get Version Command (Opcode: 0x0001)....3047
38-357 Driver Version Command (Opcode: 0x0002)....3047
38-358 Driver Version Buffer....3048
38-359 Queue Shutdown Command (Opcode: 0x0003)....3048
38-360 Set PF Context Command (Opcode: 0x0004)....3049
38-361 Shared Resources....3049

38-362 Request Resource Ownership Admin Command (Opcode: 0x0008) 3049
38-363 Release Resource Ownership Admin Command (Opcode: 0x0009) 3050
38-364 Discover Device/function Capabilities (Opcode: 0x000A, 0x000B) 3050
38-365 Capability Structure 3051
38-366 Resources Recognized by This Version of the Command 3051
38-367 Configure No-drop Policy (Opcode: 0x0112) 3054
38-368 Virtualization Admin Commands 3054
38-369 Send to PF Command (Opcode: 0x0801) 3054
38-370 Message From VF Event (Opcode: 0x0801) 3055
38-371 Send to VF Command (Opcode: 0x0802) 3055
38-372 Message From PF Event (Opcode: 0x0802) 3056
38-373 Counter Name Prefixes 3056
38-374 Ethernet Interface Group Statistics Counters 3058
38-375 Error Counters Not Implemented in Current Design 3059
38-376 Additional Per Port Counters 3060
38-377 VEB Per VLAN Counters 3061
38-378 VEB Per UP Counters 3061
38-379 VEB Per VSI Counters 3061
38-380 Other Statistics 3062
38-381 Forwarding Rules for Rx LLDP Packets 3064
38-382 LLDP Admin Queue Commands 3068
38-383 Get LLDP MIB Command 3069
38-384 Get LLDP MIB Response 3070
38-385 Configure LLDP MIB Change Event Command 3071
38-386 Configure LLDP MIB Change Event Response 3071
38-387 LLDP MIB Change Event 3072
38-388 Add LLDP TLV Command 3072
38-389 Add LLDP TLV Response 3073
38-390 Update LLDP TLV Command 3074
38-391 Update LLDP TLV Response 3074
38-392 Delete LLDP TLV Command 3075
38-393 Delete LLDP TLV Response 3076
38-394 Stop LLDP Agent Command 3077
38-395 Stop LLDP Agent Response 3077
38-396 Start LLDP Agent Command 3078
38-397 Start LLDP Agent Response 3078
38-398 Restore LLDP Agent Factory Settings Command 3078
38-399 Restore LLDP Agent Factory Settings Response 3079
38-400 Get CEE DCBX OPER CFG Command 3079
38-401 Get CEE DCBX OPER CFG Response 3080
38-402 Get CEE DCBX OPER CFG Response Buffer Format 3080
38-403 Set local LLDP MIB Command 3082
38-404 Set Local LLDP MIB Response 3082
38-405 Stop/Start a Specific LLDP Agent Command 3083
38-406 Stop/Start a Specific LLDP Agent Command Response 3083
38-407 5 VSIs While the PF Owns 128 LQPs Example 3088
38-408 Clear PXE Mode Admin Command (Opcode: 0x0110) 3089
38-409 Clear PXE Mode Admin Command Completion (Opcode: 0x0110) 3090
38-410 Tunneled Packet Processing 3091
38-411 Steering Tag and Processing Hint Programming by the LAN Engine 3092
38-412 16-Byte Receive Descriptors Read Format 3094
38-413 32-Byte Receive Descriptors Read Format 3094
38-414 Status Bits 3095
38-415 Error Bits 3096
38-416 Mirroring Functionality 3097
38-417 Length Bits 3097

38-418 Packet Types 3097
38-419 Ext_Status Bits 3100
38-420 L2 Tag Bits 3101
38-421 Flexible Bytes Low Bits 3101
38-422 FD Filter Programming Indications 3102
38-423 Status Field Bits 3102
38-424 Receive Queue Enable / Disable Flags 3103
38-425 LAN Rx Queue Context in the Private Host Memory (174 Bits = 25 Bytes) 3106
38-426 Header Split Modes Defined by the DTYPE Field 3109
38-427 Split Headers Enabled by the HSPLIT_0 Field 3110
38-428 Split Headers Enabled by the HSPLIT_1 Field 3110
38-429 Header Split vs. Packet and Buffer Sizes 3110
38-430 Integrity Offload Check for Receive Packet Types 3112
38-431 LAN Descriptor Types 3113
38-432 Transmit Buffer 3115
38-433 Transmit Queue Enable / Disable Flags 3120
38-434 LAN Tx Queue Context in the Private Host Memory 3123
38-435 Pseudo Header Pre-Loaded Values 3127
38-436 Transmit Integrity Offload for Packet Types 3128
38-437 Packet Time Stamp Latency 3136
38-438 PRTTSYN_INC as a Function of MAC Clock Frequency 3137
38-439 Receive Time Stamp Control Parameters 3140
38-440 PTP Header Format (V1 and V2 Formats) 3141
38-441 PTP V2 and V1 Message Types 3141
38-442 PE features 3143
38-443 Doorbell Page Register Summary 3158
38-444 QP WR Size Requirements 3159
38-445 iWARP QP State Behavior 3170
38-446 iWARP QP State Transition 3171
38-447 iWARP QP State Transition Driven from the Wire 3173
38-448 PE CEQ Entry Format 3175
38-449 PE AEQ Entry Format 3175
38-450 PE AE codes (AE_ID) 3178
38-451 STag and Processing Hint Programming 3183
38-452 PE Objects Dependencies 3185
38-453 PE Resource Initialization 3186
38-454 RDMA Resource Initialization 3187
38-455 UDA Resource Initialization 3188

Revision History

Document Number	Revision Number	Description	Date
336067	001	Initial release	July 2017
336067	002	Updated Section 24.7.10. Updated Section 27.8.5 bit 3 default from 0b to 1b. Updated Section 27.9.2. Added note 3 to 27.1 overview. Updated Chapter 27 to correctly state the frequencies supports (17, 30 and 40 MHz. Updated Chapter 18. Many of the defaults bit settings were incorrect for pins that defaulted to native functions. These were corrected. Updated Section 21.7 to call out no LPC DMA or bus mastering. Updated descriptions in "Surprise Powerdown to G3" in Chapter 4. Updated 9.10.7. Updated SEIO Glitch description in chapter 4 to include SEIOs with pullup resistors. Updated Chapter 20 to include description of the NMI and SMI signals on GPP_G18 and GPP_G19. Updated 10GbE DIDs in Chapter 2. Updated Chapter 19 and Chapter to 36 to reflect that BIOS can not disable the legacy 1 GbE LAN.	December 2017
336067	003	Updated Chapter 4 to include PCIe Gen4 jitter specs and notes. Corrected various sections where SLP_GbE# was still being referred to as SLP_LAN#. Updated DMI chapter to describe DMI packet sizes. Corrected PAD_CFG_DW0_GPD_6 default inconsistencies. Updated name of bits 0 and 1 in table of Section 9.10.7 (PM_CFG register). Updated sections 24.8.2.11 and 24.9.2.11 (changed defaults).	March 2018
336067	004	Replaced *Intel® QuickAssist Technology Programmer's Guide* with *Intel® QuickAssist Technology API Programmer's Guide* in Chapter 39. Renamed legacy PCHHOT# in the Thermal Management chapter with PHOT# to match pin name.	March 2018
336067	005	Replaced "Gen3" with "Gen4" in the signal descriptions in Chapter 8. Added C629 SKU information in Chapter 1. Updated SMI Status Register (SMI_STS, offset 34h) in Chapter 9. Added CDC_DUT_DETECT_N description in the power and ground signals chapter. Updated sections 4.4 and 4.6. Corrected MM# error in Table 1-3 for C624. Added C629 DID in Chapter 2. Added C629 to Table 4-4. Updated Hardstrap on GPP_B14, GPP_B18 and GPP_B22.	August 2018
336067	006	Updated Table 3-2. Updated Table 4-12: corrected GPP_G10_FANPWM2_FANPWM2IE name; added GPP_G14; removed duplicate entry of RSMRST_N, PCH_PWROK, DSW_PWROK, SRTCRST_N, RTCRST_N from the grouping of the DSW signals. Updated Chipset Initialization Register E0 (CIR_E0) in Section 9.10.45. Updated Chapter 16/Chapter 28 with native function on GPD0. Updated Proc_pwrgd description in Chapter 16. Updated Section 27.7.2 SPI Support for TPM. Chapter 38: updated Table 38-1, added electrical interface column, added NVM Recovery Mode information (.S security), added OCP Support, updated NVM Map to reflect Recovery Mode and OCP, updated Programming Information section to reflect Recovery Mode and OCP.	February 2019

Document Number	Revision Number	Description	Date
336067	007	Corrected Note 1 is SPI flash function description, Section 27.7.1.1. Made corrections to figures 17-2 and 17-3 (request and response for PCH temperature) in Chapter 17. Corrected ADR_Holdoff pin strap description in Chapter 3. Added P2SB Control register in Section 36.9. Updated HSIO PHY programming table in Section 36.10.4. Updated Section 38.20.22. Updated Chipset SKU Definition Table (Table 1-2). Updated diagram on diagrams for Power ramp with and without DSW to include SRTCRST# in Chapter 4. Updated measurement description T1 for timing tables on power ramp both with and without DSW.	May 2019
336067	008	In Chapter 2, PCH Controller Device IDs, updated the DID and virtual port name that the thermal sensor is attached to. In Chapter 22, corrected the PCIe X16 and x8 uplink Device IDs. Sections 22.8.1 and 22.9.1 Updated Chapter 38 in various sections. See change bars.	July 2019
336067	009	Chapter 29 (USB): Updated several sections. See change bars. Chapter 1: Updated PCH marking table. Chapter 38: Updated Table 38-546 (supported NC-SI Commands) footnote, Table 38-9 (Internal Switching Features), Table 38-56 (Set MAC Config Command Data Structure), Section 38.44.2.2 (Serial Number Registers). Chapter 17: Added note in Flash Access Channel Overview (Section 17.7.6.4) on SAFS support.	October 2019

§

1 Introduction

1.1 About this Manual

This document is intended for Original Equipment Manufacturers and BIOS vendors creating products based on the Intel® C620 Series Chipset Platform Controller Hub (PCH).

Note: Throughout this document the Platform Controller Hub is used as a general term and refers to all Intel® C620 Series Chipset PCH SKUs, unless specifically noted otherwise.

This manual assumes a working knowledge of the vocabulary and principles of interfaces and architectures such as PCI Express*, Universal Serial Bus, Advance Host Controller Interface, eXtensible Host Controller Interface, and so forth.

This manual abbreviates buses as B*n*, devices as D*n* and functions as F*n*. For example Device 31 Function 0 is abbreviated as D31:F0, Bus 1 Device 8 Function 0 is abbreviated as B1:D8:F0. Generally, the bus number will not be used, and can be considered to be Bus 0.

1.2 Overview

The Intel® C620 Series Chipset PCH provides extensive I/O support. Functions and capabilities include:

- ACPI Power Management Logic Support, Revision 4.0a
- *PCI Express* Base Specification*, Revision 3.0
- Integrated Serial ATA host controller, supports data transfer rates of up to 6 Gb/s on all ports.
- xHCI USB controller with SuperSpeed USB 3.0 ports
- Direct Media Interface
- Serial Peripheral Interface
- Enhanced Serial Peripheral Interface
- Flexible I/O—Allows some high speed I/O signals to be configured as PCIe* root ports, PCIe uplink for use with certain PCH SKUs, SATA (and sSATA), or USB 3.0.
- General Purpose Input Output (GPIO)
- Low Pin Count interface, interrupt controller, and timer functions
- *System Management Bus Specification*, Version 2.0
- Integrated Clock Controller/Real Time Clock Controller
- Intel® High Definition Audio (Intel® HD Audio) and Intel® Smart Sound Technology (Intel® SST)
- Integrated 10/1 Gb Ethernet
- Integrated 10/100/1000 Mbps Ethernet MAC
- Supports Intel® Rapid Storage Technology enterprise (Intel® RSTe)
- Supports Intel® Active Management Technology and Intel® Server Platform Services
- Supports Intel® Virtualization Technology (Intel® VT) for Directed I/O (Intel® VT-d)
- Supports Intel® Trusted Execution Technology (Intel® TXT)

- JTAG Boundary Scan support
- Intel® QuickAssist Technology (Intel® QAT)
- Intel® Trace Hub (Intel® TH) for debug
- Innovation Engine
- ADR Support

Note: Not all functions and capabilities may be available on all SKUs.

1.3 PCH I/O Features and Capabilities

The SKU information will be published in an upcoming revision.

The following table provides an overview of the PCHI/O capabilities.

1.4 PCH Software and Firmware

Table 1-1. PCH I/O Capabilities

Interface	Intel® C620 Series Chipset
CPU Interface	DMI 3.0 x4
PCIe	Up to 20 3.0 lanes (16 devices max) for root ports, and up to 24 3.0 lanes used as downstream ports
USB	Up to 10 superspeed, 14 highspeed
SATA	Up to 14 3.0
LAN Ports	One GbE, Four 10 GbE
Audio	HD-Audio, I2S, Direct attach Digital Microphone
LPC	24 MHz, No DMA
eSPI	Two CS#, Quad Mode
SMBus/SMLink	One host SMBus, and 6 SMLinks
SPI	Three devices, including TPM

Many of the features listed are dependent upon specific Firmware (FW) or Software (SW) to enable and operate them. Others can use industry standard drivers.

Intel RSTe is the driver available for use with the PCH. For information on the features available with Intel RSTe, check with your Intel Rep or SW PAE for full details.

There are two FW stacks provided by Intel that are used with Intel® C620 Series Chipset – Intel AMT FW (Intel® Management Engine [Intel® ME] 11) and Server Platform Software (SPS). These enable and use different features, such as the integrated 1 GbE MAC and the Innovation Engine. The Innovation Engine has its own FW stack that is developed by the customer for customer specific functionality.

Drivers and NVM setup for the 10 GbE are provided by Intel.

1.5 PCH SKUs

The chart below lists the differences between the various SKUs of the PCH. These SKU definitions are subject to change.

Table 1-2. Intel® C620 Series Chipset SKU Differentiation

SKU	C621	C622	C624	C625	C626	C627	C628	C629
Feature								
Legacy 10/100/1000 Mbps Ethernet	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
LAN Port 0	1G	10/1G	10/1G	10/1G	10/1G	10/1G	10/1G	10/1G
LAN Port 1	1G	10/1G	10/1G	10/1G	10/1G	10/1G	10/1G	10/1G
LAN Port 2	1G	1G	10/1G	10/1G	10/1G	10/1G	10/1G	10/1G
LAN Port 3	1G	1G	10/1G	10/1G	10/1G	10/1G	10/1G	10/1G
Dedicated PCIe Uplink	x1	x8	x16	x16	x16	X16	X16	X16
Muxed x8 PCIe Uplink	Disabled	Disabled	Disabled	Disabled	Enabled	Enabled	Enabled	Enabled
Intel QAT Engines	No	No	No	1	2	3	3	3
Intel QAT Clock Speed	N/A	N/A	N/A	533 MHz	533 MHz	685 MHz	685 MHz	800 MHz
AVID Enabled	No	No	No	Yes (0.85-1.0V)	Yes (0.85-1.0V)	Yes (0.85-1.0V)	Yes (0.85-1.0V)	Yes (0.85-1.0V)

1.6 PCH Markings

Table 1-3. PCH Markings (Sheet 1 of 2)

SKU	Phase	Stepping	S-Spec	QDF	MM#	ROHS Compliant	Notes
Intel® C621 Series Chipset (Intel® EY82C621 PCH)	Production	B1	R36S	N/A	954858	YES	
Intel® C621 Series Chipset (Intel® EY82C621 PCH)	Production	S0	R354	N/A	953999	YES	
Intel® C622 Series Chipset (Intel® EY82C622 PCH)	Production	S0	R36X	N/A	954863	YES	
Intel® C624 Series Chipset (Intel® EY82C624 PCH)	Production	S0	R36Y	N/A	954864	YES	
Intel® C625 Series Chipset (Intel® EY82C625 PCH)	Production	B1	R36W	N/A	954862	YES	
Intel® C626 Series Chipset (Intel® EY82C626 PCH)	Production	B1	R36V	N/A	954861	YES	
Intel® C627 Series Chipset (Intel® EY82C627 PCH)	Production	B1	R36U	N/A	954860	YES	
Intel® C628 Series Chipset (Intel® EY82C628 PCH)	Production	B1	R36T	N/A	954859	YES	
Intel® C621 Series Chipset (Intel® EY82C621 PCH)	Production	B2	R3HE	N/A	957625	YES	
Intel® C621 Series Chipset (Intel® EY82C621 PCH)	Production	S1	R3HL	N/A	957631	YES	

Table 1-3. PCH Markings (Sheet 2 of 2)

SKU	Phase	Stepping	S-Spec	QDF	MM#	ROHS Compliant	Notes
Intel® C622 Series Chipset (Intel® EY82C622 PCH)	Production	S1	R3HK	N/A	957630	YES	
Intel® C624 Series Chipset (Intel® EY82C624 PCH)	Production	S1	R3HM	N/A	957632	YES	
Intel® C625 Series Chipset (Intel® EY82C625 PCH)	Production	B2	R3HJ	N/A	957629	YES	
Intel® C626 Series Chipset (Intel® EY82C626 PCH)	Production	B2	R3HH	N/A	957628	YES	
Intel® C627 Series Chipset (Intel® EY82C627 PCH)	Production	B2	R3HG	N/A	957672	YES	
Intel® C628 Series Chipset (Intel® EY82C628 PCH)	Production	B2	R3HF	N/A	957626	YES	
Intel C629 Series Chipset (Intel® EY82C629 PCH)	Production	B2	RCWR	N/A	976392	Yes	

§

2 PCH Controller Device IDs

2.1 Device and Revision ID Table

The Device IDs (DID) listed below are the numbers that can be found in the PCI standard header registers at offset 02H for each the functions listed below. The Device IDs are unique to Intel® C620 Series Chipset with the exception of the Alternate IDs. They are common with previous generations so external SW can identify this as an Intel component. The LPC DID is used to identify the SKUs. There are two sets of DIDs for most components, one for super SKU parts and the other for production stepping steppings. The 10 GbE and Intel® QuickAssist Technology (Intel® QAT) engines only have one DID.

§

Table 2-1. Intel® C620 Series ChipsetDevice and Revision ID Table (Sheet 1 of 4)

Intel® C620 Series Chipset Production SKUs	Intel® C620 Series Chipset Super SKUs	Device Function - Device Description	A0 SRID	B0 SRID	B1 SRID	B2 SRID	S0 SRID	S1 SRID	Notes
A182	A202	D23:F0 - SATA Controller (AHCI)	0	2	3	4	8	9	AHCI

A1F8	A278	D16:F0 - IE:HECI #1	0	2	3	4	8	9	
A1F9	A279	D16:F1 - IE: HECI #2	0	2	3	4	8	9	
A1FA	A27A	D16:F2 - IE:IDE Redirection	0	2	3	4	8	9	
A1FB	A27B	D16:F3 - IE: Keyboard and Text Redirection	0	2	3	4	8	9	
A1FC	A27C	D16:F4 - IE: HECI #3	0	2	3	4	8	9	
37C0	37C0	PCIe x16 Uplink (NPX16)	0	2	3	4	8	9	
37C1	37C1	PCIe x8 Uplink (NPX8)	0	2	3	4	8	9	
37C2	37C2	Virtual Switch Port 0	0	2	3	4	8	9	For Intel QAT 0
37C3	37C3	Virtual Switch Port 1	0	2	3	4	8	9	For Intel QAT 1
37C4	37C4	Virtual Switch Port 2	0	2	3	4	8	9	For Intel QAT 2
37C5	37C5	Virtual Switch Port 3	0	2	3	4	8	9	For 10 GbE LAN
37C7	37C7	Virtual Switch Port 5	0	2	3	4	8	9	For Thermal Sensor in Endpoint (EP) mode
37C8	37C8	PF0 for Intel QuickAssist Technology 0-2	0	2	3	4	8	9	
37C9	37C9	VF for Intel QuickAssist Technology 0-2	0	2	3	4	8	9	
37B1	37B1	Thermal Sensor	0	2	3	4	8	9	For Thermal Sensor in EP mode

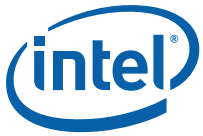

Table 2-1. Intel® C620 Series ChipsetDevice and Revision ID Table (Sheet 4 of 4)

Intel® C620 Series Chipset Production SKUs	Intel® C620 Series Chipset Super SKUs	Device Function - Device Description	A0 SRID	B0 SRID	B1 SRID	B2 SRID	S0 SRID	S1 SRID	Notes
10A6, 37CC, 37CE-37D3		10 Gb Ethernet	0	2	3	4	8	9	10A6 is for disable function or before NMV loaded. 37CC is with NVM loaded but PHY device not detected. 37CE-37D3 depends on NVM image loaded. See LEK for which PHY corresponds to which DID.

3 Pin Straps

The following signals are used for static configuration. They are sampled at the rising edge of RSMRST# or PCH_PWROK to select configuration and then revert later to their normal usage. To invoke the associated mode, the signal should be driven at least four PCI clocks prior to the time it is sampled.

The straps that are latched with RSMRST# also have a secondary qualifier. In order to the straps to be latched at this time, SLP_SUS# must be high. If DeepSX is supported then this is not an issue. If DeepSX is not supported, RSMRST# will need to wait until SLP_SUS# is high.

Table 3-1. Functional Strap Definitions (Sheet 1 of 3)

Signal	Usage	When Sampled	Comment
GPP_B14_SPKR	Top Swap Override	Rising edge of PCH_PWROK	The signal has a weak internal pull-down. 0 = **Disable** "Top Swap" mode. (Default) 1 = **Enable** "Top Swap" mode. This inverts an address bit (defined in FITC) at the top of system BIOS space. This provides an alternate physical address that the processor accesses at boot. ***Notes:*** 1. The internal pull-down is disabled after PCH_PWROK# de-asserts. 2. Software will not be able to clear the Top Swap bit until the system is rebooted. 3. The status of this strap is readable using the Top Swap bit (Bus0, Device31, Function0, offset DCh, bit4).
GPP_B18	No Reboot	Rising edge of PCH_PWROK	The signal has a weak internal pull-down. 0 = **Disable** "No Reboot" mode. 1 = **Enable** "No Reboot" mode (PCH will disable the TCO Timer system reboot feature). This function is useful when running Intel® In-Target Probe (Intel® ITP)/ XDP. ***Notes:*** 1. The internal pull-down is disabled after PCH_PWROK# de-asserts. 2. The status of this strap is readable using the NO REBOOT bit (Chipset Configuration Registers: RCBA + Offset 3410h:Bit 5).
GPP_C2_SM-BALERT#	TLS Confi-dentiality	Rising edge of RSMRST#	This signal has a weak internal pull-down. 0 = **Disable** Intel ME Crypto Transport Layer Security (TLS) cipher suite (no confidentiality). 1 = **Enable** Intel ME Crypto Transport Layer Security (TLS) cipher suite (with confidentiality). Must be pulled up to support Intel AMT with TLS and Intel® Small Business Advantage (Intel® SBA) with TLS. ***Notes:*** 1. The internal pull-down is disabled after RSMRST# de-asserts.

Table 3-1. Functional Strap Definitions (Sheet 2 of 3)

Signal	Usage	When Sampled	Comment
GPP_B22	Boot BIOS Strap Bit BBS	Rising edge of PCH_PWROK	This Signal has a weak internal pull-down. This field determines the destination of accesses to the BIOS memory range. Also controllable using Boot BIOS Destination bit (Chipset Configuration Registers: Offset 3410h:Bit 10). This strap is used in conjunction with Boot BIOS Destination Selection 0 strap. **Bit 10** — **Boot BIOS Destination** 0 — SPI 1 — LPC/eSPI ***Notes:*** 1. The internal pull-down is disabled after PCH_PWROK# de-asserts. 2. If option 1 (LPC/eSPI) is selected, BIOS may still be placed on LPC/eSPI but all platforms are required to have SPI flash connected directly to the PCH's SPI bus with a valid descriptor in order to boot. 3. Boot BIOS Destination Select to LPC by functional strap or using Boot BIOS Destination Bit will not affect SPI accesses initiated by Intel ME or LAN.
GPP_C5_SML0ALERT_IE#	eSPI_EN	Rising edge of RSMRST#	This signal has a weak internal pull-down. 0 = **LPC** functionality is selected. 1 = **eSPI** functionality is selected. ***Notes:*** 1. The internal pull-down is disabled after RSMRST# de-asserts.
HDA_SDO	Flash Descriptor Security Override	Rising edge of PCH_PWROK	This signal has a weak internal pull-down. 0 = **Enable** security measures defined in the Flash Descriptor. 1 = **Disable** Flash Descriptor Security (override). This strap should only be asserted high using external pull-up in manufacturing/debug environments ONLY. ***Notes:*** 1. The internal pull-down is disabled after PLTRST# de-asserts. 2. Asserting HDA_SDO high on the rising edge of PWROK will also halt Intel Management Engine after Chipset bring up and disable runtime Intel ME features. This is a debug mode and must not be asserted after manufacturing/debug.
GPP_H12_SML2ALART_IE# /	Master or Slave Attached Flash	Rising edge of RSMRST#	This signal has a weak internal pull-down. 0 = Master attached Flash. 1 = Slave Attached Flash. ***Notes:*** 1. The internal pull-down is disabled after RSMRST# de-asserts.
GPP_H15	ADR Timer Hold Off	RSMRST	This signal has a weak internal pull-up. 0 = ADR Timer Hold off is enabled. 1 = ADR Timer Hold off is not enabled. When sampled LOW, the ADR timer will not expire which prevents ADR_COMPLETE from asserting and keeps the Global Reset from occurring.
SPI_MISO_IO1	SPI Buffer voltage	rising edge of RSMRST#	If sampled low, then SPI buffer is set to 1.8V. If high, then the buffer is 3.3V.
GPP_H18_SML4ALERT_N_IE_N	RSVD	rising edge of RSMRST#	This pin has an internal pull-up. This strap needs to be sampled high during the rising edge of RSMRST#.
GPP_K7	RSVD	rising edge of RSMRST#	This pin has an internal pulldown. This strap needs to be sampled low during the rising edge of RSMRST#.
SPIO_MOSI_IO0	RSVD	rising edge of RSMRST#	This pin has an internal pull-up. This strap needs to be sampled high during the rising edge of RSMRST#.

Table 3-1. Functional Strap Definitions (Sheet 3 of 3)

Signal	Usage	When Sampled	Comment
GPP_B23_MEI-E_SML1AL-RT_N_PHOT_N	DCI Disable	rising edge of RSMRST#	This pin has an internal pulldown. This strap needs to be sampled low during the rising edge of RSMRST# in order to allow DCI to be enabled or disabled via soft straps or BIOS. If this strap is sampled high then DCI is disabled.
SPIO_IO_2	RSVD	rising edge of RSMRST#	This pin has an internal pull-up. This strap needs to be sampled high during the rising edge of RSMRST#.
SPIO_IO_3	RSVD	rising edge of RSMRST#	This pin has an internal pull-up. This strap needs to be sampled high during the rising edge of RSMRST#.

There are now 3 bits that encode where the Flash devices are located and where the BIOS is located. The table below can be used to understand how those encodings work.

Table 3-2. SPI Flash and BIOS Location

GPP_C5_SML0ALERT_IE# (eSPI or LPC Selection)	GPP_B22 (BIOS Location: SPI or eSPI/LPC)	GPP_H12_SML2ALART_IE# / (Master or Slave Attached Flash)	Configuration
0	**0**	**0**	BIOS and all SPI contents on SPI flash attached to PCH.
0	**0**	**1**	Invalid configuration ... not supported
0	**1**	**0**	BIOS is on LPC, the rest of the SPI contents are in a SPI Flash device attached to the PCH SPI bus.
0	**1**	**1**	Invalid configuration ... not supported
1	**0**	**0**	BIOS and all SPI contents on SPI flash attached to PCH.
1	**0**	**1**	BIOS and all SPI contents are on SPI flash attached to eSPI (same a 1,1,1).
1	**1**	**0**	BIOS is on eSPI, the rest of the SPI contents are in a SPI Flash device attached to the PCH SPI bus.
1	**1**	**1**	All content (BIOS, Intel ME, LAN, etc.) are on the eSPI bus, behind a BMC.

§

4 Electrical Characteristics

4.1 PCH Power Supply Range

Table 4-1. Voltage Ranges

Parameter	Nom	DC		AC		Total		Unit	Notes
		Min	Max	Min	Max	Min	Max		
VCCPGPPA, VCCPGPPB, VCCPGPPC, VCCPGPPD, VCCPGPPE, VCCPGPPF, VCCPGPPG, VCCPGPPH, VCCPGPPJ, VCCPGPPK; VCCPUSBDWS_3P3, VDDPDSW_3P3, VCCSPI VCCP_3P3, VCCPRTCPRIM_3P3	3.3	0.033	0.033	0.033	0.033	3.135	3.465	V	DC=± 1% AC= ±1% total = ±5%
VCCPGPPA, VCCPGPPB, VCCPGPPC, VCCPGPPD, VCCPGPPE, VCCPGPPF, VCCPGPPG, VCCPGPPH, VCCPGPPJ, VCCPGPPK; VCCP_1P8, VCCP10GBE_HV_1P8, VCCPGPP_1P8, VDDPHDA_1P8, VPSPI_1P8	1.8	0.018	0.018	0.018	0.018	1.71	1.89	V	DC=± 1% AC= ± 1% total = ± 5%
VCCA_CLKFILT_1P05, VCCA_CLKPLL_1P05, VCCA_CLKUNF_1P05, VCCA_CLKXTAL_1P05, VCCMPHY_1P05, VCCP_HSIOPLL_1P05, VCCP_UPPLL_1P05, VCCP10GBE_LV_1P05, VCCPRIM_1P05, VCCA_PLL0_1P05, VCCA_PLL1_1P05, VCCP_HSIOPLLUNF_1P05, VCCP_UPPLLUNF_1P05, VCCP10GBEPLL_1P05	1.05	0.00525	0.00525	0.00315	0.00315	1.0185	1.0815	V	DC=± 0.5% AC= ± 0.3% total = ± 3%
VCCPRIM_AVID	1.00	0.01	0.01	0.01	0.01	0.955	1.045	V	DC=± 1% AC= ± 1% total = ±4.5%
VCCPRIM_AVID	0.95	0.0095	0.0095	0.0095	0.0095	0.9072	0.99275	V	DC=± 1% AC= ± 1% total = ±4.5%
VCCPRIM_AVID	0.90	0.009	0.009	0.009	0.009	0.8595	0.9405	V	DC=± 1% AC= ± 1% total = ±4.5%
VCCPRIM_AVID	0.85	0.0085	0.0085	0.0085	0.0085	0.81175	0.88825	V	DC=± 1% AC= ± 1% total = ±4.5%
Notes: DC min/max is DC voltage offset from nominal. AC min/max is AC offset component to voltage. Total min/max is absolute maximum and minimum the voltage can be.									

Table 4-2. ICC Sx

Configuration 25C, Typical parts	Vcc_Avid	1.05V	1.8V	3.3V	3.3V_DSW
10GbE WOL enabled	1300 mA	400 mA	300 mA	10-200 mA	50 mA
10GbE WOL disabled	350 mA	60 mA	50 mA	10-200 mA	50 mA
Deep Sx	0 mA	0 mA	0 mA	0 mA	1 mA
G3	0 mA	0 mA	0 mA	0 mA	0 mA
Notes: Sx power is for a typical part at 25C. 3.3V variance is due to GPIO configuration.					

Table 4-3. Absolute Maximum Voltage Levels for Power Planes

Voltage Levels	Min Limit	Maximum Limit
Vccprim_Avid (0.85-1.0V) 1.05V	-0.5V	1.4V
1.8V	-0.5V	2.0V
3.3V	-0.7V	3.7V
Note: Max. overshoot and undershoot of I/O signals are listed in Section 4.5.		

4.2 General DC Characteristics

Table 4-4. Intel® C620 Series Chipset PCH Estimated I_{cc} (Maximum Configuration C627 and C629) (Sheet 1 of 2)

Voltage Rail	Voltage (V)	Published Performance Workload x16 Uplink Only		High Performance Workload, x24 Uplink Enabled	
		S0 Iccmax Current[3] (A)	S0 IccTDC (A)	S0 Iccmax Current[3] (A)	S0 IccTDC (A)

The *Intel*® C620 Series Chipset *PDG* has VCCP_3P3 as 0.6A and not 0.3A as it rolls all the other GPIOs up to the 3.3V rail, minus VCCPGPPA.

Table 4-11. Intel® C620 Series Chipset Real Time Clock Vcc and Icc

	G3 State	Deep Sleep	S5-S0
VccpRTC	2.0 to 3.2V	2.0 to 3.2V	2.6-3.2V
Icc	6 uA max	36 uA max	500 uA max

Notes: Icc G3 and Icc Deep Sleep is taken at 25 C temperature.
Icc G3 is taken with VccpRTC at 3.0V.

Table 4-12. DC Characteristics of Single Ended Signals (Sheet 1 of 5)

Type	Symbol	Parameter	Min	Max	Unit	Condition	Notes
Associated Signals: GPP_A0_RCIN_N_ESPI_ALERT1_N; GPP_A1_LAD0_ESPI_IO0; GPP_A2_LAD1_ESPI_IO1; GPP_A3_LAD2_ESPI_IO2; GPP_A4_LAD3_ESPI_IO3;GPP_A5_LFRAME_N_ESIP_CS0_N; GPP_A6_SERIRQ_ESPI_CS1_N; GPP_A7_PIRQA_N_ESPI_ALERT0_N; GPP_A8_CLKRUN_N; GPP_A9_CLKOUT_LPC0_ESPI_CLK; GPP_A10_CLKOUT_LPC1; GPP_A11_PME_N; GPP_A12_BMBUSY_N_SXEXITHLDOFF_N; GPP_A13_SWSWARN_N_SUSPWRDNACK; GPP_A14_ESPI_RESET_N; GPP_A15_SUSACK_N; GPP_A16_CLKOUT_LPC2;							
3.3V Operation							
Input	V_{IH}	Input High Voltage	0.625 x V_{CC} 0.5 x V_{CC}		V		1
	V_{IL}	Input Low Voltage		0.25x V_{CC} 0.3 x V_{CC}	V		2
	I_{IL}	Input Leakage Current	-15	15	µA		
	C_{IN}	Input Pin Capacitance		7	pF		
Output	V_{OH}	Output High Voltage	V_{CC} -0.45V		V	I_{oh}=3mA	
	V_{OL}	Output Low Voltage	0	0.45	V	I_{ol}=-3mA	
	R_{pu}	WPU Resistance	5K-30% 20K-30%	5K+30% 20K+30%			
	R_{pd}	WPD Resistance	5K-30% 20K-30%	5K+30% 20K+30%			

Table 4-12. DC Characteristics of Single Ended Signals (Sheet 2 of 5)

Type	Symbol	Parameter	Min	Max	Unit	Condition	Notes
1.8V Operation							
Input	V_{IH}	Input High Voltage	1.27		V		
	V_{IL}	Input Low Voltage		0.58	V		
	I_{IL}	Input Leakage Current	-15	15	µA		
	C_{IN}	Input Pin Capacitance		7	pF		
Output	V_{OH}	Output High Voltage	VCC-0.45		V	I_{oh}=3mA	
	V_{OL}	Output Low Voltage	0	0.45	V	I_{ol}=-3mA	
	R_{pu}	WPU Resistance	5K-30% 20K-30%	5K+30% 20K+30%			
	R_{pd}	WPD Resistance	5K-30% 20K-30%	5K+30% 20K+30%			
Notes: 1. The 0.625 is when set as GPIO, 0.5 is when configured as LPC. 2. The 0.25 is when configured as GPIO, 0.3 when configured as LPC.

1.05V Operation							
Input	V_{IH}	Input High Voltage	0.65 x V_{CC}		V		
	V_{IL}	Input Low Voltage		0.35x V_{CC}	V		
	I_{IL}	Input Leakage Current	-50	50	µA		
	C_{IN}	Input Pin Capacitance		5	pF		
Output	V_{OH}	Output High Voltage	V_{CC} -0.2V		V	I_{oh}=2mA	3
	V_{OL}	Output Low Voltage	0	0.2	V	I_{ol}=-3mA	3
	R_{pu}	WPU Resistance	5K-30% 20K-30%	5K+30% 20K+30%	R_{pu}		
	R_{pd}	WPD Resistance	5K-30% 20K-30%	5K+30% 20K+30%	R_{pd}		
Notes: 1. The V_{OH} specification does not apply to open-collector or open-drain drivers. Signals of this type must have an external pull-up resistor, and that is what determines the high-output voltage level. 2. Input characteristics apply when a signal is configured as Input or to signals that are only Inputs. Output characteristics apply when a signal is configured as an Output or to signals that are only Outputs. 3. For JTAGX, I_{oh}=8mA and I_{ol}=-12 mA							
Associated Signals: INTRUDER_N, RSMRST_N, PCH_PWROK, DSW_PWROK, SRTCRST_N, RTCRST_N							
Input	V_{IH}	Input High Voltage	0.65 x V_{CCRTC}	V_{CCRTC}+0.5	V		4, 6
	V_{IL}	Input Low Voltage	-0.5	0.3 x V_{CCRTC}	V		6
Notes: 1. The V_{OH} specification does not apply to open-collector or open-drain drivers. Signals of this type must have an external pull-up resistor, and that is what determines the high-output voltage level. 2. Input characteristics apply when a signal is configured as Input or to signals that are only Inputs. Output characteristics apply when a signal is configured as an Output or to signals that are only Outputs. 3. V_{CCRTC} is the voltage applied to the V_{CCRTC} well of the PCH. When the system is in G3 state, it is generally supplied by the coin cell battery. In S5 or greater state, it is supplied by VCCSUS3_3. 4. V_{IH} min should not be used as the reference point for T200 timing. See T200 specification for the measurement point detail. 5. These buffers have input hysteresis. V_{IH} levels are for rising edge transitions and V_{IL} levels are for falling edge transitions.

	V_{Cross_Delta}	Variation of VCROSS	—	140	mV		11,13,17
	V_{Max}	Max Output Voltage	—	1.15	V		11,15
	V_{Min}	Min Output Voltage	-0.3	—	V		11,16

Notes:
1. PCI Express mVdiff p-p = 2*|PCIE[x]_TXP – PCIE[x]_TXN|; PCI Express mVdiff p-p = 2*|CIE[x]_RXP – PCIE[x]_RXN|
2. SATA Vdiff, RX (V_{IMAX}/V_{IMIN}) is measured at the SATA connector on the receiver side (generally, the motherboard connector), where SATA mVdiff p-p = 2*|SATA[x]RXP – SATA[x]RXN|.
3. SATA Vdiff, tx (V_{OMIN}/V_{OMAX}) is measured at the SATA connector on the transmit side (generally, the motherboard connector), where SATA mVdiff p-p = 2*|SATA[x]TXP – SATA[x]TXN|
4. V_{DI} = | USBPx[P] – USBPx[N] |
5. Includes VDI range.
6. Applies to low-speed/full-speed USB.
7. Applies to high-speed USB 2.0.
8. USB 3.0 mVdiff p-p = 2*|USB3Rp[x] – USB3Rn[x]|; USB 3.0 mVdiff p-p = 2*|USB3Tp[x] – USB3Tn[x]|
9. For PCIe, GEN1, GEN and GEN3 correspond to the PCIe base specification revision 1, 2 and 3.
10. PCIe specifications are also applicable to the LAN port.
11. Measurement taken from single-ended waveform on a component test board
12. Measurement taken from differential waveform on a component test board
13. V_{Cross} is defined as the voltage where Clock = Clock#.
14. Only applies to the differential rising edge (that is, Clock rising and Clock# falling).
15. The max voltage including overshoot
16. The min voltage including undershoot
17. The total variation of all V_{Cross} measurements in any particular system. Note that this is a subset of V_{Cross} MIN/MAX (V_{Cross} absolute) allowed. The intent is to limit V_{Cross} induced modulation by setting V_{Cross_Delta} to be smaller than V_{Cross} absolute.

4.3 AC Characteristics

Table 4-14. PCI Express* Interface Timings (Sheet 1 of 2)

Symbol	Parameter	Min	Max	Unit	Figures	Notes
Transmitter and Receiver Timings						
UI (Gen1)	Unit Interval – PCI Express*	399.88	400.12	ps		5
UI (Gen 2)	Unit Interval – PCI Express	199.9	200.1	ps		5
UI (GEN3)	Unit Interval – PCI Express	124.96	125.03	ps		
T_{TX-EYE} (Gen 1 / Gen 2)	Minimum Transmission Eye Width	0.7	—	UI	4-1	1,2
$T_{TX-RISE/Fall}$ (Gen 1)	D+/D- TX Out put Rise/Fall time	0.125	—	UI		1,2

Table 4-14. PCI Express* Interface Timings (Sheet 2 of 2)

Symbol	Parameter	Min	Max	Unit	Figures	Notes
Transmitter and Receiver Timings						
$T_{TX-RISE/Fall}$ (Gen 2)	D+/D- TX Out put Rise/Fall time	0.15	—	UI		1,2
$T_{TX-RISE/Fall}$ (Gen 3)	D+/D- TX Out put Rise/Fall time	0.15	—	UI		
T_{RX-EYE} (Gen 1 / Gen 2)	Minimum Receiver Eye Width	0.40	—	UI	4-2	3,4
$T_{Min-Pulse}$ (Gen 2)	Instantaneous lone Pulse Width	0.9	—	UI		
$T_{Min-Pulse}$ (Gen 3)	Instantaneous lone Pulse Width	0.91	—	UI		

Notes:
1. Specified at the measurement point into a timing and voltage compliance test load and measured over any 250 consecutive TX UIs. (Also refer to the transmitter compliance eye diagram.)
2. A T_{TX-EYE} = 0.70 UI provides for a total sum of deterministic and random jitter budget of $T_{TXJITTER-MAX}$ = 0.30 UI for the Transmitter collected over any 250 consecutive TX UIs. The $T_{TXEYE-MEDIAN-to-MAX-JITTER}$ specification ensures a jitter distribution in which the median and the maximum deviation from the median is less than half of the total TX jitter budget collected over any 250 consecutive TX UIs. It should be noted that the median is not the same as the mean. The jitter median describes the point in time where the number of jitter points on either side is approximately equal as opposed to the averaged time value.
3. Specified at the measurement point and measured over any 250 consecutive UIs. The test load documented in the PCI Express specification 2.0 should be used as the RX device when taking measurements (also refer to the Receiver compliance eye diagram). If the clocks to the RX and TX are not derived from the same reference clock, the TX UI recovered from 3500 consecutive UI must be used as a reference for the eye diagram.
4. A T_{RX-EYE} = 0.40 UI provides for a total sum of 0.60 UI deterministic and random jitter budget for the Transmitter and interconnect collected any 250 consecutive UIs. The $T_{RX-EYE-MEDIAN-to--MAX-JITTER}$ specification ensures a jitter distribution in which the median and the maximum deviation from the median is less than half of the total 0.6 UI jitter budget collected over any 250 consecutive TX UIs. It should be noted that the median is not the same as the mean. The jitter median describes the point in time where the number of jitter points on either side is approximately equal as opposed to the averaged time value. If the clocks to the RX and TX are not derived from the same reference clock, the TX UI recovered from 3500 consecutive UI must be used as the reference for the eye diagram.
5. Nominal Unit Interval is 400 ps for 2.5 GT/s and 200 ps for 5 GT/s.

Suspend Clock (SUSCLK)						
f_{susclk}	Operating Frequency	32		kHz	4	
t39	High Time	9.5	—	µs	4	
t39a	Low Time	9.5	—	µs	4	

1. N/A.
2. The maximum high time (t18 Max) provide a simple ensured method for devices to detect bus idle conditions.
3. BCLK Rise and Fall times are measured from 10% VDD and 90% VDD.
4. SUSCLK duty cycle can range from 30% minimum to 70% maximum.
5. Edge rates in a system as measured from 0.8 – 2.0V.
6. The active frequency can be 5 MHz, 50 MHz, or 62.5 MHz depending on the interface speed. Dynamic changes of the normal operating frequency are not allowed.
7. Testing condition: 1 kΩ pull-up to Vcc, 1 kΩ pull-down and 10 pF pull-down and 1/2 inch trace.
8. Jitter is specified as cycle-to-cycle as measured between two rising edges of the clock being characterized. Period min and max includes cycle-to-cycle jitter and is also measured between two rising edges of the clock being characterized.
9. On all jitter measurements care should be taken to set the zero crossing voltage (for rising edge) of the clock to be the point where the edge rate is the fastest. Using a Math function = Average(Derivative(Ch1)) and set the averages to 64, place the cursors where the slope is the highest on the rising edge—usually this lower half of the rising edge. The reason this is defined is for users trying to measure in a system it is impossible to get the probe exactly at the end of the Transmission line with large Flip-Chip components. This results in a reflection induced ledge in the middle of the rising edge and will significantly increase measured jitter.
10. Phase jitter requirement: The designated outputs will meet the reference clock jitter requirements from the *PCI Express Base Specification*. The test is to be performed on a component test board under quiet conditions with all clock outputs on. Jitter analysis is performed using a standardized tool provided by the PCI SIG. Measurement methodology is defined in the Intel document *PCI Express Reference Clock Jitter Measurements.*
11. For LPC, slew rate measurements are done at 20% and 60%
12. Testing condition: 1 kW pull-up to Vcc, 1 kW pull-down and 10 pF pull-down and 1/2 inch trace (see Figure 6-54 for more detail).
13. Total of crystal cut accuracy, frequency variations due to temperature, parasitics, load capacitance variations, and aging is recommended to be less than 90 ppm.
14. Spread Spectrum (SSC) is referenced to rising edge of the clock.
15. When SMLink0 is configured to run in Fast Mode (FM) using soft strap, the supported operating range is 0 kHz ~ 400 kHz, but the typical operating frequency is in the range of 300 kHz – 400 kHz.
16. When SMLink0 is configured to run in Fast Mode Plus (FMP) using a soft strap, the supported operating range is 0 Hz ~ 1 MHz, but the typical operating frequency is in the range of 900 kHz – 1000 KHz. This is the default mode for this interface.
17. Test load: 10 pF to ground.Measured at 0.2 * Vcc - 0.8 * Vcc.
18. Spec is for jitter at pins of PCH. See section 4.4, PCIe Gen4 clock RMS jitter measurements.
19. Using 48Mhz Xtal that meets PDG specification of +/- 30ppm

Note: Refer to PCI Local Bus Specification for measurement details.

Figure 4-3. Clock Timing

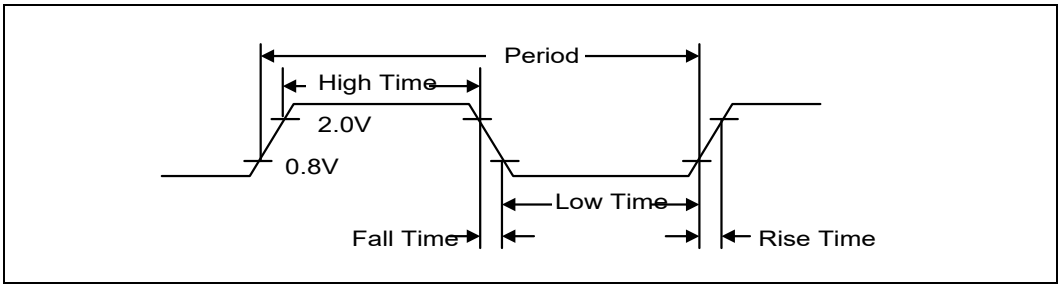

Figure 4-4. SMBus/SMLink Transaction

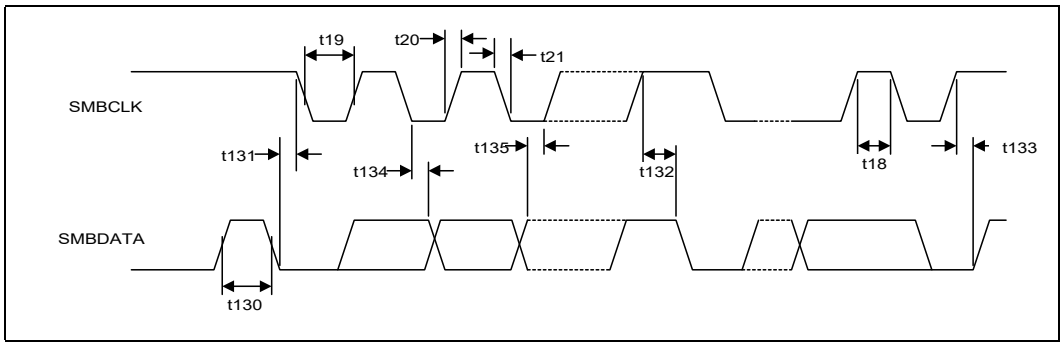

Note: The t*xx* also refers to t*xx*_SMLFM and txx_SMLFMP, t*xxx* also refers to t*xxx*SMLFM and txx_SMLFMP, SMBCLK also refers to SML[4:0]CLK, and SMBDATA also refers to SML[4:0]DATA.

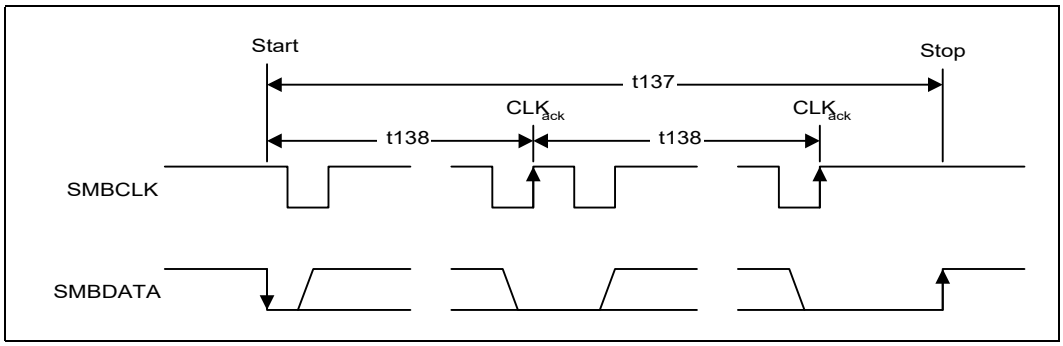
t135SMLFM	Data Setup Time	100	—	ns	5	4-5
t135SMLFMP	Data Setup Time	50	—	ns	5	4-5
t136	Device Time Out	25	35	ms	1	
t137	Cumulative Clock Low Extend Time (slave device)	—	25	ms	2	4-9
t138	Cumulative Clock Low Extend Time (master device)	—	10	ms	3	4-9
T_{por}	Time in which a device must be operational after power-on reset	—	500	ms		

Notes:
1. A device will timeout when any clock low exceeds this value.
2. t137 is the cumulative time a slave device is allowed to extend the clock cycles in one message from the initial start to stop. If a slave device exceeds this time, it is expected to release both its clock and data lines and reset itself.
3. t138 is the cumulative time a master device is allowed to extend its clock cycles within each byte of a message as defined from start-to-ack, ack-to-ack, or ack-to-stop.
4. t134 has a minimum timing for I^2C of 0 ns, while the minimum timing for SMBus/SMLINK is 300 ns.
5. Timings with the SMLFM designator apply only to SMLink0 and only when SMLink0 is operating in Fast Mode. SMLFP is forFast Mode Plus.

Figure 4-9. SMBus/SMLink Timeout



Note: SMBCLK also refers to SML[1:0]CLK and SMBDATA also refers to SML[1:0]DATA in Figure 4-4.

4.4 PCIe* 4.0 Clock RMS Jitter Measurement

Testing for clock jitter on the PCIe source clocks has become more difficult due to the nature of the extremely small jitter that is allowed. The jitter spec. listed in Table 4-15, "Intel® C620 Series Chipset Clock Timings" is the jitter at the pins of the PCH. That can prove to be difficult, so often times the jitter measurement is taken at the destination of the clocks.

Adding to the difficulty in measuring jitter with 0.5 ps or less are the inherent errors in the equipment taking the measurements. If using a digital scope, Intel has observed that the equipment can add more than 0.1 ps of jitter to the measurement, which is a very large percentage of the 0.5 ps spec. if not accounted for.

4.5 Overshoot/Undershoot Guidelines

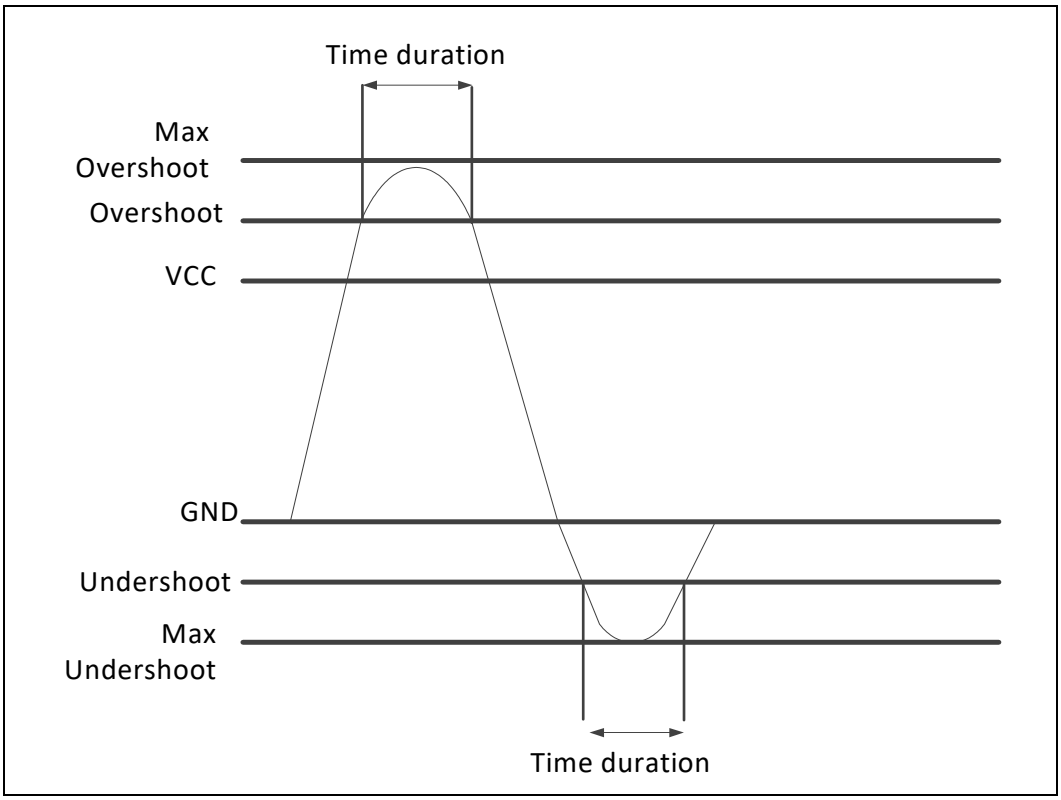
Overshoot (or undershoot) is the absolute value of the maximum voltage above VCC or below VSS. The PCH can be damaged by single and/or repeated overshoot or undershoot events on any input, output, or I/O buffer if the charge is large enough. Baseboard designs that meet signal integrity and timing requirements and that do not exceed the maximum overshoot or undershoot limits listed in the following table ensures reliable I/O performance for the lifetime of the PCH.

Table 4-29. Overshoot/Undershoot Specifications

I/O	Max Overshoot	Time Duration	Overshoot	Time Duration	Under Shoot	Time Duration	Max Under Shoot	Time Duration
3.3V I/O	4.515V	0 ns	3.75V	5 ns	-0.3V	5 ns	-1.13V	0 ns
1.8V I/O	2.48	0 ns	2.16	2.5 ns	-0.3V	2.5 ns	-0.62	0 ns
1.05V	1.48V	0 ns	1.25V	2.5 ns	-0.25V	2.5 ns	-0.48V	0 ns

Notes:
1. These specifications are measured at the PCH pin.

Figure 4-24. Maximum Acceptable Overshoot/Undershoot Waveform

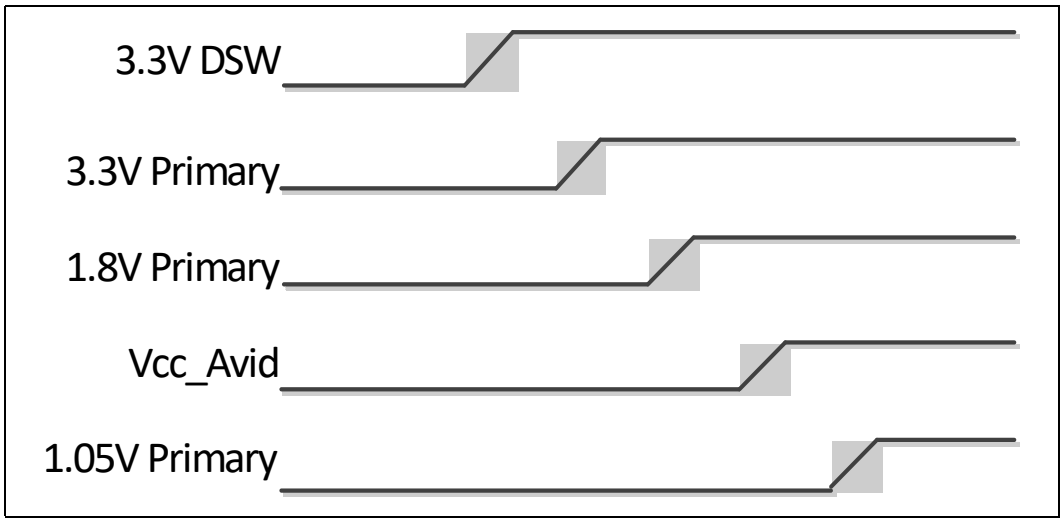


4.6 Single Ended I/O Initial Power Up

The Intel® C620 Series Chipset Single Ended I/Os (SEIO) can be powered by multiple power rails. One set can be powered by either 3.3V primary or 1.8V primary. One set can only be powered by 3.3V Deep Sleep Well (DSW), and the final group is powered by 1.05V primary. When the power rails come up, it is possible to have pulses on the outputs of these SEIOs with the exception of the 1.05V power SEIOs as described below.

The order the power wells ramp up is shown in the following figure. If the deep sleep well operation is not supported, then the 3.3V DSW and 3.3V primary wells will be tied together.

Figure 4-25. Intel® C620 Series Chipset Power Supply Ramp Order



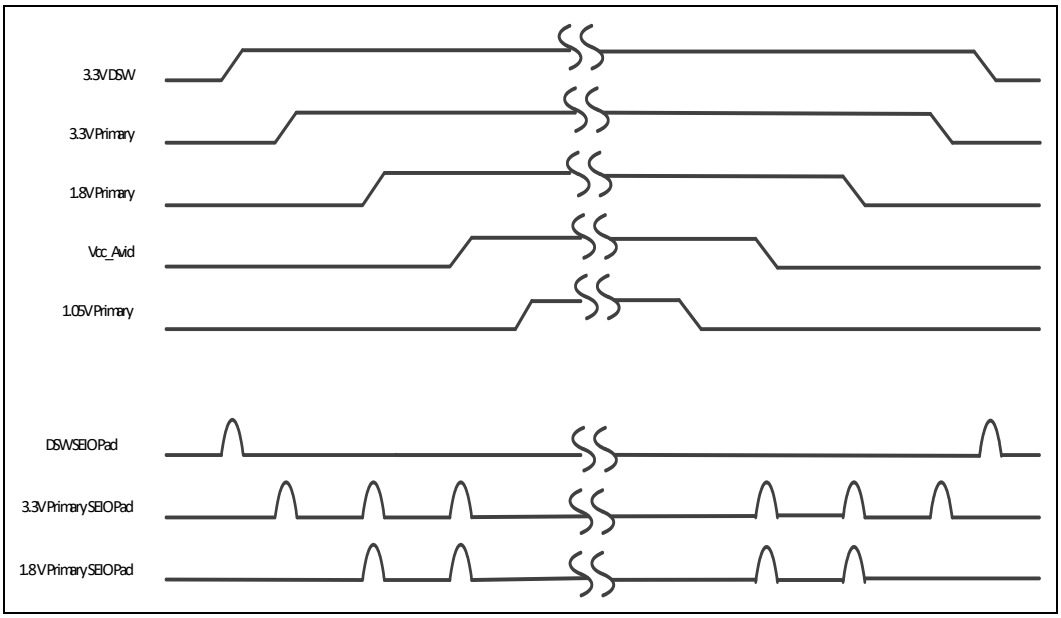
As the 3.3V DSW, 3.3V primary, 1.8V primary, and Vcc_AVID voltages power up, the SEIOs, whose I/O buffers are powered by these voltages, can see pulses on those pins as the power rails ramp. Those SEIO whose output voltage is powered by 1.05V primary (GPP_L pins, P_RDY, etc.) will not have any glitches on them as all other voltages are already up and running by the time the 1.05V I/O rail powers up.

The diagram below shows how the power up looks for those pins with pull downs on them by default (which is the vast majority). The 3.3V DSW powered SEIOs will see a pulse at the ramp of 3.3V DSW, but no further pulses will occur during the power up. At power down, when 3.3V DSW goes low, there can be a pulse on the outputs at that time, too.

The SEIOs powered, whose I/O are powered by 3.3V, can see three distinct pulses. At 3.3V ramp, there will be a pulse on the I/O. After the pulse, the SEIO is defined to be in the 'deterministic' phase, where a 20K pull-down is engaged. When 1.8V ramps, there will be a second pulse on the output, before returning to the deterministic phase. Finally, when Vcc_AVID ramps, there is a final pulse before the I/O moves to it's default initial state. At that time, most SEIOs are GPI, which would results in the pins being non-driven and thus the state of the pad will be determined by the external connection. See chapter 16 for the initial state of the GPIOS.

GPIOs powered by 1.8 will have the same pulses during the ramp of 1.8V and Vcc_AVID, but no pulses when 3.3V powers up as the I/O is unpowered at that time. The deterministic state for these GPIOS

Figure 4-26. SEIO Pulses on Power Up



Pulse duration can vary based upon the ramp time of the voltages, and individual components. The numbers given below are assuming worst case with a voltage ramp of 0.5V/msec or faster. It is possible that no pulses could be observed at all in some case. For the maximum voltage of the pulse could be as high as the voltage rail powering the I/O (3.3V or 1.8V).

3.3V pulse width up to 15 msec

1.8V pulse width up to 0.5 msec

Vcc_AVID pulse width up to 100 usec

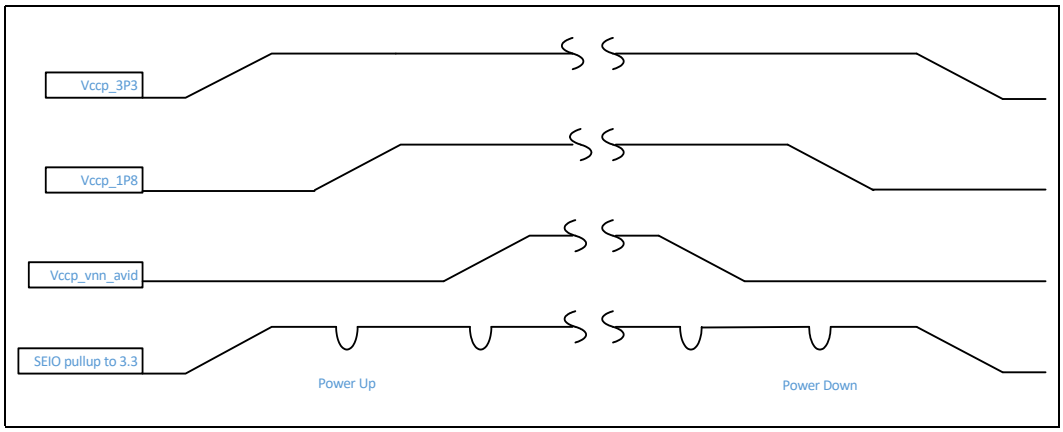
Two SEIO pins have pullups on them by default .. GPP_B0_VID0 and GPP_B1_VID1. The reason these pins have pullups on them is that they supply the Voltage ID (VID) for the power supply that provides Vcc_AVID. By default, all C620 series chipsets can operate at 1V (VID1,VID0 = 11b), so the default is to have VID0 and VID1 = 11b during initial power up. These pins are powered by 3.3V on the I/O. The same kind of glitches can occur on these pins, but instead of low going high, these are high going low glitches. The timings for these glitches are the same as the low-to-high glitches, and it’s possible for the high-to-low glitches to reach ground.

The pulse widths are specified to be the same going low as going high.

1.8V pulse width up to 0.5 msec

Vcc_AVID pulse width up to 100 usec

Figure 4-27. Power-up Glitches on GPIOs with Pull-up Resistors



4.7 Power Sequencing and Reset Signal Timings

Figure 4-28. Power Ramp with DSX Support

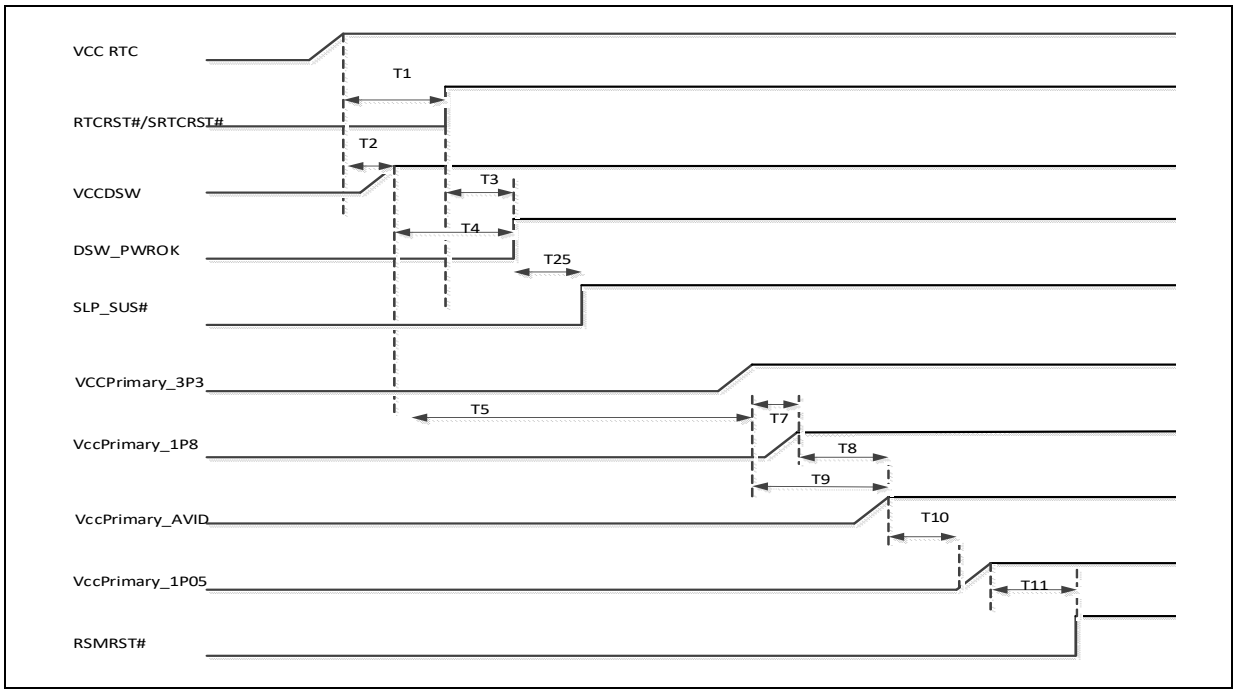


Table 4-30. Power Ramp with DSX Support (Sheet 1 of 2)

Symbol	Description	Min	Max	Unit	Comments
T1	VccRTC = 2.0V to the point in time where the voltage on the RTC resets equal 0.65 times the voltage present on the VccRTC rail during ramp. This measurement should be made from when VccRTC = 2.0V to the first of RTCRST# or SRTCRST# reaching 0.65*VccRTC.	9		ms	

Table 4-30. Power Ramp with DSX Support (Sheet 2 of 2)

Symbol	Description	Min	Max	Unit	Comments
T2	VccRTC at 95% to VccDSW at 95%	9		ms	
T3	RTCRST# to DSW_PWROK	1		ms	
T4	VccDSW at 95% to DSW_PWROK	10		ms	
T5	VccDSW at 95% to VccPRIMARY at 95%	0		ms	No lead needed between VccDSW and 1st primary power rail coming up.
T7	VccPrimary_3P3 to VccPrimary_1P8 at 95%		No limit		
T8	VccPrimary_1P8 at 95% to VccPrimary_AVID at 95%	0		ms	Preference to lead AVID
T9	VccPrimary_3P3 at 95% to VccPrimary_AVID at 95%	0		ms	Preference to lead AVID
T10	VccPrimary_AVID at 95% to Vccprimary_1P05 at 95%	0			VccPrimary_AVID is not to lag VccPrimary_1P05.
T11	VccPrimary_1P05 to RSMRST# high	10		ms	
T25	DSW_PWROK to SLP_SUS#		100	ms	

Note: T25 shows the maximum time for the case on initial boot when RTC power is first applied. It is possible to add up to 4 secs on this if BIOS programs SLP stretching. If the BIOS does not, then any G3 to S5 will always have the same 100 ms maximum time. If the BIOS does add SLP stretching, then T25 will be the new stretched value (100 ms + stretch time) going down into G3 and then back up until RTCRST# is brought low to clear the RTC registers and go back to the default timing.

Figure 4-29. Power Ramp Without DSX Support

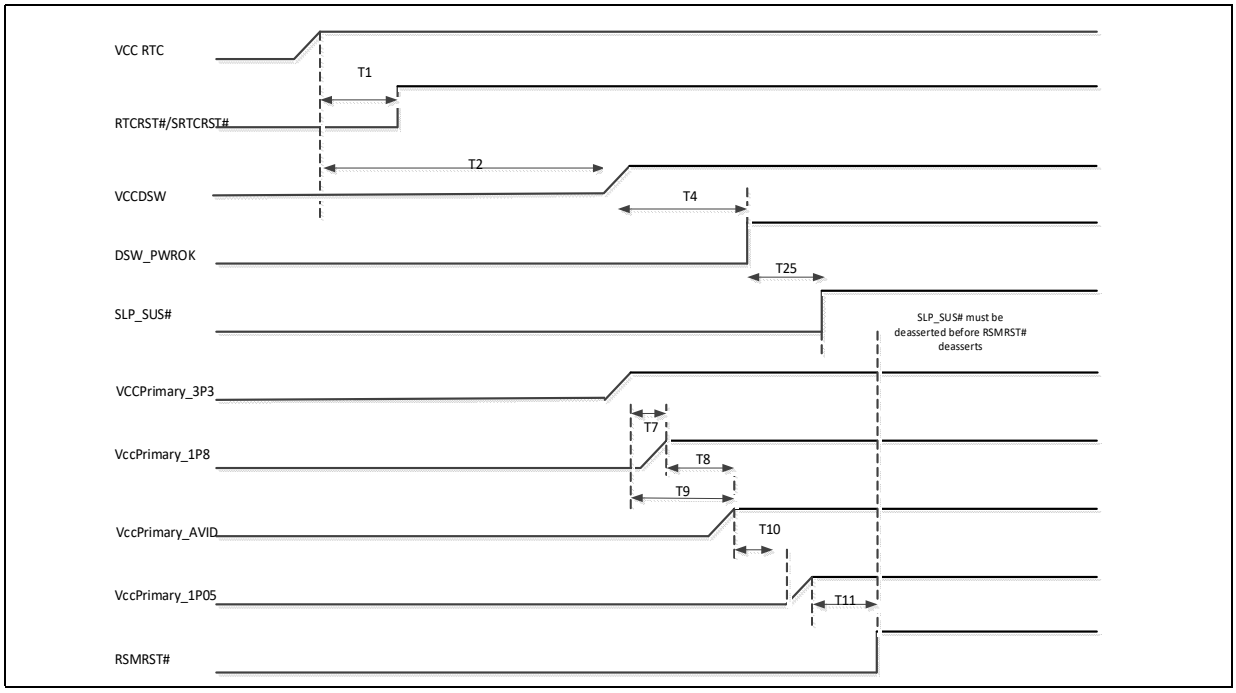

Table 4-31. Power Ramp Without DSX Support

Symbol	Description	Min	Max	Unit	Comments
T1	VccRTC = 2.0V to the point in time where the voltage on the RTC resets equal 0.65 times the voltage present on the VccRTC rail during ramp. This measurement should be made from when VccRTC = 2.0V to the first of RTCRST# or SRTCRST# reaching 0.65*VccRTC.	9		ms	
T2	VccRTC at 95% to VccDSW at 95%	9		ms

T11	VccPrimary_1P05 to RSMRST# high	10		ms	
T25	DSW_PWROK to SLP_SUS#		100	ms	

Note: T25 shows the maximum time for the case on initial boot when RTC power is first applied. It is possible to add up to 4 secs on this if BIOS programs SLP stretching. If the BIOS does not, then any G3 to S5 will always have the same 100 ms max time. If the BIOS does add SLP stretching, then T25 will be the new stretched value (100 ms + stretch time) going down into G3 and then back up until RTCRST# is brought low to clear the RTC registers and go back to the default timing.

Figure 4-30. SLP_S5# High to PLTRST# High

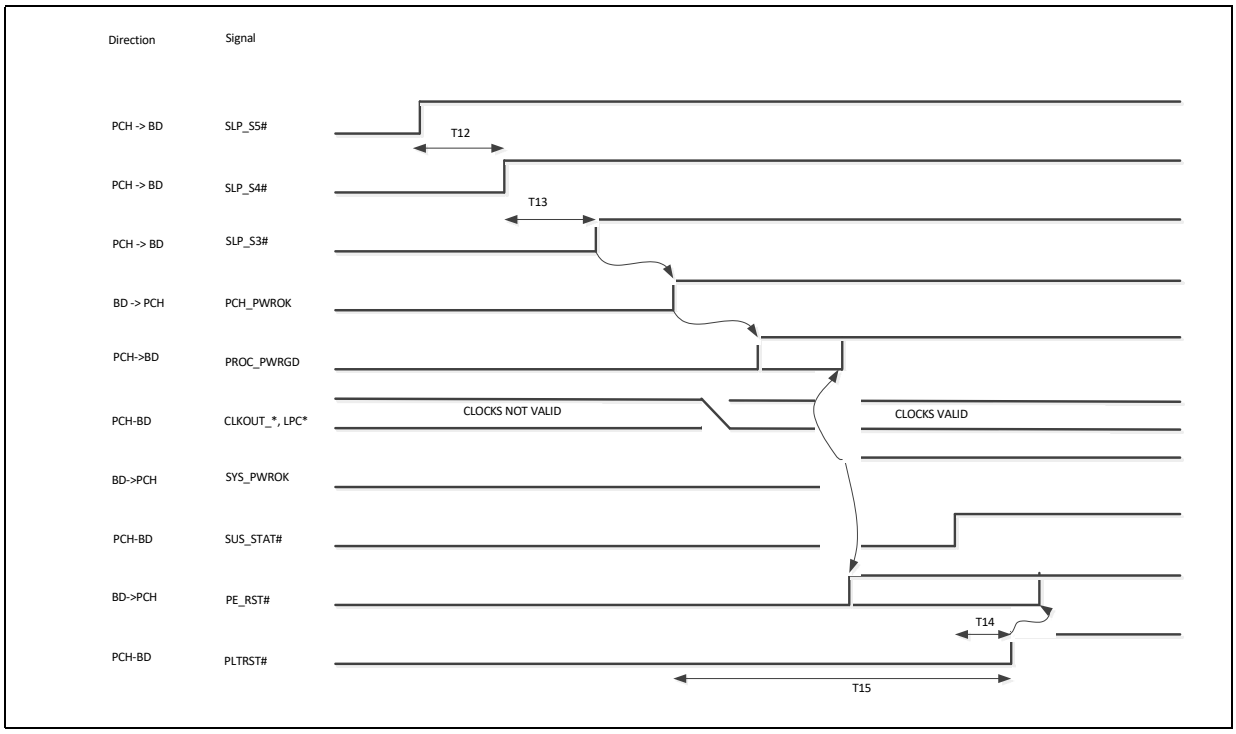

Table 4-32. SLP_S5# High to PLTRST# High

Symbol	Description	Min	Max	Unit	Comments
T12	SLP_S5# high to SLP_S4#	30		us	
T13	SLP_S4# high to SLP_S3#	30		us	
T15	PCH_PWROK# high to PLTRST# high	99		ms	
Note:	PROC_PWRGD may wait until SYS_PWROK goes high if selected by soft strap. See the appropriate Platform Design Guide to the platform requirements here.				
Note:	Board can drive PE_RST# high either with PROC_PWRGD or with PLTRST#. See the appropriate Platform Design Guide to the platform requirements here.				

Figure 4-31. S0 to S5

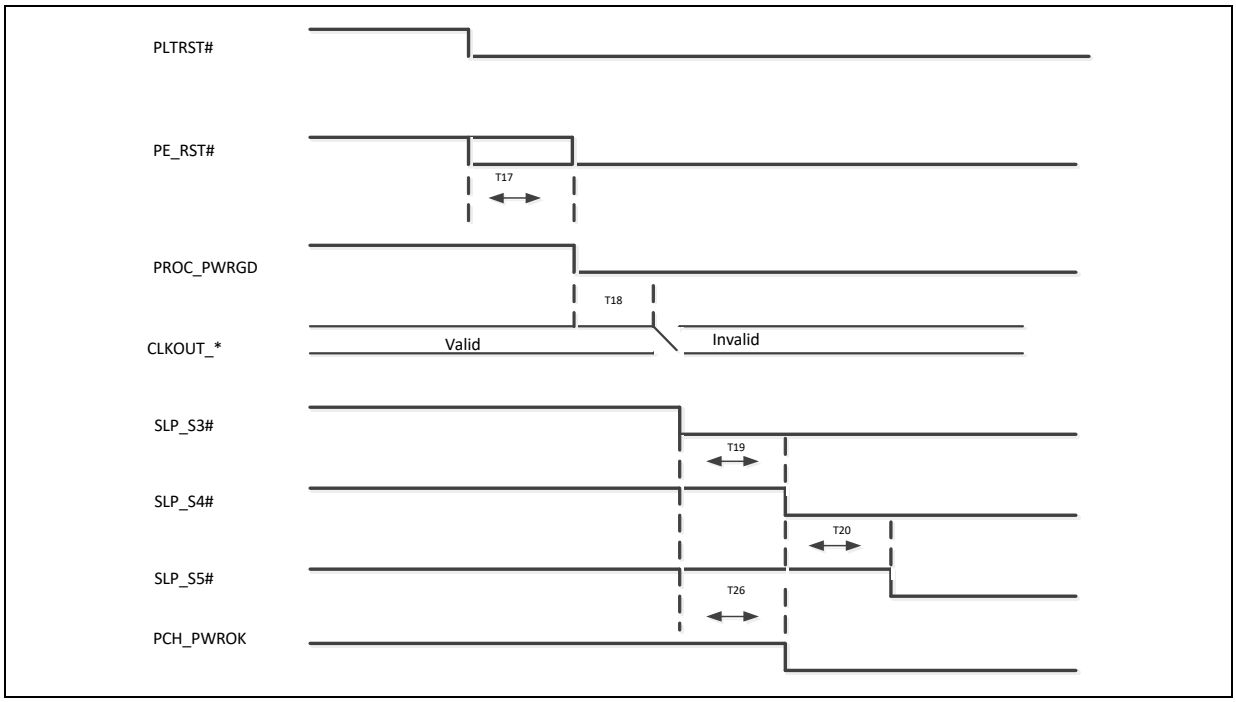

Table 4-33. S0 to S5

Symbol	Description	Min	Max	Unit	Comments
T17	PLTRST# low to PROC_PWRGD low	30		us	
T18	PROC_PWRGD to Clock invalid	10		us	Programmable. See Note below
T19	SLP_S3# to SLP_S4#	30		us	
T20	SLP_S4# to _SLP_S5#	30		us	
T26	SLP_S3# to PCH_PWROK low	0		ns	

Notes: PROC_PWRGD may wait until SYS_PWROK goes high if selected by soft strap. See the appropriate Platform Design Guide to the platform requirements here.
Board can drive PE_RST# high either with PROC_PWRGD or with PLTRST#. See the appropriate Platform Design Guide to the platform requirements here.
PCH_PWROK can go low before or after SLP_S4# and SLP_S5#.
Default for T18 is 10 usec, which is the minimum time. When the PCH is used in Endpoint Only (EPO) mode, the EPO PCH requires that its 100Mhz differential reference input clock remain active for 10ms after PE_RST# goes active on the EPO PCH. If the timing requirement is not met and power isn't subsequently removed from the EPO PCH, a global reset will occur on the EPO PCH. If the boot PCH on the host platform is an Intel® C620 Series Chipset PCH that is using internal or platform hybrid clocking mode, this timing requirement can be met by setting the host boot PCH timing T18 to 10 ms. This is programmed via the host platform boot CPH power management configuration register 1 (PM_CFG) at offset 18h.

Figure 4-32. Powerdown to DeepSX

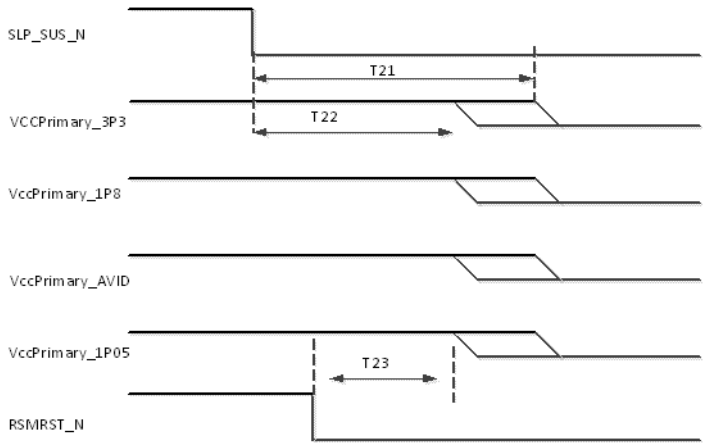

Table 4-34. Powerdown to DeepSX

Symbol	Description	Min	Max	Unit	Comments
T21	SLP_SUS_N low to All Primary rails low		100	ms	
T22	SLP_SUS_N dropping to Primary rails dropping	100		ns	
T23	RSMRST_N dropping to Primary rails dropping	1		us	
Note: There is no relationship that the power rails have to have with each other when going low.					

Figure 4-33. Surprise Powerdown to G3

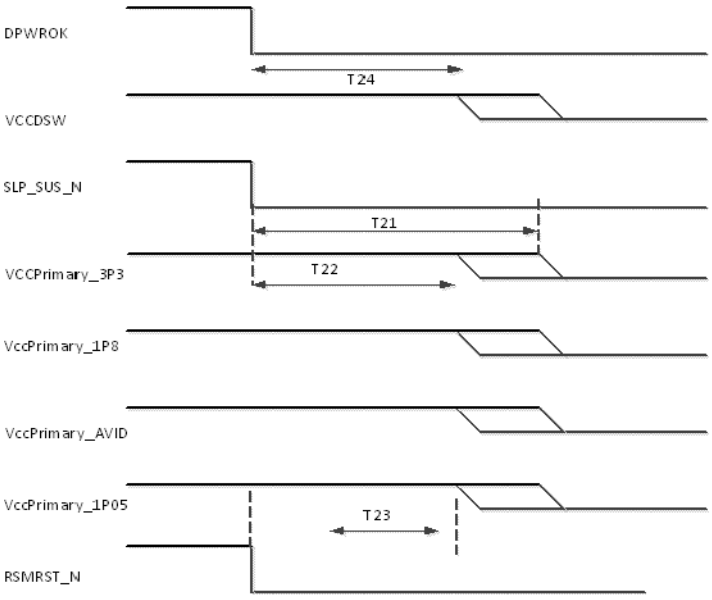

Table 4-35. Surprise Powerdown to G3

Symbol	Description	Min	Max	Unit	Comments
T21	SLP_SUS_N low to All Primary rails low		100	ms	
T22	SLP_SUS_N dropping to Primary rails dropping	100		ns	
T23	RSMRST_N dropping to Primary rails dropping	1		us	
T24	DSW_PWROK dropping before VCCDSW and the VccPRIMARY rail	1		us	See notes
Notes: There is no relationship that the power rails have to have with each other when going low. DSW_PWROK deassertion causes the PCH to internally reset and isolate all shallower wells. As long as T24 is met, T22 and T23 can be violated.					

Figure 4-34. eSPI Reset

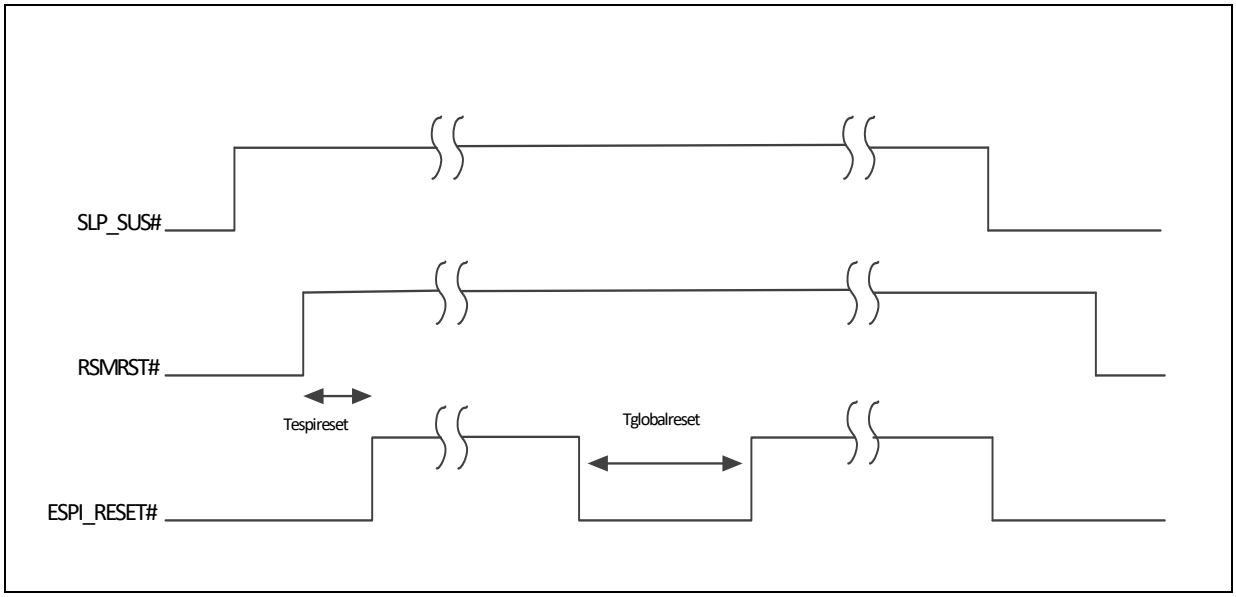

Table 4-36. eSPI Reset from G3

Symbol	Description	Min	Max	Unit	Comments
Tespireset	RSMRST# high to ESPI_RESET# high	800		usec	See note
Tgloblareset	ESPI_RESET# low during a global reset	100		usec	
Note: The Intel® C620 Series Chipset requirements are that RSMRST# goes high after SLP_SUS#, so there is no difference between leaving G3 or DEEP_SX.					

§

5 Power and Ground Signals

This section describes the power rails and ground signals on the PCH.

Name	Description
VCCA_CLKFILT_1P05	Clock filtered supply
VCCA_CLKUNF_1p05	Unfiltered clock supply
VCCA_CLKXTAL_1P05	Filtered supply for 48 MHz main crystal
VCCA_PLL0_1P05	Filtered supply to PLL
VCCA_PLL1_1P05	Filtered supply to PLL
VCCMPHY_1p05	Supply for PCIe, DMI, USB3 and SATA PHYs
VCCP_1P8	1.8 volt supply
VCCP_3p3	Use for fuses, HVCMOS and Group I primary power well
VCCP_HSIOPLL_1P05	Supply for PCIe, SATA PLL
VCCP_HSIOPLLUNF_1P05	Unfiltered supply for PCIe, SATA PLLs
VCCP_UPPLL_1P05	Supply for PCIe Uplink and DMI PLL
VCCP_UPPLLUNF_1P05	Unfiltered supply for PCIe Uplink and DMI PLL
VCCP10GBE_HV_1p8	1.8V supply for 10GbE
VCCP10GBE_LV_1p05	Main power for 10GbE LAN
VCCP10GBEPLL_1P05	Power for 10GbE LAN PLL
VCCPDSW_3p3	Deep Sleep well 3.3V supply
VCCPGPP_1P8	1.8 volt supply for GPIO groups A/B/C/D/E/F/G H/J/K
VCCPGPPA	Switchable 1.8/3.3 volt power well for GPPA
VCCPGPPB	Switchable 1.8/3.3 volt power well for GPPB
VCCPGPPC	Switchable 1.8/3.3 volt power well for GPPC
VCCPGPPD	Switchable 1.8/3.3 volt power well for GPPD
VCCPGPPE	Switchable 1.8/3.3 volt power well for GPPE
VCCPGPPF	Switchable 1.8/3.3 volt power well for GPPF
VCCPGPPG	Switchable 1.8/3.3 volt power well for GPPG
VCCPGPPH	Switchable 1.8/3.3 volt power well for GPPH
VCCPGPPJ	Switchable 1.8/3.3 volt power well for GPPJ
VCCPGPPK	Switchable 1.8/3.3 volt power well for GPPK
VCCPHDA_1p8	1.8V supply for the High Def Audio
VCCPRIM_1P05	Primary power, 1.05V
VCCPRIM_Avid	Primary power, AVID rail, varies from 0.85 to 1.0V
VCCPRTC	**RTC Well Supply.** This rail can drop to 2.0V if all other planes are off. This power is not expected to be shut off unless the RTC battery is removed or drained. VCCRTC nominal voltage is 3.0V. This rail is intended to always come up first and always stay on. It should NOT be power cycled regularly on non-coin battery designs.
VCCPRTCPRIM_3p3	Power to RTC well logic. This will be off in Deep Sleep mode.
VCCPSPI_1P8	1.8 volts to SPI periphery
VCCPUSBDSW_3P3	Deep sleep well 3.3V supply for I/O

Name	Description
VCCRTCEXT	RTC de-coupling capacitor only. This rail should NOT be driven.
VCCPSPI	Power for SPI periphery. Switchable between 3.3 and 1.8V.
VSS	Ground
CGC_DUT_DETECT_N	Package orientation detect

Note: CGC_DUT_DETECT_N, while connected to ground on the package, is not used as a ground return pin. This pin is used for helping in insuring that the Intel C620 chip is correctly oriented. If this pad location is pulled up to some reference voltage, when the PCH is correctly oriented on the package this signal will be pulled to ground. If the orientation is off, then there will not be a ball on the package at this location to connect with the socket, resulting in this signal being high.

§

6 Flexible I/O

6.1 Acronyms

Acronyms	Description
HSIO	High Speed I/O lanes
SSATA	Server Serial Advanced Technology Transport
SATA	Serial Advanced Technology Transport
PCIe	PCI Express
USB	Universal Serial Bus
GbE	Gigabit Ethernet

6.2 Overview

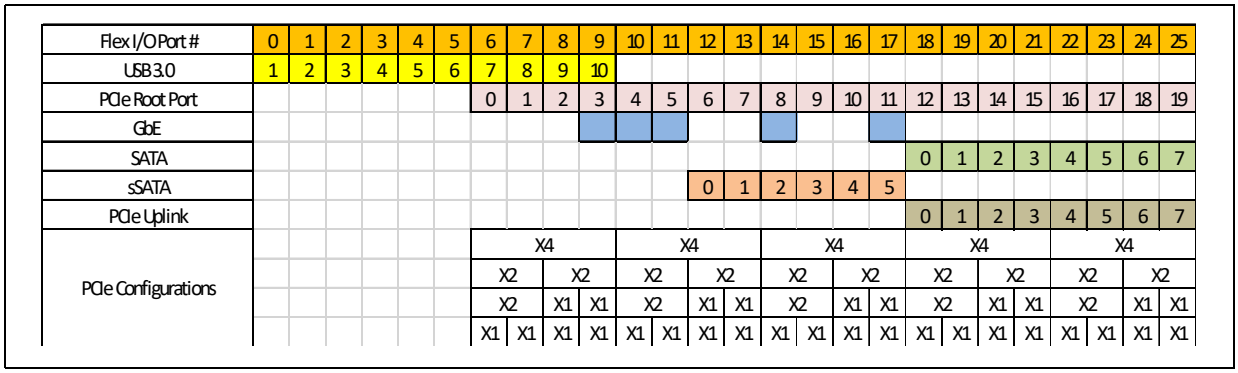
Flexible I/O is an architecture that allows some high speed signals to be statically configured as PCIe* root ports, USB 3.0, GbE, SATA, SSATA and PCIe uplink signals per I/O needs on a platform. Note that the GbE here is the single 1 GbE port that is legacy from past PCHs. It is not related to the new 10/1 GbE functions/ports added to the Intel® C620 Series Chipset PCH.

6.3 Description

The PCH implements a number of HSIO lanes that are split between the different interface: PCIe, USB 3.0, SATA, SSATA and GbE. The picture below summarizes the PCH HSIO lane muxing.

The Flexible I/O is configured through soft straps. Refer to the latest *PCH SPI Programming Guide* for more details on the soft straps.

Figure 6-1. HSIO Muxing on the Intel® C620 Series Chipset



There are 26 HSIO lanes on the PCH, supporting the following port configurations:

1. Up to 20 PCIe root port lanes (multiplexed with USB 3.0, SATA, SSATA ports, and PCIe uplink)
   — Only a maximum of 16 PCIe ports (or devices) can be enabled at any time.
   — Ports 0-3, Ports 4-7, Ports 8-11, Ports 12-15, and Ports 16-19, each can be individually configured as 4x1, 2x2, 1x2 + 2x1, or 1x4.
2. Up to 8 SATA ports
3. Up to 10 USB 3.0 ports (multiplexed with PCIe)
4. 1GbE lane
   — GbE can be mapped into one of the PCIe ports 3-5, port 8, and port 11.
   — When GbE is enabled, there can be at most up to 15 PCIe ports enabled.
5. Up to 6 SSATA ports
6. 8 PCIe uplink lanes for connecting with the CPU. This can either be done by directly connecting to the CPU or wrapping around to the PCIe root ports. One limitation of the connection to the PCIe root ports is that the maximum uplink width can not be more than 4 lanes.

§

7 Memory Mapping

7.1 Overview

This section describes (from the CPU perspective) the memory ranges that the PCH decodes.

7.2 Functional Description

7.2.1 PCI Devices and Functions

The PCH incorporates a variety of PCI devices and functions, as shown in Table 7-1. If for some reason, the particular system platform does not want to support any one of the Device Functions, with the exception of D30:F0, can individually be disabled. The integrated gigabit Ethernet controller will be disabled if no platform LAN connect component is detected (See Chapter 19, "Gigabit Ethernet Controller"). When a function is disabled, it does not appear at all to the software. A disabled function will not respond to any register reads or writes, insuring that these devices appear hidden to software.

Table 7-1. PCI Devices and Functions (Sheet 1 of 2)

Device:Functions #	Function Description
Bus 0: Device 31: Function 0	LPC Interface (eSPI Enable Strap = 0) eSPI Interface (eSPI Enable Strap = 1)
Bus 0: Device 31: Function 3	Intel® HD Audio (Audio, Voice, Speech)
Bus 0: Device 31: Function 4	SMBus Controller
Bus 0: Device 31: Function 5	SPI
Bus 0: Device 31: Function 6	GbE Controller
Bus 0: Device 29: Function 0	PCI Express Port 8
Bus 0: Device 29: Function 1	PCI Express Port 9
Bus 0: Device 29: Function 2	PCI Express Port 10
Bus 0: Device 29: Function 3	PCI Express Port 11
Bus 0: Device 29: Function 4	PCI Express Port 12
Bus 0: Device 29: Function 5	PCI Express Port 13
Bus 0: Device 29: Function 6	PCI Express Port 14
Bus 0: Device 29: Function 7	PCI Express Port 15
Bus 0: Device 28: Function 0	PCI Express Port 0
Bus 0: Device 28: Function 1	PCI Express Port 1
Bus 0: Device 28: Function 2	PCI Express Port 2
Bus 0: Device 28: Function 3	PCI Express Port 3
Bus 0: Device 28: Function 4	PCI Express Port 4
Bus 0: Device 28: Function 5	PCI Express Port 5
Bus 0: Device 28: Function 6	PCI Express Port 6
Bus 0: Device 28: Function 7	PCI Express Port 7
Bus 0: Device 27: Function 0	PCI Express Port 16

Table 7-1. PCI Devices and Functions (Sheet 2 of 2)

Device:Functions #	Function Description
Bus 0: Device 27: Function 1	PCI Express Port 17
Bus 0: Device 27: Function 2	PCI Express Port 18
Bus 0: Device 27: Function 3	PCI Express Port 19
Bus 0: Device 23: Function 0	SATA Controller
Bus 0: Device 22: Function 0	Intel ME HECI #1
Bus 0: Device 22: Function 1	Intel ME HECI #2
Bus 0: Device 22: Function 2	Intel ME IDE-Redirection (IDE-R)
Bus 0: Device 22: Function 3	Intel ME Keyboard and Text (KT) Redirection
Bus 0: Device 22: Function 4	Intel ME HECI #3
Bus 0: Device 20: Function 0	USB 3.0 xHCI Controller
Bus 0: Device 20: Function 2	Thermal Subsystem
Bus 0: Device 17: Function 0	MROM 0 Function
Bus 0: Device 17: Function 1	MROM 1 Function
Bus 0: Device 17: Function 5	SSATA Controller
Bus 0: Device 16: Function 0	IE HECI #1
Bus 0: Device 16: Function 1	IE HECI #2
Bus 0: Device 16: Function 2	IE IDE-Redirection (IDE-R)
Bus 0: Device 16: Function 3	IE Keyboard and Text (KT) Redirection
Bus 0: Device 16: Function 4	IE HECI #3
Bus N+2: Device 0:Function 0	Intel QuickAssist Technology 0
Bus N+3: Device 0:Function 0	Intel QuickAssist Technology 1
Bus N+4: Device 0:Function 0	Intel QuickAssist Technology 2 if routed up NPx16
Bus M+2: Device 0: Function 0	Intel QuickAssist Technology 2 if routed up NPx8
Bus N+5; Device 0: Function [15:0]	10/1 GbE if NPx8 is not enabled
Bus N+4; Device 0: Function [15:0]	10/1 GbE if NPx8 is enabled
Note: When a device or function is disabled, it is not reported to the software and will not respond to any register reads or writes.	

7.2.2 Fixed I/O Address Ranges

Table 7-2, "Fixed I/O Ranges Decoded by PCH" shows the Fixed I/O decode ranges from the CPU perspective. Note that for each I/O range, there may be separate behavior for reads and writes. DMI cycles that go to target ranges that are marked as Reserved will be handled by the PCH; writes are ignored and reads will return all 1's.

Address ranges that are not listed or marked RESERVED are NOT positively decoded by the PCH (unless assigned to one of the variable ranges) and will be internally terminated by the PCH.

Table 7-2. Fixed I/O Ranges Decoded by PCH (Sheet 1 of 3)

I/O Address	Read Target	Write Target	Internal Unit
20h – 21h	Interrupt Controller	Interrupt Controller	Interrupt
24h – 25h	Interrupt Controller	Interrupt Controller	Interrupt
28h – 29h	Interrupt Controller	Interrupt Controller	Interrupt
2Ch – 2Dh	Interrupt Controller	Interrupt Controller	Interrupt

Table 7-2. Fixed I/O Ranges Decoded by PCH (Sheet 2 of 3)

I/O Address	Read Target	Write Target	Internal Unit
2E - 2F	LPC/eSPI	LPC/eSPI	Forwarded to LPC/eSPI
30h – 31h	Interrupt Controller	Interrupt Controller	Interrupt
34h – 35h	Interrupt Controller	Interrupt Controller	Interrupt
38h – 39h	Interrupt Controller	Interrupt Controller	Interrupt
3Ch – 3Dh	Interrupt Controller	Interrupt Controller	Interrupt
40h	Timer/Counter	Timer/Counter	8254 Timer
42h-43h	Timer/Counter	Timer/Counter	8254 Timer
4E-4F	LPC/eSPI	LPC/eSPI	Forwarded to LPC/eSPI
50h	Timer/Counter	Timer/Counter	8254 Timer
52h-53h	Timer/Counter	Timer/Counter	8254 Timer
60h	LPC/eSPI	LPC/eSPI	Forwarded to LPC/eSPI
61h	NMI Controller	NMI Controller	CPU I/F
62h	Microcontroller	Microcontroller	Forwarded to LPC/eSPI
63h	NMI Controller1	NMI Controller1	CPU I/F
64h	Microcontroller	Microcontroller	Forwarded to LPC/eSPI
65h	NMI Controller1	NMI Controller1	CPU I/F
66h	Microcontroller	Microcontroller	Forwarded to LPC/eSPI
67h	NMI Controller[1]	NMI Controller[1]	CPU I/F
70h	RTC Controller	NMI and RTC Controller	RTC
71h	RTC Controller	RTC Controller	RTC
72h	RTC Controller	RTC Controller	RTC
73h	RTC Controller	RTC Controller	RTC
74h	RTC Controller	RTC Controller	RTC
75h	RTC Controller	RTC Controller	RTC
76h-77h	RTC Controller	RTC Controller	RTC
80h	LPC/eSPI or PCIe	LPC/eSPI or PCIe	LPC/eSPI or PCIe
84h - 86h	Reserved	LPC/eSPI or PCIe	LPC/eSPI or PCIe
88h	Reserved	LPC/eSPI or PCIe	LPC/eSPI or PCIe
8Ch - 8Eh	Reserved	LPC/eSPI or PCIe	LPC/eSPI or PCIe
90h	(alias to 80h)	(alias to 80h)	Forwarded to LPC/eSPI
92h	Reset Generator	Reset Generator	CPU I/F
94h - 96h	(Aliases to 8xh)	(Aliases to 8xh)	Forwarded to LPC/eSPI
98h	(Alias to 88h)	(Alias to 88h)	Forwarded to LPC/eSPI
9Ch - 9Eh	(Alias to 8xh)	(Aliases to 8xh)	Forwarded to LPC/eSPI
A0h - A1h	Interrupt Controller	Interrupt Controller	Interrupt
A4h - A5h	Interrupt Controller	Interrupt Controller	Interrupt
A8h - A9h	Interrupt Controller	Interrupt Controller	Interrupt
ACh - ADh	Interrupt Controller	Interrupt Controller	Interrupt
B0h - B1h	Interrupt Controller	Interrupt Controller	Interrupt
B2h - B3h	Power Management	Power Management	Power Management
B4h - B5h	Interrupt Controller	Interrupt Controller	Interrupt
B8h - B9h	Interrupt Controller	Interrupt Controller	Interrupt

Table 7-2. Fixed I/O Ranges Decoded by PCH (Sheet 3 of 3)

I/O Address	Read Target	Write Target	Internal Unit
BCh - BDh	Interrupt Controller	Interrupt Controller	Interrupt
200-207h	Gameport Low	Gameport Low	Forwarded to LPC/eSPI
208-20Fh	Gameport High	Gameport High	Forwarded to LPC/eSPI
4D0h – 4D1h	Interrupt Controller	Interrupt Controller	Interrupt Controller
CF9h	Reset Generator	Reset Generator	Interrupt controller

Note:
1. Only if the Port 61 Alias Enable bit (GCS.P61AE) is set. Otherwise, the target is PCIe.

7.2.3 Variable I/O Decode Ranges

Table 7-3, "Variable I/O Decode Ranges" shows the Variable I/O Decode Ranges. They are set using Base Address Registers (BARs) or other config bits in the various configuration spaces. The PnP software (PCI or ACPI) can use their configuration mechanisms to set and adjust these values.

Warning: The Variable I/O Ranges should not be set to conflict with the Fixed I/O Ranges. Unpredictable results if the configuration software allows conflicts to occur. The PCH does not perform any checks for conflicts.

Table 7-3. Variable I/O Decode Ranges

Range Name	Mappable	Size (Bytes)	Target
ACPI	Anywhere in 64K I/O Space	96	Power Management
IDE Bus Master	Anywhere in 64K I/O Space	16 or 32 Bytes	AMT IDE-R
SMBus	Anywhere in 64K I/O Space	32	SMB Unit
TCO	Anywhere in 64K I/O Space	32	SMB Unit
Parallel Port	3 ranges in 64K I/O Space	8	LPC Peripheral
Serial Port 1	8 Ranges in 64K I/O Space	8	LPC Peripheral
Serial Port 2	8 Ranges in 64K I/O Space	8	LPC Peripheral
Serial Port3	8 Ranges in 64K I/O space	8	LPC Peripheral
Floppy Disk Controller	2 Ranges in 64K I/O Space	8	LPC Peripheral
LPC Generic 1	Anywhere in 64K I/O Space	4 to 256 Bytes	LPC/eSPI
LPC Generic 2	Anywhere in 64K I/O Space	4 to 256 Bytes	LPC/eSPI
LPC Generic 3	Anywhere in 64K I/O Space	4 to 256 Bytes	LPC/eSPI
LPC Generic 4	Anywhere in 64K I/O Space	4 to 256 Bytes	LPC/eSPI
I/O Trapping Ranges	Anywhere in 64K I/O Space	1 to 256 Bytes	Trap
SATA Index/Data Pair	Anywhere in 64K I/O Space	16	SATA Host Controller
SSATA Index/Data Pair	Anywhere in 64K I/O Space	16	SSATA Host Controller
PCI Express Root Ports	Anywhere in 64K I/O Space	I/O Base/Limit	PCI Express Root Ports 1-12
Keyboard and Text (KT)	Anywhere in 64K I/O Space	8	AMT Keyboard and Text
GbE LAN MAC	Anywhere in 65K I/O Space	32	1 GbE LAN MAC Unit

Note: All ranges are decoded directly from DMI.

7.3 Memory Map

Table 7-4, "PCH Memory Decode Ranges (from CPU perspective)" shows (from the CPU perspective) the memory ranges that the PCH will decode. Cycles that arrive from DMI that are not directed to any of the internal memory targets that decode directly from DMI will be master aborted.

PCIe cycles generated by external PCIe masters will be positively decoded unless they fall in the PCI-PCI bridge memory forwarding ranges (those addresses are reserved for PCI peer-to-peer traffic). If the cycle is not in the internal LAN controller's range, it will be forwarded up to DMI. Software must not attempt locks to the PCH's memory-mapped I/O ranges.

Note: Total ports are different for the different SKUs.

Table 7-4. PCH Memory Decode Ranges (from CPU perspective) (Sheet 1 of 2)

Memory Range	Target	Dependency/Comments
000E0000 - 000EFFFF	LPC/eSPI or SPI	Bit 6 in BIOS Decode Enable Register is set
000F0000 - 000FFFFF	LPC/eSPI or SPI	Bit 7 in BIOS Decode Enable Register is set
FECXX000 - FECXX040	I/O(x)APIC inside PCH	X controlled via APIC Range Select (ASEL) field and APIC Enable (AEN) bit.
FEC10000 - FEC17FFF	PCIe port 1	PCIe root port 1 I/OxApic Enable (PAE) set
FEC18000 - FEC1FFFF	PCIe port 2	PCIe root port 2 I/OxApic Enable (PAE) set
FEC20000 - FEC27FFF	PCIe port 3	PCIe root port 3 I/OxApic Enable (PAE) set
FEC28000 - FEC2FFFF	PCIe port 4	PCIe root port 4 I/OxApic Enable (PAE) set
FEC30000 - FEC37FFF	PCIe port 5	PCIe root port 5 I/OxApic Enable (PAE) set
FEC38000 - FEC3FFFF	PCIe port 6	PCIe root port 6 I/OxApic Enable (PAE) set
FEC40000 - FEC47FFF	PCIe port 7	PCIe root port 7 I/OxApic Enable (PAE) set
FEC48000 - FEC4FFFF	PCIe port 8	PCIe root port 8 I/OxApic Enable (PAE) set
FEC50000 - FEC57FFF	PCIe port 9	PCIe root port 9 I/OxApic Enable (PAE) set
FEC58000 - FEC5FFFF	PCIe port 10	PCIe root port 10 I/OxApic Enable (PAE) set
FEF0_0000h - FEFF_FFFFh	LPC/eSPI or SPI	UCPR.UPRE
FFC0 0000 - FFC7 FFFF FF80 0000 - FF87 FFFF	LPC/eSPI or SPI	Bit 8 in BIOS Decode Enable Register
FFC8 0000 – FFCF FFFF FF88 0000 - FF8F FFFF	LPC/eSPI or SPI	Bit 9 in BIOS Decode Enable Register
FFD0 0000 - FFD7 FFFF FF90 0000 - FF97 FFFF	LPC/eSPI or SPI	Bit 10 in BIOS Decode Enable Register is set
FFD8 0000 – FFDF FFFF FF98 0000 - FF9F FFFF	LPC/eSPI or SPI	Bit 11 in BIOS Decode Enable Register is set
FFE0 000 - FFE7 FFFF FFA0 0000 - FFA7 FFFF	LPC/eSPI or SPI	Bit 12 in BIOS Decode Enable Register is set
FFE8 0000 – FFEF FFFF FFA8 0000 – FFAF FFFF	LPC/eSPI or SPI	Bit 13 in BIOS Decode Enable Register is set
FFF0 0000 - FFF7 FFFF FFB0 0000 - FFB7 FFFF	LPC/eSPI or SPI	Bit 14 in BIOS Decode Enable Register is set
FFF8 0000 – FFFF FFFF FFB8 0000 – FFBF FFFF	LPC/eSPI or SPI	Always enabled. The top two 64 KB blocks in this range can be swapped by the PCH.
FF70 0000 - FF7F FFFF FF30 0000 - FF3F FFFF	LPC/eSPI or SPI	Bit 3 in BIOS Decode Enable Register is set

Table 7-4. PCH Memory Decode Ranges (from CPU perspective) (Sheet 2 of 2)

Memory Range	Target	Dependency/Comments
FF60 0000 - FF6F FFFF FF20 0000 - FF2F FFFF	LPC/eSPI or SPI	Bit 2 in BIOS Decode Enable Register is set
FF50 0000 - FF5F FFFF FF10 0000 - FF1F FFFF	LPC/eSPI or SPI	Bit 1 in BIOS Decode Enable Register is set
FF40 0000 - FF4F FFFF FF00 0000 - FF0F FFFF	LPC/eSPI or SPI	Bit 0 in BIOS Decode Enable Register is set
FED0 X000h-FED0 X3FFh	HPET	BIOS determines "fixed" location which is one of four 1 KB ranges where X (in the first column) is 0h, 1h, 2h, or 3h
FED4_0000h – FED4_7FFFh	LPC or SPI (set by strap)	TPM and Trusted Mobile KBC
FED5_0000h – FED5_FFFFh	Intel ME	Always enabled
FED7_0000 – FED7_4FFF	Internal Device	Security feature related
4 KB anywhere in 4-GB range	1GbE Controller (LAN space on Flash)	Enable via standard PCI mechanism (Device 31:Function 6)
64 KB anywhere in 64-bit address range	USB 3.0 Host Controller	Enable via standard PCI mechanism (Device 20, Function 0)
16 KB anywhere in 64-bit addressing space	HD Audio Subsystem	Enable via standard PCI mechanism (Device 31, Function 3)
4 KB anywhere in 64-bit addressing space	HD Audio Subsystem	Enable via standard PCI mechanism (Device 31, Function 3)
64 KB anywhere in 64-bit addressing space	HD Audio Subsystem	Enable via standard PCI mechanism (Device 31, Function 3)
64 KB anywhere in 4-GB range	LPC/eSPI	LPC Generic Memory Range. Enable via setting bit[0] of the LPC Generic Memory Range register (D31:F0:offset 98h)
32 Bytes anywhere in 64-bit address range	SM Bus	Enable via standard PCI mechanism (Device 31: Function 4)
2 KB anywhere above 64 KB to 4 GB range	SATA Host Controller	AHCI memory-mapped registers. Enable via standard PCI mechanism (Device 23: Function 0)
2 KB anywhere above 64 KB to 4 GB range	SSATA Host Controller	AHCI memory-mapped registers. Enable via standard PCI mechanism (Device 17: Function 0)
Memory Base/Limit anywhere in 4GB range	PCI Express Root Ports 1-20	Enable via standard PCI mechanism
Prefetchable Memory Base/ Limit anywhere in 64-bit address range	PCI Express Root Ports 1-20	Enable via standard PCI mechanism
4 KB anywhere in 64-bit address range	Thermal Reporting	Enable via standard PCI mechanism (Device 20: Function 2)
16 Bytes anywhere in 64-bit address range	HECI #1, #2, #3	Enable via standard PCI mechanism (Device 22: Function 0-1, 4)
4 KB anywhere in 4-GB range	AMT Keyboard and Text	Enable via standard PCI mechanism (Device 22: Function 3)

7.3.1 Boot-Block Update Scheme

The PCH supports a "Top-Block Swap" mode that has the PCH swap the top block in the FWH or SPI flash (the boot block) with another location. This allows for safe update of the Boot Block (even if a power failure occurs). When the "top-swap" enable bit is set, the PCH will invert A16 for cycles going to the upper two 64 KB blocks in the FWH or appropriate address lines as selected in Boot Block Size (BOOT_BLOCK_SIZE) soft strap for SPI.

Specifically for FHW, in this mode accesses to FFFF_0000h-FFFF_FFFFh are directed to FFFE_0000h-FFFE_FFFFh and vice versa. When the Top Swap Enable bit is 0, the PCH will not invert A16.

Specifically for SPI, in this mode the "Top-Block Swap" behavior is as described below. When the Top Swap Enable bit is 0, the PCH will not invert any address bit.

Table 7-5. SPI Mode Address Swapping

BOOT_BLOCK_SIZE Value	Accesses to	Being Directed to
000 (64KB)	FFFF_0000h - FFFF_FFFFh	FFFE_0000h - FFFE_FFFFh and vice versa
001 (128KB)	FFFE_0000h - FFFF_FFFFh	FFFC_0000h - FFFD_FFFFh and vice versa
010 (256KB)	FFFC_0000h - FFFF_FFFFh	FFF8_0000h - FFFB_FFFFh and vice versa
011 (512KB)	FFF8_0000h - FFFF_FFFFh	FFF0_0000h - FFF7_FFFFh and vice versa
100 (1MB)	FFF0_0000h - FFFF_FFFFh	FFE0_0000h - FFEF_FFFFh and vice versa
101 - 111	Reserved	Reserved
Note: This bit is automatically set to 0 by RTCRST#, but not by PLTRST#.

8 PCH and System Clocks

8.1 Acronyms

Acronyms	Description
ICC	Integrated Clock Controller
LPC	Low Pin Count
PCH	Platform Controller Hub
PLL	Phase Locked Loop Circuit
SSC	Spread Spectrum Clocking

8.2 Overview

This document describes the signals and different clocking modes that the Intel® C620 Series Chipset PCH supports. How you route the signals is the province of the appropriate platform PDG, as each platform can have different rules and restrictions on how the clocks are routed, connectivity, and modes supported.

8.3 Signal Descriptions

Name	Type	SSC Capable	Description	Connection
CLKOUT_ITPXDP_P CLKOUT_ITPXDP_N	O	Yes	**Differential Intel ITP Debug Clock:** 100 MHz differential output to processor XDP/Intel ITP connector on the platform. Not there in External Mode.	ITP Header
CLKOUT_NSSCCAP0_P CLKOUT_NSSCCAP0_N	O	Yes	**Non-spread capable:** 100 MHz Clock that is capable of being selected as non-spread spectrum different than the SRC and PLAT clocks.	
CLKOUT_NSSCCAP1_P CLKOUT_NSSCCAP1_N	O	Yes	**Non-spread capable:** 100 MHz Clock that is capable of being selected as non-spread spectrum different than the SRC and PLAT clocks	
CLKOUT_PLAT0_P CLKOUT_PLAT0_N	O	Yes	**Platform Clock:** 100 MHz Differential clock for use on the Platform for connections to the PCH. PCIe 4.0 compliant	PCH PCIe
CLKOUT_PLAT1_P CLKOUT_PLAT1_N	O	Yes	**Platform Clock:** 100 MHz Differential clock for use on the Platform for connections to the PCH. PCIe 4.0 compliant	PCH PCIe
CLKOUT_SRC_N_0 CLKOUT_SRC_P_0	O	Yes	**Source Clock:** 100 MHz Differential clocks that are PCIe 4.0 compliant	PCH PCIe, CPU Bclk, CPU PCIe, DBxxxzl
CLKOUT_SRC_N_1 CLKOUT_SRC_P_1	O	Yes	**Source Clock:**100 MHz Differential clocks that are PCIe 4.0 compliant	PCH PCIe, CPU Bclk, CPU PCIe, DBxxxzl
CLKOUT_SRC_N_2 CLKOUT_SRC_P_2	O	Yes	**Source Clock:**100 MHz Differential clocks that are PCIe 4.0 compliant	PCH PCIe, CPU Bclk, CPU PCIe, DBxxxzl
CLKOUT_SRC_N_3 CLKOUT_SRC_P_3	O	Yes	**Source Clock:** 100 MHz Differential clocks that are PCIe 4.0 compliant	PCH PCIe, CPU Bclk, CPU PCIe, DBxxxzl
CLKOUT_SRC_N_4 CLKOUT_SRC_P_4	O	Yes	**Source Clock:** 100 MHz Differential clocks that are PCIe 4.0 compliant	PCH PCIe, CPU Bclk, CPU PCIe, DBxxxzl
CLKOUT_SRC_N_5 CLKOUT_SRC_P_5	O	Yes	**Source Clock:** 100 MHz Differential clocks that are PCIe 4.0 compliant	PCH PCIe, CPU Bclk, CPU PCIe, DBxxxzl

Name	Type	SSC Capable	Description	Connection
CLKOUT_SRC_N_6 CLKOUT_SRC_P_6	O	Yes	**Source Clock:** 100 MHz Differential clocks that are PCIe 4.0 compliant	PCH PCIe, CPU Bclk, CPU PCIe, DBxxxzl
CLKOUT_SRC_N_7 CLKOUT_SRC_P_7	O	Yes	**Source Clock:** 100 MHz Differential clocks that are PCIe 4.0 compliant	PCH PCIe, CPU Bclk, CPU PCIe, DBxxxzl
CLKOUT_SRC_N_8 CLKOUT_SRC_P_8	O	Yes	**Source Clock:** 100 MHz Differential clocks that are PCIe 4.0 compliant	PCH PCIe, CPU Bclk, CPU PCIe, DBxxxzl
CLKOUT_SRC_N_9 CLKOUT_SRC_P_9	O	Yes	**Source Clock:** 100 MHz Differential clocks that are PCIe 4.0 compliant	PCH PCIe, CPU Bclk, CPU PCIe, DBxxxzl
CLKOUT_SRC_N_10 CLKOUT_SRC_P_10	O	Yes	**Source Clock:** 100 MHz Differential clocks that are PCIe 4.0 compliant	PCH PCIe, CPU Bclk, CPU PCIe, DBxxxzl
CLKOUT_SRC_N_11 CLKOUT_SRC_P_11	O	Yes	**Source Clock:** 100 MHz Differential clocks that are PCIe 4.0 compliant	PCH PCIe, CPU Bclk, CPU PCIe, DBxxxzl
CLKOUT_SRC_N_12 CLKOUT_SRC_P_12	O	Yes	**Source Clock:** 100 MHz Differential clocks that are PCIe 4.0 compliant	PCH PCIe, CPU Bclk, CPU PCIe, DBxxxzl
CLKOUT_SRC_N_13 CLKOUT_SRC_P_13	O	Yes	**Source Clock:** 100 MHz Differential clocks that are PCIe 4.0 compliant	PCH PCIe, CPU Bclk, CPU PCIe, DBxxxzl
CLKOUT_SRC_N_14 CLKOUT_SRC_P_14	O	Yes	**Source Clock:** 100 MHz Differential clocks that are PCIe 4.0 compliant	PCH PCIe, CPU Bclk, CPU PCIe, DBxxxzl
CLKOUT_SRC_N_15 CLKOUT_SRC_P_15	O	Yes	**Source Clock:** 100 MHz Differential clocks that are PCIe 4.0 compliant	PCH PCIe, CPU Bclk, CPU PCIe, DBxxxzl
CLKOUT_LPC0_ESPI_CLK	O	No	**LPC Clock 0:** Single ended 24 MHz clock for LPC and eSPI. This output is a dedicated clock that can not be turned off.	LPC, eSPI, TPM
GPP_A10_CLKOUT_LPC1	O	No	**LPC Clock 1:** Single ended 24 MHz clock for devices attached to the LPC or for general usage	LPC
GPP_A16_CLKOUT_LPC2	O	No	**LPC Clock 2:** Single ended 24 MHz clock for devices attached to the LPC or for general usage.	LPC
CLOCKSE_BMCCLK	O	No	**BMC Clock:** Single ended 48 MHz clock, used to provide reference for USB clocking. Expected to be sent to an external controller.	
CLOCKSE_PMSYNCCLK1	O	No	**PMSYNC Clock:** Single ended clock running at 24 MHz. The provides reference clocking for PM_SYNC1.	
CLOCKSE_PMSYNCCLK2	O	No	**PMSYNC Clock:** Single ended clock running at 24 MHz. The provides reference clocking for PM_SYNC2.	
GPD8_SUSCLK	O	No	**Sus Clock:** 32 kHz clock sourced from the RTC.	
GPP_B5_SRCCLKREQ0#	I/O	N/A	**Source Clock Request**: Active low signal that is used to enable/disable one of the 100 MHz CLKOUT_SRC_N/P differential clocks. Multiplexed with a general purpose I/O pin.	
GPP_B6_SRCCLKREQ1#	I/O	N/A	**Source Clock Request**: Active low signal that is used to enable/disable one of the 100 MHz CLKOUT_SRC_N/P differential clocks. Multiplexed with a general purpose I/O pin.	
GPP_B7_SRCCLKREQ2#	I/O	N/A	**Source Clock Request**: Active low signal that is used to enable/disable one of the 100 MHz CLKOUT_SRC_N/P differential clocks. Multiplexed with a general purpose I/O pin.	
GPP_B8_SRCCLKREQ3#	I/O	N/A	**Source Clock Request**: Active low signal that is used to enable/disable one of the 100 MHz CLKOUT_SRC_N/P differential clocks. Multiplexed with a general purpose I/O pin.	
GPP_B9_SRCCLKREQ4#	I/O	N/A	**Source Clock Request**: Active low signal that is used to enable/disable one of the 100 MHz CLKOUT_SRC_N/P differential clocks. Multiplexed with a general purpose I/O pin.	

Name	Type	SSC Capable	Description	Connection
GPP_B10_SRCCLKREQ5#	I/O	N/A	**Source Clock Request:** Active low signal that is used to enable/disable one of the 100 MHz CLKOUT_SRC_N/P differential clocks. Multiplexed with a general purpose I/O pin.	
GPP_H0_SRCCLKREQ6#	I/O	N/A	**Source Clock Request**: Active low signal that is used to enable/disable one of the 100 MHz CLKOUT_SRC_N/P differential clocks. Multiplexed with a general purpose I/O pin.	
GPP_H1_SRCCLKREQ7#	I/O	N/A	**Source Clock Request**: Active low signal that is used to enable/disable one of the 100 MHz CLKOUT_SRC_N/P differential clocks. Multiplexed with a general purpose I/O pin.	
GPP_H2_SRCCLKREQ8#	I/O	N/A	**Source Clock Request**: Active low signal that is used to enable/disable one of the 100 MHz CLKOUT_SRC_N/P differential clocks. Multiplexed with a general purpose I/O pin.	
GPP_H3_SRCCLKREQ9#	I/O	N/A	**Source Clock Request**: Active low signal that is used to enable/disable one of the 100 MHz CLKOUT_SRC_N/P differential clocks. Multiplexed with a general purpose I/O pin.	
GPP_H4_SRCCLKREQ10#	I/O	N/A	**Source Clock Request**: Active low signal that is used to enable/disable one of the 100 MHz CLKOUT_SRC_N/P differential clocks. Multiplexed with a general purpose I/O pin.	
GPP_H5_SRCCLKREQ11#	I/O	N/A	**Source Clock Request**: Active low signal that is used to enable/disable one of the 100 MHz CLKOUT_SRC_N/P differential clocks. Multiplexed with a general purpose I/O pin.	
GPP_H6_SRCCLKREQ12#	I/O	N/A	**Source Clock Request**: Active low signal that is used to enable/disable one of the 100 MHz CLKOUT_SRC_N/P differential clocks. Multiplexed with a general purpose I/O pin.	
GPP_H7_SRCCLKREQ13#	I/O	N/A	**Source Clock Request**: Active low signal that is used to enable/disable one of the 100 MHz CLKOUT_SRC_N/P differential clocks. Multiplexed with a general purpose I/O pin.	
GPP_H8_SRCCLKREQ14#	I/O	N/A	**Source Clock Request**: Active low signal that is used to enable/disable one of the 100 MHz CLKOUT_SRC_N/P differential clocks. Multiplexed with a general purpose I/O pin.	
GPP_H9_SRCCLKREQ15#	I/O	N/A	**Source Clock Request**: Active low signal that is used to enable/disable one of the 100 MHz CLKOUT_SRC_N/P differential clocks. Multiplexed with a general purpose I/O pin.	
XTAL_IN	I	N/A	**Crystal Input:** Input connection for 48 MHz crystal to PCH oscillator circuit	
XTAL_OUT	O	N/A	**Crystal Output:** Output connection for 48 MHz crystal to PCH oscillator circuit	
XCLK_BIASREF	I/O	N/A	**Differential Clock Bias Reference**: Used to set BIAS reference for differential clocks	
LAN_XTAL_IN	I	N/A	**Crystal Input:** Input connection for the 25 MHz crystal used for the 10 GbE LAN	
LAN_XTAL_OUT	O	N/A	**Crystal Output:** Output connection for the 25 MHz crystal used for the 10 GbE LAN	
EXTCLKN EXTCLKP	I	N/A	**External Clocks** Differential 100 MHz clock that is used when in the external clocking mode. When the PCH is configured to be in the iSCLK or Platform Hybrid mode, these pins must be No Connects.	

Notes:
1. The SRCCLKRQ# signals can be configured to map to any of the PCH PCI Express Root Ports that are using any of the CLKOUT_SRC_P/N differential pairs.

8.4 Clock Signal Planes and States

Table 8-1. Clock Signal Planes and States

Signal Name	Power Plane	During Reset	Immediately After Reset	S3/S4/S5	Deep Sx
CLKOUT_ITPXDP_P CLKOUT_ITPXDP_N	Primary	Toggling	Toggling	Driven Low	OFF
CLKOUT_NSSCCAP[1:0]_P CLKOUT_NSSCCAP[1:0]_N	Primary	Toggling	Toggling	Driven Low	OFF
CLKOUT_PLAT[1:0]_P CLKOUT_PLAT[1:0]_N	Primary	Toggling	Toggling	Driven Low	OFF
CLKOUT_SRC_P[15:0] CLKOUT_SRC_N[15:0]	Primary	Toggling	Toggling	Driven Low	OFF
CLKOUT_LPC[2:0]	Primary	Toggling	Toggling	Driven Low	OFF
CLOCKSE_BMC	Primary	Toggling	Toggling	Driven Low	OFF
CLOCKSE_PMSYNCCLK[2:1]	Primary	Toggling	Toggling	Driven Low	OFF
SUSCLK	Primary	Toggling	Toggling	Toggling	OFF

Note:
1. Signal names have been shortened to only reflect those with clock functions.

8.5 Clocking Overview

The Intel® C620 Series Chipset works with three different clocking solutions for the Intel® Xeon® Processor Scalable Family-Based Platform: native isCLK clocking, platform hybrid clocking and external clocking.

- Native isCLK is the implementation where the Intel® C620 Series Chipset provides a complete clocking solution. No external components can be used.
- With platform hybrid, the PCH operates the same as in Native isCLK with the following exception: one or more 100 MHz clocks from the Intel® C620 Series Chipset are routed to external clock buffers to increase the number of 100 MHz clocks for the system. In platform hybrid all clocks can come from the buffers, or there can be a mix of clocks from the buffers and 100 MHz clocks from the PCH.
- External clocking effectively replaces the Intel® C620 Series Chipset clock controller with a CK420BQ and appropriate clock buffers for the 100 MHz differential clocks. The singled ended clocks will still come out of the Intel® C620 Series Chipset, and the 24 MHz clock must be used from the Intel® C620 Series Chipset.
- There is no special setup or programming needed for isCLK vs Platform Hybrid. However, for external clocking multiple softstraps are used to enable running in native isCLK mode vs external clocking mode.

8.6 Clock Interfaces

8.6.1 Crystal Oscillators and Clock Inputs

There are three crystals used in the PCH: 32 kHz used for the RTC, 25 MHz that supplies the clock to the 10 GbE LAN, and 48 MHz that provides clocking for the Intel QuickAssist Technology functions, sPCH functions (DMI, USB, PCIe, SATA, etc), and internal data paths. In addition, there is a differential clock input that is only used when in External Clock mode. For all configurations, the RTC and 48 MHz crystals must be connected. The 25-MHz crystal is not needed for implementations that do not have the

10 Gb Ethernet Controller enabled. In external mode, EXTCLKN/P is driven by an external 100-MHz differential clock. The other clocks are still sourced from the 48-MHz Crystal.

8.6.2 100-MHz Differential Clocks

CLKOUT_NSSCCAP[1:0] are a pair of 100 MHz differential clocks that can have spread spectrum enabled and disabled on them independently of the rest of the 100 MHz differential clocks. This can be done because these clocks are sourced from a different PLL than the rest of the 100 MHz clocks. One effect of this is that these clocks can not be used to drive the BLCK inputs on the CPU, drive clock inputs to PCIe slots/devices that connect to the CPU, or clocks inputs to PCIe slots/devices that connect to the PCH. They are best considered independent clocks that can be used by components that do not need them to be used for transferring data between the CPUs and the PCHs. For example, if you had a SAS controller on the board that needed 100 MHz non-spread clocks for transferring data between the controller and the hard drives, the CLKOUT_NSSCCAP clocks could be used for this purpose.

The rest of the clocks (CLKOUT_ITPXDP, CLKOUT_PLAT[1:0], CLKOUT_SRC_N/P_[15:0]) are all generated by the same PLL, and operate the same with regards to spread spectrum. SSC is either on for all these clocks, or off. The PLL for these clocks also provides the clocking for USB3. The USB3 specification requires SSC to be turned on with a certain range, resulting in these clocks all, by default, having spread spectrum enabled operating in that mode. It is possible to disable SSC on these clocks, but that will end up in non-compliance with the USB3 specification.

While all are 100 MHz clocks, there are some differences between the clocks with regards to power and ground connections. For connections to the CPU BCLKs, CLKOUT_SRC clocks must be used. See the appropriate Platform Design Guide for more details on clock selection.

In Platform Hybrid mode, it is possible to use either the CLKOUT_SRC clocks to drive the clock buffers, or the CLKOUT_PLAT[1:0] can be used. The preference would be to use the CLKOUT_SRC clocks. Again, see your PDG for guidelines.

All 100 MHz differential clocks are only active in the S0 state. When in Sx state, they will be driven low.

The CLKOUT_SRC clocks can have their outputs enabled/disabled either via FITC setups, HECI commands or with the SRCCLKREQ# pins. The SRCCLKREQ# pins are a good option for PCIe slots as they can be used to externally enable or disable the output of the CLKOUT_SRC pins depending on whether a card is in the slot or not.

8.6.3 Single Ended Clocks

The Intel® C620 Series Chipset will provide single ended clocks for LPC and eSPI, 48 MHz clock for USB/BMC support, PM_Sync clocks for connection to the CPU, and Susclks in all clocking configurations: isCLK, Platform Hybrid and External Clock. The LPC/eSPI, PM_SYNC, and 48 MHz clocks are operational in S0 state, but not in Sx state. Susclk is operational in the Sx states. The source of the LPC/eSPI, 48 MHz, and PM_Sync clocks comes from the 48 MHz crystal, so that crystal is needed in all three clocking modes. The Susclk comes from the RTC crystal.

The CLKOUT_LPC[2:0] clocks are not identical in operation. CLKOUT_LPC0 is intended to be used for driving your TPM device in addition to one LPC device. This clock is always free running. It can not be started or stopped. Because of that, this clock is not enabled on a rising edge or disabled on a falling edge, resulting in the beginning clocks

and ending clocks not meeting specs with regards to clock periods/high times at their start and stop. These non-compliant clocks will occur for many clock periods while PLTRST# is low, when the platform is in reset. When PLTRST# is high, the CLKOUT_LPC0 clock will operate per specification.

When the Intel® C620 Series Chipset is configured to be run in endpoint only mode, there are restrictions on the clocking supported. In this configuration, only external clocking is allowed. Native isCLK and Platform Hybrid is not permitted.

8.7 Integrated Clock Controller FW Accessible Registers Summary

The integrated clock controller FW accessible registers are distributed withing the PCH Private Configuration Space which is accessible through the PCH sideband interface using the following Target Port (Destination port) Identification of 0xDC

Table 8-2. Summary of Integrated Clock Controller FW Accessible Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
1000h	1003h	Timing Control SRC Clock (TMCSRCCLK)—Offset 1000h	0h
1004h	1007h	Timing Control SRC Clock Register 2 (TMCSRCCLK2)—Offset 1004h	0h
1008h	100Bh	Enable Control CLKREQ (ENCCKRQ)—Offset 1008h	0h
100Ch	100Fh	Mask Control CLKREQ (MSKCKRQ)—Offset 100Ch	0h
1020h	1023h	ICC Security (ICCSEC)—Offset 1020h	0h
1024h	1027h	CLKREQ Mapping to CLKOUT_SRC (CKRQMAPSRC)—Offset 1024h	76543210h
1028h	102Bh	CLKREQ Mapping to CLKOUT_SRC Register 2 (CKRQMAPSRC2)—Offset 1028h	76543210h
102Ch	102Fh	Power Management (PM)—Offset 102Ch	0h
1034h	1037h	ICC Debug (ICCDBG)—Offset 1034h	0h
2000h	2003h	USB3Gen2PCIe PLL Control (G2PLLCTRL)—Offset 2000h	0h

8.7.1 Timing Control SRC Clock (TMCSRCCLK)—Offset 1000h

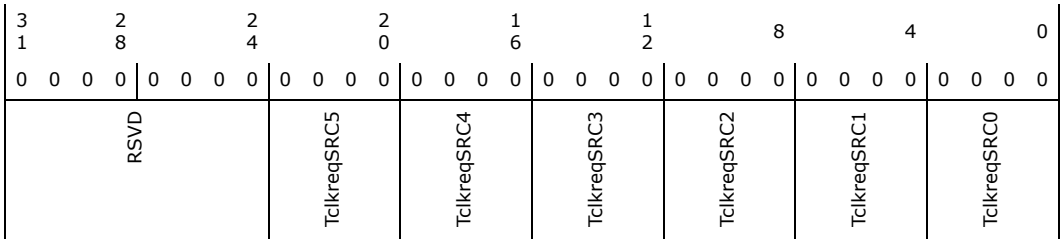
Controls minimum enable timing of PCIe SRC Clocks for support of PCIe L1Off using CLKREQ#

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	0h RW	**Minimum Time from Effective Mapped CLKREQ# assertion to CLKOUT_SRC5 ungated (TclkreqSRC5):** See description for TclkreqSRC0 field[3:0]
19:16	0h RW	**Minimum Time from Effective Mapped CLKREQ# assertion to CLKOUT_SRC4 ungated (TclkreqSRC4):** See description for TclkreqSRC0 field[3:0]
15:12	0h RW	**Minimum Time from Effective Mapped CLKREQ# assertion to CLKOUT_SRC3 ungated (TclkreqSRC3):** See description for TclkreqSRC0 field[3:0]
11:8	0h RW	**Minimum Time from Effective Mapped CLKREQ# assertion to CLKOUT_SRC2 ungated (TclkreqSRC2):** See description for TclkreqSRC0 field[3:0]
7:4	0h RW	**Minimum Time from Effective Mapped CLKREQ# assertion to CLKOUT_SRC1 ungated (TclkreqSRC1):** See description for TclkreqSRC0 field[3:0]

Bit Range	Default and Access	Field Name (ID): Description
3:0	0h RW	***Note:*** Minimum Time from Effective Mapped CLKREQ# assertion to CLKOUT_SRC0 ungated (TclkreqSRC0): Minimum elapsed time from the Effective Mapped CLKREQ# signal assertion to the corresponding PCIe SRC Clock being allowed to toggle. This minimum time of CLKOUT_SRCn[P/N] staying gated at low voltage allows for the PCIe devices voltage rail to ramp to safe level on the exit from L1Off state before being driven with clock from the PCH. 0000: 0 us minimum elapsed time from Effective Mapped CLKREQ# assertion to corresponding CLKOUT_SRCn ungated - Default - This setting is for PCIe device that does not support L1Off. This setting must also be used when corresponding CLKOUT_SRCn is configured for non-PCIe clock use, i.e., as MEX reference clock, etc. 0001: 5 us minimum elapsed time ... 0010: 10 us minimum elapsed time ... 0011: 15 us minimum elapsed time ... 0100: 20 us minimum elapsed time ... 0101: 25 us minimum elapsed time ... 0110: 30 us minimum elapsed time ... 0111: 35 us minimum elapsed time ... 1000: 40 us minimum elapsed time ... 1001: 45 us minimum elapsed time ... 1010: 50 us minimum elapsed time ... 1011: 60 us minimum elapsed time ... 1100: 70 us minimum elapsed time ... 1101: 80 us minimum elapsed time ... 1110: 90 us minimum elapsed time ... 1111: 100 us minimum elapsed time ... ***Notes:*** The effective time to restart the CLKOUT_SRCn should be the larger of the programmed minimum delay, or of the normal natural latency to restart the clock from the current powered state of ICC. The effective time must not be cummulative. 0us minimum elapsed time setting results in the normal latency that would be incurred to restart the CLKOUT_SRCn from the current state of ICC, i.e., if PLL source is already up and only the CLKOUT_SRCn is being gated, then the effective latency is the normal delay to ungate the clock at the output buffer. If PLL source has been power managed off, then the effective latency is the normal delay to restart the PLL, divider, and to ungate the clock at the output buffer. No other additional delay is incurred. Non-zero minimum elapsed time setting should result in similar delay as 0us minimum case described above when the normal latency for clock restart is naturally larger than the programmed setting. Non-zero minimum elapsed time setting should only result in the programmed latency when the normal latency for clock restart, with respect to the current state of ICC, is smaller than the programmed setting. BIOS is expected to program this register field based on its discovery of the PCIe device capabilities, such as device support for L1Off, and device Tpowerup timing. Trefclk_min is enforced by ICC only when the PCIe link is exiting from L1.OFF state where the device is unpowered. ICC will not enforce Trefclk_min when the link is exiting from other L1 improved states, such as L1.SNOOZE where the device is still powered for lower latency L1 improved exit. PCIe root port communicates this port state distinction to ICC. Port state information is communicated per port and is mapped 1:1 with the raw SRCCLKREQB_n from GPIO, i.e., port 0 state is associated with SRCCLKREQB_0. Thus the mapping function of CLKREQ# to CLKOUTSRC also needs to be applied to port state information prior to use.

8.7.2 Timing Control SRC Clock Register 2 (TMCSRCCLK2)—Offset 1004h

Controls minimum enable timing of PCIe SRC Clocks for support of PCIe L1Off using CLKREQ#

8.7.3 Enable Control CLKREQ (ENCCKRQ)—Offset 1008h

Controls enabling of Mapped CLKREQ#s for SRC clocks

Access Method

Type: MSG Register

12	0h RW	**Enable Maskable Mapped CLKREQ# for CLKOUT_SRC12 (ENCRQSRC12):** Enable dynamic control of CLKOUT_SRC12 by the Maskable Mapped CLKREQ#. See description for ENCRQSRC0.
11	0h RW	**Enable Maskable Mapped CLKREQ# for CLKOUT_SRC11 (ENCRQSRC11):** Enable dynamic control of CLKOUT_SRC11 by the Maskable Mapped CLKREQ#. See description for ENCRQSRC0.
10	0h RW	**Enable Maskable Mapped CLKREQ# for CLKOUT_SRC10 (ENCRQSRC10):** Enable dynamic control of CLKOUT_SRC10 by the Maskable Mapped CLKREQ#. See description for ENCRQSRC0.
9	0h RW	**Enable Maskable Mapped CLKREQ# for CLKOUT_SRC9 (ENCRQSRC9):** Enable dynamic control of CLKOUT_SRC9 by the Maskable Mapped CLKREQ#. See description for ENCRQSRC0.
8	0h RW	**Enable Maskable Mapped CLKREQ# for CLKOUT_SRC8 (ENCRQSRC8):** Enable dynamic control of CLKOUT_SRC8 by the Maskable Mapped CLKREQ#. See description for ENCRQSRC0.
7	0h RW	**Enable Maskable Mapped CLKREQ# for CLKOUT_SRC7 (ENCRQSRC7):** Enable dynamic control of CLKOUT_SRC7 by the Maskable Mapped CLKREQ#. See description for ENCRQSRC0.
6	0h RW	**Enable Maskable Mapped CLKREQ# for CLKOUT_SRC6 (ENCRQSRC6):** Enable dynamic control of CLKOUT_SRC6 by the Maskable Mapped CLKREQ#. See description for ENCRQSRC0.
5	0h RW	**Enable Maskable Mapped CLKREQ# for CLKOUT_SRC5 (ENCRQSRC5):** Enable dynamic control of CLKOUT_SRC5 by the Maskable Mapped CLKREQ#. See description for ENCRQSRC0.

Bit Range	Default and Access	Field Name (ID): Description
4	0h RW	**Enable Maskable Mapped CLKREQ# for CLKOUT_SRC4 (ENCRQSRC4):** Enable dynamic control of CLKOUT_SRC4 by the Maskable Mapped CLKREQ#. See description for ENCRQSRC0.
3	0h RW	**Enable Maskable Mapped CLKREQ# for CLKOUT_SRC3 (ENCRQSRC3):** Enable dynamic control of CLKOUT_SRC3 by the Maskable Mapped CLKREQ#. See description for ENCRQSRC0.
2	0h RW	**Enable Maskable Mapped CLKREQ# for CLKOUT_SRC2 (ENCRQSRC2):** Enable dynamic control of CLKOUT_SRC2 by the Maskable Mapped CLKREQ#. See description for ENCRQSRC0.
1	0h RW	**Enable Maskable Mapped CLKREQ# for CLKOUT_SRC1 (ENCRQSRC1):** Enable dynamic control of CLKOUT_SRC1 by the Maskable Mapped CLKREQ#. See description for ENCRQSRC0.
0	0h RW	**Enable Maskable Mapped CLKREQ# for CLKOUT_SRC0 (ENCRQSRC0):** Enable dynamic control of CLKOUT_SRC0 by the Maskable Mapped CLKREQ#. This register bit may be updated dynamically. Hardware design must support this usage model. 0: Disable dynamic control of CLKOUT_SRCn - Default 1: Enable dynamic control of CLKOUT_SRCn by the maskable mapped CLKREQ# When enabled by this register bit, CLKOUT_SRCn is subject to gating/ungating control by the maskable mapped CLKREQ#. Furthermore, when latency tolerance permits, the maskable mapped CLKREQ# de-assertion allows for PLL source shutdown following the gating of CLKOUT_SRCn. Actual PLL shutdown accounts for votes from all other clock consumers of shared PLL source. When the maskable mapped CLKREQ# re-asserts, the minimum latency to restart the output clock is subject to the L1.Off Trefclkmin field TclkreqSRCn, register TMCSRCCLK. When disabled by this register bit, CLKOUT_SRCn is insensitive to the state of the maskable mapped CLKREQ#. CLKOUT_SRCn is either always running after ICC initialization, or always gated as globally configured via the corresponding CLKEN bit (residing inside iSCLK HIP register set.) ***Note:*** The output of this processing is referred to as Effective Mapped CLKREQ#.

8.7.4 Mask Control CLKREQ (MSKCKRQ)—Offset 100Ch

Controls Masking of Mapped CLKREQ#s for SRC clocks

Access Method

9.3 Overview

The Power Management Controller that handles all PCH power management related activities. This unit administers power management functions of the PCH including interfacing with other logic and controllers on the platform to perform power state transitions (such as SLP_S3# and PLTRST#); configure, manage and respond to wake events; aggregate and report latency tolerance information for devices and peripherals connected to and integrated into the PCH.

9.4 Signal Description

Name	Type	Description
GPD1_ACPRESENT	I	**ACPRESENT:** This input pin indicates when the platform is plugged into AC power or not. The PCH uses this information to implement the Deep Sx policies. For example, the platform may be configured to enter Deep Sx when in S4 or S5 and only when running on battery. This is powered by Deep Sx Well.
GPP_A12_BM_BUSY_N_SXEXITHLDOFF_N	I	**Bus Master Busy:** Generic bus master activity indication driven into the PCH. Can be configured to set the PM1_STS.BM_STS bit. Can also be configured to assert indications transmitted from the PCH to the processor using the PMSYNCH pin.
DSW_PWROK	I	**DSW PWROK**: Power OK Indication for the VCCDSW3_3 voltage rail. When DSW_PWROK goes high, the PCH will drive SLP_SUS# high. Because SLP_SUS# is now defined as needing to be high at least by the time RSMRST# goes high, DSW_PWROK now must lead RSMRST# This signal is in the RTC well.
GPD2_GBE_WAKE_N	I	**GbE WAKE**: is an active low wake indicator from the GbE PHY to the one GbE MAC. ***Note:*** External pull-up required.

Name	Type	Description
GPD11_GBEPHY	O	**GBE PHY Power Control:** This is used to indicate that power needs to be restored to the I219 PHY
PCH_PWROK	I	**PCH Power OK:** When asserted, PCH_PWROK is an indication to the PCH that all of its core power rails have been stable for at least 5 ms. PCH_PWROK can be driven asynchronously. When PCH_PWROK is negated, the PCH asserts PLTRST#. ***Note:*** PCH_PWROK must not glitch, even if RSMRST# is low.
GPP_B13_PLTRST_N	O	**Platform Reset:** The PCH asserts PLTRST# to reset devices on the platform (such as SIO, PCIe devices, LAN, processor, and so forth.). The PCH asserts PLTRST# during power-up and when S/W initiates a hard reset sequence through the Reset Control register (I/O port CF9h). The PCH drives PLTRST# active a minimum of 1 ms when initiated through the Reset Control register (I/O port CF9h). ***Note:*** PCI/PCIe* 2.0 specification requires that the power rails associated with PCI/PCIe* (typically the 3.3V, 5V, and 12V core well rails) have been valid for 100 ms prior to PLTRST# de-assertion. System designers must ensure the requirement is met on the platform.
GPP_A11_PME_N	I / OD	**Power Management Event**: Driven by devices to wake the system or issue SCI.
GPD3_PWRBTN_N	I	**Power Button:** The Power Button will cause SMI# or SCI to indicate a system request to go to a sleep state. If the system is already in a sleep state, this signal will cause a wake event. If PWRBTN# is pressed for more than four seconds, this will cause an unconditional transition (power button override) to the S5 state. Override will occur even if the system is in the S3-S4 states. This signal has an internal pull-up resistor and has an internal 16 ms de-bounce on the input. ***Note:*** Upon entry to S5 due to a power button override, if Deep Sx is enabled and conditions are met, the system will transition to Deep Sx.
RSMRST_N	I	Resume Well Reset: When high, this pin indicates that all power rails associated with the PCH Primary well are valid and stable. This signal must be asserted for at least T201 after the primary wells are valid**.**
GPD6_SLP_A_N	O	**SLP_A#:** Used to control power to the active sleep well. The PCH no longer has an ASW well, but there could still be one on the board. ***Note:*** There is no corresponding APWROK signal input to the PCH, but the PCH does have an internally generated version of APWROK that is timed from SLP_A#.
SLP_GBE_N	O	**GBE Sub-System Sleep Control:** When SLP_GBE# is de-asserted it indicates that the PHY device must be powered. When SLP_GBE# is asserted, power can be shut off to the PHY device. SLP_GBE# will always be de-asserted in S0 and anytime SLP_A# is de-asserted.
GPP_B12_GLB_RST_WARN_N	O	**Global Reset Warn**: An early indication that the PCH has detected a condition that will cause it to signal the system to perform a global reset.
GPD_D4_SLP_S3_N	O	**S3 Sleep Control:** SLP_S3# is for power plane control. This signal shuts off power to all non-critical systems when in S3 (Suspend To RAM), S4 (Suspend to Disk), or S5 (Soft Off) states.
GPD_D5_SLP_S4_N	O	**S4 Sleep Control**: SLP_S4# is for power plane control. This signal shuts power to all non-critical systems when in the S4 (Suspend to Disk) or S5 (Soft Off) state. ***Note:*** This pin must be used to control the DRAM power in order to use the PCH DRAM power-cycling feature.
GPD_D10_SLP_S5_N	O	**S5 Sleep Control:** SLP_S5# is for power plane control. This signal is used to shut power off to all non-critical systems when in the S5 (Soft Off) states.
SLP_SUS_N	O	**Deep Sx Indication:** When asserted (driven low), this signal indicates PCH is in Deep Sx state where internal Sus power is shut off for enhanced power saving. When de-asserted (driven high), this signal indicates exit from Deep Sx state and Sus power can be applied to PCH. If Deep Sx is not supported, then this pin can be left unconnected. ***Note:*** This pin is in the DSW power well.

Name	Type	Description
GPP_A15_SUSACK_N	I	**SUSACK#:** If Deep Sx is supported, the BMC/motherboard controlling logic must change SUSACK# to match SUSWARN# once the BMC/motherboard controlling logic has completed the preparations discussed in the description for the SUSWARN# pin. ***Note:*** SUSACK# is only required to change in response to SUSWARN# if Deep Sx is supported by the platform.
GPD_SUSCLK	O	**Suspend Clock:** This clock is an output of the RTC generator circuit to use by other chips for refresh clock.
GPP_A13_SUSWARN_N_SUSWRDNACK	O	**SUSWARN#:** This pin asserts low when the PCH is planning to enter the Deep Sx power state and remove Primary power (using SLP_SUS#). The BMC/motherboard controlling logic must observe edges on this pin, preparing for SUS well power loss on a falling edge and preparing for Primary well related activity (host/Intel ME wakes and runtime events) on a rising edge. SUSACK# must be driven to match SUSWARN# once the above preparation is complete. SUSACK# should be asserted within a minimal amount of time from SUSWARN# assertion as no wake events are supported if SUSWARN# is asserted but SUSACK# is not asserted. Platforms supporting Deep Sx, but not wishing to participate in the handshake during wake and Deep Sx entry may tie SUSACK# to SUSWARN#. This pin is multiplexed with SUSPWRDNACK since it is not needed in Deep Sx supported platforms.
GPP_A13_SUSWARN_N_SUSWRDNACK	O	**SUSPWRDNACK:** Active high. Asserted by the PCH on behalf of the Intel ME when it does not require the PCH Primary well to be powered. Platforms are not expected to use this signal when the PCH Deep Sx feature is used.
GPP_A12_BMBUSY_N_SXEXITHLDOFF_N	I	**Sx Exit Holdoff Delay**: Delay exit from Sx state after SLP_A# is de-asserted. In LPC mode, the SPI bus will be tristated so that an external device can access the SPI component. In the eSPI/LPC interface is in eSPI mode this input has no effect.
SYS_PWROK	I	**System Power OK:** This generic power good input to the PCH is driven and utilized in a platform-specific manner. While PCH_PWROK always indicates that the core wells of the PCH are stable, SYS_PWROK is used to inform the PCH that power is stable to some other system component(s) and the system is ready to start the exit from reset.
SYS_RESET_N	I	**System Reset**: This pin forces an internal reset after being de-bounced. The PCH will reset immediately if the SMBus is idle; otherwise, it will wait up to 25 ms ±2 ms for the SMBus to idle before forcing a reset on the system.
WAKE_N	I / OD	**PCI Express Wake Event in Sx:** Input Pin in Sx. Sideband wake signal on PCI Express asserted by components requesting wake up. During S0, this pin functions as an OBFF indicator (open drain in S0). ***Note:*** External pull-up required.
GPP_A8_CLKRUN_N	I / OD	**LPC Clock Run:** Used to control CLKOUT_LPC[2:1]. Connects to peripherals that need to request clock restart or prevention of clock stopping.
GPP_K10_PE_RST_N	I	**PE_RST_N:** Reset signal into the QAT and 10/1 GbE functions. This signal must be driven/connected any time QAT or 10/1GbE functionality is enabled.
GPP_B0_CORE_VID_0, GPP_B1_CORE_VID_1	OD	**CORE VID 0/1**: OD outputs that are used to encode one of 4 possible voltages that the Vcc_AVID plane should be running at. This is SKU dependent. If AVID is not supported on a SKU, the these pins will default to 11b (with external pull-up resistors).
GPP_I4_DO_RESET_IN_N	I	**DO_RESET_IN_N**: Used by non-legacy PCHs. The DO_RESET_OUT_N from the legacy PCH drives this signal. Default for this pin is GPIO, so it is not expected to have this native function on the pin unless multi-PCH functionality is being explicitly supported.
GPP_I5_DO_RESET_OUT_N	IOD	**DO_RESET_OUT_N**: Signal from the legacy PCH to the non-legacy PCH(s)used to coordinate power up and power down sequencing between the PCHs. Default for this pin is GPIO, so it is not expected to have this native function on the pin unless multi-PCH functionality is being explicitly supported. Default for this pin is GPIO, so it is not expected to have this native function on the pin unless multi-PCH functionality is being explicitly supported.

Name	Type	Description
GPP_I6_RESET_DONE	IOD	**RESET_DONE**: Output of the non-legacy PCHs and input to the Legacy PCH. Used to indicate that the non-legacy PCHs have accomplished their appropriate reset sequences and the legacy PCH can continue on.
GPP_G17_ADR_COMPLETE	O	Active when the ADR timer expires to indicate that the self refresh is complete, or that the memory can now be put in battery backup mode.

9.5 Integrated Pull-ups and Pull-downs

Signal	Resistor Type	Value	Notes
GPD1_ACPRESENT	Pull-down	15 kΩ - 40 kΩ	1
GPD2_GBE_WAKE_N	Pull-down	15 kΩ - 40 kΩ	1
GPD3_PWRBTN_N	Pull-up	15 kΩ - 40 kΩ	
GPP_A11_PME_N	Pull-up	15 kΩ - 40 kΩ	
GPP_A15_SUSACK_N	Pull-up	15 kΩ - 40 kΩ	
WAKE_N	Pull-down	15 kΩ - 40 kΩ	1, 2

Notes:
1. Pull-down is configurable and can be enabled in Deep Sx state; refer to DSX_CFG register (RCBA+3334h) for more details.
2. Open drain when driven as OBFF indication
3. Non-DSW pull-ups and pull-downs are not valid until all voltages are valid.

9.6 I/O Signal Planes and States

Signal Name	Power Plane	During Reset	Immediately after Reset	S3/S4/S5	Deep Sx
BMBUSY_N	Primary	Undriven	Undriven	Undriven	Off
RSMRST_N	RTC	Undriven	Undriven	Undriven	Undriven
PCH_PWROK	RTC	Undriven	Undriven	Undriven	Undriven
SYS_PWROK	Primary	Undriven	Undriven	Undriven	Off
DSW_PWROK	RTC	Undriven	Undriven	Undriven	Undriven
GLB_RST_WARN_N[1,6]	Primary	Driven High	Driven High	Driven High	Off
SLP_S3_N[6]	DSW	Driven Low	Driven High	Driven Low	Driven Low
SLP_S4_N[6]	DSW	Driven Low	Driven High	Driven High/ Driven Low[2]	Driven High/ Driven Low[9]
SLP_S5_N[6]	DSW	Driven Low	Driven High	Driven High/ Driven Low[3]	Driven High/ Driven Low[9]
SLP_GBE_N[6]	DSW	Driven Low	Driven Low	Driven High/ Driven Low[7]	Driven High/ Driven Low[7]
SLP_A_N[6]	DSW	Driven Low	Driven High	Driven High/ Driven Low[12]	Driven High/ Driven Low[12]
SLP_SUS_N[6]	DSW	Driven Low	Driven High	Driven High	Driven Low
SUSCLK[10]	DSW	Driven Low	Toggling	Toggling	Toggling[10]
SUSWARN_N/ SUSPWRDNACK[6,10]	Primary	Driven Low	Driven Low	Driven Low[5]	Off
SUSACK_N	Primary	Internal Pull-up	Internal Pull-up	Internal Pull-up	Off
ACPRESENT_N[6,10]	DSW	Undriven / Driven Low[4]	Undriven	Undriven	Undriven / Driven Low[8]

Signal Name	Power Plane	During Reset	Immediately after Reset	S3/S4/S5	Deep Sx
WAKE_N	DSW	Undriven	Undriven	Undriven	Undriven / Driven Low[8]
GBE_WAKE_N	DSW	Undriven	Undriven	Undriven	Undriven / Driven Low[8]
GPD11_GBEPHY[10]	DSW	Driven Low	Driven Low	Driven Low	Driven Low
PME_N	Primary	Internal Pull-up	Internal Pull-up	Internal Pull-up	Off
PWRBTN_N	DSW	Internal Pull-up	Internal Pull-up	Internal Pull-up	Internal Pull-up
SYS_RESET_N	Primary	Undriven	Undriven	Undriven	Off
PLTRST_N	Primary	Driven Low	Driven High	Driven Low	Off
SXEXITHLDOFF_N	Primary	Undriven	Undrive	Undriven	Off
ADR_COMPLETE	Primary	0	0/1	0/1	Off

Notes:
1. Driven High during S0 and driven Low during S0 CS.
2. SLP_S4# is driven high in S3, driven low in S4/S5.
3. SLP_S5# is driven high in S3/S4, driven low in S5.
4. In non-Deep Sx mode, pin is driven low.
5. Based on wake events and ME state. SUSPWRDNACK is always '0' while in M0 or M3, but can be driven to '0' or '1' while in Moff state. SUSPWRDNACK is the default mode of operation. If Deep Sx is supported, then subsequent boots will default to SUSWARN#.
6. The pin requires glitch-free output sequence. The pad should only be pulled low momentarily when the corresponding buffer power supply is not stable.
7. Based on wake event and ME state.
8. Pull-down is configurable and can be enabled in Deep Sx state; refer to DSX_CFG register (RCBA+3334h) for more details.
9. When platform enters Deep Sx, the SLP_S4# and SLP_S5# pin will retain the value it held prior to Deep Sx entry.
10. Internal weak pull resistor is default off but configurable (pu/pd/none) after boot.
11. The CORE_VID pin output can be 0 or 1 depending on fuse.
12. Pin state is a function of whether the platform is configured to have ME on or off in Sx.
13. Signal names have been shortened to just the native functions.

9.7 Functional Description

9.7.1 Features

- Support for *Advanced Configuration and Power Interface, Version 4.0a* providing power and thermal management
  - — ACPI 24-Bit Timer SCI and SMI# Generation
- PCI PME# signal for wake up from low-power states
- System Sleep State Control
  - — ACPI S3 state – Suspend to RAM
  - — ACPI S4 state – Suspend-to-Disk
  - — ACPI G2/S5 state – Soft Off
  - — Power Failure Detection and Recovery
  - — Deep Sx
- Intel Management Engine Power Management Support
  - — Wake events from the Intel Management Engine (enabled from all S-States including catastrophic S5 conditions)

- SLP_S0# signal for external platform VR power gating or EC power management handling during lower power condition

9.7.2 PCH and System Power States

Table 9-1 shows the power states defined for PCH-based platforms. The state names generally match the corresponding ACPI states.

Table 9-1. General Power States for Systems Using the PCH

State/ Substates	Legacy Name/Description
G0/S0/C0	**Full On**: Processor operating. Individual devices may be shut down or be placed into lower power states to save power.
G0/S0/Cx	**Cx State**: Cx states are processor power states within the S0 system state that provide for various levels of power savings. The processor manages c-state itself. The actual c-state is not passed to the PCH. Only c-state related messages are sent to the PCH and PCH will base its behavior on the actual data passed.
G1/S3	**Suspend-To-RAM:** The system context is maintained in system DRAM, but power is shut off to non-critical circuits. Memory is retained and refreshes continue. All external clocks stop except RTC.
G1/S4	**Suspend-To-Disk:** The context of the system is maintained on the disk. All power is then shut off to the system except for the logic required to resume.
G2/S5	**Soft Off:** System context is not maintained. All power is shut off except for the logic required to restart. A full boot is required when waking.
Deep Sx	**Deep Sx:** An optional low power state where system context may or may not be maintained depending upon entry condition. All power is shut off except for minimal logic that allows exiting Deep Sx. If Deep Sx state was entered from S3 state, then the resume path will place system back into S3. If Deep Sx state was entered from S4 state, then the resume path will place system back into S4. If Deep Sx state was entered from S5 state, then the resume path will place system back into S5.
G3	**Mechanical OFF:** System context not maintained. All power is shut off except for the RTC. No "Wake" events are possible. This state occurs if the user turns off a mechanical switch, or if the system power supply is at a level that is insufficient to power the "waking" logic. When system power returns, transition will depend on the state just prior to the entry to G3 and the AFTERG3_EN bit in the GEN_PMCON_3 register (D31:F0, offset A4). Refer to Table 9-7 for more details.

Table 9-2 shows the transitions rules among the various states.

Note: Transitions among the various states may appear to temporarily transition through intermediate states. For example, in going from S0 to S4, it may appear to pass through the G1/S3 state. These intermediate transitions and states are not listed in the Table 9-2.

Table 9-2. State Transition Rules for the PCH (Sheet 1 of 2)

Present State	Transition Trigger	Next State
G0/S0/C0	• OPI Msg • SLP_EN bit set • Power Button Override[2,5] • Mechanical Off/Power Failure	• G0/S0/Cx • G1/Sx or G2/S5 state • G2/S5 • G3
G0/S0/Cx	• OPI Msg • Power Button Override[2,5] • Mechanical Off/Power Failure	• G0/S0/C0 • S5 • G3
G1/S3	• Any Enabled Wake Event • Power Button Override[2,5] • Conditions met as described in Section 9.7.7.6.1 and Section 9.7.7.6.2 • Mechanical Off/Power Failure	• G0/S0/C0[2] • G2/S5 • Deep Sx • G3

Table 9-2. State Transition Rules for the PCH (Sheet 2 of 2)

Present State	Transition Trigger	Next State
G1/S4	• Any Enabled Wake Event • Power Button Override[2,5] • Conditions met as described in Section 9.7.7.6.1 and Section 9.7.7.6.2 • Mechanical Off/Power Failure	• G0/S0/C0[2] • G2/S5 • Deep Sx • G3
G2/S5	• Any Enabled Wake Event • Conditions met as described in Section 9.7.7.6.1 and Section 9.7.7.6.2 • Mechanical Off/Power Failure	• G0/S0/C0[2] • Deep Sx • G3
G2/Deep Sx	• Any Enabled Wake Event • ACPRESENT Assertion • Mechanical Off/Power Failure	• G0/S0/C0[2] • G1/S3, G1/S4 or G2/S5 (see Section 9.7.7.6.2) • G3
G3	• Power Returns	• S0/C0 (reboot) or G2/S5[3] (stay off until power button pressed or other wake event)[1,2]

Notes:
1. Some wake events can be preserved through power failure.
2. Includes all other applicable types of events that force the host into and stay in G2/S5.
3. If the system was in G1/S4 before G3 entry, then the system will go to S0/C0 or G1/S4.
4. Upon entry to S5 due to a power button override, if Deep Sx is enabled and conditions are met per Section 9.7.7.6, the system will transition to Deep Sx.

9.7.3 System Power Planes

The system has several independent power planes, as described in Table 9-3.

Note: When a particular power plane is shut off, it should go to a 0V level.

Table 9-3. System Power Plane (Sheet 1 of 2)

Plane	Controlled By	Description
Processor	SLP_S3# signal	The SLP_S3# signal can be used to cut the power to the processor completely.
Main (Applicable to Platform, PCH does not have a Main well)	SLP_S3# signal	When SLP_S3# goes active, power can be shut off to any circuit not required to wake the system from the S3 state. Since the S3 state requires that the memory context be preserved, power must be retained to the main memory. The processor, devices on the PCI bus, LPC I/F, and PCI Express will typically be power-gated when the Main power plane is shut, although there may be small subsections powered. ***Note:*** The PCH power id not controlled by the SLP_S3# signal, but instead by the SLP_SUS# signal.
Memory	SLP_S4# signal SLP_S5# signal	When SLP_S4# goes active, power can be shut off to any circuit not required to wake the system from the S4. Since the memory context does not need to be preserved in the S4 state, the power to the memory can also be shut down. When SLP_S5# goes active, power can be shut off to any circuit not required to wake the system from the S5 state. Since the memory context does not need to be preserved in the S5 state, the power to the memory can also be shut.
Intel ME	SLP_A#	SLP_A# signal is asserted when the ME platform goes to M-Off. Depending on the platform, this pin may be used to control power to various devices that are part of the ME sub-system in the platform.
LAN	SLP_GBE#	This signal is asserted in Sx/M-Off when both host and Intel ME WoL are not supported. This signal can be use to control power to the Intel GbE PHY.

Table 9-3. System Power Plane (Sheet 2 of 2)

Plane	Controlled By	Description
Suspend Well	SLP_SUS#	This signal is asserted when the Sus rails can be externally shut off for enhanced power saving.
DEVICE[n]	Implementation Specific	Individual subsystems may have their own power plane. For example, GPIO signals may be used to control the power to disk drives, audio amplifiers, or the display screen.

9.7.4 SMI#/SCI Generation

Upon any enabled SMI event taking place while the End of SMI bit is set, the PCH will clear the EOS bit and assert SMI to the processor, which will cause it to enter SMM space. SMI assertion is performed using a Virtual Legacy Wire message. Prior system generations (those based upon legacy processors) used an actual SMI# pin.

Once the SMI VLW has been delivered, the PCH takes no action on behalf of active SMI events until Host software sets the EOS bit. At that point, if any SMI events are still active, the PCH will send another SMI VLW message.

The SCI is a level-mode interrupt that is typically handled by an ACPI-aware operating system. In non-APIC systems (which is the default), the SCI IRQ is routed to one of the 8259 interrupts (IRQ 9, 10, or 11). The 8259 interrupt controller must be programmed to level mode for that interrupt.

In systems using the APIC, the SCI can be routed to interrupts 9, 10, 11, 20, 21, 22, or 23. The interrupt polarity changes depending on whether it is on an interrupt shareable with a PIRQ or not. The interrupt remains asserted until all SCI sources are removed.

Table 9-4 shows which events can cause an SMI and SCI.

Note: Some events can be programmed to cause either an SMI or SCI. The usage of the event for SCI (instead of SMI) is typically associated with an ACPI-based system. Each SMI or SCI source has a corresponding enable and status bit.

Table 9-4. Causes of SMI and SCI (Sheet 1 of 3)

Cause	SCI	SMI	Additional Enables (Note 1)	Where Reported
PME#	Yes	Yes	PME_EN=1	PME_STS
PME_B0 (Internal, Bus 0, PME-Capable Agents)	Yes	Yes	PME_B0_EN=1	PME_B0_STS
PCI Express* PME Messages	Yes	Yes	PCI_EXP_EN=1 (Not enabled for SMI)	PCI_EXP_STS
PCI Express Hot-Plug Message	Yes	Yes	HOT_PLUG_EN=1 (Not enabled for SMI)	HOT_PLUG_STS
Power Button Press	Yes	Yes	PWRBTN_EN=1	PWRBTN_STS
Power Button Override (Note 6)	Yes	No	None	PRBTNOR_STS
RTC Alarm	Yes	Yes	RTC_EN=1	RTC_STS
ACPI Timer overflow (2.34 seconds)	Yes	Yes	TMROF_EN=1	TMROF_STS
GPIO (Note 8)	Yes	Yes		
GBE_WAKE#	Yes	Yes	LAN_WAKE#_EN=1	LAN_WAKE#_STS
TCO SCI message from processor	Yes	No	None	TCOSCI_STS
TCO SCI Logic	Yes	No	TCOSCI_EN=1	TCOSCI_STS
TCO SMI Logic	No	Yes	TCO_EN=1	TCO_STS

Table 9-4. Causes of SMI and SCI (Sheet 2 of 3)

Cause	SCI	SMI	Additional Enables (Note 1)	Where Reported
TCO SMI –	No	Yes	None	NEWCENTURY_STS
TCO SMI – TCO TIMEROUT	No	Yes	None	TIMEOUT
TCO SMI – OS writes to TCO_DAT_IN register	No	Yes	None	SW_TCO_SMI
TCO SMI – Message from processor	No	Yes	None	OPISMI_STS
TCO SMI – NMI occurred (and NMIs mapped to SMI)	No	Yes	NMI2SMI_EN=1	NMI2SMI_STS
TCO SMI – INTRUDER# signal goes active	No	Yes	INTRD_SEL=10	INTRD_DET
TCO SMI – Change of the BIOSWE (D31:F0:DCh, Bit 0) bit from 0 to 1	No	Yes	BLE=1	BIOSWR_STS
TCO SMI – Write attempted to BIOS	No	Yes	BIOSWE=1	BIOSWR_STS
BIOS_RLS written to 1 (Note 7)	Yes	No	GBL_EN=1	GBL_STS
GBL_RLS written to	No	Yes	BIOS_EN=1	BIOS_STS
Write to B2h register	No	Yes	APMC_EN = 1	APM_STS
Periodic timer expires	No	Yes	PERIODIC_EN=1	PERIODIC_STS
64 ms timer expires	No	Yes	SWSMI_TMR_EN=1	SWSMI_TMR_STS
Enhanced USB Legacy Support Event	No	Yes	LEGACY_USB2_EN = 1	LEGACY_USB2_STS
Serial IRQ SMI reported	No	Yes	None	SERIRQ_SMI_STS
Device monitors match address in its range	No	Yes	None	DEVTRAP_STS
SMBus Host Controller	No	Yes	SMB_SMI_EN Host Controller Enabled	SMBus host status reg.
SMBus Slave SMI message	No	Yes	None	SMBUS_SMI_STS
SMBus SMBALERT# signal active	No	Yes	None	SMBUS_SMI_STS
SMBus Host Notify message received	No	Yes	HOST_NOTIFY_INTREN	SMBUS_SMI_STS HOST_NOTIFY_STS
Access microcontroller 62h/66h	No	Yes	MCSMI_EN	MCSMI_STS
SLP_EN bit written to 1	No	Yes	SLP_SMI_EN=1	SLP_SMI_STS
SPI Command Completed	No	Yes	None	SPI_STS
eSPI SCI/SMI Request	Yes	Yes	eSPI_SCI_EN See eSPI section.	eSPI_SCI_STS eSPI_SMI_STS
Software Generated GPE	Yes	Yes	SWGPE_EN=1	SWGPE_STS
ME	Yes	Yes	ME_SCI_EN=1 ME_SCI_EN=0; ME_SMI_EN=1;	ME_SCI_STS ME_SMI_STS
GPIO Lockdown Enable bit changes from '1' to '0'	No	Yes	GPIO_UNLOCK_SMI_EN=1	GPIO_UNLOCK_SMI_STS
USB3 (xHCI) SMI Event	No	Yes	XHCI_SMI_EN=1	XHCI_SMI_STS
Wake Alarm Device Timer	Yes	Yes	WADT_EN	WADT_STS

Table 9-4. Causes of SMI and SCI (Sheet 3 of 3)

Cause	SCI	SMI	Additional Enables (Note 1)	Where Reported

Notes:
1. SCI_EN must be 1 to enable SCI, except for BIOS_RLS. SCI_EN must be 0 to enable SMI.
2. SCI can be routed to cause interrupt 9:11 or 20:23 (20:23 only available in APIC mode).
3. GBL_SMI_EN must be 1 to enable SMI.
4. EOS must be written to 1 to re-enable SMI for the next 1.
5. The PCH must have SMI fully enabled when the PCH is also enabled to trap cycles. If SMI is not enabled in conjunction with the trap enabling, then hardware behavior is undefined.
6. When a power button override first occurs, the system will transition immediately to S5. The SCI will only occur after the next wake to S0 if the residual status bit (PRBTNOR_STS) is not cleared prior to setting SCI_EN.
7. GBL_STS being set will cause an SCI, even if the SCI_EN bit is not set. Software must take great care not to set the BIOS_RLS bit (which causes GBL_STS to be set) if the SCI handler is not in place.
8. Refer to GPIO chapter for specific GPIOs enabled for SCIs and/or SMIs.

9.7.4.1 PCI Express SCI

PCI Express ports and the processor have the ability to cause a Power Management Event (PME) using messages. When a PME message is received, the PCH will set the PCI_EXP_STS bit. If the PCI_EXP_EN bit is also set, the PCH can cause an SCI using the GPE1_STS register.

9.7.4.2 PCI Express Hot-Plug

PCI Express has a hot-plug mechanism and is capable of generating a SCI using the GPE1 register. It is also capable of generating an SMI. However, it is not capable of generating a wake event. This is not a surprise hot plug.

9.7.5 C-States

PCH-based systems implement C-states by having the processor control the states. The chipset exchanges messages with the processor as part of the C-state flow, but the chipset does not directly control any of the processor impacts of C-states, such as voltage levels or processor clocking. In addition to the messages, the PCH also provides additional information to the processor using a sideband pin (PM_SYNC, PM_SYNC2).

9.7.6 Dynamic 24 MHz Clock Control

The 24 MHz clock can be dynamically controlled independent of any other low-power state. The Dynamic 24 MHz Clock control is handled using the CLKRUN# signal.

9.7.6.1 Conditions for Checking the 24 MHz Clock

When there is a lack of activity, the PCH has the capability to stop the 24 MHz clocks to conserve power. “Clock activity” is defined as any activity that would require the 24 MHz clock to be running.

Any of the following conditions will indicate that it is **not okay** to stop the 24 MHz clock:

- Cycles on LPC
- SERIRQ activity

9.7.6.2 Conditions for Maintaining the 24 MHz Clock

LPC or any other devices that wish to maintain the 24 MHz clock running will observe the CLKRUN# signal de-asserted, and then must re-assert it (drive it low) within 92 clocks.

- When the PCH has tri-stated the CLKRUN# signal after de-asserting it, the PCH then checks to see if the signal has been re-asserted (externally).
- After observing the CLKRUN# signal asserted for one clock, the PCH again starts asserting the signal.
- If an internal device needs the PCI bus, the PCH asserts the CLKRUN# signal.

9.7.6.3 Conditions for Stopping the 24 MHz Clock

- When there is a lack of activity (as defined above) for ninety 24 MHz clock cycles, the PCH de-asserts (drive high) CLKRUN# for one clock and then tri-states the signal.
- If no device drives CLKRUN# low within 93 clock cycles after it has been de-asserted, the PCH will stop the 24 MHz clocks.

9.7.6.4 Conditions for Re-starting the 24 MHz Clock

- A peripheral asserts CLKRUN# to indicate that it needs the 24 MHz clock re-started.
- Observing the CLKRUN# signal asserted externally for one (free running) clock, the PCH again starts driving CLKRUN# asserted.

If an internal source requests the clock to be re-started, the PCH re-asserts CLKRUN#, then the PCH will start the 24 MHz clocks.

9.7.7 Sleep States

9.7.7.1 Sleep State Overview

The PCH directly supports different sleep states (S1–S5), which are entered by methods such as setting the SLP_EN bit or due to a Power Button press. The entry to the Sleep states is based on several assumptions:

- The G3 state cannot be entered using any software mechanism. The G3 state indicates a complete loss of power.

9.7.7.2 Initiating Sleep State

Sleep states (S1–S5) are initiated by:

- Masking interrupts, turning off all bus master enable bits, setting the desired type in the SLP_TYP field, and then setting the SLP_EN bit. The hardware then attempts to gracefully put the system into the corresponding Sleep state.
- Pressing the PWRBTN# Signal for more than four seconds to cause a power button Override event. In this case the transition to the S5 state is less graceful, since there are no dependencies on OPI messages from the processor or on clocks other than the RTC clock.
- Assertion of the THERMTRIP# signal will cause a transition to the S5 state. This can occur when system is in S0 or S1 state.
- Shutdown by integrated manageability functions (ASF/Intel AMT)
- Internal watchdog timer timeout events

- SMBus unconditional shutdown

Table 9-5. Sleep Types

Sleep Type	Comment
S3	The PCH asserts SLP_S3#. The SLP_S3# signal controls the power to non-critical circuits. Power is only retained to devices needed to wake from this sleeping state, as well as to the memory.
S4	The PCH asserts SLP_S3# and SLP_S4#. The SLP_S4# signal shuts off the power to the memory subsystem. Only devices needed to wake from this state should be powered.
S5	The PCH asserts SLP_S3#, SLP_S4# and SLP_S5#.

9.7.7.3 Exiting Sleep States

Sleep states (S1–S5) are exited based on wake events. The wake events forces the system to a full on state (S0), although some non-critical subsystems might still be shut off and have to be brought back manually. For example, the hard disk may be shut off during a sleep state and have to be enabled using a GPIO pin before it can be used.

Upon exit from the PCH-controlled sleep states, the WAK_STS bit is set. The possible causes of wake events (and their restrictions) are shown in Table 9-6.

Table 9-6. Causes of Wake Events (Sheet 1 of 2)

Cause	How Enabled	Wake from Sx	Wake from Deep Sx	Wake from Sx After Power Loss (Note 1)	Wake from "Reset" Types (Note 2)
RTC Alarm	Set RTC_EN bit in PM1_EN register.	Yes	Yes	Yes	No
Power Button	Always enabled as Wake event.	Yes	Yes	Yes	Yes
Any GPIOs enabled for wake from the set of GPP_A to GPP_E		Yes	No	No	No
GBE_WAKE#	Enabled natively (unless pin is configured to be in GPIO mode)	Yes	Yes	Yes	Yes
GBE	Will use PME#. Wake enable set with LAN logic.	Yes	No	Yes	No
Intel® High Definition Audio	Event sets PME_B0_STS bit; PM_B0_EN must be enabled. Can not wake from S5 state if it was entered due to power failure or power button override.	Yes	No	Yes	No
Primary PME#	PME_B0_EN bit in GPE0_EN[127:96] register.	Yes	No	Yes	No
Secondary PME#	Set PME_EN bit in GPE0_EN[127:96] register.	Yes	No	Yes	No
PCI Express WAKE# pin	PCIEXPWAK_DIS bit.	Yes	Yes	Yes	No
SMBALERT#	(Note 4)	Yes	No	Yes	Yes
SMBus Slave Wake Message (01h)	Wake/SMI# command always enabled as a Wake event. ***Note:*** SMBus Slave Message can wake the system from S3–S5, as well as from S5 due to Power Button Override.	Yes	No	Yes	Yes
SMBus Host Notify message received	HOST_NOTIFY_WKEN bit SMBus Slave Command register. Reported in the SMB_WAK_STS bit in the GPE0_STS register.	Yes	No	Yes	Yes

Table 9-6. Causes of Wake Events (Sheet 2 of 2)

Cause	How Enabled	Wake from Sx	Wake from Deep Sx	Wake from Sx After Power Loss (Note 1)	Wake from "Reset" Types (Note 2)
Intel® ME Non-Maskable Wake	Always enabled as a wake event.	Yes	No	Yes	Yes
Integrated WoL Enable Override	WoL Enable Override bit (in Configuration Space).	Yes	No	Yes	Yes
Wake Alarm Device	WADT_EN in GPE0_EN[127:96]	Yes	Yes	No	No

Notes:
1. This column represents what the PCH would honor as wake events but there may be enabling dependencies on the device side which are not enabled after a power loss.
2. Reset Types include: Power Button override, Intel ME initiated power button override, Intel ME initiated host partition reset with power down, Intel ME Watchdog Timer, SMBus unconditional power down, processor thermal trip, PCH catastrophic temperature event.
3. SMBALERT# signal is muxed with a GPIO pin that defaults to GPIO mode. Hence, SMBALERT# related wakes are possible only when this GPIO is configured in native mode, which means that BIOS must program this GPIO to operate in native mode before this wake is possible. Because GPIO configuration is in the resume well, wakes remain possible until one of the following occurs: BIOS changes the pin to GPIO mode, a G3 occurs or Deep Sx entry occurs.

9.7.7.4 PCI Express WAKE# Signal and PME Event Message

PCI Express ports can wake the platform from any sleep state (S1, S3, S4, or S5 or Deep Sx) using the WAKE# pin. WAKE# is treated as a wake event, but does not cause any bits to go active in the GPE_STS register.

PCI Express ports and the processor have the ability to cause PME using messages. These are logically OR'd to set the single PCI_EXP_STS bit. When a PME message is received, the PCH will set the PCI_EXP_STS bit. If the PCI_EXP_EN bit is also set, the PCH can cause an SCI via GPE0_STS register.

9.7.7.5 Sx-G3-Sx, Handling Power Failures

Depending on when the power failure occurs and how the system is designed, different transitions could occur due to a power failure.

The AFTERG3_EN bit provides the ability to program whether or not the system should boot once power returns after a power loss event. If the policy is to not boot, the system remains in an S5 state (unless previously in S4). There are only three possible events that will wake the system after a power failure:

1. **PWRBTN#:** PWRBTN# is always enabled as a wake event. When RSMRST# is low (G3 state), the PWRBTN_STS bit is reset. When the PCH exits G3 after power returns (RSMRST# goes high), the PWRBTN# signal is already high (because V_{CC}-standby goes high before RSMRST# goes high) and the PWRBTN_STS bit is 0.
2. **RTC Alarm:** The RTC_EN bit is in the RTC well and is preserved after a power loss. Like PWRBTN_STS the RTC_STS bit is cleared when RSMRST# goes low.

The PCH monitors both PCH_PWROK and RSMRST# to detect for power failures. If PCH_PWROK goes low, the PWROK_FLR bit is set. If RSMRST# goes low, PWR_FLR is set.

Although PME_EN is in the RTC well, this signal cannot wake the system after a power loss. PME_EN is cleared by RTCRST#, and PME_STS is cleared by RSMRST#.

Table 9-7. Transitions Due to Power Failure

State at Power Failure	AFTERG3_EN Bit	Transition When Power Returns
S0, S1, S3	1 0	S5 S0
S4	1 0	S4 S0
S5	1 0	S5 S0
Deep Sx	1 0	Deep Sx[1] S0

Note:
1. Entry state to Deep Sx is preserved through G3 allowing resume from Deep Sx to take appropriate path (that is, return to S3, S4 or S5).

9.7.7.6 Deep Sx

To minimize power consumption while in S3/S4/S5, the PCH supports a lower power, lower featured version of these power states known as Deep Sx. In the Deep Sx state, the Suspend wells are powered off, while the Deep Sx Well remains powered. A limited set of wake events are supported by the logic located in the DSW.

The Deep Sx capability and the SUSPWRDNACK pin functionality are mutually exclusive.

9.7.7.6.1 Entry Into Deep Sx

A combination of conditions is required for entry into Deep Sx.

All of the following must be met:

a. Intel ME in M-Off AND

((ACPRESENT = 0) AND ((DPS3_EN_DC AND S3) OR (DPS4_EN_DC AND S4) OR (DPS5_EN_DC AND S5)))

Table 9-8. Supported Deep Sx Policy Configurations

Configuration	DPS3_EN_DC	DPS4_EN_DC	DPS4_EN_AC	DPS5_EN_DC	DPS5_EN_AC
1. Enabled in S5 when on battery (ACPRESENT = 0)	0	0	0	1	0
2. Enabled in S4 and S5 when on battery (ACPRESENT = 0)	0	1	0	1	0
3. Enabled in S3, S4 and S5 when on battery (ACPRESENT = 0)	1	1	0	1	0
4. Deep S3/S4/ S5 disabled	0	0	0	0	0

Note: All other configuration is RESERVED.

The PCH also performs a SUSWARN#/SUSACK# handshake to ensure the platform is ready to enter Deep Sx. The PCH asserts SUSWARN# as notification that it is about to enter Deep Sx. Before the PCH proceeds and asserts SLP_SUS#, the PCH waits for SUSACK# to assert.

9.7.7.6.2 Exit from Deep Sx

While in Deep Sx, the PCH monitors and responds to a limited set of wake events (RTC Alarm, Power Button and WAKE#). Upon sensing an enabled Deep Sx wake event, the PCH brings up the suspend well by de-asserting SLP_SUS#.

Table 9-9. Deep Sx Wake Events

Event	Enable
RTC Alarm	RTC_DS_WAKE_DIS (RCBA+3318h:Bit 21)
Power Button	Always enabled
PCIe* WAKE# pin	PCIEXP_WAK_DIS
Wake Alarm Device	WADT_EN

ACPRESENT has some behaviors that are different from the other Deep Sx wake events. If the Intel ME has enabled ACPRESENT as a wake event then it behaves just like any other Intel ME Deep Sx wake event. However, even if ACPRESENT wakes are not enabled, if the host policies indicate that Deep Sx is only supported when on battery, then ACPRESENT going high will cause the PCH to exit Deep Sx. In this case, the suspend wells gets powered up and the platform remains in S3/M-Off, S4/M-Off or S5/M-Off. If ACPRESENT subsequently drops (before any host or Intel ME wake events are detected), the PCH will re-enter Deep Sx.

9.7.8 Event Input Signals and Their Usage

The PCH has various input signals that trigger specific events. This section describes those signals and how they should be used.

9.7.8.1 PWRBTN# (Power Button)

The PCH PWRBTN# signal operates as a "Fixed Power Button" as described in the *Advanced Configuration and Power Interface Specification.* The PWRBTN# signal has a 16 ms debounce on the input. The state transition descriptions are included in Table 9-10.

The transitions start as soon as the PWRBTN# is pressed (but after the debounce logic if PM_CFG.PB_DB_MODE='0'), and does not depend on when the Power Button is released. If PM_CFG.PB_DB_MODE='1', the transitions start as soon as the PWRBTN# is pressed, even before passing through the debounce logic. Subsequent PWRBTN# edges are ignored until the debounce period has expired. A power button override will force a transition to S5, even if PCH_PWROK is not active.

During the time that any SLP_* signal is stretched for an enabled minimum assertion width, the host wake-up is held off. As a result, it is possible that the user will press and continue to hold the Power Button waiting for the system to wake. Unfortunately, a 4 second press of the Power Button is defined as an unconditional power down, resulting in the opposite behavior that the user was intending. Therefore the Power Button Override Timer will be extended to 9-10 seconds while the SLP_* stretching timers are in progress. Once the stretching timers have expired, the Power Button will awake the system. If the user continues to press Power Button for the remainder of the 9-10 seconds it will result in the override condition to S5. Extension of the Power Button Override timer is only enforced following graceful sleep entry and during host partition resets with power cycle or power down. The timer is not extended immediately following power restoration after a global reset, G3 or Deep Sx.

Table 9-10. Transitions Due to Power Button

Present State	Event	Transition/Action	Comment
S0/Cx	PWRBTN# goes low	SMI or SCI generated (depending on SCI_EN, PWRBTN_EN and GLB_SMI_EN)	Software typically initiates a Sleep state
S3 – S5, Deep Sx	PWRBTN# goes low	Wake Event. Transitions to S0 state	Standard wakeup ***Note:*** Could be impacted by SLP_* min assertion.
G3	PWRBTN# pressed	None	No effect since no power Not latched nor detected ***Note:*** During G3 exit, PWRBTN# must be asserted at least until SLP_SUS# de-asserts to be registered by PCH as a valid wake event.
S0 – S4	PWRBTN# held low for at least 4 consecutive seconds	Unconditional transition to S5 state and if Deep Sx is enabled and conditions are met per Section 9.7.7.6, the system will then transition to Deep Sx.	No dependence on processor or any other subsystem

Power Button Override Function

If PWRBTN# is observed active for at least four consecutive seconds (always sampled after the output from debounce logic), the PCH should unconditionally transition to the G2/S5 state or Deep Sx, regardless of present state (S0 – S4), even if the PCH_PWROK is not active. In this case, the transition to the G2/S5 state or Deep Sx does not depend on any particular response from the processor, nor any similar dependency from any other subsystem.

The PWRBTN# status is readable to check if the button is currently being pressed or has been released. If PM_CFG.PB_DB_MODE='0', the status is taken after the debounce. If PM_CFG.PB_DB_MODE='1', the status is taken before the debounce. In either case, the status is readable using the PWRBTN_LVL bit.

Note: The 4-second PWRBTN# assertion should only be used if a system lock-up has occurred.

Sleep Button

The *Advanced Configuration and Power Interface Specification* defines an optional Sleep button. It differs from the power button in that it only is a request to go from S0 to S1–S4 (not S5). Also, in an S5 state, the Power Button can wake the system, but the Sleep Button cannot.

Although the PCH does not include a specific signal designated as a Sleep Button, one of the GPIO signals can be used to create a "Control Method" Sleep Button. See the *Advanced Configuration and Power Interface Specification* for implementation details.

9.7.8.2 PME# (PCI Power Management Event)

The PME# signal comes from a PCI Express device to request that the system be restarted. The PME# signal can generate an SMI#, SCI, or optionally a wake event. The event occurs when the PME# signal goes from high to low. No event is caused when it goes from low to high.

There is also an internal PME_B0 bit. This is separate from the external PME# signal and can cause the same effect.

9.7.8.3 SYS_RESET# Signal

When the SYS_RESET# pin is detected as active after the 16 ms debounce logic, the PCH attempts to perform a "graceful" reset by entering a host partition reset entry sequence.

Once the reset is asserted, it remains asserted for 5 to 6 ms regardless of whether the SYS_RESET# input remains asserted or not. It cannot occur again until SYS_RESET# has been detected inactive after the debounce logic, and the system is back to a full S0 state with PLTRST# inactive.

Note: If bit 3 of the CF9h I/O register is set then SYS_RESET# will result in a full power-cycle reset.

Note: It is not recommended to use the PCH_PWROK pin for a reset button as it triggers a global power cycle reset.

Note: SYS_RESET# is in the primary power well but it only affects the system when PCH_PWROK is high.

9.7.8.4 THERMTRIP# Signal

If THERMTRIP# goes active, the processor is indicating an overheat condition, and the PCH immediately transitions to an S5 state, driving SLP_S3#, SLP_S4#, SLP_S5# low, and setting the GEN_PMCON_2.PTS bit. The transition looks like a power button override.

When a THERMTRIP# event occurs, the PCH will power down immediately without following the normal S0 -> S5 path. The PCH will immediately drive SLP_S3#, SLP_S4#, and SLP_S5# low within 1 us after sampling THERMTRIP# active.

If the processor is running extremely hot and is heating up, it is possible (although very unlikely) that components around it, such as the PCH, are no longer executing cycles properly. Therefore, if THERMTRIP# goes active, and the PCH is relying on state machine logic to perform the power down, the state machine may not be working, and the system will not power down.

The PCH provides filtering for short low glitches on the THERMTRIP# signal in order to prevent erroneous system shut downs from noise. Glitches shorter than 25 nsec are ignored.

PCH must only honor the THERMTRIP# pin while it is being driven to a valid state by the processor. The THERMTRIP# Valid Point ='0', implies PCH will start monitoring THERMTRIP# at PLTRST# de-assertion (default). The THERMTRIP# Valid Point ='1', implies PCH will start monitoring THERMTRIP# at PROCPWRGD assertion. Regardless of the setting, PCH must stop monitoring THERMTRIP# at PROCPWRGD de-assertion.

Note: A thermal trip event will clear the PWRBTN_STS bit.

9.7.8.5 Sx_Exit_Holdoff# Signal

When S3/S4/S5 is entered and SLP_A# is asserted, Sx_Exit_Holdoff# can be asserted by a platform component to delay reset to S0. SLP_A# deassertion is an indication of the intent to resume to S0, but this will be delayed as long as Sx_Exit_Holdoff# is asserted. Sx_Exit_Holdoff# is ignored outside of an S3/S4/S5 entry sequence with

SLP_A# asserted. With the deassertion of RSMRST# (either from G3->S0 or DeepSX -> S0), this pin is a GPIO input and must be programmed by BIOS to operate as Sx_Exit_Holdoff#. When SLP_A# is asserted (or it is deasserted bu Sx_Exit_Holdoff is asserted), the PCH will not access the SPI Flash. How a platform uses this signal is platform specific. This signal is only sampled when the eSPI/LPC bus is used as an LPC.

9.7.8.6 PE_RST#

PE_RST# is a new signal on the PCH. The new Intel QAT and 10/1 GbE functions operate as standalone functions, and in End Point Only mode, the core sPCH functions are disabled but Intel QAT and 10/1GbE can still operate sending data back and forth on the PCIe uplink. Because of this, they have their own reset pin, PE_RST#. On a board, the resets driven by the PCH would be looped back into the PE_RST# pin. In the event of the PCH being used in EPO mode, then the appropriate slot reset signal will be driven onto PE_RST#.

9.7.8.7 Multi-PCH Reset Synchronization

The Intel® C620 Series Chipset PCH now incorporates a hand shake mechanism for systems with multiple PCHs. There would be one Legacy PCH (LPCH) and there can be multiple non-legacy PCHs (NLPCH). The LPCH will always be the PCH that coordinates boot, the SX entry and reset sequencing. The NLPCH will be reactive to sequencing state indications from the LPCH. The DO_RST_OUT# pins from all the NLPCH will go to the DO_RST_IN# pin of the LPCH. The DO_RST_OUT# of the LPCH will go to the DO_RST_IN# pins of the NLPCHs. Finally, RST_DONE are outputs from the NLPCH and go into the RST_DONE of the LPCH. When in the S0 state, each PCH recognizes DO_RST_IN# assertion as a warm reset. It is always the LPCH that initiates this. If a NLPCH PCH needs a reset to occur, it will drive DO_RST_OUT# to the LPCH, which will in turn drive its DO_RST_OUT# to the DO_RST_IN# of the NLPCHs.

9.7.9 ALT Access Mode

Before entering a low power state, several registers from powered down parts may need to be saved. In the majority of cases, this is not an issue, as registers have read and write paths. However, several of the ISA compatible registers are either read only or write only. To get data out of write-only registers, and to restore data into read-only registers, the PCH implements an ALT access mode.

If the ALT access mode is entered and exited after reading the registers of the PCH timer (8254), the timer starts counting faster (13.5 ms). The following steps listed below can cause problems:

1. BIOS enters ALT access mode for reading the PCH timer related registers.
2. BIOS exits ALT access mode.
3. BIOS continues through the execution of other needed steps and passes control to the operating system.

After getting control in step #3, if the operating system does not reprogram the system timer again, the timer ticks may be happening faster than expected.

Operating systems reprogram the system timer and therefore do not encounter this problem.

For other operating systems, the BIOS should restore the timer back to 54.6 ms before passing control to the operating system. If the BIOS is entering ALT access mode before entering the suspend state it is not necessary to restore the timer contents after the exit from ALT access mode.

9.7.9.1 Write Only Registers with Read Paths in ALT Access Mode

The registers described in Table 9-11 have read paths in ALT access mode. The access number field in the table indicates which register will be returned per access to that port.

Table 9-11. Write Only Registers with Read Paths in ALT Access Mode

Restore Data				Restore Data			
I/O Addr	# of Rds	Access	Data	I/O Addr	# of Rds	Access	Data
20h	12	1	PIC ICW2 of Master controller	40h	7	1	Timer Counter 0 status, bits [5:0]
		2	PIC ICW3 of Master controller			2	Timer Counter 0 base count low byte
		3	PIC ICW4 of Master controller			3	Timer Counter 0 base count high byte
		4	PIC OCW1 of Master controller[1]			6	Timer Counter 2 base count low byte
		5	PIC OCW2 of Master controller			7	Timer Counter 2 base count high byte
		6	PIC OCW3 of Master controller	42h	1		Timer Counter 2 status, bits [5:0]
		7	PIC ICW2 of Slave controller	70h	1		Bit 7 = NMI Enable, Bits [6:0] = RTC Address
		8	PIC ICW3 of Slave controller	70h	1		Bit 7 = Read value is '0'. Bits [6:0] = RTC Address
		9	PIC ICW4 of Slave controller				
		10	PIC OCW1 of Slave controller[1]				
		11	PIC OCW2 of Slave controller				
		12	PIC OCW3 of Slave controller				

Notes:
1. The OCW1 register must be read before entering ALT access mode.
2. Bits 5, 3, 1, and 0 return 0.

9.7.9.2 PIC Reserved Bits

Many bits within the PIC are reserved, and must have certain values written in order for the PIC to operate properly. Therefore, there is no need to return these values in ALT access mode. When reading PIC registers from 20h and A0h, the reserved bits shall return the values listed in Table 9-12.

Table 9-12. PIC Reserved Bits Return Values

PIC Reserved Bits	Value Returned
ICW2(2:0)	000
ICW4(7:5)	000
ICW4(3:2)	00
ICW4(0)	0
OCW2(4:3)	00
OCW3(7)	0
OCW3(5)	Reflects bit 6
OCW3(4:3)	01

9.7.9.3 Read Only Registers with Write Paths in ALT Access Mode

The registers described in Table 9-13 have write paths to them in ALT access mode. Software restores these values after returning from a powered down state. These registers must be handled special by software. When in normal mode, writing to the base address/count register also writes to the current address/count register. Therefore, the base address/count must be written first, then the part is put into ALT access mode and the current address/count register is written.

Table 9-13. Register Write Accesses in ALT Access Mode

I/O Address	Register Write Value
08h	DMA Status Register for Channels 0–3
D0h	DMA Status Register for Channels 4–7

9.7.10 System Power Supplies, Planes, and Signals

9.7.10.1 Power Plane Control with SLP_S3#, SLP_S4#, SLP_S5#, SLP_A# and SLP_GbE#

The SLP_S3# output signal can be used to cut power to the system core supply, since it only goes active for the Suspend-to-RAM state (typically mapped to ACPI S3). Power must be maintained to the PCH primary well, and to any other circuits that need to generate Wake signals from the Suspend-to-RAM state. During S3 (Suspend-to-RAM) all signals attached to powered down planes will be tri-stated or driven low, unless they are pulled using a pull-up resistor.

Cutting power to the system core supply may be done using the power supply or by external FETs on the motherboard.

The SLP_S4# or SLP_S5# output signal can be used to cut power to the system core supply, as well as power to the system memory, since the context of the system is saved on the disk. Cutting power to the memory may be done using the power supply, or by external FETs on the motherboard.

The SLP_S4# output signal is used to remove power to additional subsystems that are powered during SLP_S3#.

SLP_S5# output signal can be used to cut power to the system core supply, as well as power to the system memory, since the context of the system is saved on the disk. Cutting power to the memory may be done using the power supply, or by external FETs on the motherboard.

SLP_A# output signal can be used to cut power to the Intel ME and SPI flash on a platform that supports the M3 state (for example, certain power policies in Intel AMT).

SLP_GbE# output signal can be used to cut power to the external Intel 82579 GbE PHY device.

9.7.10.2 SLP_S4# and Suspend-to-RAM Sequencing

The system memory suspend voltage regulator is controlled by the glue logic. The SLP_S4# signal should be used to remove power to system memory rather than the SLP_S5# signal. The SLP_S4# logic in the PCH provides a mechanism to fully cycle the power to the DRAM and/or detect if the power is not cycled for a minimum time.

Note: To use the minimum DRAM power-down feature that is enabled by the SLP_S4# Assertion Stretch Enable bit (D31:F0:A4h Bit 3), the DRAM power must be controlled by the SLP_S4# signal.

9.7.10.3 PCH_PWROK Signal

When asserted, PCH_PWROK is an indication to the PCH that its core well power rails are powered and stable. PCH_PWROK can be driven asynchronously. When PCH_PWROK is low, the PCH asynchronously asserts PLTRST#. PCH_PWROK must not glitch, even if RSMRST# is low.

It is required that the power associated with the PCIe have been valid for 99 ms prior to PCH_PWROK assertion in order to comply with the 100 ms PCIe* 2.0 specification on PLTRST# de-assertion.

Note: SYS_RESET# is recommended for implementing the system reset button. This saves external logic that is needed if the PCH_PWROK input is used. Additionally, it allows for better handling of the SMBus and processor resets and avoids improperly reporting power failures.

9.7.10.4 SLP_GBE# Pin Behavior

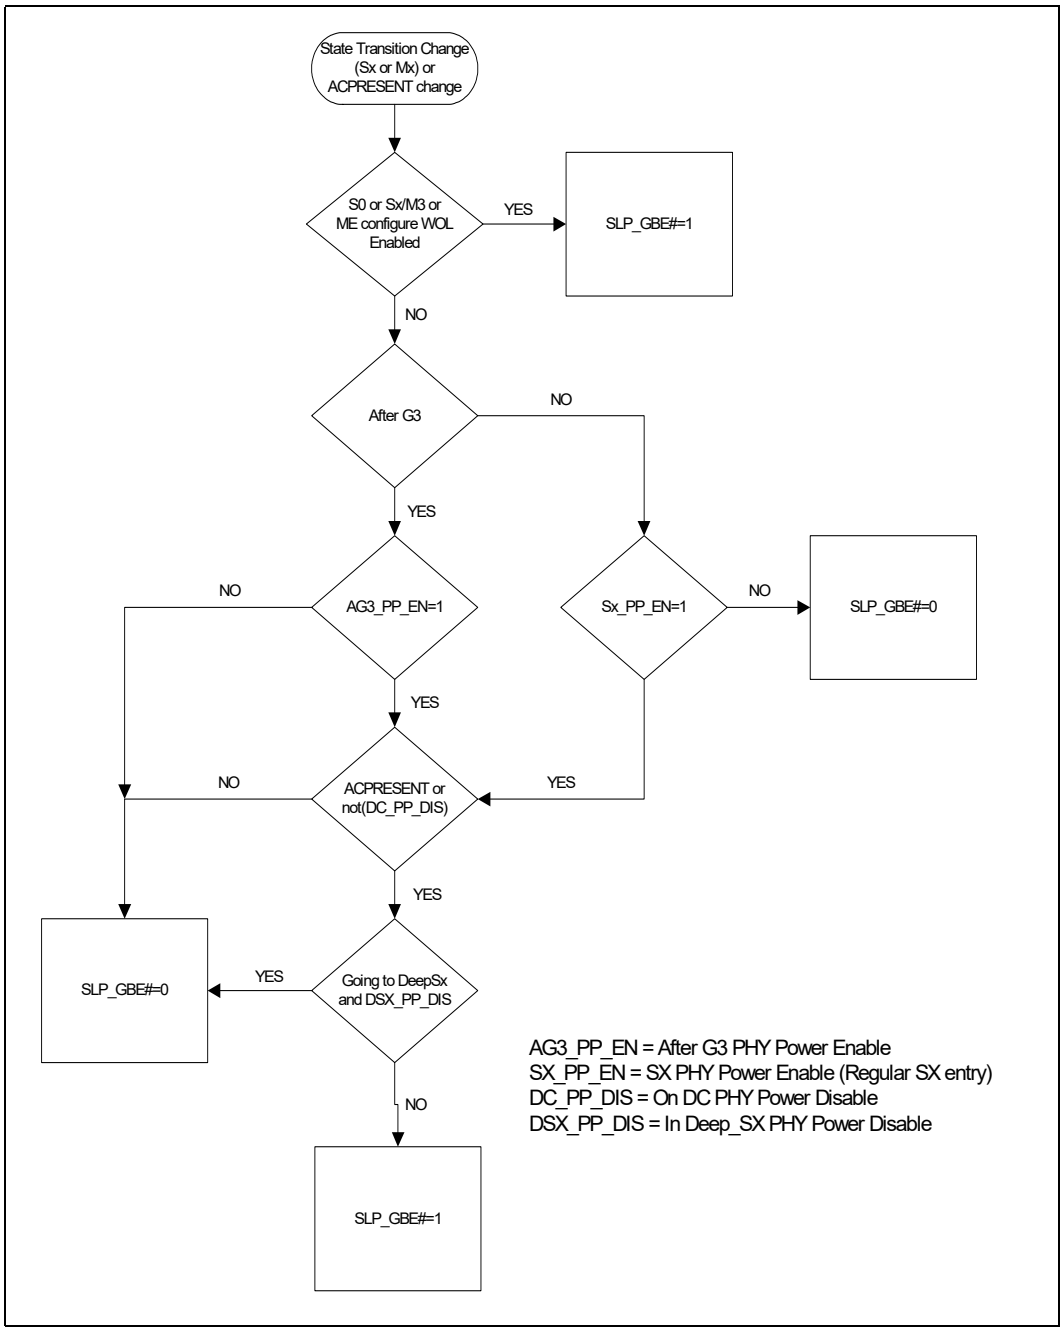
The PCH controls the voltage rails into the external GBE PHY using the SLP_GBE# pin.

- The GBE PHY is always powered when the host and ME systems are running.
  - SLP_GBE#='1' whenever SLP_S3#='1' or SLP_A#='1'.
- If the GBE PHY is required by the Intel ME in Sx/M-Off or Deep Sx, the Intel ME must configure SLP_GBE#='1' irrespective of the power source and the destination power state. The Intel ME must be powered at least once after G3 to configure this.
- If the GBE PHY is required after a G3 transition, the host BIOS must set AG3_PP_EN (B0:D31:F0:A2h bit 12).
- If the GBE PHY is required in Sx/M-Off, the host BIOS must set SX_PP_EN (B0:D31:F0:A2h bit 11).
- If the GBE PHY is required in Deep Sx, the host BIOS must keep DSX_PP_DIS (B0:D31:F0:A2h bit 13) cleared.
- If the GBE PHY is not required if the source of power is battery, the host BIOS must set DC_PP_DIS (B0:D31:F0:A2h bit 14).

Note: The Intel ME configuration of SLP_GBE# in Sx/M-Off and Deep Sx is dependent on the Intel ME power policy configuration.

The flow chart below shows how a decision is made to drive SLP_GBE# every time its policy needs to be evaluated.

Figure 9-1. Conceptual Diagram of SLP_GbE#



9.7.10.5 SUSPWRDNACK/SUSWARN#/GPP_A13 Steady State Pin Behavior

Table 9-14 summarizes SUSPWRDNACK/SUSWARN#/GPP_A13 pin behavior.

Table 9-14. SUSPWRDNACK/SUSWARN#/GPP_A13 Pin Behavior

Pin	Deep Sx (Supported /Not-Supported)	GPP_A13 Input/Output (Determine by GP_IO_SEL bit)	Pin Value in S0	Pin Value in Sx/M-Off	Pin Value in Sx/M3	Pin Value in Deep Sx
SUSPWRDNACK	Not Supported	Native	0	Depends on Intel® ME power package and power source (Note 1)	0	Off
SUSWARN#	Supported	Native	1	1 (Note 2)	1	Off
GPP_A13	Don't Care	IN	High-Z	High-Z	High-Z	Off
	Don't Care	OUT	Depends on GPP_A13 output data value	Depends on GPP_A13 output data value	Depends on GPP_A13 output data value	Off

Notes:
1. PCH will drive SPDA pin based on ME power policy configuration.
2. If entering Deep Sx, pin will assert and become undriven ("Off") when suspend well drops upon Deep Sx entry.

Table 9-15. SUSPWRDNACK During Reset

Reset Type (Note 1)	SPDA Value
Straight to S5	PCH initially drive '0' and then drive per the Intel ME power policy configuration.

9.7.10.6 RTCRST# and SRTCRST#

RTCRST# is used to reset PCH registers in the RTC well to their default value. If a jumper is used on this pin, it should only be pulled low when system is in the G3 state and then replaced to the default jumper position. Upon booting, BIOS should recognize that RTCRST# was asserted and clear internal PCH registers accordingly. It is imperative that this signal not be pulled low in the S0 to S5 states.

SRTCRST# is used to reset portions of the Intel Management Engine and should not be connected to a jumper or button on the platform. The only time this signal gets asserted (driven low in combination with RTCRST#) should be when the coin cell battery is removed or not installed and the platform is in the G3 state. Pulling this signal low independently (without RTCRST# also being driven low) may cause the platform to enter an indeterminate state. Similar to RTCRST#, it is imperative that SRTCRST# not be pulled low in the S0 to S5 states.

9.7.11 Legacy Power Management Theory of Operation

Instead of relying on ACPI software, legacy power management uses BIOS and various hardware mechanisms. The scheme relies on the concept of detecting when individual subsystems are idle, detecting when the whole system is idle, and detecting when accesses are attempted to idle subsystems.

However, the operating system is assumed to be at least APM enabled. Without APM calls, there is no quick way to know when the system is idle between keystrokes. The PCH does not support burst modes.

9.7.12 Reset Behavior

When a reset is triggered, the PCH will send a warning message to the processor to allow the processor to attempt to complete any outstanding memory cycles and put memory into a safe state before the platform is reset. When the processor is ready, it will send an acknowledge message to the PCH. Then a reset_warn/reset_ack handshake occurs with the processor. Once the message is received the PCH asserts PLTRST#.

If the PCH does not receive an acknowledge message from the processor within 4-5 seconds after sending the reset_warn message, it will trigger a global reset which will drive PLTRST# low.

A PLTRST# asserted is called a Host Reset or Host Partition Reset. Depending on the trigger, a host reset may also result in power cycling see Table 9-16 for details. If a host reset is triggered and the PCH times out before receiving an acknowledge message from the processor, a Global Reset with power-cycle will occur.

A reset in which the host and Intel ME partitions of the platform are reset is called a Global Reset. During a Global Reset, all PCH functionality is reset except RTC Power Well backed information and Suspend well status, configuration, and functional logic for controlling and reporting the reset. Intel ME and Host power back up after the power-cycle period.

Straight to S5 is another reset type where all power wells that are controlled by the SLP_S3#, SLP_S4#, and SLP_A# pins, as well as SLP_S5# and SLP_GBE# (if pins are not configured as GPIOs), are turned off. All PCH functionality is reset except RTC Power Well backed information and suspend well status, configuration, and functional logic for controlling and reporting the reset. The host stays there until a valid wake event occurs.

A new functionality that is in the Intel® C620 Series Chipset is the function called Demoted Warm Reset (DWR). In this mode of operation, global resets that would cause power cycles are demoted to a warm reset which does not. This feature has been added to cover the condition where some action would cause a power cycle, and that action could cause error register information to be lost. Because the condition that caused the global reset is possibly not cleared without a power cycle, it is possible that the system may not return to a function state if DWR is enabled. DWR is enabled via the GBL2HOST_EN register.

Table 9-16 shows the various reset triggers.

Table 9-16. Causes of Host and Global Resets (Sheet 1 of 3)

Trigger	Host Reset Without Power Cycle[1]	Host Reset With Power Cycle[2]	Global Reset With Power Cycle[3]	Straight to S5[6] (Host Stays There)
Global reset occurs while Global2Host is enabled.	Yes	No	No (note 8)	
Write of 0Eh to CF9h (RST_CNT Register)	No	Yes	No (Note 4)	
Write of 06h to CF9h (RST_CNT Register)	Yes	No	No (Note 4)	
SYS_RESET_N Asserted and CF9h (RST_CNT Register) Bit 3 = 0	Yes	No	No (Note 4)	

Table 9-16. Causes of Host and Global Resets (Sheet 2 of 3)

Trigger	Host Reset Without Power Cycle[1]	Host Reset With Power Cycle[2]	Global Reset With Power Cycle[3]	Straight to S5[6] (Host Stays There)
PE_RST_N in End Point Only mode	No	Yes	No	
DO_RESET_IN_N asserts and CF9 Bit 3 =0	Yes	No	No	
DO_RESET_IN_N asserts and CF9 Bit 3 =1	No	Yes	No (Note 4)	
SYS_RESET# Asserted and CF9h (RST_CNT Register) Bit 3 = 1	No	Yes	No (Note 4)	
SMBus Slave Message received for Reset with Power-Cycle	No	Yes	No (Note 4)	
SMBus Slave Message received for Reset without Power-Cycle	Yes	No	No (Note 4)	
SMBus Slave Message received for unconditional Power Down	No	No	No	Yes
TCO Watchdog Timer reaches zero two times	Yes	No	No (Note 4)	
Power Failure: PCH_PWROK signal goes inactive in S0/S1 or DSW_PWROK drops	No	No	Yes	
SYS_PWROK Failure: SYS_PWROK signal goes inactive in S0/S1	No	No	Yes	
Processor Thermal Trip (THERMTRIP#) causes transition to S5 and reset asserts	No	No	No	Yes
PCH internal thermal sensors signals a catastrophic temperature condition	No	No	No	Yes
Power Button 4 second override causes transition to S5 and reset asserts	No	No	No	Yes
Special shutdown cycle from processor causes CF9h-like PLTRST# and CF9h (RST_CNT Register) Bit 3 = 1	No	Yes	No (Note 4)	
Special shutdown cycle from processor causes CF9h-like PLTRST# and CF9h (RST_CNT Register) Bit 3 = 0	Yes	No	No (Note 4)	
Intel® Management Engine Triggered Host Reset without Power-Cycle	Yes	No	No (Note 4)	
Intel® Management Engine Triggered Host Reset with Power-Cycle	No	Yes	No (Note 4)	
Intel® Management Engine Triggered Power Button Override	No	No	No	Yes
Intel® Management Engine Watchdog Timer Timeout	No	No	No	Yes
Intel® Management Engine Triggered Global Reset	No	No	Yes	
Intel® Management Engine Triggered Host Reset with power down (host stays there)	No	Yes (Note 5)	No (Note 4)	
IE Triggered Host Reset without Power-Cycle	Yes	No	No (Note 4)	
IE Triggered Host Reset with Power-Cycle	No	Yes	No (Note 4)	
IE Triggered Power Button Override	No	No	No	Yes
IE Triggered Global Reset	No	No	Yes	
IE Triggered Host Reset with power down (host stays there)	No	Yes (Note 5)	No (Note 4)	
IE Watchdog Timer Timeout	No	No	No	Yes
IE Hardware Uncorrectable Error	No	No	No	Yes

Table 9-16. Causes of Host and Global Resets (Sheet 3 of 3)

Trigger	Host Reset Without Power Cycle[1]	Host Reset With Power Cycle[2]	Global Reset With Power Cycle[3]	Straight to S5[6] (Host Stays There)
PLTRST# Entry Timeout (Note 7)	No	No	Yes	
PROCPWRGD Stuck Low	No	No	Yes	
Power Management Watchdog Timer	No	No	No	Yes
Intel® Management Engine Hardware Uncorrectable Error	No	No	No	Yes

Notes:
1. The PCH drops this type of reset request if received while the system is in S3/S4/S5.
2. PCH does not drop this type of reset request if received while system is in a software-entered S3/S4/S5 state. However, the PCH will perform the reset without executing the RESET_WARN protocol in these states.
3. The PCH does not send warning message to processor, reset occurs without delay.
4. Trigger will result in global reset with power-cycle if the acknowledge message is not received by the PCH.
5. The PCH waits for enabled wake event to complete reset.
6. Upon entry to S5, if Deep Sx is enabled and conditions are met per Section 9.7.7.6, the system will transition to Deep Sx.
7. PLTRST# Entry Timeout is automatically initiated if the hardware detects that the PLTRST# sequence has not been completed within four seconds of being started.
8. Qualified global reset occurs while global resets are converted to warm resets

9.7.13 ADR

The Asynchronous DRAM Refresh (ADR) feature provides a mechanism to enable preservation of key data in NVDIMM system memory, in the event of AC power supply failure. ADR entry forces a flush of data from specific ADR protected "write buffers" inside processor. Any write data not in the buffers conceptually referred to as the "ADR protected buffers" is lost on power-failure.

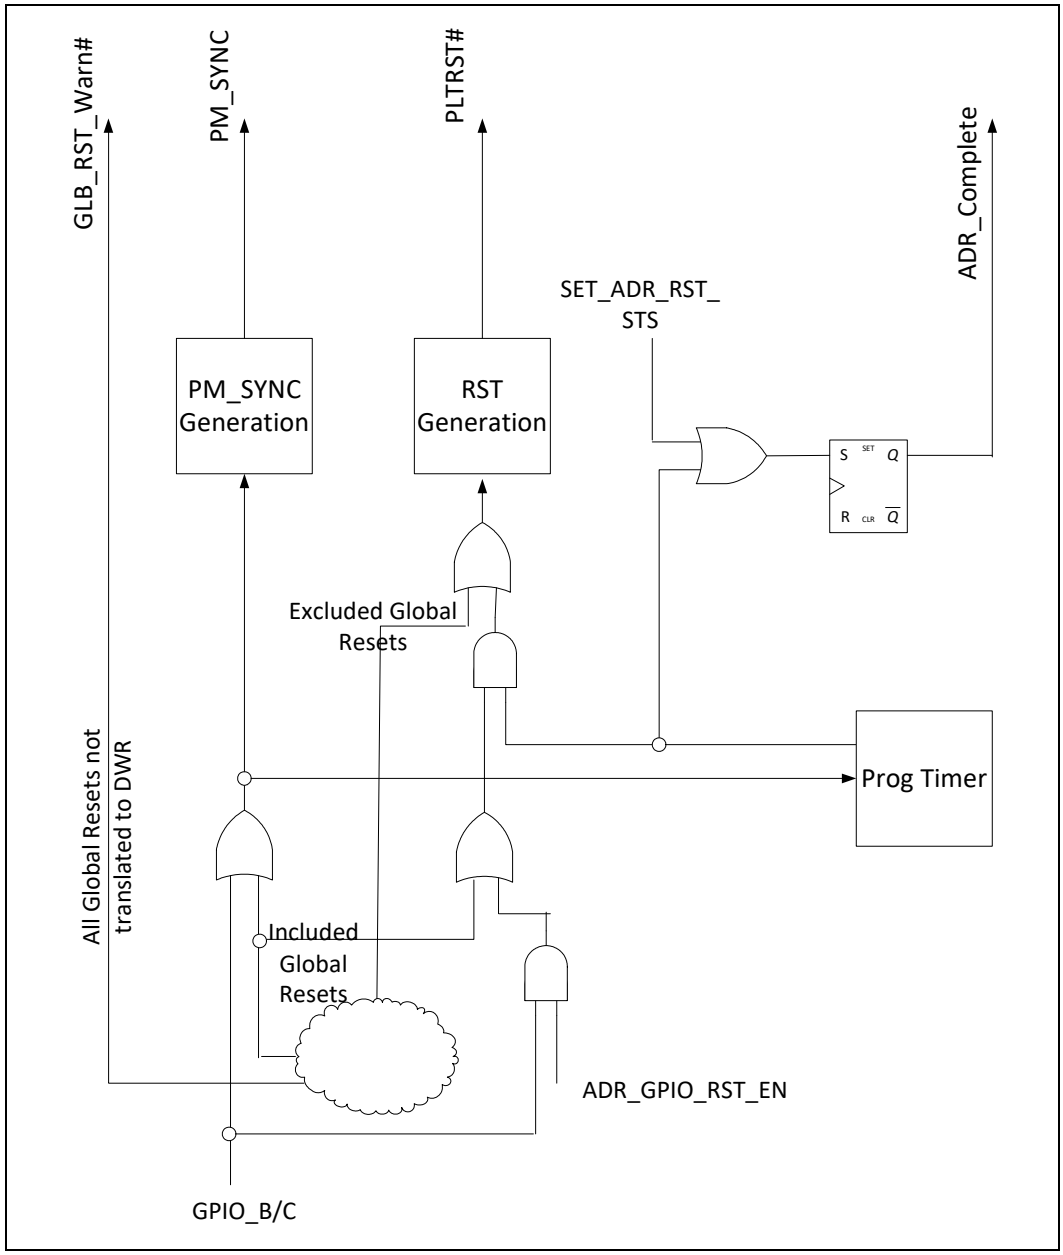
The objective of ADR is to provide an early warning to the CPU of an impending reset or power failure so that it can save critical information while the reset is in progress. For any Host partition reset or S3/4/5 entry, the CPU already receives this early warning via the Reset_Warn or Go_S3/4/5 DMI message. However, prior to this feature the CPU did not receive any warning for a global reset. This feature adds that warning for global reset sources that are considered to be "safe" to delay. A separate enable bit for each global reset source is provided in the ADR_EN register. The method used to provide this early warning to the CPU involves the PM_SYNC pin. The CPU will monitor a particular PM_SYNC state for this indication. For power failure source of global reset, it would be impossible for the PCH to use PM_SYNC to warn the CPU of a PCH_PWROK or RSMRST# power failure, since PM_SYNC control is immediately lost in those scenarios. However, platforms supporting ADR receive an early warning from the power supply indicating that AC power has been lost and the platform voltage rails will soon be dropping. This indication will be connected to one of 4 GPIOs capable of driving PM_SYNC. So, before PCH_PWROK or RSMRST# drops that GPIO will drop and trigger the warning to the CPU over PM_SYNC.

The GPIO that triggers and ADR cycle is not an edge triggered GPIO. It is level sensitive. As long as the GPIO is active, then the ADR cycle is in progress and messages will be sent up the PM_SYNC line to the CPU. If the signal on the GPIO is removed, then the logic sees the ADR request as being removed. Therefore, once the GPIO goes active to trigger an ADR, it must keep it in that state until either 1) the platform shuts down by dropping the power good signals, or 2) PLTRST# goes low, signaling the platform is now in reset.

When the timer for ADR expires, the signal ADR_COMPLETE goes active. This bit will stay active until BIOS clears it.

The picture below is a conceptual drawing of how ADR functions.

Figure 9-2. ADR Flow



9.8 Power Management Configuration Registers Summary

The power management registers are distributed within the PCI Device 31: Function 2 space, with dedicated I/O and memory-mapped spaces. Bits not explicitly defined in each register are assumed to be reserved. Writes to reserved bits must retain their previous values. Other than a read/modify/write, software should not attempt to use the value read from a reserved bit, as it may not be consistently 1 or 0.

Table 9-17. Summary of Power Management Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	PCI Identifier (PCIID)—Offset 0h	8086h
4h	7h	Device Status & Command (PCISTS_PCICMD)—Offset 4h	4h
8h	Bh	Class Code & Revision ID (PCICC_PCIRID)—Offset 8h	5800000h
Ch	Fh	Header Type & Master Latency Timer (PCIHTYPE_PCIMLT)—Offset Ch	800000h
10h	13h	32-bit Power Management Data Base Address Register (PM_DATA_BAR)—Offset 10h	0h
2Ch	2Fh	Subsystem Identifiers (PCISID)—Offset 2Ch	0h
40h	43h	ACPI Base Address (ABASE)—Offset 40h	1h
44h	47h	ACPI Control (ACTL)—Offset 44h	0h
48h	4Bh	PM Base Address (PWRMBASE)—Offset 48h	0h
A0h	A3h	General PM Configuration A (GEN_PMCON_A)—Offset A0h	A0000000h
A4h	A7h	General PM Configuration B (GEN_PMCON_B)—Offset A4h	4006h
A8h	ABh	BM_BREAK_EN and Cx State Configuration Register (BM_CX_CNF)—Offset A8h	0h
ACh	AFh	Extended Test Mode Register 3 (ETR3)—Offset ACh	0h

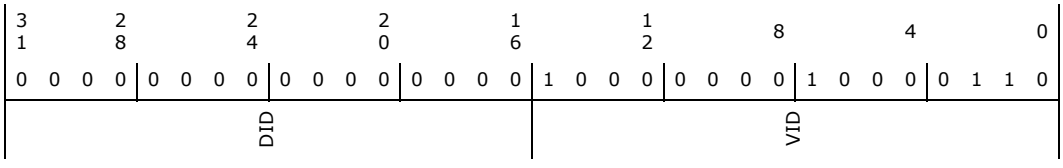
9.8.1 PCI Identifier (PCIID)—Offset 0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 8086h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V	**Device Identification (DID):** These bits are controlled as follows:
15:0	8086h RO	**Vendor Identification (VID):** This is a 16-bit value assigned to Intel. Intel VID=8086h.

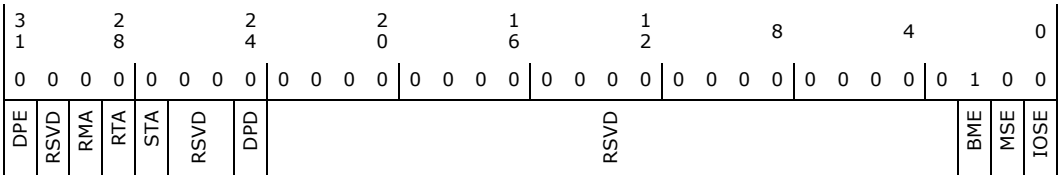
9.8.2 Device Status and Command (PCISTS_PCICMD)—Offset 4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 4h



Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Detected Parity Error (DPE):** Set when the bridge detects a parity error on the internal backbone. This bit is reset by PLTRST# assertion.
30	0h RO	Reserved
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the bridge receives a completion with unsupported request status from the backbone. This bit is reset by PLTRST# assertion.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the bridge receives a completion with completer abort status from the backbone. This bit is reset by PLTRST# assertion.
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set when the bridge generates a completion packet with target abort status on the backbone. This bit is reset by PLTRST# assertion.
26:25	0h RO	Reserved
24	0h RW/1C/V	**Data Parity Error Detected (DPD):** Set when the bridge receives a completion packet from the backbone from a previous request, and detects a parity error. This bit is reset by PLTRST# assertion.
23:3	0h RO	Reserved
2	1h RW	**Bus Master Enable (BME):** Bus master Enable does not apply to messages sent out by PMC. This bit is reset by PLTRST# assertion.
1	0h RW	**Memory Space Enable (MSE):** Controls a device's response to Memory Space accesses. This bit controls whether the host to PMC MMIO BAR is enabled or not. This bit is reset by PLTRST# assertion.
0	0h RO	**I/O Space Enable (IOSE):** PMC does not define any IO BARs in the standard PCI header BAR offsets.

9.8.3 Class Code and Revision ID (PCICC_PCIRID)—Offset 8h

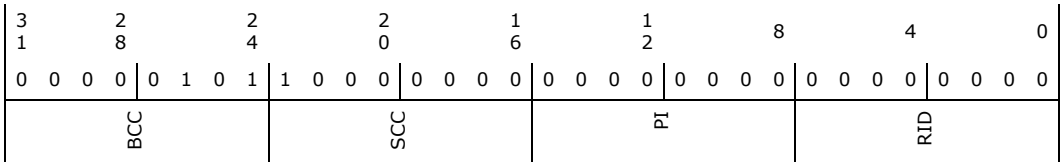
Writing to btis [7:0] of this register controls what is reported in the all of the RID fields of the corresponding registers in the component. The value written does not get directly loaded in this register. However, the value is checked to see which value to report.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 5800000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	5h RO	**Base Class Code (BCC):** Indicates a memory controller device class.
23:16	80h RO	**Sub-Class Code (SCC):** Indicates an unspecified other memory controller.
15:8	0h RO	**Programming Interface (PI):** No programming interface.
7:0	0h RW/V	**Revision ID (RID):** Indicates the part revision. This field is reset by PLTRST# assertion.

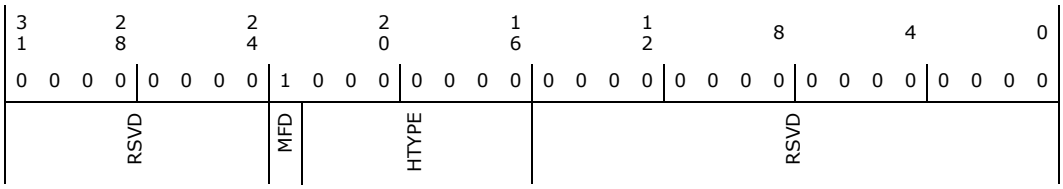
9.8.4 Header Type and Master Latency Timer (PCIHTYPE_PCIMLT)—Offset Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 800000h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved
23	1h RO	**Multi-Function Device (MFD):** Indicates that this is part of a multi-function device.
22:16	0h RO	**Header Type (HTYPE):** Indicates a generic device header.
15:0	0h RO	Reserved

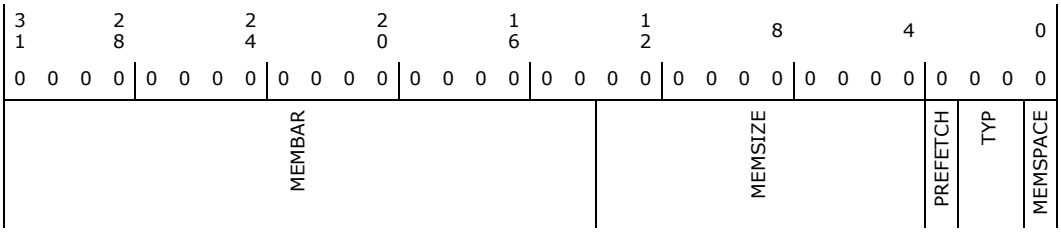
9.8.5 32-bit Power Management Data Base Address Register (PM_DATA_BAR)—Offset 10h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RW	**Memory BAR (MEMBAR):** Software programs this register with the base address of the device's memory region. This field is reset by PLTRST# assertion.
13:4	0h RO	**Memory Size (MEMSIZE):** Hardwired to 0 to indicate 16 KB of memory space
3	0h RO	**Prefetchable (PREFETCH):** A device can mark a range as prefetchable if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables. Hardwired to 0 to indicate the device's memory space as notprefetchable.
2:1	0h RO	**Type (TYP):** Hardwired to 0 to indicate that Base register is 32-bits wide and mapping can be done anywhere in the 32-bit Memory Space.
0	0h RO	**Memory Space Indicator (MEMSPACE):** Hardwired to 0 to identify a Memory BAR.

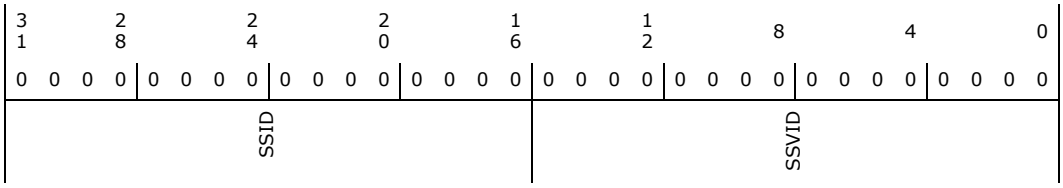
9.8.6 Subsystem Identifiers (PCISID)—Offset 2Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** Written by BIOS. Not used by hardware. This field is reset by PLTRST# assertion.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** Written by BIOS. Not used by hardware. This field is reset by PLTRST# assertion.

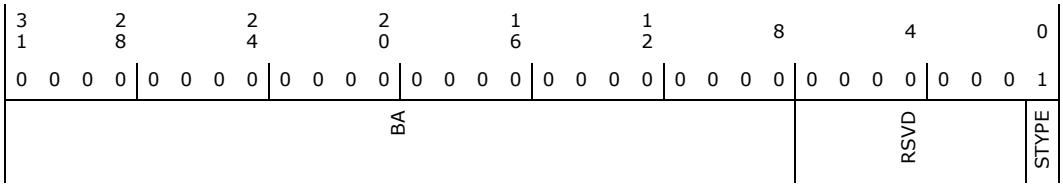
9.8.7 ACPI Base Address (ABASE)—Offset 40h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 1h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**Base Address (BA):** Provides the 256 bytes of I/O space for ACPI logic. This field is reset by PLTRST# assertion.
7:1	0h RO	Reserved.
0	1h RO	**Space Type (STYPE):** Always 1 to indicate I/O space.

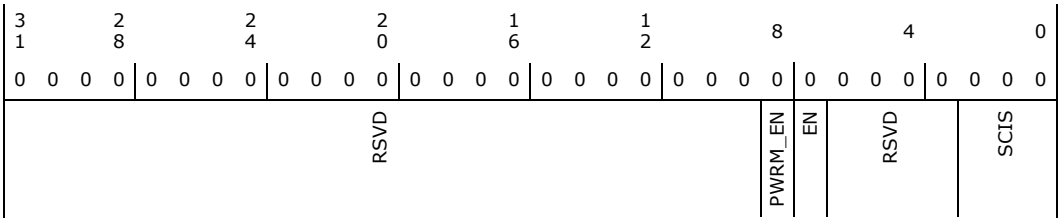
9.8.8 ACPI Control (ACTL)—Offset 44h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	Reserved
8	0h RW	**PWRM Enable (PWRM_EN):** When set, decode of the memory range pointed by PWRMBASE is enabled. This bit is reset by PLTRST# assertion.
7	0h RW	**ACPI Enable (EN):** When set, decode of the I/O range pointed to by the ACPI base register is enabled and the ACPI power management function is enabled. This bit is reset by PLTRST# assertion.
6:3	0h RO	Reserved
2:0	0h RW	**SCI IRQ Select (SCIS):** Specifies on which IRQ the SCI will internally appear. If not using the APIC, the SCI must be routed to IRQ[9-11], and that interrupt is not sharable with the SERIRQ stream, but is shareable with other PCI interrupts. If using the APIC, the SCI can also be mapped to IRQ20-23, and can be shared with other interrupts. Bits - SCI Map ---- - ------- 000 - IRQ9 001 - IRQ10 010 - IRQ11 011 - Reserved 100 - IRQ20 (only if APIC is enabled) 101 - IRQ21 (only if APIC is enabled) 110 - IRQ22 (only if APIC is enabled) 111 - IRQ23 (only if APIC is enabled) When the interrupt is mapped to APIC interrupts 9, 10 or 11, the APIC should be programmed for active-high reception. When the interrupt is mapped to APIC interrupts 20 through 23, the APIC should be programmed for active-low reception. This field is reset by PLTRST# assertion.

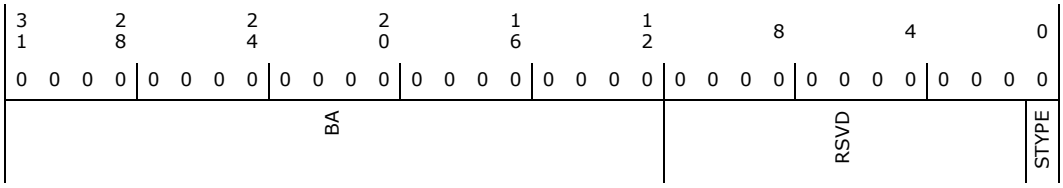
9.8.9 PM Base Address (PWRMBASE)—Offset 48h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**Base Address (BA):** Provides the 4 KB of memory space for Power Management registers. This field is reset by PLTRST# assertion.
11:1	0h RO	Reserved.
0	0h RO	**Space Type (STYPE):** Always 0 to indicate memory space.

9.8.10 General PM Configuration A (GEN_PMCON_A)—Offset A0h

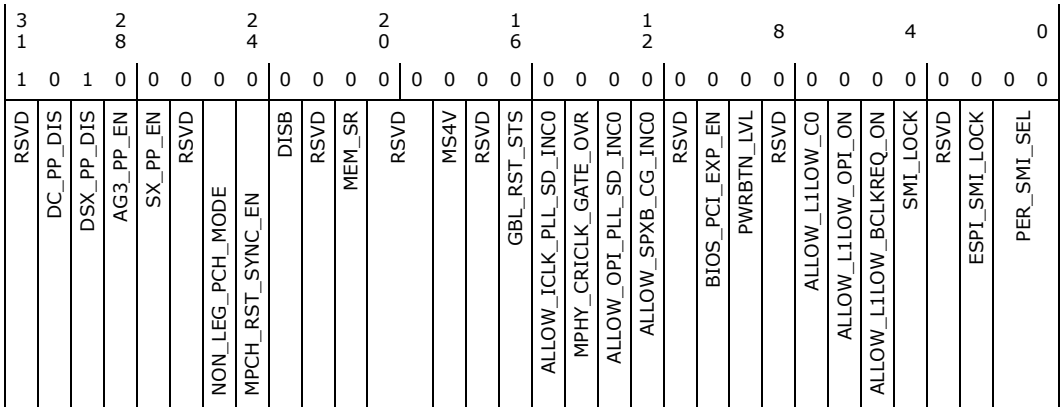
Usage ACPI, Legacy

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 2

Default: A0000000h



Bit Range	Default & Access	Field Name (ID): Description
31	1b RO	**Reserved**
30	0b RW	**DC PHY Power Disable (DC_PP_DIS):** This bit determines the Host software contribution to whether the LAN PHY remains powered in Sx/MOFF or Deep Sx while on battery. This bit is reset by RTCRST# assertion.
29	1b RW	**Deep Sx PHY Power Disable (DSX_PP_DIS):** This bit determines the Host software contribution to whether the LAN PHY remains powered in Deep Sx. If this bit is cleared, for the PHY to be powered in Deep Sx state, SX_PP_EN must be set to '1'. This bit is reset by RTCRST# assertion.
28	0b RW	**After G3 PHY Power Enable (AG3_PP_EN):** This bit determines the Host software contribution to whether the LAN PHY is powered up after exiting G3 (to either Sx/MOFF or Deep Sx). This bit is reset by RTCRST# assertion.
27	0b RW	**Sx PHY Power Enable (SX_PP_EN):** This bit determines the Host software contribution to whether the LAN PHY remains powered in an Sx/MOFF state that was entered from S0 (rather than from G3). This bit is reset by DSW_PWROK de-assertion.
26	0b RO	**Reserved**
25	0b RW/L	**Non Legacy PCH Mode (NON_LEG_PCH_MODE):** When this bit is set to 1b, the PCH is in non-legacy PCH Mode
24	0b RW/L	**MultiPCH Reset Sync Enable (MPCH_RST_SYNC_EN):** When this bit is set to 1b the PCH will synchronize the resets between a legacy and non-legacy PCH.
23	0h RW	**DRAM Initialization Scratchpad Bit (DISB):** This bit does not effect hardware functionality in any way. It is provided as a scratchpad bit that is maintained through main power well resets and CF9h-initiated resets. BIOS is expected to set this bit prior to starting the DRAM initialization sequence and to clear this bit after completing the DRAM initialization sequence. BIOS can detect that a DRAM initialization sequence was interrupted by a reset by reading this bit during the boot sequence. If the bit is 1, then the DRAM initialization was interrupted. This bit is reset by RSMRST# assertion.
22	0h RO	Reserved
21	0h RO/V	**Memory Placed in Self-Refresh (MEM_SR):** This bit will be set to '1' if DRAM should have remained powered and held in Self-Refresh through the last power state transition (i.e. the last time the system left S0). The scenarios where this should be the case are: - successful S3 entry / exit - successful Host partition reset without power cycle These scenarios both involve a handshake between the PCH and the Processor. The acknowledge from the Processor back to the PCH is assumed to imply that memory was successfully placed into Self-Refresh (the PCH has no way to verify whether that actually occurred). This bit will be cleared whenever the PCH begins a transition out of S0. ***Note:*** This bit is meaningless when recovering from a Demoted Warm Reset (DWR)
20:19	0h RO	Reserved
18	0h RW/1C/V	**Minimum SLP_S4# Assertion Width Violation Status (MS4V):** Hardware sets this bit when the SLP_S4# assertion width is less than the time programmed in the SLP_S4# Minimum Assertion Width field (D31.F0.A4h.5:4). The PCH begins the timer when SLP_S4# pin (including ME override logic) is asserted during S4/S5 entry, or when the RSMRST# input is deasserted during Primary well power-up. ***Notes:*** 1. The status bit is cleared by software writing a 1 to the bit. 2. This bit is functional regardless of the value in the "SLP_S4# Assertion Stretch Enable" and the "Disable SLP_X Stretching After SUS Power Failure" bits. 3. This bit is reset by the assertion of the RSMRST# pin, but can be set in some cases before the default value is readable.
17	0h RO	Reserved
16	0h RW/1C/V	**Global Reset Status (GBL_RST_STS):** This bit is set after a global reset (not G3 or Deep Sx) occurs. See the GEN_PMCON_B.HOST_RST_STS bit for potential usage models. The status bit is cleared by software writing a 1 to the bit.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Allow iCLK PLL Shutdown in C0 (ALLOW_ICLK_PLL_SD_INC0):** 0 = PMC allows iCLK PLL Shutdown only when the CPU is in a non-C0 (Cx) state. (Default) 1 = iCLK PLL can be shut down when the CPU is in C0 or Cx state assuming all other gating conditions are satisfied. This bit is reset by PLTRST# assertion.
14	0h RW	**Dynamic mPHY CRI Clock Gate Override (MPHY_CRICLK_GATE_OVR):** 0 = Enable CRI clock gating in the modPHY. (Default) 1 = Disable CRI clock gating in the modPHY This bit is reset by PLTRST# assertion.
13	0h RW	**Allow OPI PLL Shutdown in C0 (ALLOW_OPI_PLL_SD_INC0):** 0 = PMC allows OPI PLL Shutdown only when the CPU is in a non-C0 (Cx)state. (Default) 1 = OPI PLL can be shut down when the CPU is in C0 or Cx state assuming all other gating conditions are satisfied. ***Note:*** The signal driven by this configuration bit is connected to both OPI and USB3/PXP PLLs to support PLL shutdown when backbone clock is sourced from the USB3/PXP PLL (a backup mode). This bit is reset by PLTRST# assertion.
12	0h RW	**Allow SPXB Clock Gating in C0 (ALLOW_SPXB_CG_INC0):** 0 = PMC allows SBXB backbone clock gating only when the CPU is in a non-C0 state (Cx). (Default) 1 = SPXB backbone clock can be gated when the CPU is in C0 or Cx state assuming all other gating conditions are satisfied. This bit is reset by PLTRST# assertion.
11	0h RO	Reserved
10	0h RW	**BIOS PCI Express Enable (BIOS_PCI_EXP_EN):** This bit acts as a global enable for the SCI associated with the PCI express ports. 0 = The various PCI Express* ports and processor CANNOT cause PCI_EXP_STS bit to go active. (Default) 1 = The various PCI Express* ports and processor CAN cause PCI_EXP_STS bit to go active. This bit is reset by PLTRST# assertion.
9	0h RO/V	**Power Button Level (PWRBTN_LVL):** This read-only bit indicates the current state of the PWRBTN# signal. 1= High, 0 = Low. The value reflected in this bit is dependent upon PM_CFG1.PB_DB_MODE. The PB_DB_MODE bit's value causes the following behavior: - '0': PWRBTN_LVL is taken from the debounced PWRBTN# pin value that is seen at the output of a 16ms debouncer. - '1': PWRBTN_LVL is taken from the raw PWRBTN# pin (before the debouncer).
8	0h RO	Reserved
7	0h RW	**Allow L1.LOW Entry During C0 (ALLOW_L1LOW_C0):** 0 = PMC only allows L1.LOW entry if the CPU is in a non-C0 state (Cx). (Default) 1 = PMC allows L1.LOW entry in C0 or Cx state. This bit is reset by PLTRST# assertion.
6	0h RW	**Allow L1.LOW Entry with OPI Voltage On (ALLOW_L1LOW_OPI_ON):** 0 = PMC only allows L1.LOW entry if the OPI voltage is off. (Default) 1 = PMC allows L1.LOW entry regardless of whether the OPI voltage is on/off. This bit is reset by PLTRST# assertion.
5	0h RW	**Allow L1.LOW Entry with CPU BCLK REQ Asserted (ALLOW_L1LOW_BCLKREQ_ON):** 0 = PMC only allows L1.LOW entry if the CPU's BCLK request is de-asserted.(Default) 1 = PMC allows L1.LOW entry regardless of whether the CPU's BCLK request is asserted/de-asserted. This bit is reset by PLTRST# assertion.
4	0h RW/L	**SMI Lock (SMI_LOCK):** When this bit is set, writes to the GLB_SMI_EN bit will have no effect. Once the SMI_LOCK bit is set, writes of '0' to SMI_LOCK bit will have no effect (i.e., once set, this bit can only be cleared by PLTRST# assertion).

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW/L	**ESPI SMI LOCK (ESPI_SMI_LOCK):** When this bit is set to 1b, writes to the ESPI_SMI_EN bit will have not effect. Once the ESPI_SMI_LOCK bit is set, writes of 0b to it will have no effect. Only a PLTRST# will reset this to 0b.
2	0b RO	Reserved
1:0	0h RW	**Period SMI Select (PER_SMI_SEL):** Software sets these bits to control the rate at which the periodic SMI# is generated: 00 = 64 seconds (Default), 01 = 32 seconds, 10 = 16 seconds, 11 = 8 seconds Tolerance for the timer is ± 1 second. This field is reset by PLTRST# assertion.

9.8.11 General PM Configuration B (GEN_PMCON_B)—Offset A4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 4006h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	1	1	0
RSVD													SLPSX_STR_POL_LOCK	ACPI_BASE_LOCK	PM_DATA_BAR_DIS	PME_B0_S5_DIS	SUS_PWR_FLR	WOL_EN_OVRD	DIS_SLP_X_STRCH_SUS_UP	SLP_S3_MIN_ASST_WDTH		HOST_RST_STS	RSVD	SWSMI_RATESEL		S4MAW		S4ASE	RTC_PWR_STS	PWR_FLR	AG3E

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	Reserved
18	0h RW/L	**SLP_Sx# Stretching Policy Lock-Down (SLPSX_STR_POL_LOCK):** When set to 1, this bit locks down the following fields: (Those bits become read-only.) - GEN_PMCON_3.DIS_SLP_X_STRCH_SUSPF - GEN_PMCON_3.SLP_S3_MIN_ASST_WDTH - GEN_PMCON_3.S4MAW - GEN_PMCON_3.S4ASE - PM_CFG.SLP_A_MIN_ASST_WDTH - PM_CFG.SLP_GBE_MIN_ASST_WDTH - PM_CFG.PWR_CYC_DUR Writes of '0' to this bit are always ignored. This bit becomes locked when a value of '1' is written to it. Once locked, the only way to clear this bit is to perform a platform reset (PLTRST# assertion).
17	0h RW/L	**ACPI Base Lock (ACPI_BASE_LOCK):** When set to 1, this bit locks down the ACPI Base Address Register (ABASE) at offset 40h. The Base Address Field becomes read-only. Writes of '0' to this bit are always ignored. This bit becomes locked when a value of '1' is written to it. Once locked, the only way to clear this bit is to perform a platform reset (PLTRST# assertion).

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW/L	**Power Management Data BAR Disable (PM_DATA_BAR_DIS):** When set to 1, this bit disables all accesses to the MMIO range pointed to by PM_DATA_BAR. This does not affect the BAR value itself, which can still be changed after this bit is set. But once the bit is set to '1', the PMC will drop writes to the data region pointed to by PM_DATA_BAR. And reads will return 0. Writes of '0' to this bit are always ignored. This bit becomes locked when a value of '1' is written to it. Once locked, the only way to clear this bit is to perform a platform reset (PLTRST# assertion).
15	0h RW	**PME B0 S5 Disable (PME_B0_S5_DIS):** When set to '1', this bit blocks wake events from PME_B0_STS in S5, regardless of the state of PME_B0_EN. When cleared (default), wake events from PME_B0_STS are allowed in S5 if PME_B0_EN = '1'. Wakes from power states other than S5 are not affected by this policy bit. The net effect of setting PME_B0_S5_DIS = '1' is described by the truth table below: Y = Wake; N = Don't wake; B0 = PME_B0_EN; OV = WOL Enable Override B0/OV | S3/S4 | S5 00 | N | N 01 | N | Y (LAN only) 11 | Y (all PME B0 sources) | Y (LAN only) 10 | Y (all PME B0 sources) | N This bit is cleared by the RTCRST# assertion.
14	1h RW/1C	**SUS Well Power Failure (SUS_PWR_FLR):** This bit is set to '1' whenever Primary well power is lost, as indicated by RSMRST# assertion. Software writes a 1 to this bit to clear it. This bit is in the Primary well, and defaults to '1' based on RSMRST# assertion (not cleared by any type of reset).
13	0h RW	**WOL Enable Override (WOL_EN_OVRD):** 0 = WoL polices are determined by OS-visible bits. 1 = WoL is enabled enabled to wake the system from S5 regardless of the value in the PME_B0_EN bit in the GPE0_EN register. This allows the system BIOS to enable WoL regardless of the policies selected through the OS. This bit is maintained in the RTC power well, therefore permitting WOL following a surprise power failure even in cases in which the system may have been running in S0 without the PME Enables set. (Note that the LAN NVRAM configuration must support WOL after SUS power loss.) This bit has no effect on wakes from S1, S3, or S4. This bit is cleared by the RTCRST# assertion.
12	0h RW/L	**Disable SLP_X Stretching After SUS Well Power Up (DIS_SLP_X_STRCH_SUS_UP):** 0 = SLP_* stretching will be performed after SUS power failure as enabled in various other fields. SLP_* stretch timers start on SUS well power up (the PCH has no ability to count stretch time while the SUS well is powered down). 1 = All SLP_* pin stretching is disabled when powering up after a SUS well power loss. ***Notes:*** This policy bit has a different effect on SLP_SUS# stretching than on the other SLP_* pins, since SLP_SUS# is the control signal for one of the scenarios where SUS well power is lost (Deep Sx). The effect of setting this bit to '1' on: - SLP_S3#, SLP_S4#, SLP_A# and SLP_GBE# stretching: disabled after any SUS power loss - SLP_SUS# stretching: disabled after G3, but no impact on Deep Sx This field is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. This bit is cleared by the RTCRST# assertion.
11:10	0h RW/L	**SLP_S3# Minimum Assertion Width (SLP_S3_MIN_ASST_WDTH):** This 2-bit value indicates the minimum assertion width of the SLP_S3# signal to guarantee that the Main power supplies have been fully power-cycled. This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc. Settings are: 00: 60 usec 01: 1 ms 10: 50 ms 11: 2 sec This field is not writable when the SLP_Sx# Stretching Policy Lock- Down bit is set. This bit is cleared by the RSMRST# pin.
9	0h RW/1C/V	**Host Reset Status (HOST_RST_STS):** This bit is set by hardware when a host partition reset (not a global reset, Deep Sx, or G3) occurs. This bit is an optional tool to help BIOS determine when a host partition reset might have collided with a wake from a valid sleep state. A possible usage model would be to consult and then write a '1' to clear this bit during the boot flow before determining what action to take based on reading PM1_STS.WAK_STS = '1'. If HOST_RST_STS = '1' and/or GEN_PMCON_A.GBL_RST_STS = '1', the cold reset boot path could be followed rather than the resume path, regardless of the setting of WAK_STS. This bit does not affect PCH operation in any way, and can therefore be left set if BIOS chooses not to use it.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RO	Reserved
7:6	0h RW	**SWSMI Rate Select (SWSMI_RATESEL):** This 2-bit value indicates when the SWSMI timer will time out. Valid values are: 00 [=] 1.5 ms ± 0.6 ms 01 [=] 16 ms ± 4 ms 10 [=] 32 ms ± 4 ms 11 [=] 64 ms ± 4 ms These bits are not cleared by any type of reset except RTCRST# assertion.
5:4	0h RW/L	**SLP_S4# Minimum Assertion Width (S4MAW):** This 2-bit value indicates the minimum assertion width of the SLP_S4# signal to guarantee that the DRAMs have been safely power-cycled. This value may be modified per platform depending on DRAM types, power supply capacitance, etc. Valid values are: 11: 1 second 10: 2 seconds 01: 3 seconds 00: 4 seconds This value is used in two ways: 1. If the SLP_S4# assertion width is ever shorter than this time, a status bit (D31.F0.A2h.2) is set for BIOS to read when S0 is entered 2. If enabled by bit 3 in this register, the hardware will prevent the SLP_S4# signal from deasserting within this minimum time period after asserting. Note that the logic that measures this time is in the Primary well. Therefore, when leaving a G3 or Deep Sx state, the minimum time is measured from the deassertion of the internal Primary well reset (unless the "Disable_SLP_X Stretching After SUS Power Failure" bit is set). This field is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. RTCRST# forces this field to the conservative default state (00b).
3	0h RW/L	**SLP_S4# Assertion Stretch Enable (S4ASE):** 0 = The minimum assertion time for SLP_S4# 1 = The SLP_S4# pin (which includes the ME override logic) will minimally assert for the time specified in bits 5:4 of this register. This bit is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. This bit is cleared by RTCRST# assertion.
2	1h RW	**RTC Power Status (RTC_PWR_STS):** Intel PCH will set this bit to '1' when RTCRST# indicates a weak or missing battery. The bit will remain set until the software clears it by writing a '0' back to this bit position. This bit is not cleared by any type of reset.
1	1h RW/1C	**Power Failure (PWR_FLR):** This bit is in the DSW well and defaults to '1' based on DSW_PWROK assertion (not cleared by any type of reset). 0 = Indicates that the trickle current has not failed since the last time the bit was cleared. 1 = Indicates that the trickle current (from the main battery or trickle supply) was removed or failed. Software writes a '1' to this bit to clear it.
0	0h RW	**AFTERG3_EN (AG3E):** Determines what state to go to when power is reapplied after a power failure (G3 state). 0 = System will return to an S0 state (boot) after power is re-applied. 1 = System will return to the S5 state (except if it was in S4, in which case it will return to S4-like state). In the S5 state, the only enabled wake-up event is the Power Button or any enabled wake event that was preserved through the power failure. This bit is in the RTC well and is only cleared by RTCRST# assertion.

9.8.12 BM_BREAK_EN and Cx State Configuration Register (BM_CX_CNF)—Offset A8h

Usage ACPI, Legacy. Power well Primary. This register is used to enable BM break events and C-state related modes. Note that these C-state settings have no effect if the C-states are not entered.

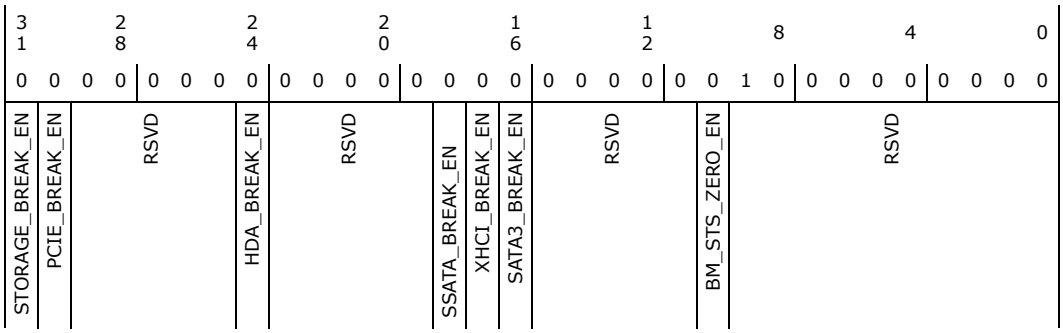
Access Method

Type: CFG Register (Size: 32 bits)

Device: 31

Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Storage Break Enable (STORAGE_BREAK_EN):** When this bit is a 1, Serial ATA traffic will cause BM_STS to be set, even if the BM_STS_ZERO_EN bit is set. This bit is reset by PLTRST# assertion.
30	0h RW	**PCI Express Break Enable (PCIE_BREAK_EN):** When this bit is a 1, PCI Express traffic will cause BM_STS to be set, even if the BM_STS_ZERO_EN bit is set. This bit is reset by PLTRST# assertion.
29:25	0h RO	Reserved
24	0h RW	**HD Audio Break Enable (HDA_BREAK_EN):** When this bit is a 1, HD Audio traffic will cause BM_STS to be set, even if the BM_STS_ZERO_EN bit is set. This bit is reset by PLTRST# assertion.
23:18	0h RO	Reserved
18	0b RW	**SSATA Break Enable (SSATA_BREAK_EN):** When this bit is set to 1b, SSATA traffic will cause BM_STS to be set, even if the BM_STS_ZERO_EN bit is set.
17	0h RW	**XHCI Break Enable (XHCI_BREAK_EN):** When this bit is a 1, XHCI traffic will cause BM_STS to be set, even if the BM_STS_ZERO_EN bit is set. This bit is reset by PLTRST# assertion.
16	0h RW	**SATA3 Break Enable (SATA3_BREAK_EN):** When this bit is a 1, SATA3 traffic will cause BM_STS to be set, even if the BM_STS_ZERO_EN bit is set. This bit is reset by PLTRST# assertion.
15:11	0h RO	Reserved

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	**Bus Master Status Zero Enable (BM_STS_ZERO_EN):** When this bit is a 1, PCH will not set the BM_STS if there is bus master activity from PCI, PCI Express and internal bus masters. ***Note:*** If the BM_STS bit is already set when the BM_STS_ZERO_EN bit is set, the BM_STS bit will remain set. Software will still need to clear the BM_STS bit. ***Note:*** BM_STS_ZERO_EN does not apply to PHOLD (LPC DMA or LPC bus master activity). A separate policy bit (PHOLD_BM_STS_BLOCK) determines whether PHOLD will set BM_STS. This bit is reset by PLTRST# assertion.
9	1b RO	Reserved
8:0	0h RO	Reserved

9.8.13 Extended Test Mode Register 3 (ETR3)—Offset ACh

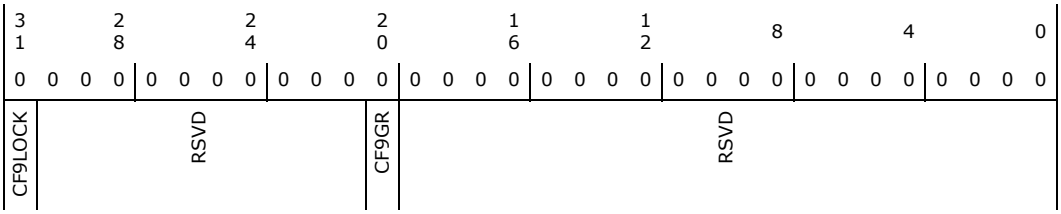
This register resides in the primary well. All bits except bit[23:16] are reset by host_deep_rst_b. Bit[23:16] are reset by pri_pwrgood_rst_b only.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V/L	**CF9h Lockdown (CF9LOCK):** 0 = CF9h Global Reset bit R/W. 1 = CF9h Global Reset bit RO. When set, this bit becomes RO and is reset by a CF9h reset or RSMRST# assertion (other reset types are not applicable). In manufacturing/debug environments this bit should be left as default '0'. In all other environments, BIOS must program this bit to '1'.
30:21	0h RO	Reserved.
20	0h RW/L	**CF9h Global Reset (CF9GR):** 0 = A CF9h write of 6h or Eh will only reset the Host partition. 1 = A CF9h write of 6h or Eh will cause a Global Reset of both the Host and the ME partitions. It is recommended that BIOS should set this bit early on in the boot sequence, and then clear it and set the CF9LOCK bit prior to loading the OS in both an ME Enabled and a ME Disabled system. This register is locked by the CF9 Lockdown (CF9LOCK) bit. This register is not reset by a CF9h reset. It is reset by RSMRST# assertion.
19:0	0h RO	Reserved.

9.9 PMC I/O Based Registers Summary

The below table shows registers associated with ACPI and Legacy power management support. These register locations are all offsets from ACPI base address defined in PCI Device 31: Function 2 (ABASE), and can be moved to any 256-byte aligned I/O location. In order to access these registers, the ACPI Enable bit in ACPI Control Register (B0:D31:F2 offset 44h) must be set. The registers are defined to support the ACPI 4.0a specification and generally use the same bit names.

Note: All reserved bits and registers will always return 0 when read and will have no effect when written.

Table 9-18. Summary of PMC I/O Based Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Power Management 1 Enables and Status (PM1_EN_STS)—Offset 0h	0h
4h	7h	Power Management 1 Control (PM1_CNT)—Offset 4h	0h
8h	Bh	Power Management 1 Timer (PM1_TMR)—Offset 8h	0h
30h	33h	SMI Control and Enable (SMI_EN)—Offset 30h	2h
34h	37h	SMI Status Register (SMI_STS)—Offset 34h	0h
40h	43h	General Purpose Event Control (GPE_CTRL)—Offset 40h	0h
44h	47h	Device Activity Status Register (DEVACT_STS)—Offset 44h	0h
50h	53h	PM2a Control Block (PM2A_CNT_BLK)—Offset 50h	0h
80h	83h	General Purpose Event 0 Status [31:0] (GPE0_STS_31_0) - Offset 80h	0h
84h	87h	General Purpose Event 0 Status [63:32] (GPE0_STS_63_32) - Offset 84h	0h
88h	8Bh	General Purpose Event 0 Status [95:64] (GPE0_STS_95_64) - Offset 88h	0h
8Ch	8Fh	General Purpose Event 0 Status [127:96] (GPE0_STS_127_96) - Offset 8Ch	0h
90h	93h	General Purpose Event 0 Enable [31:0] (GPE0_EN_31_0)—Offset 90h	0h
94h	97h	General Purpose Event 0 Enable [63:32] (GPE0_EN_31_0)—Offset 94h	0h
98h	9Ah	General Purpose Event 0 Enable [95:64] (GPE0_EN_31_0)—Offset 98h	0h
9Ch	9Fh	General Purpose Event 0 Enable [127:96] (GPE0_EN_127_96)—Offset 9Ch	0h

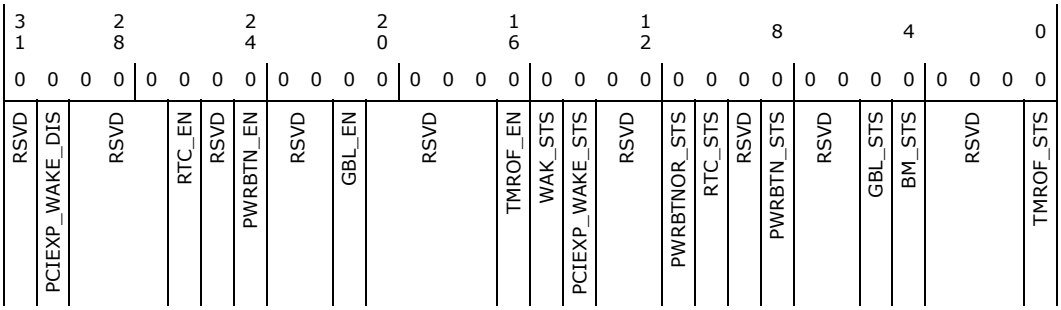
9.9.1 Power Management 1 Enables and Status (PM1_EN_STS)—Offset 0h

Access Method

Type: IO Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved
30	0h RW	**PCI Express Wake Disable (PCIEXP_WAKE_DIS):** This bit disables the inputs to the PCIEXP_WAKE_STS bit in the PM1 Status register from waking the system. Modification of this bit has no impact on the value of the PCIEXP_WAKE_STS bit. This bit is reset by DSW_PWROK de-assertion.
29:27	0h RO	Reserved
26	0h RW/V	**RTC Alarm Enable (RTC_EN):** This is the RTC alarm enable bit. It works in conjunction with the SCI_EN bit: RTC_EN SCI_EN Effect when RTC_STS is set 0 X No SMI# or SCI. If system was in S3-S5, no wake even occurs. 1 0 SMI#. If system was in S3-S5, then a wake event occurs before the SMI#. 1 1 SCI. If system was in S3-S5, then a wake event occurs before the SCI. ***Note:*** This bit is in the RTC well and is reset by RTCRST# assertion, to allow an RTC event to wake after a power failure.
25	0h RO	Reserved
24	0h RW/V	**Power Button Enable (PWRBTN_EN):** This bit is the power button enable. It works in conjunction with the SCI_EN bit: PWRBTN_EN SCI_EN Effect when PWRBTN_STS is set 0 X No SMI# or SCI. 1 0 SMI#. 1 1 SCI. ***Note:*** PWRBTN_EN has no effect on the PWRBTN_STS bit being set by the assertion of the power button. The Power Button is always enabled as a Wake event.
23:22	0h RO	Reserved
21	0h RW	**Global Enable (GBL_EN):** Global enable bit. When both the GBL_EN and the GBL_STS are set, PCH generates an SCI. This bit is reset by PLTRST# assertion.
20:17	0h RO	Reserved

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**Timer Overflow Interrupt Enable (TMROF_EN):** This is the timer overflow interrupt enable bit. It works in conjunction with the SCI_EN bit: TMROF_EN SCI_EN Effect when TMROF_STS is set 0 X No SMI# or SCI. 1 0 SMI#. 1 1 SCI. This bit is reset by PLTRST# assertion.
15	0h RW/1C/V	**Wake Status (WAK_STS):** This bit is set when the system is in one of the Sleep states (via the SLP_EN bit) and an enabled Intel PCH Wake event occurs. Upon setting this bit, the Intel PCH will transition the system to the ON state. This bit can only be set by hardware and can only be cleared by writing a one to this bit position. This bit is not affected by hard resets caused by a CF9 write, but is reset by RSMRST#. If a power failure occurs (such as removed batteries) without the SLP_EN bit set, the WAK_STS bit will not be set when the power returns if the AFTER_G3 bit is 0. If the AFTER_G3 bit is 1, then the WAK_STS bit will be set after waking from a power failure. If necessary, the BIOS can clear the WAK_STS bit in this case.
14	0h RW/1C/V	**PCI Express Wake Status (PCIEXP_WAKE_STS):** This bit is set by hardware to indicate that the system woke due to a PCI Express wakeup event. This event can be caused by the PCI Express WAKE# pin being active, or one or more of the PCI Express ports being in beacon state, or receipt of a PCI Express PME message at root port. This bit should only be set when one of these events causes the system to transition from a non-S0 system power state to the S0 system power state. This bit is set independent of the PCIEXP_WAKE_DIS bit. Software writes a 1 to clear this bit. If WAKE# pin is still active during the write or one or more PCI Express ports is in the beacon state or PME message received indication is not cleared in the root port, then the bit will remain active (i.e. all inputs to this bit are level sensitive). ***Note:*** This bit does not itself cause a wake event or prevent entry to a sleeping state. Thus if the bit is 1 and the system is put into a sleeping state, the system will not automatically wake.
13:12	0h RO	Reserved
11	0h RW/1C/V	**Power Button Override (PWRBTNOR_STS):** This bit is set any time a Power Button Override Event occurs (i.e. the power button is pressed for at least 4 consecutive seconds), the corresponding bit is received in the SMBus slave message, the ME-Initiated Power Button Override bit is set, the ME-Initiated Host Reset with Power Down is set, or due to an internal thermal sensor catastrophic condition. These events cause an unconditional transition to the S5 state. The BIOS or SCI handler clears this bit by writing a 1 to it. This bit is not affected by hard resets via CF9h writes, and is not reset by RSMRST#. Thus, this bit is on RTC well and is preserved through power failures (reset by RTCRST#). Note that this bit is still asserted when the global SCI_EN is set to '1' then an SCI will be generated.
10	0h RW/1C/V	**RTC Status (RTC_STS):** This bit is set when the RTC generates an alarm (assertion of the IRQ8# signal), and is not affected by any other enable bit. See RTC_EN for the effect when RTC_STS goes active. This bit is only set by hardware and can only be reset by writing a one to this bit position. This bit is not affected by hard resets caused by a CF9 write, but is reset by DSW_PWROK de-assertion.
9	0h RO	Reserved
8	0h RW/1C/V	**Power Button Status (PWRBTN_STS):** This bit is set when the PWRBTN# signal is asserted (low), independent of any other enable bit. See PWRBTN_EN for the effect when PWRBTN_STS goes active. PWRBTN_STS is always a wake event. This bit is only set by hardware and can be cleared by software writing a one to this bit position. This bit is not affected by hard resets caused by a CF9 write, but is reset by DSW_PWROK de-assertion. If the PWRBTN# signal is held low for more than 4 seconds, the Intel PCH clears the PWRBTN_STS bit, sets the PWRBTNOR_STS bit, the system transitions to the S5 state, and only PWRBTN# is enabled as a wake event. If PWRBTN_STS bit is cleared by software while the PWRBTN# pin is still held low, this will not cause the PWRBTN_STS bit to be set. The PWRBTN# signal must go inactive and active again to set the PWRBTN_STS bit. Note that the SMBus Unconditional Powerdown message, the CPU Thermal Trip and the Internal Thermal Sensors' Catastrophic Condition result in behavior matching the Powerbutton Override, which includes clearing this bit.
7:6	0h RO	Reserved

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW/1C/V	**GBL Status (GBL_STS):** This bit is set when an SCI is generated due to the BIOS wanting the attention of the SCI handler. BIOS has a corresponding bit, BIOS_RLS, which will cause an SCI and set this bit. The SCI handler should then clear this bit by writing a 1 to it. This bit will not cause wake events or SMI#. This bit is not effected by SCI_EN. ***Note:*** GBL_STS being set will cause an SCI, even if the SCI_EN bit is not set. Software must take great care not to set the BIOS_RLS bit (which causes GBL_STS to be set) if the SCI handler is not in place. This bit is reset by PLTRST# assertion.
4	0h RW/1C/V	**Bus Master Status (BM_STS):** This bit is set to 1 by the Intel PCH when a PCH-visible bus master requests access to memory or the BM_BUSY# signal is active. This bit is cleared by the Processor writing a 1 to this bit position. This bit will not cause a wake event, SCI, or SMI. This bit is reset by PLTRST# assertion.
3:1	0h RO	Reserved
0	0h RW/1C/V	**Timer Overflow Status (TMROF_STS):** This is the timer overflow status bit. This bit gets set anytime bit 22 of the 24 bit timer goes low (bits are counted from 0 to 23). This will occur every 2.3435 seconds. See TMROF_EN for the effect when TMROF_STS goes active. Software clears this bit by writing a 1 to it. This bit is reset by PLTRST# assertion.

9.9.2 Power Management 1 Control (PM1_CNT)—Offset 4h

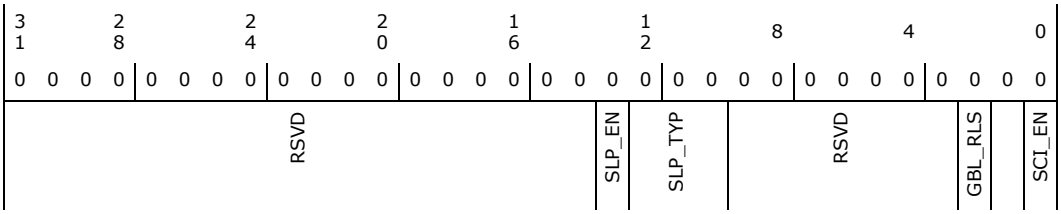
Lockable: No Usage: ACPI or Legacy Power Well: Bits 0-9, 13-31: Primary, Bits 10-12: RTC

Access Method

Type: IO Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13	0h WO	**Sleep Enable (SLP_EN):** This is a write-only bit and reads to it always return a zero. Setting this bit causes the system to sequence into the Sleep state defined by the SLP_TYP field. This bit is reset by PLTRST# assertion.
12:10	0h RW	**Sleep Type (SLP_TYP):** This 3-bit field defines the type of Sleep the system should enter when the SLP_EN bit is set to 1. Bits Mode Typical Mapping 000 ON S0 001 Reserved 010 Reserved 011 Reserved 100 Reserved 101 Suspend-To-RAM S3 110 Suspend-To-Disk S4 111 Soft Off S5 These bits are reset by RTCRST# only.
9:3	0h RO	Reserved
2	0h WO	**Global Release (GBL_RLS):** This bit always reads as 0. ACPI software writes a '1' to this bit to raise an event to the BIOS. BIOS software has corresponding enable and status bits to control its ability to receive ACPI events.
1	0h RW	**Scratchpad**
0	0h RW	**SCI Enable (SCI_EN):** Selects the SCI interrupt or the SMI# for various events. 0 = These events will generate an SMI#. 1 = These events will generate an SCI. This bit is reset by PLTRST# assertion.

9.9.3 Power Management 1 Timer (PM1_TMR)—Offset 8h

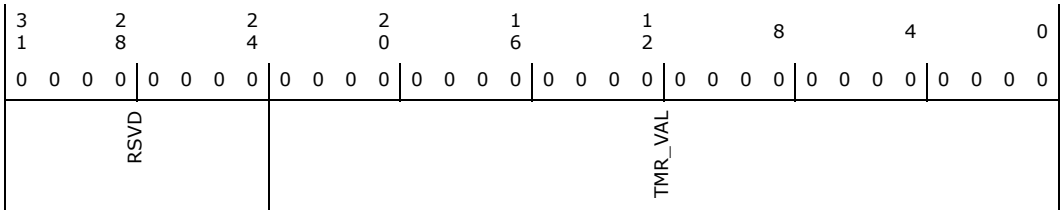
Lockable: No Usage: ACPI Power Well: Primary

Access Method

Type: IO Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:0	0h RO/V	**Timer Value (TMR_VAL):** This read-only field returns the running count of the PM timer. This counter runs off a 3.579545 MHz clock (derived from 14.31818 MHz divided by 4). It is reset (to 0) during a PCI reset, and then continues counting as long as the system is in the S0 state. Anytime bit 22 of the timer goes HIGH to LOW (bits referenced from 0 to 23), the TMROF_STS bit is set. The High-to-Low transition will occur every 2.3435 seconds. Writes to this register have no effect.

9.9.4 SMI Control and Enable (SMI_EN)—Offset 30h

Lockable: No
Usage: ACPI or Legacy
Power Well: Primary

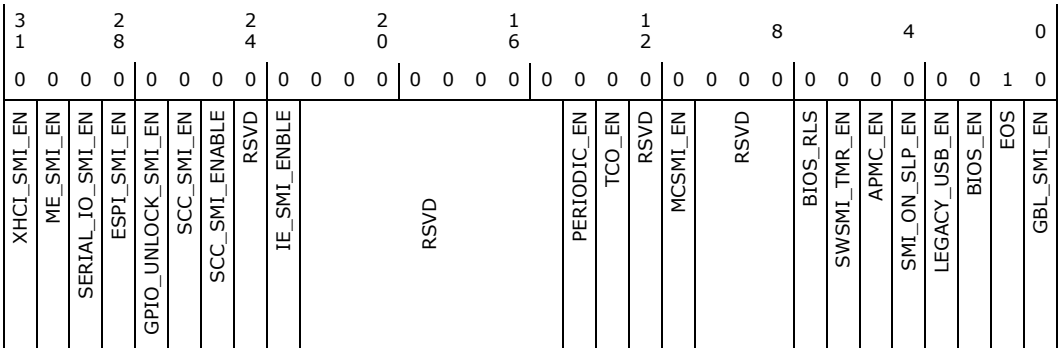
Note: This register is symmetrical to the SMI Status Register.

Access Method

Type: IO Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 2h



Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**XHCI SMI Enable (XHCI_SMI_EN):** Software sets this bit to enable XHCI SMI events. This bit is reset by PLTRST# assertion.
30	0h RW	**ME SMI Enable (ME_SMI_EN):** Software sets this bit to enable ME SMI# events. This bit is reset by PLTRST# assertion.
29	0h RW	**Intel Serial I/O SMI Enable (SERIAL_IO_SMI_EN):** Software sets this bit to enable Intel Serial I/O SMI events. This bit is reset by PLTRST# assertion.
28	0h RW	**eSPI SMI Enable (ESPI_SMI_EN):** Software sets this bit to enable eSPI SMI events. This bit is reset by PLTRST# assertion.
27	0h RW/1S	**GPIO Unlock SMI Enable (GPIO_UNLOCK_SMI_EN):** Setting this bit will cause the Intel PCH to generate an SMI# when the GPIO_UNLOCK_SMI_STS bit is set in the SMI_STS register. Once written to '1', this bit can only be cleared by PLTRST# assertion.
26	0h RW	**SCC SMI Enable (SCC_SMI_EN):** Software sets this bit to enable SCC SMI events. This bit is reset by PLTRST# assertion.
25	0b RW	**SCC SMI Enable (SCC_SMI_EN)**: Software sets this bit to enable SCC SMI events
24	0b RO	**Reserved**
23	0b RW	**IE SMI Enable (IE_SMI_EN)**: Software sets this bit to enable IE SMI events.
22:15	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Periodic Enable (PERIODIC_EN):** Setting this bit will cause the Intel PCH to generate an SMI# when the PERIODIC_STS bit is set in the SMI_STS register. This bit is reset by PLTRST# assertion.
13	0h RW/L	**TCO Enable (TCO_EN):** 1 = Enables the TCO logic to generate SMI#. 0 = Disables TCO logic from generating an SMI#. If the NMI2SMI_EN bit is set, then SMIs that are caused by NMIs (i.e. rerouted) will not be gated by the TCO_EN bit. Even if the TCO_EN bit is 0, the NMIs will still be routed to cause the SMI#. ***Note:*** This bit can not be written once the TCO_LOCK bit (at offset 08h of TCO I/O Space) is set. This prevents unauthorized software from disabling the generation of TCO-based SMIs. This bit is reset by PLTRST# assertion.
12	0h RO	Reserved
11	0h RW	**Microcontroller SMI Enable (MCSMI_EN):** Software sets this bit to 1 to enables Intel PCH to trap access to the microcontroller range (62h or 66h). A 'trapped' cycles will be claimed by Intel PCH, but not forwarded to LPC. An SMI# will also be generated. This bit is reset by PLTRST# assertion.
10:8	0h RO	Reserved
7	0h WO	**BIOS Release (BIOS_RLS):** Enables the generation of an SCI interrupt for ACPI software when a '1' is written to this bit position by BIOS software. This bit always reads a '0'. ***Note:*** GBL_STS being set will cause an SCI, even if the SCI_EN bit is not set. Software must take great care not to set the BIOS_RLS bit (which causes GBL_STS to be set) if the SCI handler is not in place. This bit is reset by PLTRST# assertion.
6	0h RW	**Software SMI Timer Enable (SWSMI_TMR_EN):** Software sets this bit to a '1' to start the Software SMI# Timer. When the timer expires (depending on the SWSMI_RATE_SEL bits), it will generate an SMI# and set the SWSMI_TMR_STS bit. The SWSMI_TMR_EN bit will remain at 1 until software sets it back to 0. Clearing the SWSMI_TMR_EN bit before the timer expires will reset the timer and the SMI# will not be generated. The default for this bit is 0. This bit is reset by PLTRST# assertion.
5	0h RW	**APMC Enable (APMC_EN):** If set, this enables writes to the APM_CNT register to cause an SMI#. This bit is reset by PLTRST# assertion.
4	0h RW	**SMI On Sleep Enable (SMI_ON_SLP_EN):** If this bit is set, the Intel PCH will generate an SMI# when a write access attempts to set the SLP_EN bit (in the PM1_CNT register). Furthermore, the Intel PCH will not put the system to a sleep state. It is expected that the SMI# handler will turn off the SMI_ON_SLP_EN bit before actually setting the SLP_EN bit. This bit is reset by PLTRST# assertion.
3	0h RW	**Legacy USB Enable (LEGACY_USB_EN):** Enables legacy USB circuit to cause SMI#. This bit is reset by PLTRST# assertion.
2	0h RW	**BIOS Enable (BIOS_EN):** Enables the generation of SMI# when ACPI software writes a 1 to the GBL_RLS bit. Note that if the BIOS_STS bit, which gets set when software writes a 1 to GBL_RLS bit, is already a 1 at the time that BIOS_EN becomes 1, an SMI# will be generated when BIOS_EN gets set. This bit is reset by PLTRST# assertion.
1	1h RW/1S/V	**End of SMI (EOS):** This bit controls the arbitration of the SMI signal to the processor. This bit must be set in order for Intel PCH to assert SMI# low to the processor after SMI# has been asserted previously. Once Intel ICH asserts SMI# low, the EOS bit is automatically cleared. In the SMI handler, the CPU should clear all pending SMIs (by servicing them and then clearing their respective status bits), set the EOS bit, and exit SMM. This will allow the SMI arbiter to reassert SMI upon detection of an SMI event and the setting of a SMI status bit. The SMI# signal will go inactive for 4 PCI clocks. This bit is reset by PLTRST# assertion.
0	0h RW/L	**Global SMI Enable (GBL_SMI_EN):** 0 = No SMI# will be generated by PCH. 1 = Enables the generation of SMI# in the system upon any enabled SMI event. ***Note:*** When the SMI_LOCK bit is set, this bit cannot be changed. This bit is reset by PLTRST# assertion.

9.9.5 SMI Status Register (SMI_STS)—Offset 34h

Lockable: No
Usage: ACPI or Legacy
Power Well: Primary

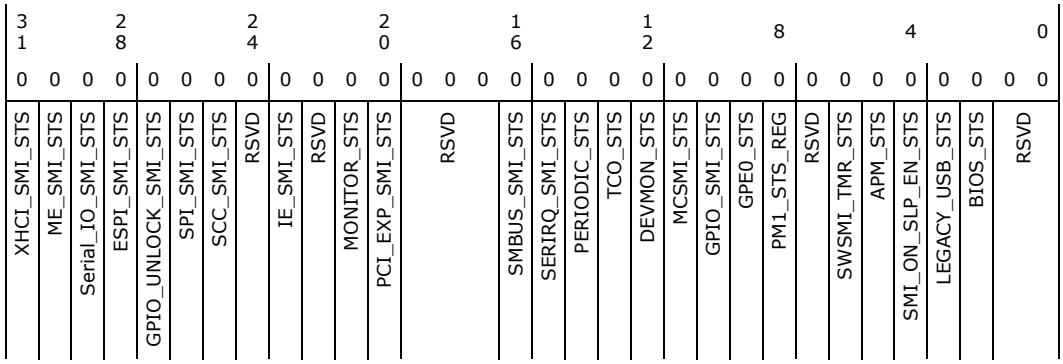
Note: If the corresponding _EN bit is set when the _STS bit is set, the Intel PCH will cause an SMI# (except bits 8-10, which don't cause SMI#).

Access Method

Type: IO Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**XHCI SMI Status (XHCI_SMI_STS):** This bit will be set when any USB3 (XHCI) Host Controller is requesting an SMI.
30	0h RO/V	**ME SMI Status (ME_SMI_STS):** This bit will be set when Intel ME is requesting an SMI#.
29	0h RW/1C/V	**Intel Serial I/O SMI Status (Serial_IO_SMI_STS):** This bit gets set when Intel Serial I/O agent is requesting SMI #. This bit is set by hardware and cleared by software writing a 1 to this bit position.
28	0h RO/V	**eSPI SMI Status (ESPI_SMI_STS):** This bit is set if an eSPI agent is requesting an SMI#. This bit is set by hardware and cleared by the BMC sending an SMI deassertion VW.
27	0h RW/1C/V	**GPIO Unlock SMI Status (GPIO_UNLOCK_SMI_STS):** This bit will be set of the GPIO registers lockdown logic is requesting an SMI#. Writing a '1' to this bit position clears this bit to '0'. This bit is reset by PLTRST# assertion.
26	0h RO/V	**SPI SMI Status (SPI_SMI_STS):** This bit will be set when the SPI logic is requesting an SMI#. This bit is read only because the sticky status and enable bits associated with this function are located in the SPI registers.
25	0h RW/1C/V	**SCC SMI Status (SCC_SMI_STS):** This bit gets set when SCC agent is requesting SMI#.This bit is set by hardware and cleared by software writing a 1 to this bit position
24	0b RO	**Reserved**
23	0b RO/V	**IE SMI Status (IE_SMT_STS):** This bit will be set if IE is requesting an SMI#
22	0b RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
21	0h RO/V	**Monitor Status (MONITOR_STS):** This bit will be set if the Trap/SMI logic has caused the SMI. This will occur when the CPU or a bus master accesses an assigned register (or a sequence of accesses).
20	0h RO/V	**PCI_EXP_SMI Status (PCI_EXP_SMI_STS):** 1- PCI Express SMI event occurred. This could be due to a PCI Express PME event or Hot Plug Event.
19:17	0h RO	Reserved.
16	0h RW/1C/V	**SMBus SMI Status (SMBUS_SMI_STS):** 0 = This bit is set from the 64 KHz clock domain used by the SMBus. Software must wait at least 15.63 microseconds after initial assertion of this bit before clearing it. This bit is sticky and is cleared by writing a 1 to this bit position. 1 = Indicates that the SMI# was caused by: 1.The SMBus Slave receiving a message that an SMI# should be caused, or 2. The SMBALERT# signal goes active and the SMB_SMI_EN bit is set and the SMBALERT_DIS bit is cleared, or 3. The SMBus Slave receiving a HOST_NOTIFY message and the HOST_NOTIFY_INTREN and the SMB_SMI_EN bits are set, or 4. The SMBus Slave receiving a "SMI in S0" message. This bit is reset by PLTRST# assertion.
15	0h RO/V	**SERIRQ_SMI Status (SERIRQ_SMI_STS):** 1 = Indicates the SMI# was caused by the SERIRQ decoder. 0 = SMI# not caused by SERIRQ decoder. ***Note:*** This bit is not sticky. Writes to this bit will have no effect.
14	0h RW/1C/V	**Periodic Status (PERIODIC_STS):** This bit will be set at the rate determined by the PER_SMI_SEL bits. If the PERIODIC_EN bit is also set, the Intel PCH will generate an SMI#. This bit is cleared by writing a 1 to this bit position. This bit is reset by PLTRST# assertion.
13	0h RW/1C/V	**TCO Status (TCO_STS):** 0 = SMI not caused by TCO logic. 1 = Indicates SMI was caused by the TCO logic. ***Note:*** Will not cause wake event. This bit is cleared by writing a 1 to this bit position. This bit is reset by PLTRST# assertion.
12	0h RO/V	**DEVMON Status (DEVMON_STS):** This read-only bit is set when bit 0 in the DEVTRAP_STS register is set. It is not sticky, so writes to this bit will have no effect.
11	0h RW/1C/V	**Microcontroller SMI Status (MCSMI_STS):** This bit is set if there is an access to the power management microcontroller range (62h or 66h). If this bit is set, and the MCSMI_EN bit is also set, the Intel PCH will generate an SMI#. This bit is set by hardware and cleared by software writing a 1 to its bit position. This bit is reset by PLTRST# assertion.
10	0h RO/V	**GPIO SMI Status (GPIO_SMI_STS):** This bit will be a 1 if any GPIO that is enabled to trigger SMI is asserted. GPIOs that are not routed to cause an SMI will have no effect on this bit. This bit is NOT sticky. Writes to this bit will have no effect. ***Note:*** See the GPIO chapter for the individual GPIO SMI status, enable, and routing bit definitions.
9	0h RO/V	**GPE0 Status (GPE0_STS):** There are several status/enable bit pairs in GPE0_STS/EN_127_96 that are capable of triggering SMI#s. This bit is a logical OR of all of those pairs (i.e. this bit is asserted whenever at least one of those pairs has both the status and enable bit asserted). This bit is NOT sticky. Writes to this bit will have no effect. ***Note:*** The setting of this bit does not cause the SMI#. The following bit pairs are included in this logical OR: - GPE0_STS/EN_127_96 [18, 17, 16, 13, 11, 10, 8, 2]
8	0h RO/V	**PM1 Status Register (PM1_STS_REG):** This is an OR of the bits (except for bits 5 and 4) in the ACPI PM1 Status Reg. Not sticky. Writes to this bit have no effect. ***Note:*** The setting of this bit does not cause the SMI#.
7	0h RO	Reserved.
6	0h RW/1C/V	**Software SMI Timer Status (SWSMI_TMR_STS):** This bit will be set to 1 by the hardware when the Software SMI# Timer expires. This bit will remain 1 until the software writes a 1 to this bit. This bit is reset by PLTRST# assertion.
5	0h RW/1C/V	**APM Status (APM_STS):** SMI# was generated by a write access to the APM control register and if the APMC_EN bit is set. This bit is cleared by writing a one to its bit position. This bit is reset by PLTRST# assertion.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW/1C/V	**SMI_ON_SLP_EN Status (SMI_ON_SLP_EN_STS):** This bit will be set by the Intel PCH when a write access attempts to set the SLP_EN bit. This bit is cleared by writing a 1 to this bit position. This bit is reset by PLTRST# assertion.
3	0h RO/V	**Legacy USB Status (LEGACY_USB_STS):** This non-sticky read-only bit is a logical OR of each of the SMI status bits in the USB Legacy Keybd Register ANDed with the corresponding enable bits. This bit will not be active if the enable bits are not set. Writes to this bit will have no effect.
2	0h RW/1C/V	**BIOS Status (BIOS_STS):** This bit gets set by hardware when a 1 is written by software to the GBL_RLS bit. When both BIOS_EN and the BIOS_STS bit are set, an SMI# will be generated. The BIOS_STS bit is cleared when software writes a 1 to this bit position. This bit is reset by PLTRST# assertion.
1:0	0h RO	Reserved

9.9.6 General Purpose Event Control (GPE_CTRL)—Offset 40h

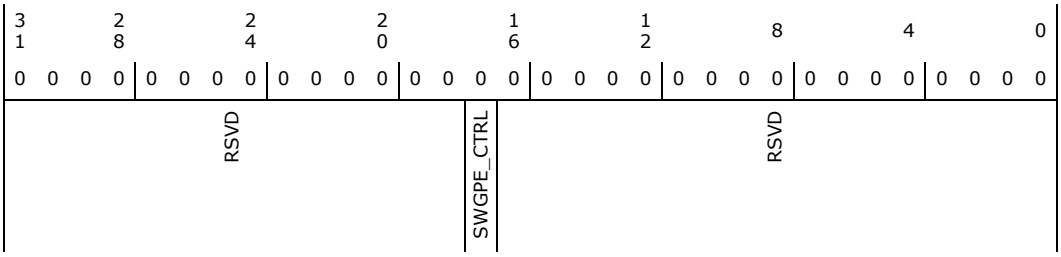
Lockable: No Usage: ACPI or Legacy Power Well:

Access Method

Type: IO Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RW/V	**Software GPE Control (SWGPE_CTRL):** This bit allows software to control the assertion of SWGPE_STS bit. This bit is used by hardware as the level input signal for the SWGPE_STS bit in the GPE0_STS register. When SWGPE_CTRL is 1, SWGPE_STS will be set to 1, and writes to SWGPE_STS with a value of 1 to clear SWGPE_STS will result in SWGPE_STS being set back to 1 by hardware. When SWGPE_CTRL is 0, writes to SWGPE_STS with a value of 1 will clear SWGPE_STS to 0. This bit is reset by RSMRST# assertion.
16:0	0h RO	Reserved.

9.9.7 Device Activity Status Register (DEVACT_STS)—Offset 44h

Each bit indicates if an access has occurred to the corresponding device's trap range, or for bits [6:9], if the corresponding PCI interrupt is active. This register is used in conjunction with the Periodic SMI# timer to detect any system activity for legacy power management. The periodic SMI# timer indicates if it is the right time to read the DEVACT_STS register.

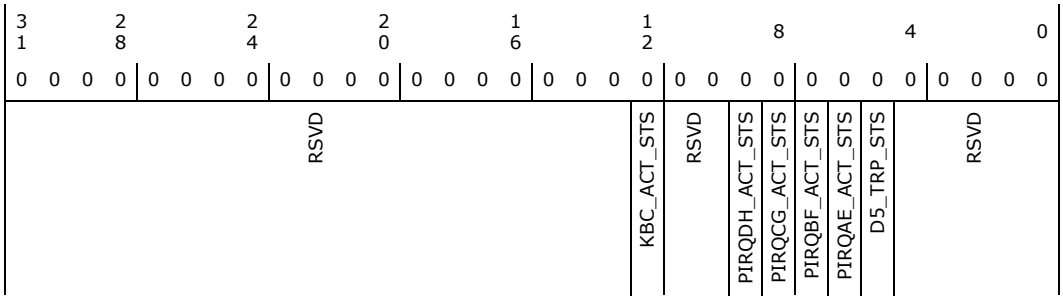
Note: Software clears bits that are set in this register by writing a 1 to the bit position.

Access Method

Type: IO Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	Reserved.
12	0h RW/1C/V	**Keyboard Controller Device Activity (KBC_ACT_STS):** KBC (60/64h). 0 = Indicates that there has been no access to this device I/O range. 1 = This device I/O range has been accessed. Clear this bit by writing a 1 to the bit location. This bit is reset by PLTRST# assertion.
11:10	0h RO	Reserved
9	0h RW/1C/V	**PIRQDH Activity Status (PIRQDH_ACT_STS):** PIRQ[D or H] 0 = The corresponding PCI interrupts have not been active. 1 = At least one of the corresponding PCI interrupts have been active. Clear this bit by writing a 1 to the bit location. This bit is cleared by PLTRST# assertion.
8	0h RW/1C/V	**PIRQCG Activity Status (PIRQCG_ACT_STS):** PIRQ[C or G] 0 = The corresponding PCI interrupts have not been active. 1 = At least one of the corresponding PCI interrupts have been active. Clear this bit by writing a 1 to the bit location. This bit is cleared by PLTRST# assertion.
7	0h RW/1C/V	**PIRQBF Activity Status (PIRQBF_ACT_STS):** PIRQ[B or F] 0 = The corresponding PCI interrupts have not been active. 1 = At least one of the corresponding PCI interrupts have been active. Clear this bit by writing a 1 to the bit location. This bit is cleared by PLTRST# assertion.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW/1C/V	**PIRQAE Activity Status (PIRQAE_ACT_STS):** PIRQ[A or E] 0 = The corresponding PCI interrupts have not been active. 1 = At least one of the corresponding PCI interrupts have been active. Clear this bit by writing a 1 to the bit location. This bit is cleared by PLTRST# assertion.
5	0h RW/1C/V	**D5 Trap Status (D5_TRP_STS):** 0 = The corresponding I/O have not been accessed. 1 = The following are accessed (as determined by the I/O ranges in the LPC decoder and even if the LPC forwarding is not enabled): SP1, SP2, PP, FDC. Clear this bit by writing a 1 to the bit location. This bit is cleared by PLTRST# assertion.
4:0	0h RO	Reserved

9.9.8 PM2a Control Block (PM2A_CNT_BLK)—Offset 50h

Lockable: No Usage: ACPI or Legacy Power Well: Primary

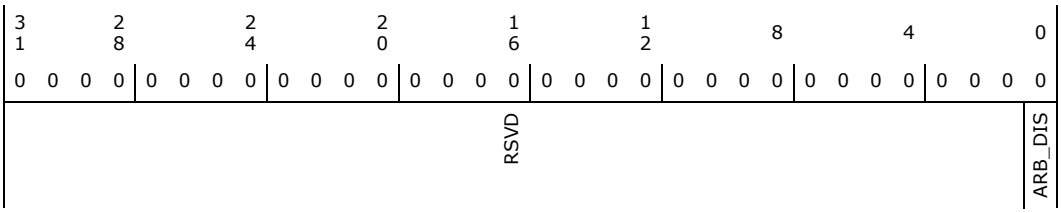
Note: The BIOS must describe this register as 1 byte wide to the OS.

Access Method

Type: IO Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved
0	0h RW	**Arbiter Disable (ARB_DIS):** This bit is a scratchpad bit for legacy software compatibility. This bit is reset by PLTRST# assertion.

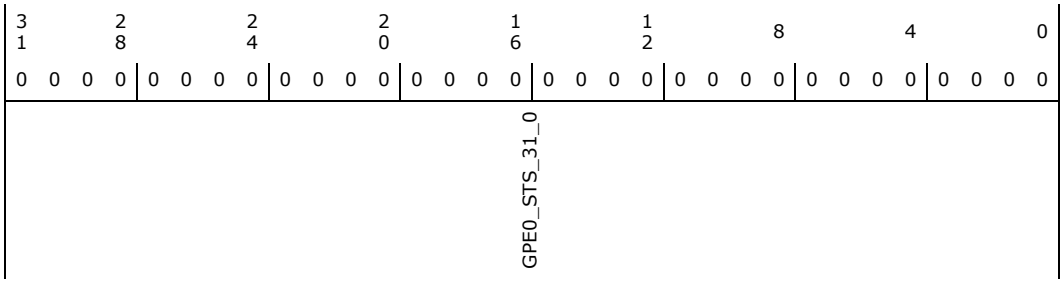
9.9.9 General Purpose Event 0 Status [31:0] (GPE0_STS_31_0) - Offset 80h

Access Method

Type: IO Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/1C/V	General Purpose Event 0 Status [31:0] (GPE0_STS_31_0): These bits are set any time the corresponding GPIO is setup as an input and the corresponding GPIO signal is high (or low if the corresponding RXINV bit is set). If the corresponding enable bit is set in the GPE0_EN_31_0 register, then when the GPE0_STS_31_0 is set: • If the system is in an S3-S5 state, the event will also wake up the system. • If the system is in the S0 state (or upon waking back to S0) an SCI will be generated, depending on the GPIROURTSCI bit for the corresponding GPI. These bits are sticky bit and are cleared by writing a "1" back to the bit position. ***Note:*** The GPP/GPD group mapped to this register is configured via GPIO_CFG.DW0 and MISCCFG.DW0 Both GPIO_CFG.DW0 and MISCCFG.DW0 must be programmed to the same state. The GPIO_CFG register is in Chapter 9, "Power Management," and the MISCCFG is in Chapter 18, "General Purpose Input and Output."

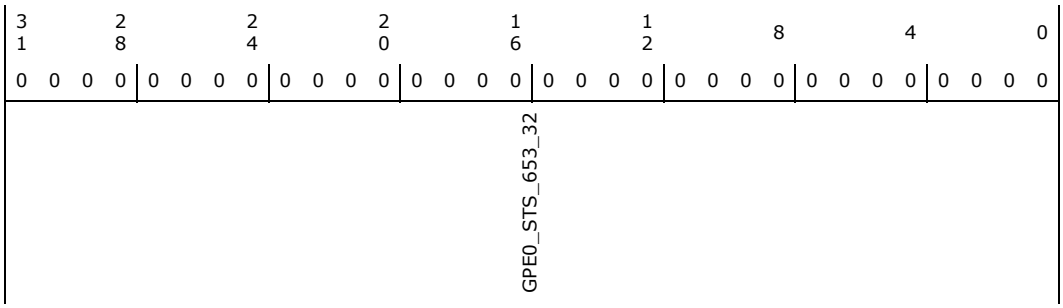
9.9.10 General Purpose Event 0 Status [63:32] (GPE0_STS_63_32) - Offset 84h

Access Method

Type: IO Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/1C/V	General Purpose Event 0 Status [63:32] (GPE0_STS_63_32): These bits are set any time the corresponding GPIO is setup as an input and the corresponding GPIO signal is high (or low if the corresponding RXINV bit is set). If the corresponding enable bit is set in the GPE0_EN_31_0 register, then when the GPE0_STS_31_0 is set: • If the system is in an S3-S5 state, the event will also wake up the system. • If the system is in the S0 state (or upon waking back to S0) an SCI will be generated, depending on the GPIROURTSCI bit for the corresponding GPI. These bits are sticky bit and are cleared by writing a "1" back to the bit position. ***Note:*** The GPP/GPD group mapped to this register is configured via GPIO_CFG.DW0 and MISCCFG.DW0 Both GPIO_CFG.DW0 and MISCCFG.DW0 must be programmed to the same state. The GPIO_CFG register is in Chapter 9, "Power Management," and the MISCCFG is in Chapter 18, "General Purpose Input and Output."

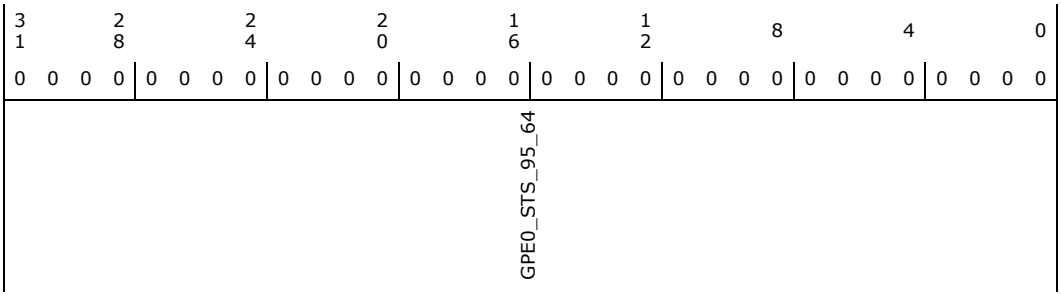
9.9.11 General Purpose Event 0 Status [95:64] (GPE0_STS_95_64) - Offset 88h

Access Method

Type: IO Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/1C/V	General Purpose Event 0 Status [95:64] (GPE0_STS_95_64): These bits are set any time the corresponding GPIO is setup as an input and the corresponding GPIO signal is high (or low if the corresponding RXINV bit is set). If the corresponding enable bit is set in the GPE0_EN_31_0 register, then when the GPE0_STS_31_0 is set: • If the system is in an S3-S5 state, the event will also wake up the system. • If the system is in the S0 state (or upon waking back to S0) an SCI will be generated, depending on the GPIROURTSCI bit for the corresponding GPI. These bits are sticky bit and are cleared by writing a "1" back to the bit position. ***Note:*** The GPP/GPD group mapped to this register is configured via GPIO_CFG.DW0 and MISCCFG.DW0 Both GPIO_CFG.DW0 and MISCCFG.DW0 must be programmed to the same state. The GPIO_CFG register is in Chapter 9, "Power Management," and the MISCCFG is in Chapter 18, "General Purpose Input and Output."

9.9.12 General Purpose Event 0 Status [127:96] (GPE0_STS_127_96)—Offset 8Ch

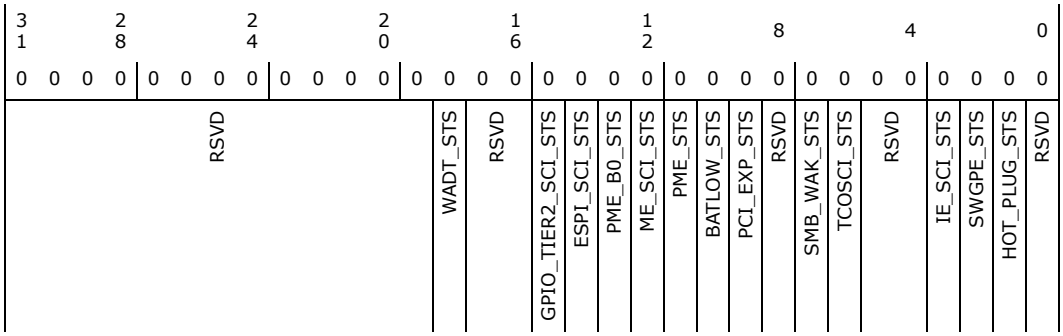
Note: This register is symmetrical to the General Purpose Event 0 Enable [127:96] Register. Unless indicated otherwise below, if the corresponding _EN bit is set, then when the STS bit get set, the Intel PCH will generate a Wake Event. Once back in an S0 state (or if already in an S0 state when the event occurs), the Intel PCH will also generate an SCI if the SCI_EN bit is set, or an SMI# if the SCI_EN bit is not set and GBL_SMI_EN is set.
The GPE0_STS bits [95:0] are claimed by the GPIO register block.

Access Method

Type: IO Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	Reserved
18	0h RW/1C/V	**Wake Alarm Device Timer Status (WADT_STS):** This bit is set whenever the any of the wake alarm device timers signal a timer expiration. This bit is reset by RSMRST# assertion.
17:16	0h RO	Reserved
15	0h RW/1C/V	**GPIO Tier2 SCI Status (GPIO_TIER2_SCI_STS):** This bit is a logical OR of sci_wake from tier 2 GPIO's.
14	0h RW/1C/V	**eSPI SCI Status (ESPI_SCI_STS):** This bit will be set when an agent attached to eSPI is requesting an SCI. ***Note:*** This source is not able to cause a wake event. This bit is reset by RSMRST# assertion.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RW/1C/V	**Power Management Event Bus 0 Status (PME_B0_STS):** This bit will be set to 1 by the Intel PCH when any internal device with PCI Power Management capabilities on bus 0 asserts the equivalent of the PME# signal. Additionally, if the PME_B0_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the PME_B0_STS bit will generate an SCI (or SMI# if SCI_EN is not set). If the PME_B0_EN bit is set, and the system is in an S3-S4 state (or S5 state due to SLP_TYP and SLP_EN), then the setting of the PME_B0_STS bit will generate a wake event. If the system is in an S5 state due to power button override, then the PME_B0_STS bit will not cause a wake event or SCI. This bit is cleared by a software write of '1'. Internal devices which can set this bit: - Integrated LAN (Legacy 1 GbE, not the 10/1 GbE LAN - HD Audio/Audio DSP - SATA - EHCI ('USB2') - XHCI ('USB3') - ME Maskable Host Wake This bit is reset by RSMRST# assertion.
12	0h RW/1C/V	**ME SCI Status (ME_SCI_STS):** This bit will be set when Intel ME is requesting an SCI. Software must clear the ME source of the SCI before clearing this bit. ***Note:*** This source is not able to cause a wake event. This bit is reset by RSMRST# assertion.
11	0h RW/1C/V	**Power Management Event Status (PME_STS):** This bit will be set to 1 by hardware when the PME# signal goes active. Additionally, if the PME_EN and SCI_EN bits are set, and system is in an S0 state, then the setting of the PME_STS bit will generate an SCI (or SMI# if SCI_EN is not set). If the PME_EN bit is set, and the system is in an S3-S4 state (or S5 state due to SLP_TYP and SLP_EN), then the setting of the PME_STS bit will generate a wake event. If the system is in an S5 state due to power button override, then PME_STS will not cause a wake event or SCI. This bit is cleared by writing a 1 to this bit position or RSMRST# assertion.
10	0h RW/1C/V	**RSVD**
9	0h RW/1C/V	**PCI Express Status (PCI_EXP_STS):** This bit will be set to 1 by hardware to indicate that: - The PME event message was received on one or more of the PCI-Express Ports - An Assert PMEGPE message received from the MCH via DMI. ***Note:*** The PCI WAKE# pin and the PCI Express Beacons have no impact on this bit. Software attempts to clear this bit by writing a 1 to this bit position. If the PCI_EXP_STS bit went active due to an Assert PMEGPE message, then a Deassert PMEGPE message must be received prior to the software write in order for the bit to be cleared. If the bit is not cleared and the corresponding PCI_EXP_EN bit is set, the leveltriggered SCI will remain active. Note that a race condition exists where the PCI Express device sends another PME message because the PCI Express device was not serviced within the time when it must resend the message. This may result in a spurious interrupt, and this is comprehended and approved by the PCI Express specification. The window for this race condition is approximately 95-105 milliseconds. This bit is reset by RSMRST# assertion.
8	0h RW/1C/V	**RSVD**
7	0h RW/1C/V	**SMBus Wake Status (SMB_WAK_STS):** This bit is set to 1 by the hardware to indicate that the wake event was caused by the PCH's SMBus logic. This could be due to either the SM Bus slave unit receiving a message or the SMBALERT# signal going active. ***Notes:*** 1. The SMBus controller will independently cause an SMI# so this bit does not need to do so (unlike the other bits in this register). 2. This bit is set by the SMBus slave command 01h (Wake/SMI#) even when the system is in the S0 state. Therefore, to avoid an instant wake on subsequent transitions to sleep states, software must clear this bit after each reception of the Wake/SMI# command or just prior to entering the sleep state. 3. The SMBALERT_STS bit (D31:F3:I/O Offset 00h:bit 5) should be cleared by software before clearing this bit. This bit is reset by RSMRST# assertion.
6	0h RW/1C/V	**TCOSCI Status (TCOSCI_STS):** This bit will be set to 1 by hardware when the TCO logic or Thermal Sensor logic causes an SCI. This bit can be reset by writing a one to this bit position or by RSMRST# assertion.
5:4	0h RO	Reserved

Bit Range	Default & Access	Field Name (ID): Description
3	RW/1C/V	**IE SCI Status (IE_SCI_STS):** This bit will be set when IE is requesting an SCI. Software must clear the IE source of the SCI before clearing this bit. This bit will not cause a wake event.
2	0h RW/1C/V	**Software GPE Status (SWGPE_STS):** The SWGPE_CTRL bit (bit 1 of GPE_CTRL reg) acts as a level input to this bit. This bit is reset by RSMRST# assertion.
1	0h RW/1C/V	**Hot Plug Status (HOT_PLUG_STS):** Enables PCH to cause an SCI when the HOT_PLUG_STS bit is set. This is used to allow the PCI Express ports to cause an SCI due to hot-plug events. The following events cause HOT_PLUG_STS bit to set - Assert GPE message received from any of the PCIE ports in PCH - Assert HPGPE message received from any of the PCIE ports in PCH - Assert GPE message received downstream from MCH - Assert HPGPE message received downstream from MCH. This bit is reset by RSMRST# assertion.
0	0h RO	Reserved

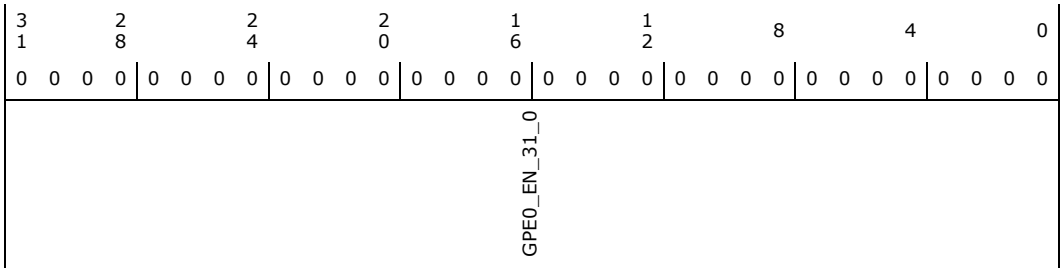
9.9.13 General Purpose Event 0 Enable[31:0] (GPE0_EN_31_0) - Offset 90h

Access Method

Type: IO Register
(Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**General Purpose Event 0 Enable [31:0] (GPE0_EN_31_0)**: These bits enable the corresponding GPE0_STS[31:0] bits being set to cause an SCI and/or wake event. ***Note:*** The GPP/GPD group mapped to this register is configured via GPIO_CFG.DW2 and MISCCFG.DW2 Both GPIO_CFG.DW2 and MISCCFG.DW2 must be programmed to the same state. The GPIO_CFG register is in Chapter 9, "Power Management," and the MISCCFG is in Chapter 18, "General Purpose Input and Output."

9.9.14 General Purpose Event 0 Enable[63_32] (GPE0_EN_63_32) - Offset 94h

14	0h RW/V	**eSPI SCI Enable (ESPI_SCI_EN):** Used to enable the setting of the ESPI_SCI_STS bit to generate a SCI.
13	0h RW/V	**PME_B0 Enable (PME_B0_EN):** Enables the setting of the PME_B0_STS bit to generate a wake event and/or an SCI or SMI#. This bit is reset by RTCRST# assertion.
12	0h RW/V	**ME SCI Enable (ME_SCI_EN):** Used to enable the setting of the ME_SCI_STS bit to generate a SCI.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW/V	**Power Management Event Enable (PME_EN):** Enables the setting of the PME_STS to generate a wake event and/or an SCI. This bit is reset by RTCRST# assertion.
10	0h RW/V	**Reserved**
9	0h RW/V	**PCI Express Enable (PCI_EXP_EN):** Enables PCH to cause an SCI when PCI_EXP_STS bit is set. This is used to allow the PCI Express ports, including the link to the MCH, to cause an SCI due to wake/PME events.
8	0h RW/V	**RI Enable (RI_EN):** When RI_EN and RI_STS are both set, a Wake event will occur. If RI_EN is not set, then when RI_STS is set, no Wake event will occur. This bit is reset by RTCRST# assertion.
7	0h RO	Reserved
6	0h RW/V	**TCOSCI Enable (TCOSCI_EN):** When TCOSCI_EN and TCOSCI_STS are both set, an SCI will be generated. This bit is reset by RSMRST# assertion.
5:4	0h RO	Reserved
3	0b RW/V	**IE SCI Enable (IE_SCI_EN)**. When set to 1b, enables IE_SCI_STS bit to generate an SCI.
2	0h RW/V	**Software GPE Enable (SWGPE_EN):** This bit, when set to 1, enables the SW GPE function. If SWGPE_CTRL is written to a 1, hardware will set SWGPE_STS (acts as a level input) If SWGPE_STS, SWGPE_EN, and SCI_EN are all 1's, an SCI will be generated If SWGPE_STS = 1, SWGPE_EN = 1, SCI_EN = 0, and GBL_SMI_EN = 1 then an SMI# will be generated
1	0h RW/V	**Hot Plug Enable (HOT_PLUG_EN):** Enables PCH to cause an SCI when the HOT_PLUG_STS bit is set. This is used to allow the PCI Express ports to cause an SCI due to hot-plug events. The following events cause HOT_PLUG_STS bit to set: - Assert GPE message received from any of the PCIE ports in PCH - Assert HPGPE message received from any of the PCIE ports in PCH - Assert GPE message received downstream from MCH - Assert HPGPE message received downstream from MCH
0	0h RO	Reserved

9.10 PMC Memory Mapped Registers Summary

Table 9-19. Summary of PMC Memory Mapped Registers (Sheet 1 of 3)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Wake Alarm Device Timer: AC (WADT_AC)—Offset 0h	FFFFFFFFh
4h	7h	Wake Alarm Device Timer: DC (WADT_DC)—Offset 4h	FFFFFFFFh

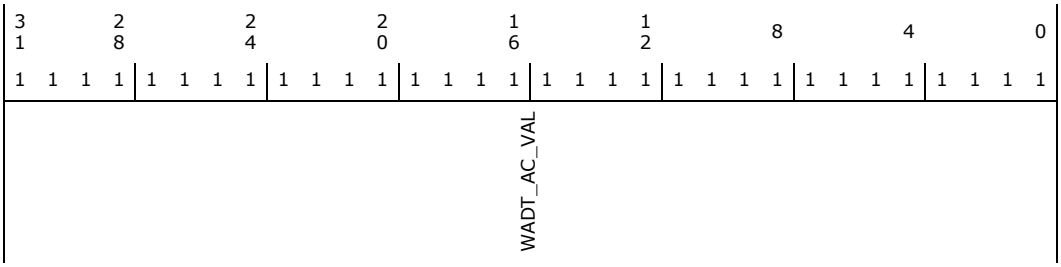
9.10.1 Wake Alarm Device Timer: AC (WADT_AC)—Offset 0h

Access Method

Type: PWRMBASE MEM Register (Size: 32 bits)

Device: 31
Function: 2

Default: FFFFFFFFh



Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW/V	**Wake Alarm Device Timer Value for AC Mode (WADT_AC_VAL):** This field contains the 32-bit wake alarm device timer value (granularity 1s) for AC power. The timer begins decrementing when written to a value other than FFFFFFFFh (regardless of the power source when the write occurs). Upon counting down to 0: If on AC power, GPE0b_STS.WADT_STS will be set. This status bit being set will generate a host wake if GPE0b_EN.WADT_EN is 1. If the power source is DC at this time, the status bit is not set. However, if AC power subsequently returns to the platform, the AC Expired Timer begins running. See the WADT_EXP_AC register for details. The timer returns to its default value of FFFFFFFFh. This bit is reset by DSW_PWROK de-assertion.

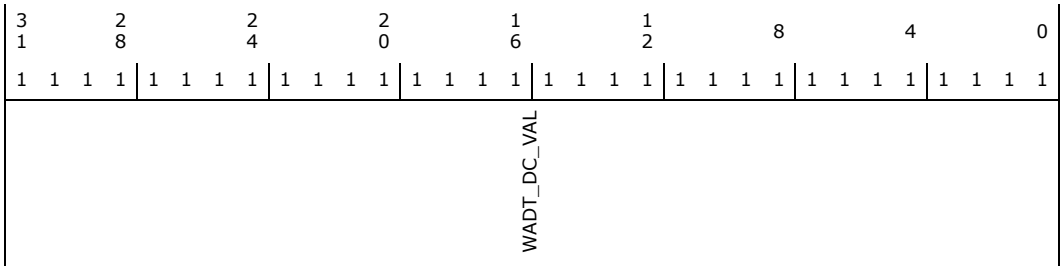
9.10.2 Wake Alarm Device Timer: DC (WADT_DC)—Offset 4h

Access Method

Type: PWRMBASE MEM Register (Size: 32 bits)

Device: 31
Function: 2

Default: FFFFFFFFh



Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW/V	**Wake Alarm Device Timer Value for DC Mode (WADT_DC_VAL):** This field contains the 32-bit wake alarm device timer value (granularity 1s) for DC power. The timer begins decrementing when written to a value other than FFFFFFFFh (regardless of the power source when the write occurs). Upon counting down to 0: If on DC power, GPE0b_STS.WADT_STS will be set. This status bit being set will generate a host wake if GPE0b_EN.WADT_EN is 1. If the power source is AC at this time, the status bit is not set. However, if DC power subsequently returns to the platform, the DC Expired Timer begins running. See the WADT_EXP_DC register for details. The timer returns to its default value of FFFFFFFFh. This bit is reset by DSW_PWROK de-assertion.

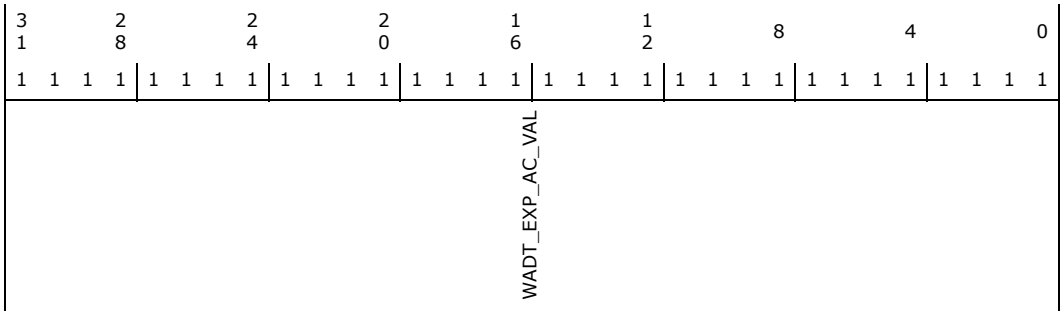
9.10.3 Wake Alarm Device Expired Timer: AC (WADT_EXP_AC)—Offset 8h

Access Method

Type: PWRMBASE MEM Register (Size: 32 bits)

Device: 31
Function: 2

Default: FFFFFFFFh



Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW/V	**Wake Alarm Device Expired Timer Value for AC Mode (WADT_EXP_AC_VAL):** This field contains the 32-bit wake alarm device [quote]Expired Timer[quote] value (granularity 1s) for AC power. The timer begins decrementing after switching from DC to AC power, in the case where the WADT_AC timer has already expired while the platform was on DC power. This timer only decrements while operating on AC power. So if the power source switches back to DC power, the timer will stop (but not reset). When AC power returns, the timer will again begin decrementing. ***Note:*** This timer will only begin decrementing under the conditions described above if this field has been configured for something other than its default value of FFFFFFFFh (i.e. FFFFFFFFh = disabled). Upon expiration of this timer: If on AC power, GPE0b_STS.WADT_STS will be set. This status bit being set will generate a host wake if GPE0b_EN.WADT_EN is 1. BOTH the AC and DC Expired Timers return to their defaults value of FFFFFFFFh. This bit is reset by DSW_PWROK de-assertion.

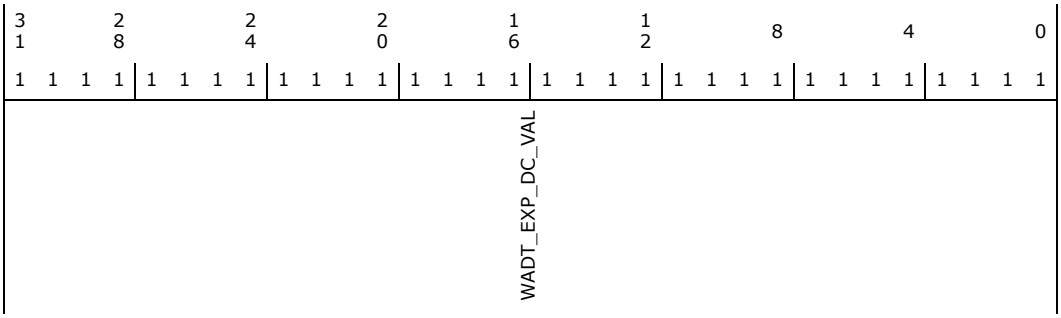
9.10.4 Wake Alarm Device Expired Timer: DC (WADT_EXP_DC)—Offset Ch

Access Method

Type: PWRMBASE MEM Register (Size: 32 bits)

Device: 31
Function: 2

Default: FFFFFFFFh



Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW/V	**Wake Alarm Device Expired Timer Value for DC Mode (WADT_EXP_DC_VAL):** This field contains the 32-bit wake alarm device [quote]Expired Timer[quote] value (granularity 1s) for DC power. The timer begins decrementing after switching from AC to DC power, in the case where the WADT_DC timer has already expired while the platform was on AC power. This timer only decrements while operating on DC power. So if the power source switches back to AC power, the timer will stop (but not reset). When DC power returns, the timer will again begin decrementing. ***Note:*** This timer will only begin decrementing under the conditions described above if this field has been configured for something other than its default value of FFFFFFFFh (i.e. FFFFFFFFh = disabled). Upon expiration of this timer: If on DC power, GPE0b_STS.WADT_STS will be set. This status bit being set will generate a host wake if GPE0b_EN.WADT_EN is 1. BOTH the AC and DC Expired Timers return to their defaults value of FFFFFFFFh. This bit is reset by DSW_PWROK de-assertion.

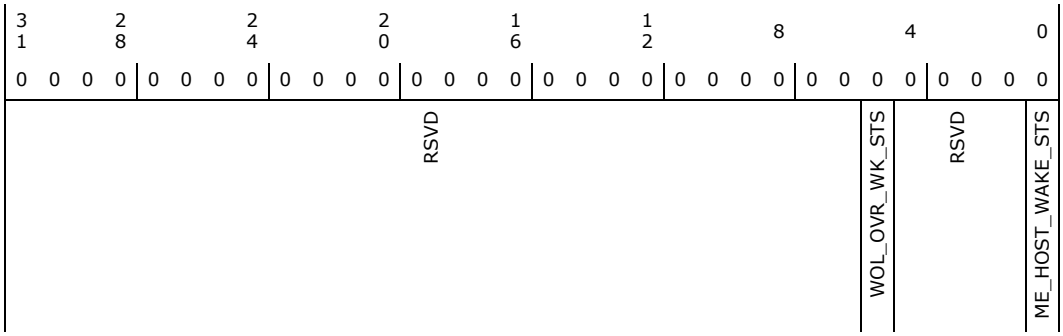
9.10.5 Power and Reset Status (PRSTS)—Offset 10h

Access Method

Type: PWRMBASE MEM Register (Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	Reserved
5	0h RW/1C/V	**Wake On LAN Override Wake Status (WOL_OVR_WK_STS):** This bit gets set when integrated LAN Signals a Power Management Event AND the system is in S5. BIOS can read this status bit to determine this wake source. Software clears this bit by writing a 1 to it.
4:1	0h RO	Reserved
0	0h RW/1C/V	**ME_HOST_WAKE_STS (ME_HOST_WAKE_STS):** This bit is set when the ME generates a non-maskable wake event and is not affected by any other enable bit. When this bit is set, the host power management logic wakes to S0.

9.10.6 Chipset Initialization Register 14 (CIR14)—Offset 14h

BIOS may write to the register.

9.10.7 Power Management Configuration Reg 1 (PM_CFG)—Offset 18h

Access Method

Type: PWRMBASE MEM Register (Size: 32 bits)

Device: 31
Function: 2

Default: 20h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
RSVD				Register Lock	RSVD					RTC_DSX_WAKE_DIS	RSVD	SLP_SUS_MIN_ASST_WDTH		SLP_A_MIN_ASST_WDTH		SLP_GBE_MIN_ASST_WDTH		RSVD			PB_DB_MODE	PWR_CYC_DUR		RSVD		COCS	RSVD			TIMING T581	

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RW	Reserved
27	0b RW/L	**Register Lock**: When this bit is set, the GBL2HOST_EN register is locked down. One written set to "1", only a PLTRST# will reset the bit to o.
26:23	0h RW	**Reserved**
22	0b RW	**Reserved.** BIOS will need to program this bit to 1b. This bit is self locking. Once set to 1b it will take a system reset to clear back to 0b
21	0h RW	**RTC Wake from DeepSx Disable (RTC_DSX_WAKE_DIS):** When set, this bit disables RTC wakes from waking the system from DeepSx. This bit is reset by RTCRST# assertion.
20	0h RO	Reserved
19:18	0h RW/L	**SLP_SUS# Minimum Assertion Width (SLP_SUS_MIN_ASST_WDTH):** This 2-bit value indicates the minimum assertion width of the SLP_SUS# signal to guarantee that the SUS well power supplies have been fully power-cycled. This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc. Settings are: 00 = 0 ms (i.e. stretching disabled - default) 01 = 500ms 10 = 1s 11 = 4s This field is not writable when the SLP_Sx# Stretching Policy Lock- Down bit is set. This field is ignored when exiting a G3 state if the "Disable SLP_X Stretching After SUS Power Failure" bit is set. Note that unlike with all other SLP_* pin stretching, this disable bit only impacts SLP_SUS# stretching during G3 exit rather than both G3 and DeepSx exit. SLP_SUS# stretching always applies to DeepSx regardless of the disable bit. **Programming Note**: For platforms that enable DeepSx, BIOS must program SLP_SUS# stretching to be greater than or equal to the largest stretching value on any other SLP_* pin (SLP_S3#, SLP_S4#, SLP_GBE#, or SLP_A#). This bit is cleared by the RTCRST# pin.

Bit Range	Default & Access	Field Name (ID): Description
17:16	0h RW/L	**SLP_A# Minimum Assertion Width (SLP_A_MIN_ASST_WDTH):** This 2-bit value indicates the minimum assertion width of the SLP_A# signal to guarantee that the ASW power supplies have been fully power-cycled. This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc. Settings are: 00 = 0 ms (i.e. stretching disabled - default) 01 = 4 s 10 = 98 ms 11 = 2 s This field is not writable when the SLP_Sx# Stretching Policy Lock- Down bit is set. This field is ignored when exiting a G3 or Deep Sx state if the "Disable SLP_X Stretching After SUS Power Failure" bit is set. This bit is cleared by the RTCRST# pin.
15:14	0h RW/L	**SLP_GBE# Minimum Assertion Width (SLP_GBE_MIN_ASST_WDTH):** This 2-bit value indicates the minimum assertion width of the SLP_GBE# signal to guarantee that the power to the PHY has been fully power-cycled. This value may be modified per platform depending on power supply, capacitance, board capacitance, power failure detection circuits, etc. This field is not writable when the SLP_Sx# Stretching Policy Lock Down bit is set to 1. This bit is reset by RTCRST# assertion.
13:11	0b RW	**After G3 Last State Enable (AG3_LS_EN):** When PM_CFG.AG3E is '0', AG3_LS_EN determines whether the PCH will consider the platform's previous state when determining whether to power-up after G3. Encodings: 0 = (default): PCH power-up policies after G3 do not depend on the platform's state when the G3 occurred. 1 = PCH power-up policies after G3 depend on the platform's state when the G3 occurred. — If the power failure occurred while the platform was in S0 or while in the process of going to S0, the platform will power-up to S0 upon exiting G3. If the power failure occurred while the platform was in Sx or while in the process of going to Sx, the platform will stay in S4/S5 upon exiting G3. ***Note:*** This bit applies only when GEN_PMCON_3.AG3E is '0'. If AG3E is '1', the platform will always stay in S4/S5 after G3 regardless of the value of AG3_LS_EN. ***Note:*** The destination state is considered to be S0 during both host wake and throughout host partition resets with/without power cycle. Reset with RTCRST#
12	0b RW	**After Type 8 Global Reset Last State Enable (A8GR_LS_EN):** AGR_LS_EN determines whether the PCH will consider the platform's previous state when determining whether to power-up after non-thermal and non-explicitly requested type 8 global resets. See the "Reset Sources" table for a list of impacted reset types. Encodings: 0 = (default): PCH power-up policies after a global reset do not depend on the platform's state when the reset occurred. 1 = PCH power-up policies after a global reset depend on the platform's state when the reset occurred. — If the global reset occurred while the platform was in S0 or while in the process of going to S0, the platform will power-up to S0 after the reset. — If the global reset occurred while the platform was in Sx or while in the process of going to Sx, the platform will stay in S5 upon exiting G3. ***Note:*** he destination state is considered to be S0 during both host wake and throughout host partition resets with/without power cycle. This bit is reset by RTCRST#
11	0b RW	**Global Reset Three Strike Counter Enable (GR_TSC_EN):** When set, GR_TSC_EN will cause the PMC to keep the platform in S5 after the third consecutive type 7 global reset occurs during the boot flow. The three strike counter is reset in the following situations: • The system reaches S0. A type 8 global reset occurs, including after the three strike counter causes the system to stay in S5. • RSMRST# asserts (due to DeepSx entry or a G3 event occurring). This bit is reset by RTCRST#

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	**Power Button Debounce Mode (PB_DB_MODE):** This bit controls when interrupts (SMI#, SCI) are generated in response to assertion of the PWRBTN# pin. This bit's values cause the following behavior: - '0': The 16ms debounce period applies to all usages of the PWRBTN# pin (legacy behavior). - '1': When a falling edge occurs on the PWRBTN# pin, an interrupt is generated and the 16ms debounce timer starts. Subsequent interrupts are masked while the debounce timer is running. Power button override logic always samples the post-debounce version of the pin. This bit is reset by RTCRST# assertion.
9:8	0h RW/L	**Reset Power Cycle Duration (PWR_CYC_DUR):** The value in this register determines the minimum time a platform will stay in reset (SLP_S3#, SLP_S4#, SLP_S5# asserted and also SLP_A# and SLP_GBE# asserted if applicable) during a host partition reset with power cycle or a global reset. The duration programmed in this register takes precedence over the applicable SLP_# stretch timers in these reset scenarios. This field is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. Note that the duration programmed in this register should never be smaller than the stretch duration programmed in the following registers: - GEN_PMCON_3.SLP_S3_MIN_ASST_WDTH - GEN_PMCON_3.S4MAW - PM_CFG.SLP_A_MIN_ASST_WDTH - PM_CFG.SLP_GBE_MIN_ASST_WDTH This bit is reset by RTCRST# assertion.
7:6	0h RO	Reserved
5	1h RW/V	**CPU OC Strap (COCS):** SW programs this pin with the value that should be reflected to the GPIO8_OCS pin, when the pin is in native mode. Hardware also sets this bit when the over-clocking watchdog timer expires. This bit is reset by RSMRST# assertion.
4:2	0h RO	Reserved
1:0	0h RW/V	**Timing T581:** This field configures the t581 timing in the Purley PDG involved in the power down flow (PROCPWRGD de-assertion to CLKOUT_BCLK turning OFF). Encodings (all min timings): 00: 10 us (default) 01: 100 us 10: 1 ms 11: 10 ms reset_type=host_deep_rst_b

9.10.8 PCH Power Management Status (PCH_PM_STS)—Offset 1Ch

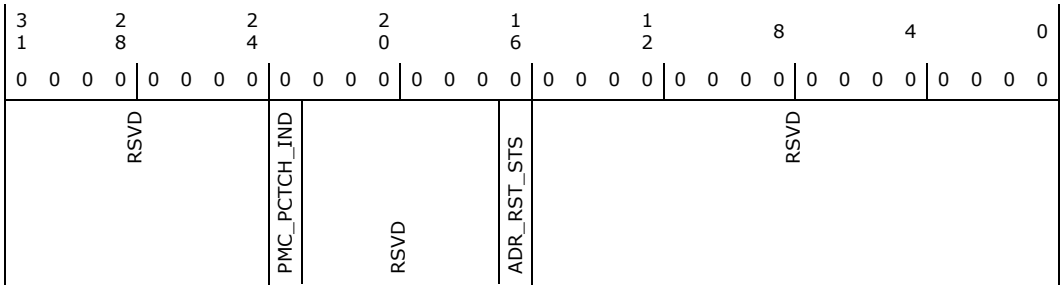
This register contains the status bit to indicate that an ADR flow occurred. All other bits are reserved.

Access Method

Type: PWRMBASE MEM Register (Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0b RO/V	**PMC Patch Load indicator (PMC_PATCH_IND)**: This bit is reset to 0b on RSMRST# going high or a global reset. The PMC sets this bit to "1" when it loads and starts using a patch. The PMC is always expected to load a PMC FW patch. BIOS should check this bit at boot and alert the user if not set to "1"
22:17	0h RO	**Reserved**
16	0b RW/1C/V	**ADR Reset Status (ADR_RST_STS):** Went set to "1", this bit indicates that the Automatic DIMM Self-Refresh (ADR) flow was executed during a prior global reset entry.
15-0	0h RO/RW/ 1C/V	**Reserved**

9.10.9 Chipset Initialization Register 20(CIR20)—Offset 20h

The BIOS may write to the register.

9.10.10 PCH Power Management Status (PCH_PM_STS2)—Offset 24h

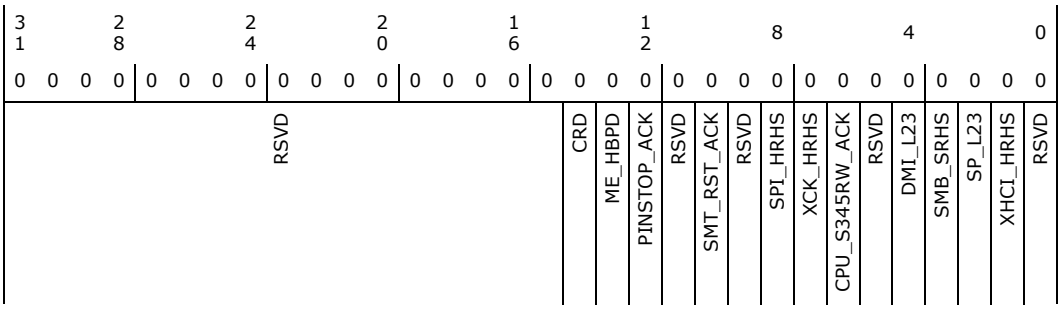
This register contains misc. fields used to record events pertaining to PCH power management. Unless otherwise indicated, all RWC bits are cleared with a write of '1' by software.

Access Method

Type: PWRMBASE MEM Register (Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	Reserved
14	0h RW/1C/V	**CPU Reset Done Failure (CRD):** CPU Reset Done message did not arrive from the CPU.
13	0h RW/1C/V	**ME Host Boot Prep Done Failure (ME_HBPD): Intel** ME Host Boot Preparation did not complete.
12	0h RW/1C/V	**PINSTOP Acknowledge Failure (PINSTOP_ACK):** The GbE PHY did not respond to the PINSTOP message.
11	0h RO	Reserved
10	0h RW/1C/V	**SMT Reset Acknowledge Failure (SMT_RST_ACK):** One or more SMT controllers did not respond to the ME bus reset warning.
9	0h RO	Reserved
8	0h RW/1C/V	**SPI Common Prep Handshake Failure (SPI_HRHS):** The SPI controller did not complete the host partition reset/Sx entry handshake.
7	0h RW/1C/V	**XCK Common Prep Handshake Failure (XCK_HRHS):** The integrated clocking unit did not complete the host partition reset/Sx entry handshake.
6	0h RW/1C/V	**CPU S345/Reset Warn Acknowledge Failure (CPU_S345RW_ACK):** The CPU did not respond to the GO_S345 or RESET_WARN message.
5	0h RO	Reserved
4	0h RW/1C/V	**DMI L23 Entry Failure (DMI_L23):** The DMI interface did not respond to the request to entry L23.
3	0h RW/1C/V	**SMBus Host Reset Handshaking Failure (SMB_SRHS):** The host SMBus controller did not complete the host partition reset handshake.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW/1C/V	**South Port L23 Entry Failure (SP_L23):** The PCH PCI Express ports did not complete the host partition reset/Sx entry handshake.
1	0h RW/1C/V	**XHCI Common Prep Handshake Failure (XHCI_HRHS):** The XHCI controller did not complete the host partition reset/Sx entry handshake.
0	0h RO	Reserved

9.10.11 S3 Power Gating Policies (S3_PWRGATE_POL)—Offset 28h

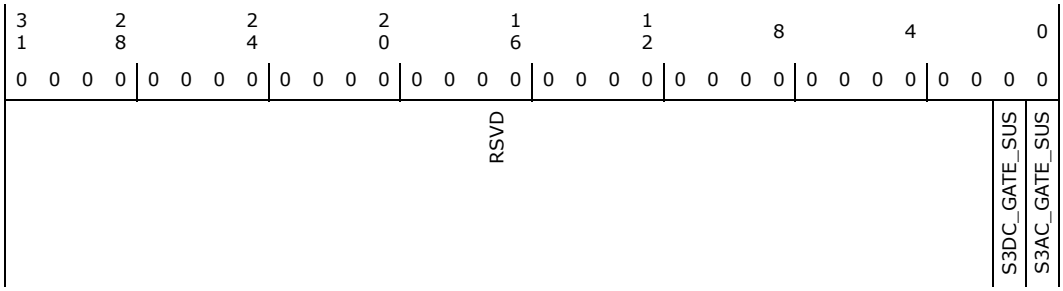
This register contains policy bits to configure various power gating options while the system is in S3. Note that setting any of these policies to "enabled" may not directly result in power gating - in some cases other HW qualifications may be dynamically applied.
This register is in the RTC power well and is reset by RTCRST# assertion.

Access Method

Type: PWRMBASE MEM Register (Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	Reserved
1	0h RW	**S3 Power Gate Enable in DC Mode: SUS Well (S3DC_GATE_SUS):** A '1' in this bit enables power gating of the SUS well in S3 while operating on DC power (based on the AC_PRESENT pin value).
0	0h RW	**S3 Power Gate Enable in AC Mode: SUS Well (S3AC_GATE_SUS):** A '1' in this bit enables power gating of the SUS well in S3 while operating on AC power (based on the AC_PRESENT pin value).

9.10.12 S4 Power Gating Policies (S4_PWRGATE_POL)—Offset 2Ch

This register contains policy bits to configure various power gating options while the system is in S4.

Note: Setting any of these policies to "enabled" may not directly result in power gating - in some cases other HW qualifications may be dynamically applied.

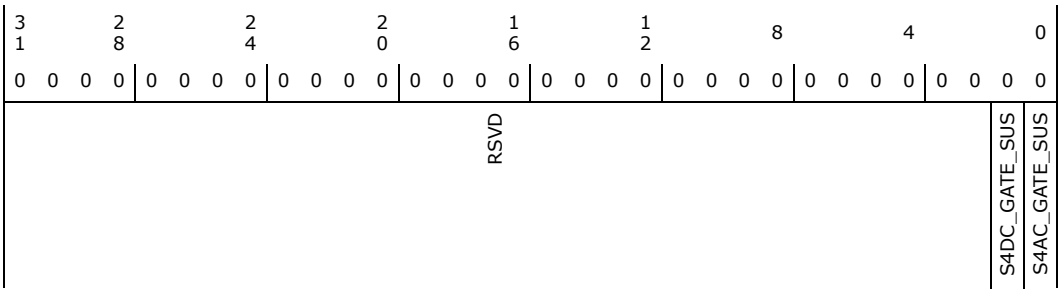
This register is in the RTC power well and is reset by RTCRST# assertion.

Access Method

Type: PWRMBASE MEM Register (Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	Reserved
1	0h RW	**S4 Power Gate Enable in DC Mode: SUS Well (S4DC_GATE_SUS):** A '1' in this bit enables power gating of the SUS well in S4 while operating on DC power (based on the AC_PRESENT pin value).
0	0h RW	**S4 Power Gate Enable in AC Mode: SUS Well (S4AC_GATE_SUS):** A '1' in this bit enables power gating of the SUS well in S4 while operating on AC power (based on the AC_PRESENT pin value).

9.10.13 S5 Power Gating Policies (S5_PWRGATE_POL)—Offset 30h

This register contains policy bits to configure various power gating options while the system is in S5.

Note: Setting any of these policies to "enabled" may not directly result in power gating - in some cases other HW qualifications may be dynamically applied.

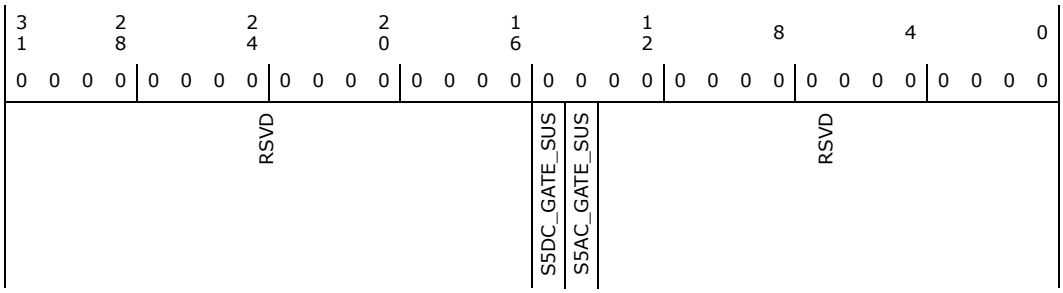
This register is in the RTC power well and is reset by RTCRST# assertion.

Access Method

Type: PWRMBASE MEM Register (Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved
15	0h RW	**S5 Power Gate Enable in DC Mode: SUS Well (S5DC_GATE_SUS):** A '1' in this bit enables power gating of the SUS well in S5 while operating on DC power (based on the AC_PRESENT pin value).
14	0h RW	**S5 Power Gate Enable in AC Mode: SUS Well (S5AC_GATE_SUS):** A '1' in this bit enables power gating of the SUS well in S5 while operating on AC power (based on the AC_PRESENT pin value).
13:0	0h RO	Reserved

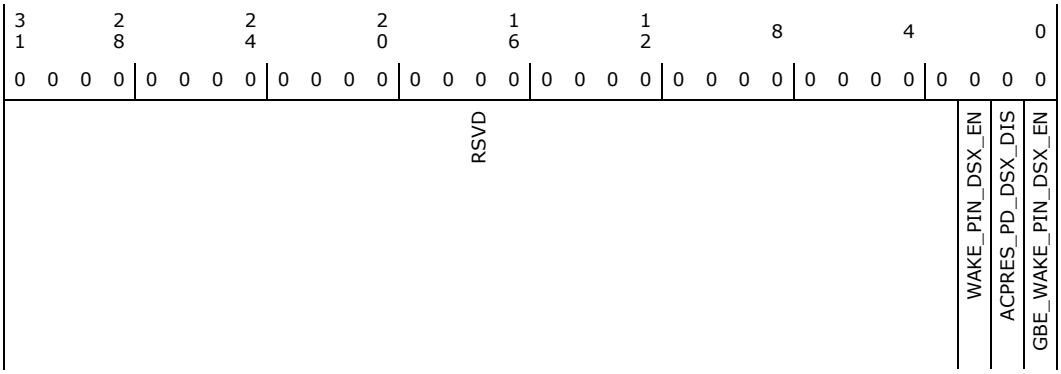
9.10.14 DeepSx Configuration (DSX_CFG)—Offset 34h

This register contains misc. fields used to configure the PCH's power management behavior.
This register is in the RTC power well and is reset by RTCRST# assertion.

Access Method

Type: PWRMBASE MEM Register (Size: 32 bits)
Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	Reserved
2	0h RW	**WAKE# Pin DeepSx Enable (WAKE_PIN_DSX_EN):** When this bit is 1, the PCI Express WAKE# pin is monitored while in Deep Sx, supporting waking from Deep Sx due to assertion of this pin. In this case, the platform must externally pull up the pin to the DSW (instead of pulling up to the SUS as has historically been the case). When this bit is 0: - DeepSx enabled configurations: The PCH internal pull-down on the WAKE# pin is enabled in Deep Sx and during G3 exit and the pin is not monitored during this time. -Deep Sx disabled configurations: The PCH internal pull-down on the WAKE# pin is never enabled. ***Note:*** Deep Sx disabled configurations must leave this bit at 0.
1	0h RW	**AC_PRESENT Pin Pulldown in DeepSx Disable (ACPRES_PD_DSX_DIS):** When this bit is 1, the internal pull-down on the ACPRESENT pin is disabled. However, the pulldown is not necessarily enabled if the bit is '0'. This bit must be left at '0' for Deep Sx disabled configurations, and the pulldown is disabled for those configurations even though the bit is '0'. To support ME wakes from Deep Sx using MGPIO2, the pin is always monitored regardless of the value of this host policy bit. When this bit is '0': DeepSx enabled configurations: The PCH internal pull-down on ACPRESENT is enabled in Deep Sx and during G3 exit. Deep Sx disabled configurations: The PCH internal pull-down on ACPRESENT is always disabled.
0	0h RW	**GbE WAKE pin in DeepSx Enable (GbE_WAKE_PIN_DSX_EN):** When this bit is 1b, the GPD2_GBE_WAKE_N pin is monitored while in DeepSX, supporting waking from DeepSX due to assertion of this pin. DeepSX disabled configurations must leave this bit 0. When this bit is 0: DeepSX enabled configurations: The PCH internal pulldown on GBE_WAKE_N is enabled in DeepSX and during G3 exit, and the pin is not monitored during this time. DeepSX disabled configurations: The PCH internal pulldown is never enabled.

9.10.15 Power Management Configuration Reg 2 (PM_CFG2)—Offset 3Ch

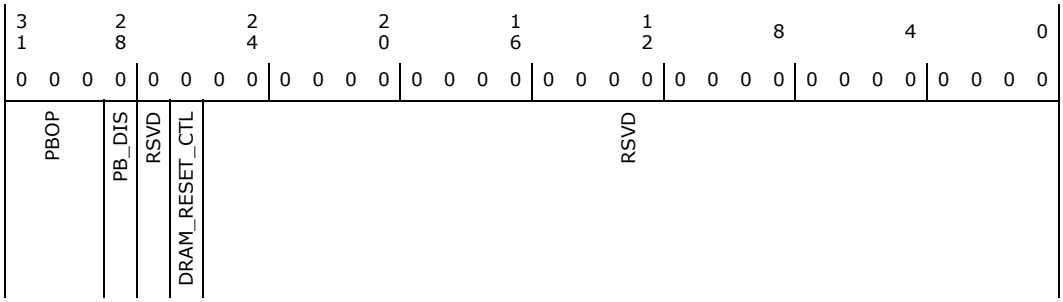
Access Method

Type: PWRMBASE MEM Register (Size: 32 bits)

Device: 31

Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**Power Button Override Period (PBOP):** This field determines, while the power button remains asserted, how long the PMC will wait before initiating a global reset. Encoding: 000b - 4 seconds 001b - 6 seconds 010b - 8 seconds 011b - 10 seconds 100b - 12 seconds 101b - 14 seconds Others - Reserved This bit is reset by DSW_PWROK de-assertion.
28	0h RW	**Power Button Native Mode Disable (PB_DIS):** When this bit is '0' (default), the PMC's power button logic will act upon the input value from the GPIO unit, as normal. When this bit is set to '1', the PMC must force its internal version of the power button pin to '1'. This will result in the PMC logic constantly seeing the pin as de-asserted. This bit is reset by RTCRST# assertion.
27	0h RO	Reserved
26	0h RW/V	**DRAM_RESET# Control (DRAM_RESET_CTL):** BIOS uses this bit to control the DRAM_RESET# pin from the PCH, which is routed to the reset pin on the DRAM. Encoding: 0 = DRAM_RESET# output is asserted (driven low) 1 = DRAM_RESET# output is tri-stated. ***Note:*** This bit is cleared to '0' by HW when SLP_S4# goes low. This bit is reset by DSW_PWROK de-assertion.
25:0	0h RO	Reserved

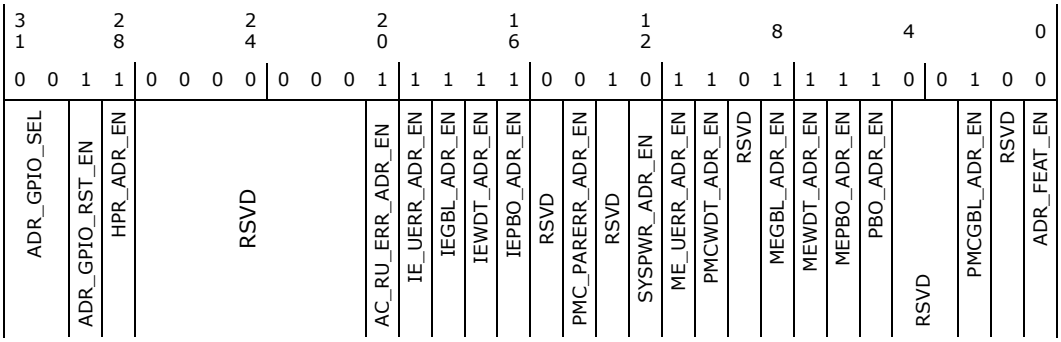
9.10.48 ADR_EN - ADR Enable - Offset F0h

Access Method

Type: PWRMBASE MEM Register (Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:30	00b RW	**ADR GPIO Selection (ADR_GPIO_SEL):**. This field selects which PM_SYNC GPIO state will be a source of ADR. The input may also be a source of a global reset based on ADR_GPIO_RST_EN. 00 GPIO_A 01 GPIO_B 10 GPIO_C 11 GPIO_D ***Note:*** The PCH only supports use of CPU_GP_0 as the board level trigger of ADR. Therefore, this field must be programmed to the PM_SYNC GPIO state which is assigned to the CPU_GP_0 in the PM_SYNC_MISC_CFG register (which will be GPIO_B or GPIO_C)
29	1b RW	**ADR GPIO Reset Enable (ADR_GPIO_RST_EN):** If this bit is set to '1'b, a Global Reset will be generated when the ADR timer expires after being triggered by the ADR_GPIO selected in the ADR_GPIO_SEL field and the feature is enabled both by fusing and ADR_FEATEN = 1. If this bit is cleared, the ADR GPIO may still be enabled to affect the PM_SYNC pin, but on it's own it will not trigger a global reset. ***Note:*** This enable bit is not required for this source to trigger the warning to the CPU over PM_SYNC. This bit only impacts whether or not this source will actually trigger a global reset.
28	1b RW	**Host Partition Reset ADR Enable (HPR_ADR_EN):** If this bit is to "1", PMC FW will set the ADR_RST_STS bit upon receipt of the Reset_Warn_ACK DMI message.
27:21	00h RO	**Reserved**
20	1b RW/V	**AC RU Error ADR Enable (AC_RU_ERR_ADR_EN):** If this bit is set to "1", the reset unit for QAT and 10/1GbE LAN will have it's error global reset resource included in the ADR feature.
19	1b RW/v	**IE Uncorrectable Error ADR Enable (IE_UERR_ADR_EN):** When set, an uncorrectable error source in IE that causes a global reset is included in the ADR feature
18	1b RW/V	**IE Initiated Global Reset ADR Enable (IEGBL_ADR_EN)**: When set to '1'. the IE initiated global reset source is included in the ADR enable.
17	1b RW/V	**IE FW watchdog Timer ADR Enable (IEWDT_ADR_EN)**: If set to "1", the IE firmware watchdog timer global reset source is included in the ADR feature.
16	1b RW/V	**IE Initiated Power Button Override ADR Enabled (IEPBO_ADR_EN)**: If set to "1", the IE initiated power button override global reset source is included in the ADR feature.

Bit Range	Default & Access	Field Name (ID): Description
15	0b RO	**Reserved**
14	0b RW/V	**PMC Parity Error ADR Enable (PMC_PARERR_ADR_EN).** If this bit is set to '1', the PMC RAM parity error global reset sources is included in the ADR feature.
13	1b RW/V	**Reserved**
12	0b RW/V	**SYS_PWROK Failure ADR Enabled (SYSPWR_ADR_EN).** If this bit is set to '1', the SYS_PWROK failure global reset source is included in the ADR feature
11	1b RW/V	**ME Uncorrectable Error ADR Enable (ME_UERR_ADR_EN):** If set to '1', the Intel ME uncorrectable error global reset source is included in the ADR enable
10	1b RW/V	**PMC FW Watchdog timer ADR enable (PMCWDT_ADR_EN)**; If set to '1', the PMC firmware watchdog timer global reset source is included in the ADR feature.
9	0b RO	**Reserved**
8	1b RW/V	**ME Initiated Global Reset ADR enable (MEGBL_ADR_EN)**: If set to "1", the Intel ME initiated global reset source is included in the ADR feature.
7	1b RW/V	**ME FW Watchdog Timer ADR Enable (MEWDT_ADR_EN):** If set to "1", the Intel ME FW Watchdog timer global reset source is included in the ADR feature.
6	1B RW/V	**ME Initiated Power Button Override ADR Enable (MEPBO_ADR_EN):** If set to "1", the Intel ME initiated Power Button Override global reset source is included in the ADR feature.
5	1b RW/V	**Power Button Override ADR Enable (PBO_ADR_EN**): If set to "1", the Power Button Override global reset source is included in the ADR feature.
4:3	00b RO	**Reserved**
2	1b RW/V	**PMC FW Initiated Global Reset ADR Enable (PMCGBL_ADR_EN):** If set to "1", PMC FW initiated global reset sources are included in the ADR feature. These sources are: Host Partition Reset entry timeout Any host partition reset triggered with the "Promote Host Partition Reset to Global Reset" policy bit set to "1"
1	RO	**Reserved**
0	0h RW/1V	**ADR Feature Enable (ADR_FEAT_EN) -:** If this bit is a '1' and the feature is enabled in the fusing, PCH support for Automatic DIMM Self-Refresh is enabled. The other bits in this register determine which individual reset sources will trigger an ADR. ***Note:*** This bit must not be set to '1' until PM_SYNC has been fully configured to convey the global reset warning to the CPU.

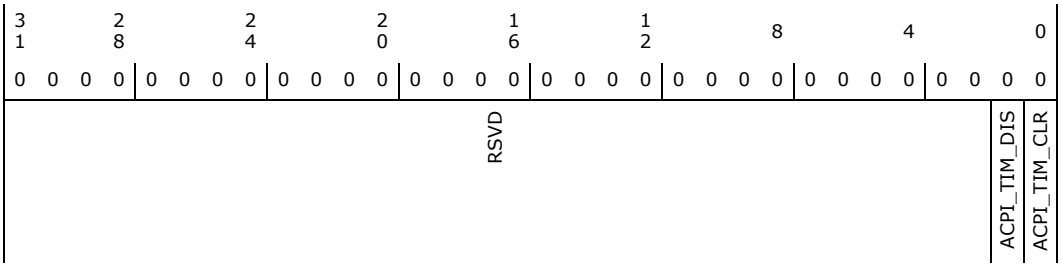
9.10.49 ACPI Timer Control (ACPI_TMR_CTL)—Offset FCh

Access Method

Type: PWRMBASE MEM Register (Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	Reserved
1	0h RW	**ACPI Timer Disable (ACPI_TIM_DIS):** This bit determines whether the ACPI Timer is enabled to run. Note that even when enabled, the timer only runs during S0. - 0: ACPI Timer is enabled (default) - 1: ACPI Timer is disabled (halted at the current value) This bit is reset by PLTRST# assertion.
0	0h RW/1S/V	**ACPI Timer Clear (ACPI_TIM_CLR):** Writing a 1 to this bit will clear the ACPI Timer to all 0s. Hardware will automatically clear the bit back to 0 once the timer clear operation has completed. Writing a 0 to this bit has no effect. Implementation ***Note:*** The PCH must be capable of honoring this bit even while ACPI_TIM_DIS=1. This bit is reset by PLTRST# assertion.

9.10.50 Global to Host Reset Enable(GBL2HOST_EN)—Offset 10Ch

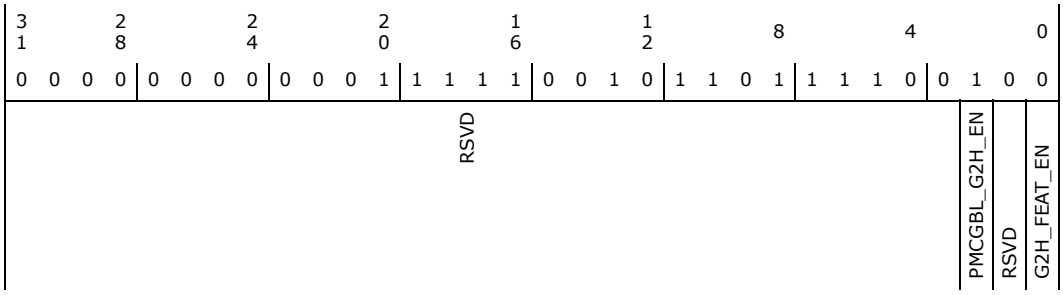
This register allows software to demote a global reset initiated by the PMC controller down to a host portion reset. This is used to keep resets that would cause a power cycle, and losing error status in the CPU, from occurring. When you enable a Global to Host reset by setting bit 0 = 1b, the only bit that can then be a "1" is bit 2. All other bits must be set to 0b.

Access Method

Type: PWRMBASE MEM Register (Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:3	0003E4BCh RO	Reserved. BIOS will write 0h to these registers.
2	0b RW/L	**Power Management Global Reset to Host enable**: When set to 1b and Bit0 of this register is a 1b, then the following errors are converted to a host reset. Host partition reset entry timeout
1	0b RO	Reserved.
0	0b RW/L	**G2H Feature Enable (G2H_FEAT_EN):** When set to 1b, the PCH will support conversion of global resets to warm resets. Which global resets are converted are defined by the other bits in this register.

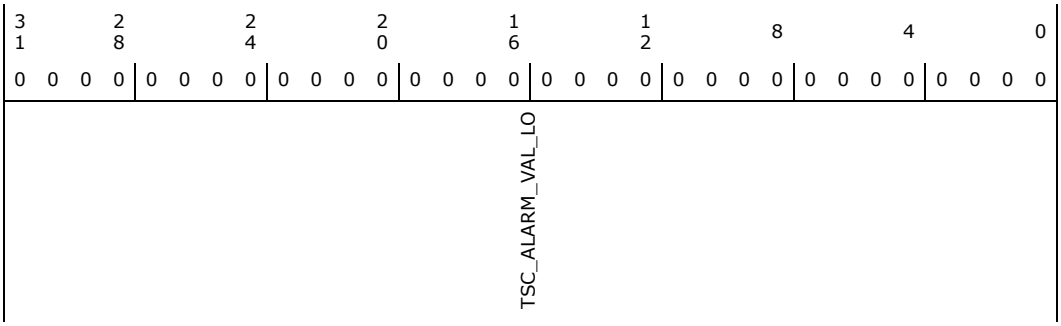
9.10.51 Last TSC Alarm Value[31:0] (TSC_ALARM_LO)—Offset 110h

Access Method

Type: PWRMBASE MEM Register (Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Last TSC Alarm Value [31:0] (TSC_ALARM_VAL_LO):** This field contains bits 31:0 of the last TSC alarm value received from the CPU. This field is reset by PLTRST# assertion.

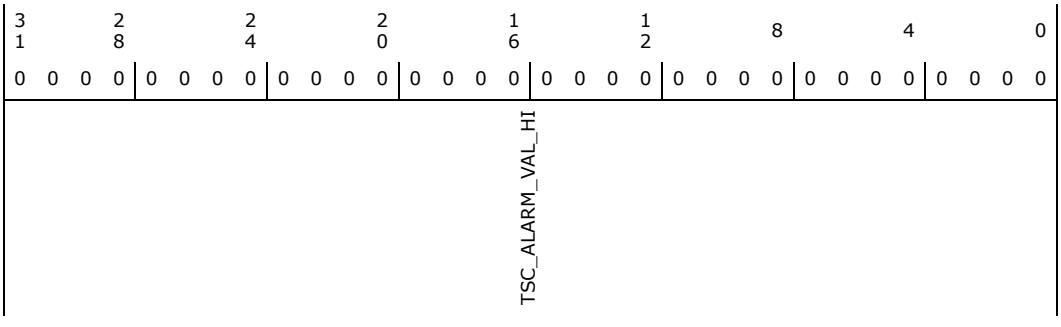
9.10.52 Last TSC Alarm Value[63:32] (TSC_ALARM_HI)—Offset 114h

Access Method

Type: PWRMBASE MEM Register (Size: 32 bits)

Device: 31
Function: 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Last TSC Alarm Value [63:32] (TSC_ALARM_VAL_HI):** This field contains bits 63:32 of the last TSC alarm value received from the CPU. This field is reset by PLTRST# assertion.

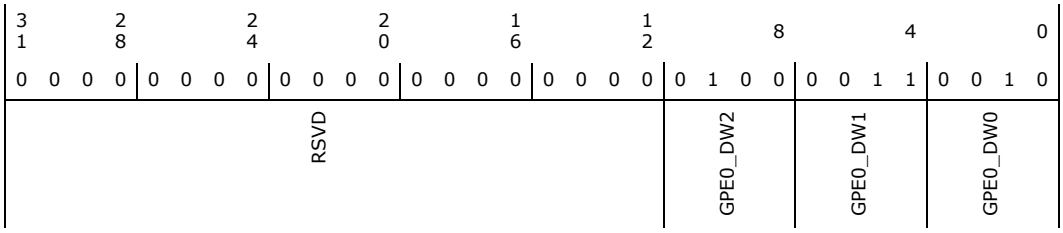
9.10.53 GPIO Configuration (GPIO_CFG)—Offset 120h

Access Method

Type: PWRMBASE MEM Register (Size: 32 bits)

Device: 31
Function: 2

Default: 432h



Bit Range	Default & Access	Field Name (ID): Description

10 Direct Media Interface

10.1 Acronyms

Acronyms	Description
DMI	Direct Media Interface

10.2 References

Specification	Location
PCI Express Specification*	http://www.pcisig.com/specifications

10.3 Overview

The PCH communicates with the processor using high speed DMI which supports 8 GT/s data rates.

10.4 Signal Description

Name	Type	Description
DMI_RXN[3:0] DMI_RXP[3:0]	I	DMI receive lanes
DMI_TXN[3:0] DMI_TXP[3:0]	O	DMI transmit lanes

10.5 Integrated Pull-Ups and Pull-Downs

Signal	Resistor Type	Value	Notes
DMI_RXN[3:0] DMI_RXP[3:0]	Pull-Down	14K - 26K	
DMI_TXN[3:0] DMI_TXP[3:0]	Pull-Up	14K - 26K	

Note: DMI_TX* pins are terminated to VCC/2 and DMI_RX* pins are terminated to VSS.

10.6 I/O Signal Planes and States

Signal Name	Power Plane	During Reset	Immediately after Reset	S3/S4/S5	Deep Sx
DMI_RXN[3:0] DMI_RXP[3:0]	Primary	Internal Pull-down	Internal Pull-down	Internal Pull-down	Off
DMI_TXN[3:0] DMI_TXP[3:0]	Primary	Internal Pull-up	Internal Pull-up	Internal Pull-up	Off

10.7 Functional Description

PCH DMI is compliant to the DMI 2.0 specification with a bit rate of 2.5GT/s, 5.0GT/s and 8.0GT/s. The DMI Link is compliant to the PCI Express 3.0 specification for the root complex internal links that support up to 8.0 GT/s, with the exceptions called out in the DMI 2.0 specification and in this document.

Some of key features besides PCI Express Specifications are listed below:

- Addition of LT Memory Write and LT Memory Read TLPs.
- All virtual channels other than VC0 are private and not exposed to the OS.
- Non-unique Transaction IDs are allowed on DMI.
- Downstream requests restricted to VC0 (CPU and peer).
- Shorter than conventional DMI Link Reset sequence.
- DMI can be set to x1 by soft straps for debug. Normal functional operation is x4
- Upstream I/O and Config cycles are not supported.
- DMI does not implement the PCI Express defined Root Complex Register Block and is not OS visible.
- DMI can support data packet sizes up to 256 bytes, and will pass through transactions at whatever data sizes it is presented with (64, 128, 256). The CPU has settings in it’s DMI port for what size maximum data payload it can handle. The max data payload at the PCH I/O ports must not be bigger than what the CPU can handle, and conversely the max CPU data payload sizes must not be bigger than what the I/O ports in the PCH can handle. It is legal to send data payloads that are smaller than the max payloads.

§

11 System Management

11.1 Acronyms

Acronyms	Description
BMC	Baseboard Management Controller
SPD	Serial Presence Detect
TCO	Total Cost of Ownership

11.2 Overview

The PCH provides various functions to make a system easier to manage and to lower the TCO of the system. Features and functions can be augmented using external A/D converters and GPIO, as well as an external micro-controller.

11.3 Feature

The following features and functions are supported by the PCH:

- First timer timeout to generate SMI# after programmable time
  - The first timer timeout causes SMI#, allowing SMM-based recovery from OS lock up.
- Second hard-coded timer timeout to generate reboot.
  - This second timer is used only after the first timeout occurs.
  - The second timeout allows for automatic system reset and reboot if HW error detected.
  - Option to prevent reset the second timeout via HW strap
- Processor present detection
  - Detects if processor fails to fetch the first instruction after reset.
- Various Error detection (such as ECC Errors) indicated by host controller
  - Can generate SMI#, SCI, SERR, NMI, or TCO interrupt.
- Intruder Detect input
  - Can generate TCO interrupt or SMI# when the system cover is removed.
  - INTRUDER# is allowed to go active in any power state, including G3.

11.3.1 Theory of Operation

The System Management functions are designed to allow the system to diagnose failing subsystems. The intent of this logic is that some of the system management functionality can be provided without the aid of an external microcontroller.

11.3.1.1 Detecting a System Lockup

When the processor is reset, it is expected to fetch its first instruction. If the processor fails to fetch the first instruction after reset, the TCO timer times out twice and the PCH asserts PLTRST#.

11.3.1.2 Handling an Intruder

The PCH has an input signal, INTRUDER#, that can be attached to a switch that is activated by the system's case being open. This input has a two RTC clock debounce. If INTRUDER# goes active (after the debouncer), this will set the INTRD_DET bit in the TCO2_STS register. The INTRD_SEL bits in the TCO_CNT register can enable the PCH to cause an SMI# or interrupt. The BIOS or interrupt handler can then cause a transition to the S5 state by writing to the SLP_EN bit.

The software can also directly read the status of the INTRUDER# signal (high or low) by clearing and then reading the INTRD_DET bit. This allows the signal to be used as a GPI if the intruder function is not required.

If the INTRUDER# signal goes inactive some point after the INTRD_DET bit is written as a 1, then the INTRD_DET bit will go to a 0 when INTRUDER# input signal goes inactive.

Note: This is slightly different than a classic sticky bit, since most sticky bits would remain active indefinitely when the signal goes active and would immediately go inactive when a 1 is written to the bit.

Note: The INTRD_DET bit resides in the PCH's RTC well, and is set and cleared synchronously with the RTC clock. Thus, when software attempts to clear INTRD_DET (by writing a 1 to the bit location) there may be as much as two RTC clocks (about 65 µs) delay before the bit is actually cleared. Also, the INTRUDER# signal should be asserted for a minimum of 1 ms to ensure that the INTRD_DET bit will be set.

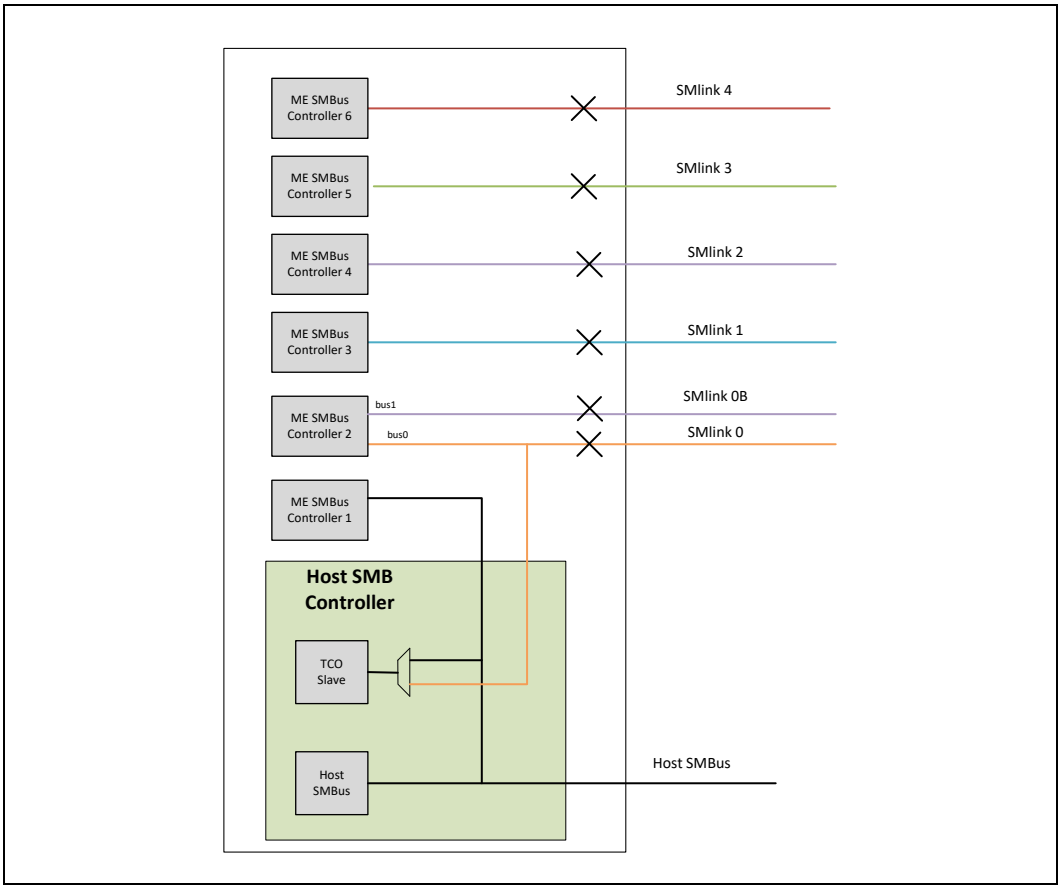
Note: If the INTRUDER# signal is still active when software attempts to clear the INTRD_DET bit, the bit remains set and the SMI is generated again immediately. The SMI handler can clear the INTRD_SEL bits to avoid further SMIs. However, if the INTRUDER# signal goes inactive and then active again, there will not be further SMIs, since the INTRD_SEL bits would select that no SMI# be generated.

11.3.2 TCO Modes

11.3.2.1 TCO Compatible Mode

In TCO Legacy/Compatible mode, only the host SMBus is utilized. The TCO Slave is connected to the host SMBus internally by default. In this mode, the Intel ME SMBus controllers are not used and should be disabled by soft strap. See the latest PCH SPI Flash Programming Guide for more detail.

Figure 11-1. TCO Compatible Mode SMBus Configuration



In TCO Legacy/Compatible mode the PCH can function directly with an external LAN controller or equivalent external LAN controller to report messages to a network management console without the aid of the system processor. This is crucial in cases where the processor is malfunctioning or cannot function due to being in a low-power state. Table 11-1 includes a list of events that will report messages to the network management console.

Table 11-1. Event Transitions that Cause Messages

Event	Assertion?	Deassertion?	Comments
INTRUDER# pin	Yes	No	Must be in "S1 or hung S0" state
Watchdog Timer Expired	Yes	No (NA)	"S1 or hung S0" state entered
SMBALERT# pin	Yes	Yes	Must be in "S1 or hung S0" state
CPU_PWR_FLR	Yes	No	"S1 or hung S0" state entered

11.3.2.2 Advanced TCO Mode

The PCH supports the Advanced TCO mode in which SMLink0 through SMlink4 are used in addition to the host SMBus.

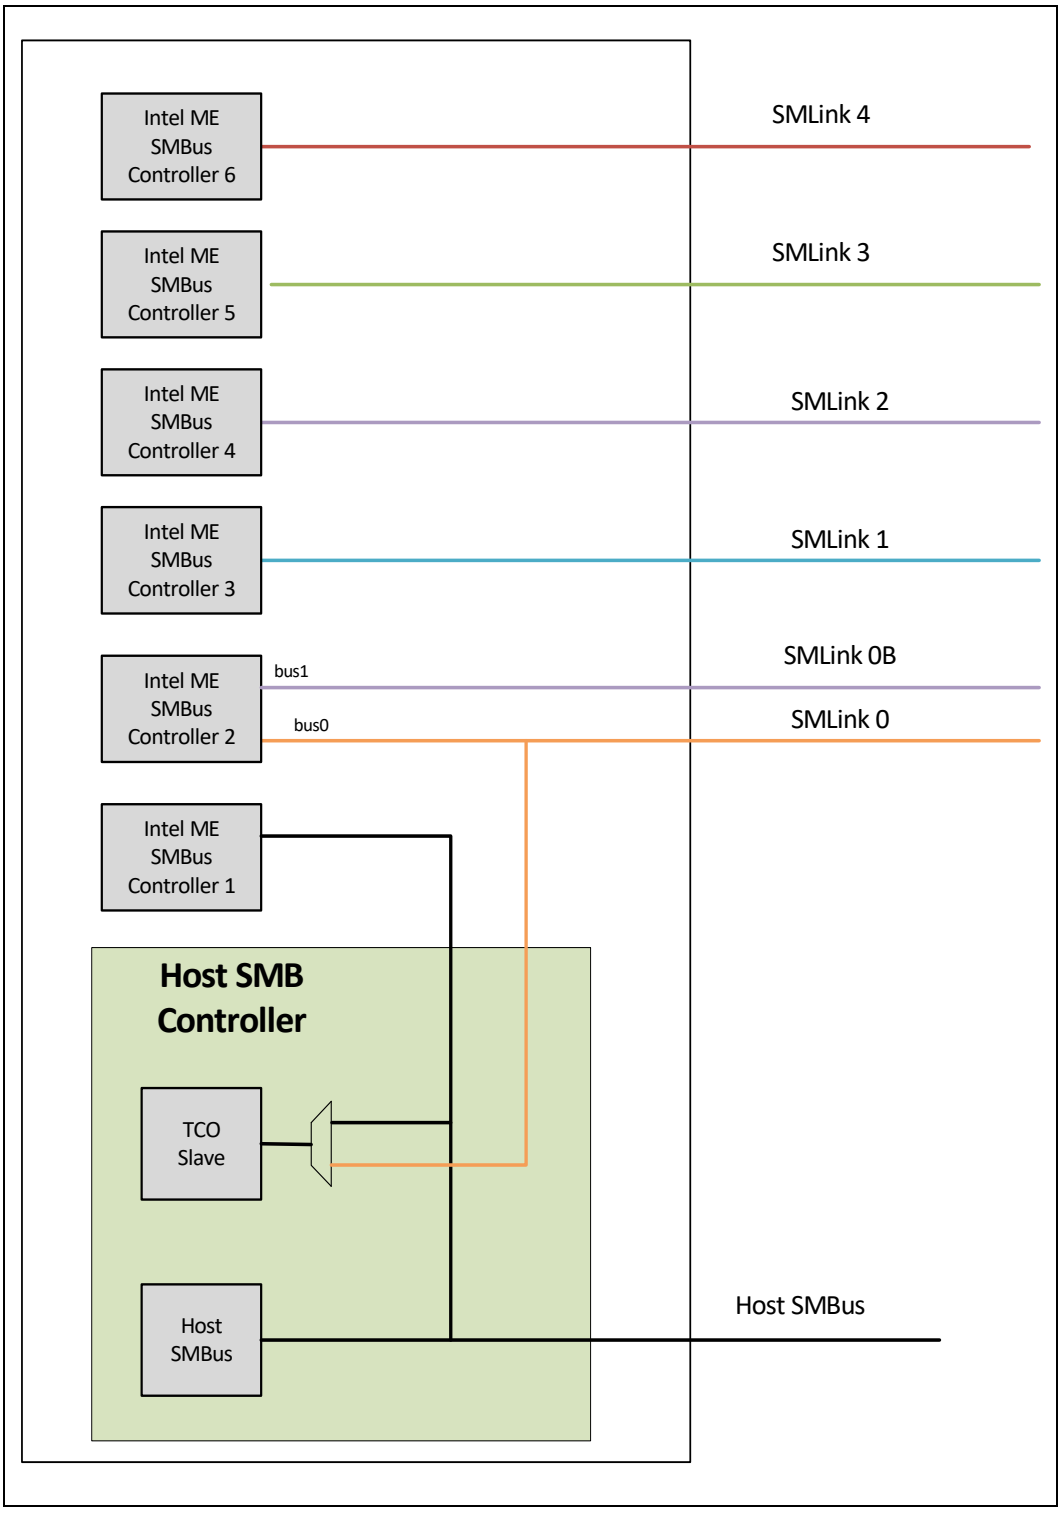
In this mode, the Intel ME SMBus controllers must be enabled by soft strap in the flash descriptor. See Figure 11-2 for more details.

In advanced TCO mode, the TCO slave can either be connected to the host SMBus or the SMLink0. See the latest SPI Flash Programming Guide for more detail.

SMLink0 is needed for the integrated single 1GbE LAN if Intel ME 11 FW is used. When an Intel LAN PHY is connected to SMLink0, a soft strap must be set to indicate that the PHY is connected to SMLink0. The interface will be running at the frequency of up to 1 MHz depending on different factors such as board routing or bus loading when the Fast Mode is enabled using a soft strap. See the latest SPI Flash Programming Guide for more detail. If System Platform Services FW is used, then SMLink0 is used to communicate with the BMC.

SMLink1 is connected to the PMBus for communication with power supplies with Server Platform Services FW. SMLink0b, SMLink2, SMLink3, and SMLink4 are free to be used however the board design chooses to.

Figure 11-2. Advanced TCO Mode



11.4 SMBus TCO I/O Registers Summary

The TCO I/O registers reside in a 32-byte range that starts from the I/O Base Address described in the TCOBAR register in the SMBus PCI Configuration space.

Table 11-2. Summary of SMBus TCO I/O Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	1h	TCO_RLD Register (TRLD)—Offset 0h	4h
2h	2h	TCO_DAT_IN Register (TDI)—Offset 2h	0h
3h	3h	TCO_DAT_OUT Register (TDO)—Offset 3h	0h
4h	5h	TCO1_STS Register (TSTS1)—Offset 4h	0h
6h	7h	TCO2_STS Register (TSTS2)—Offset 6h	0h
8h	9h	TCO1_CNT Register (TCTL1)—Offset 8h	0h
Ah	Bh	TCO2_CNT Register (TCTL2)—Offset Ah	8h
Ch	Dh	TCO_MESSAGE1 and TCO_MESSAGE2 (TMSG)—Offset Ch	0h
Eh	Eh	TCO_WDSTATUS Register (TWDS)—Offset Eh	0h
10h	10h	LEGACY_ELIM Register (LE)—Offset 10h	3h
12h	13h	TCO_TMR Register (TTMR)—Offset 12h	4h

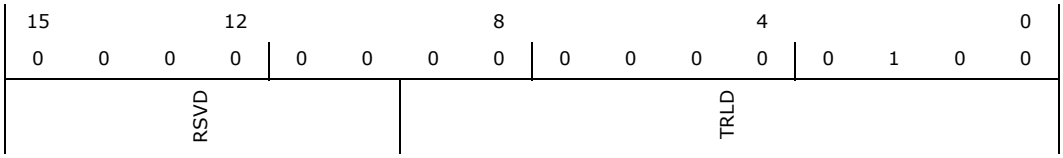
11.4.1 TCO_RLD Register (TRLD)—Offset 0h

Access Method

Type: I/O Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 4h



Bit Range	Default and Access	Field Name (ID): Description
15:10	0h RO	Reserved
9:0	4h RW	**TCORLD (TRLD):** Reading this register will return the current count of the TCO timer. Writing any value to this register will reload the timer to prevent the timeout.

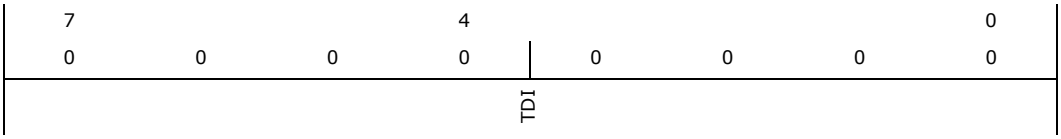
11.4.2 TCO_DAT_IN Register (TDI)—Offset 2h

Access Method

Type: I/O Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**TCO_DAT_IN (TDI):** Data Register for passing commands from the OS to the SMI handler. Writes to this register will cause an SMI and set the OS_TCO_SMI bit in the TCO_STS register.

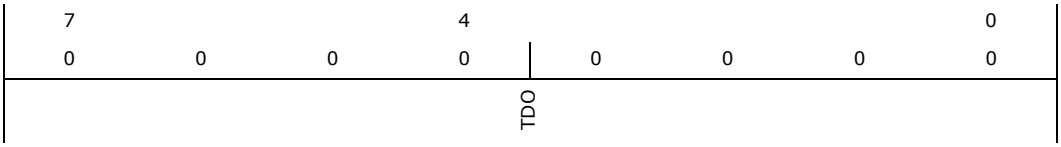
11.4.3 TCO_DAT_OUT Register (TDO)—Offset 3h

Access Method

Type: I/O Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**TCO_DAT_OUT (TDO):** Data Register for passing commands from the SMI handler to the OS. Writes to this register will set the TCO_INT_STS bit in the TCO_STS register. It also causes an interrupt, as selected by the TCO_IRQ_SEL bits.

11.4.4 TCO1_STS Register (TSTS1)—Offset 4h

Unless otherwise indicated, these bits are sticky and are cleared by writing a 1 to the corresponding bit position.

Access Method

Type: I/O Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 0h

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD		TCO_SLVSEL	CPUSERR_STS	RSVD	CPUSMI_STS	CPUSCI_STS	BIOSWR_STS	NEWCENTURY_STS	RSVD			TIMEOUT	TCO_INT_STS	OS_TCO_SMI	NMI2SMI_STS

Bit Range	Default and Access	Field Name (ID): Description
15:14	0h RO	Reserved
13	0h RO/Strap	**TCO Slave Select (TCO_SLVSEL):** This register bit indicates the value of TCO Slave Select Soft Strap.
12	0h RW/1C	**CPUSERR_STS (CPUSERR_STS):** This bit is set to 1 if the CPU complex sends a DMI special cycle message indicating that it wants to cause an SERR#. The software must read the MCH to find out why it wanted the SERR#. Software must write a 1 back to this bit to clear it.
11	0h RO	Reserved
10	0h RW/1C	**CPUSMI_STS (CPUSMI_STS):** This bit is set to 1 if the CPU complex sends a DMI special cycle message indicating that it wants to cause an SMI. The software must read the CPU to find out why it wanted the SMI. Software must write a 1 back to this bit to clear it.
9	0h RW/1C	**CPUSCI_STS:** This bit is set to 1 if the CPU complex sends a DMI special cycle message indicating that it wants to cause an SCI. The software must read the CPU to find out why it wanted the SCI. Software must write a 1 back to this bit to clear it.
8	0h RW/1C	**BIOSWR_STS:** Intel PCH sets this bit to 1 and generates an SMI# to indicate an illegal attempt to write to the BIOS located in the FWH that is accessed over the LPC. This occurs when either: a) The BIOSWP bit is changed from 0 to 1 and the LE bit is also set, or b) Any write is attempted to the BIOS and the BIOSWP bit is also set. This bit does not get set to 1 when: 1) a or b above occurs on eSPI controller. 2) a or b above occurs on SPI Flash controller. ***Note:*** On write cycles attempted to the 4 MB lower alias to the BIOS space, the BIOSWR_STS bit will not be set.

Bit Range	Default and Access	Field Name (ID): Description
7	0h RW/1C	**NEWCENTURY_STS (NEWCENTURY_STS):** This bit will be set when the year rolls over from 1999 to 2000. If the bit is already 1, it will remain 1. This bit can be cleared either by software writing a 1 back to the bit position, or by RTCRST# going active. When this bit is set, an SMI# will be generated. However, this will not be a wake event (i.e., if the system is in a sleeping state when the NEWCENTURY_STS bit is set, the system will not wake up). ***Note:*** This bit 7 is not valid when the RTC battery is first put in (or if the RTC battery does not provide sufficient power when the system is unplugged). Software can determine that the RTC well was not maintained by checking the RTC_PWR_STS bit (GEN_PMCON_3 register in the Power Management Controller, D31:F2:A4, bit 2) or by other means (such as doing a checksum on the RTC RAM array). If the RTC well is determined to not have been maintained, the BIOS should set the time to a legal value and then clear the NEWCENTURY_STS bit. ***Note:*** This bit may take up to 3 RTCCLKs for the bit to be cleared when a 1 is written to the bit to clear it. After writing a 1 to the NEWCENTURY_STS bit, software should also not exit the SMI handler until after the bit has been cleared. This is to make sure the SMI is not re-entered. BIOS Assumption: When booting, the BIOS checks the NEWCENTURY_STS bit. If set, the BIOS should increment the value in the RTC RAM register associated with the century. The BIOS should then clear the NEWCENTURY_STS bit. This scenario would occur if the system was asleep when the century rolls over. If the system is in an S0 state (not sleeping) and the SMI# occurs with the NEWCENTURY_STS bit sets, the SMI handler should increment the value in the RTC RAM register and clear the NEWCENTURY_STS bit.
6:4	0h RO	Reserved
3	0h RW/1C	**TIMEOUT (TIMEOUT):** Bit set to 1 by Intel PCH to indicate that the SMI was caused by TCO timer reaching 0. ***Note:*** The SMI handler should clear this bit to prevent an immediate re-entry to the SMI handler.
2	0h RW/1C	**TCO_INT_STS (TCO_INT_STS):** Bit set to 1 when SMI handler caused the interrupt by writing to the TCO_DAT_OUT register.
1	0h RW/1C	**OS_TCO_SMI:** Bit set to 1 when OS code caused an SMI# by writing to the TCO_DAT_IN register.
0	0h RO/V	**NMI2SMI_STS:** The PCH sets this bit when an SMI# occurs because an event occurred that would otherwise have caused an NMI.

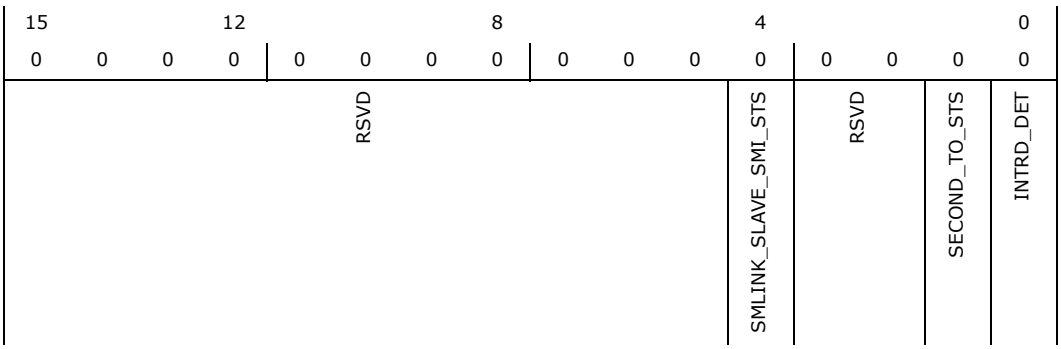
11.4.5 TCO2_STS Register (TSTS2)—Offset 6h

Access Method

Type: I/O Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:5	0h RO	Reserved
4	0h RW/1C	**SMLINK_SLAVE_SMI_STS:** The PCH will set this bit to 1 when it receives the SMI message (encoding 08h in the command type) on the SMLinks Slave Interface. Software clears the bit by writing a 1 to this bit position. This bit is in the resume well. It is reset by RSMRST#, but not by the PCI Reset associated with exit from S3-S5 states. This allows the software (presumably BIOS) to get the interrupt, see this new bit set, and decidedly go into the pre-determined (by local policy) sleep state.
3:2	0h RO	Reserved
1	0h RW/1C	**SECOND_TO_STS:** Intel PCH sets this bit to 1 to indicate that the TIMEOUT bit had been (or is currently) set and a second timeout occurred before the TCO_RLD register was written. If this bit is set and the NO_REBOOT config bit is 0, then the Intel PCH will reboot the system after the second timeout. The reboot is done by asserting PLTRST#. This bit is only cleared by writing a 1 to this bit or by a RSMRST#.
0	0h RW/1C	**INTRD_DET (INTRD_DET):** The bit is set to 1 by the PCH to indicate that an intrusion was detected. This bit is cleared by writing a 1 to this bit or by RTCRST#. ***Note:*** This bit has a recovery time. After writing a 1 to this bit position (to clear it), the bit may be read back as a 1 for up 65 microseconds before it is read as a 0. Software must be aware of this recovery time when reading this bit after clearing it. ***Note:*** If the INTRUDER# signal is active when the software attempts to clear the INTRD_DET bit, the bit will remain as a 1, and the SMI# will be generated again immediately. The SMI handler can clear the INTRD_SEL bits to avoid further SMIs. However, if the INTRUDER# signals goes inactive and then active again, there will not be further SMIs. If the INTRUDER# signal goes inactive some point after the INTRD_DET bit is written as a 1, then the INTRD_DET signal will go to a 0 when INTRUDER# input signal goes inactive. Note that this is slightly different than a classic sticky bit, since most sticky bits would remain active indefinitely when the signal goes active and would immediately go inactive when a 1 is written to the bit.

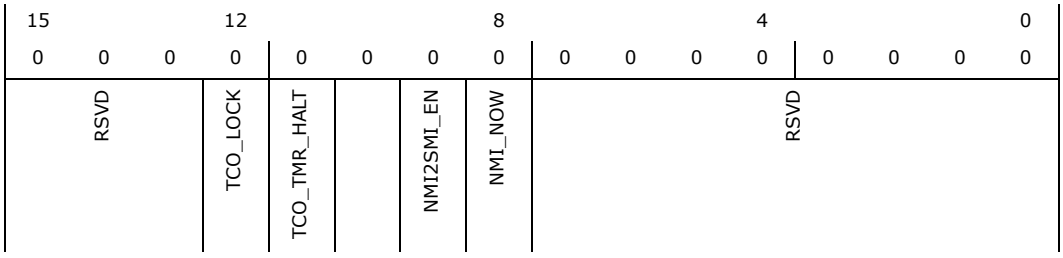
11.4.6 TCO1_CNT Register (TCTL1)—Offset 8h

Access Method

Type: I/O Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:13	0h RO	Reserved
12	0h RW	**TCO_LOCK:** When set to 1, this bit prevents writes from changing the TCO_EN bit (in offset 30h of Power Management I/O space). Once this bit is set to 1, it can not be cleared by software writing a 0 to this bit location. A core-well reset is required to change this bit from 1 to 0. This bit defaults to 0.
11	0h RW	**TCO_TMR_HALT:** 1 = The TCO timer will halt. It will not count, and thus cannot reach a value that would cause an SMI# or to cause the SECOND_TO_STS bit to be set. This will also prevent rebooting. 0 = The TCO timer is enabled to count. This is the default.
10	0h RW	**Reserved**
9	0h RW	**NMI2SMI_EN:** Setting this bit 1 forces all NMIs to instead cause an SMI#, and will be reported in the TCO1_STS register. NMI2SMI_EN bit is set AND the NMI_EN# bit is set to 0, the NMI# will be routed to cause an SMI#. No NMI will be caused. However, if the GBL_SMI_EN bit is not set, then no SMI# will be generated, either. If NMI2SMI_EN is set but the NMI_EN# bit is set to 1, then no NMI or SMI# will be generated. The following table shows the possible combinations: NMI_EN#, GBL_SMI_EN 00: No SMI# based on NMI events (since no SMI# at all because SMI_EN = 0) 01: SMI# will be caused based on NMI events 10: No SMI# at all because SMI_EN is 0 11: No SMI# based on NMI events because NMI_EN#=1
8	0h RW	**NMI_NOW:** Writing a 1 to this bit causes an NMI. This allows the BIOS or SMI handler to force entry to the NMI handler. The NMI handler is expected to clear this bit. Another NMI will not be generated until the bit is cleared by writing a 1 back to the same bit position.
7:0	0h RO	Reserved

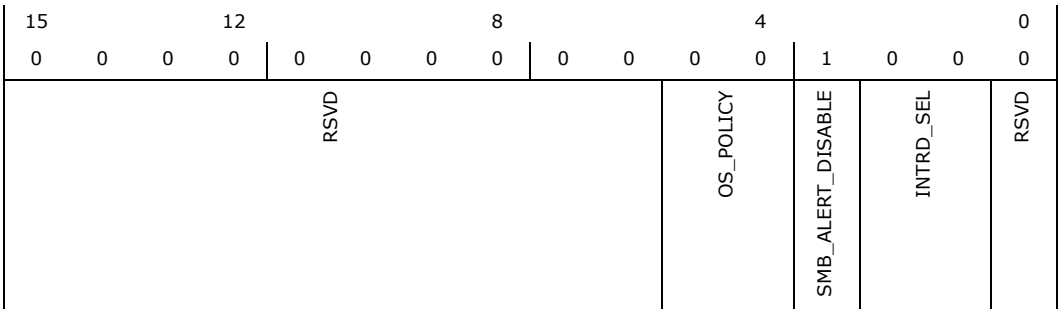
11.4.7 TCO2_CNT Register (TCTL2)—Offset Ah

Access Method

Type: I/O Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 8h



Bit Range	Default and Access	Field Name (ID): Description
15:6	0h RO	Reserved.
5:4	0h RW	**OS_POLICY (OS_POLICY):** OS-based software writes to these bits to select the policy that the BIOS will use after the platform resets due the WDT. The following convention is recommended for the BIOS and OS: 00 Boot normally 01 Shut down 10 Do not load OS. Hold in pre-boot state and use LAN to determine next step 11 Reserved Implementation. ***Note:*** These are just scratch pad bits. They should not be reset when the TCO logic resets the platform due to Watchdog Timer.
3	1h RW	**SMB_ALERT_DISABLE:** Disables muxed GPIO/SMBALERT# signal as an alert source for the heartbeats and the SMBus slave. At reset (RSMRST# pin assertion only), this bit is set and the muxed GPIO/SMBALERT# alerts are disabled.
2:1	0h RW	**INTRD_SEL (INTRD_SEL):** Selects the action to take if the INTRUDER# signal goes active. 11: Reserved 01: Interrupt (as selected by TCO_INT_SEL). 10: SMI# 00 INTRUDER# doesn't cause SMI# or interrupt
0	0h RO	Reserved

11.4.8 TCO_MESSAGE1 and TCO_MESSAGE2 (TMSG)—Offset Ch

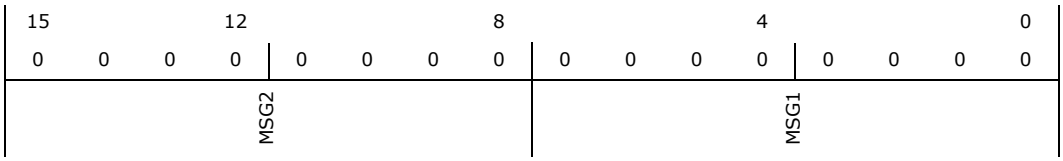
TCOBASE+0Ch (MSG1) TCOBASE+0Dh (MSG2) BIOS can write into these registers to indicate its boot progress. The external micro-controller can read these registers to monitor the boot progress.

Access Method

Type: I/O Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RW	**TCO_MESSAGE2 (MSG2)**
7:0	0h RW	**TCO_MESSAGE1 (MSG1)**

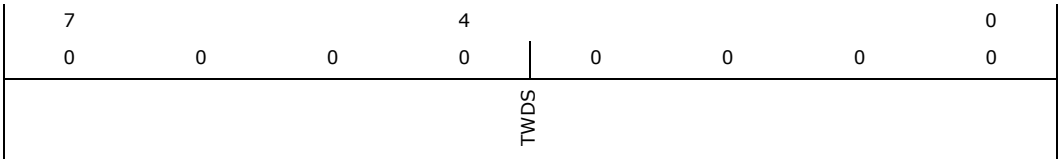
11.4.9 TCO_WDSTATUS Register (TWDS)—Offset Eh

Access Method

Type: I/O Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**TCO_WDSTATUS Register (TWDS):** The BIOS or system management software can write into this register to indicate more details on the boot progress. The register will rest to 00h based on a RSMRST# (but not PCI Reset). The external micro-controller can read this register to monitor boot progress.

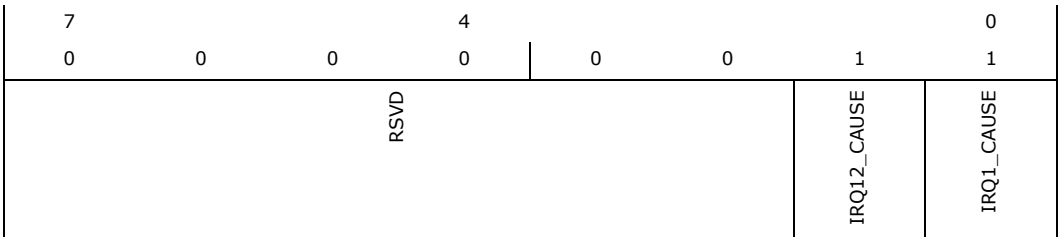
11.4.10 LEGACY_ELIM Register (LE)—Offset 10h

Access Method

Type: I/O Register
(Size: 8 bits)

Device: 31
Function: 4

Default: 3h



Bit Range	Default and Access	Field Name (ID): Description
7:2	0h RO	Reserved.
1	1h RW	**IRQ12_CAUSE (IRQ12_CAUSE):** When software sets the bit to 1, IRQ12 will be high (asserted). When software sets the bit to 0, IRQ12 will be low (not asserted). Default for this bit is 1.
0	1h RW	**IRQ1_CAUSE (IRQ1_CAUSE):** When software sets the bit to 1, IRQ1 will be high (asserted). When software sets the bit to 0, IRQ1 will be low (not asserted). Default for this bit is 1.

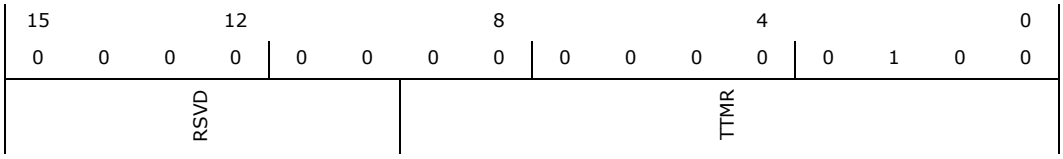
11.4.11 TCO_TMR Register (TTMR)—Offset 12h

Access Method

Type: I/O Register
(Size: 16 bits)

Device: 31
Function: 4

Default: 4h



Bit Range	Default and Access	Field Name (ID): Description
15:10	0h RO	Reserved.
9:0	4h RW	**TCOTMR (TTMR):** Value that is loaded into the timer each time the TCO_RLD register is written. Values of 0000h or 0001h will be ignored and should not be attempted. The timer is clocked at approximately 0.6 seconds, and thus allows timeouts ranging from 1.2 second to 613.8 seconds. ***Note:*** The timer has an error of ± 1 tick (0.6s).

§

12 High Precision Event Timer

12.1 References

Specification	Location
IA-PC HPET (High Precision Event Timers) Specification, Revision 1.0a	http://www.intel.com/content/www/us/en/software-developers/software-developers-hpet-spec-1-0a.html

12.2 Overview

This function provides a set of timers that can be used by the operating system. The timers are defined such that the operating system may assign specific timers to be used directly by specific applications. Each timer can be configured to cause a separate interrupt.

The PCH provides eight timers. The timers are implemented as a single counter, and each timer has its own comparator and value register. The counter increases monotonically. Each individual timer can generate an interrupt when the value in its value register matches the value in the main counter.

Timer 0 supports periodic interrupts.

The registers associated with these timers are mapped to a range in memory space (much like the I/O APIC). However, it is not implemented as a standard PCI function. The BIOS reports to the operating system the location of the register space via ACPI. The hardware can support an assignable decode space; however, the BIOS sets this space prior to handing it over to the operating system. It is not expected that the operating system will move the location of these timers once it is set by the BIOS.

12.2.1 Timer Accuracy

The timers are accurate over any 1 ms period to within 0.05% of the time specified in the timer resolution fields.

Within any 100-microsecond period, the timer reports a time that is up to two ticks too early or too late. Each tick is less than or equal to 100 ns; thus, this represents an error of less than 0.2%.

The timer is monotonic. It does not return the same value on two consecutive reads (unless the counter has rolled over and reached the same value).

The main counter uses the PCH's 24-MHz crystal as its clock. The accuracy of the main counter is as accurate as the crystal that is used in the system.

12.2.2 Timer Off-Load

The PCH supports a timer off-load feature that allows the HPET timers to remain operational during very low power S0 operational modes when the 24-MHz clock is disabled. The clock source during this off-load is the Real Time Clock's 32.768-kHz clock. This clock is calibrated against the 24-MHz clock during boot time to an accuracy that ensures the error introduced by this off-load is less than 10 ppb (.000001%).

When the 24-MHz clock is active, the 64-bit counter will increment by one each cycle of the 24-MHz clock when enabled. When the 24-MHz clock is disabled, the timer is maintained using the RTC clock. The long-term (> 1 msec) frequency drift allowed by the HPET specification is 500 ppm. The off-load mechanism ensures that it contributes < 1ppm to this, which will allow this specification to be easily met given the clock crystal accuracies required for other reasons.

Timer off-load is prevented when there are HPET comparators active.

The HPET timer in the PCH runs typically on the 24-MHz crystal clock and is off-loaded to the 32-kHz clock once the CPU enters C10. This is the state where there are no C10 wake events pending and when the off-load calibrator is not running. HPET timer re-uses this 28 bit calibration value calculated by PMC when counting on the 32-kHz clock. During C10 entry, PMC sends an indication to HPET to off-load and keeps the indication active as long as the CPU is in C10 on the 32-kHz clock. The HPET counter will be off-loaded to the 32-kHz clock domain to allow the 24-MHz clock to shut down when it has no active comparators.

12.2.3 Off-Loadable Timer

The Off-loadable Timer Block consists of a 64b fast clock counter and an 82b slow clock counter. During fast clock mode the counter increments by one on every rising edge of the fast clock. During slow clock mode, the 82 bit slow clock counter will increment by the value provided by the Off-load Calibrator.

The Off-loadable Timer will accept an input to tell it when to switch to the slow RTC clock mode and provide an indication of when it is using the slow clock mode. The switch will only take place on the slow clock rising edge, so for the 32-kHz RTC clock the max delay is around 30 microseconds to switch to or from slow clock mode. Both of these flags will be in the fast clock domain.

When transitioning from fast clock to slow clock, the fast clock value will be loaded into the upper 64b of the 82b counter, with the 18 LSBs set to zero. The actual transition through happens in two stages to avoid metastability. There is a fast clock sampling of the slow clock through a double flop synchronizer. Following a request to transition to the slow clock, the edge of the slow clock is detected and this causes the fast clock value to park. At this point the fast clock can be gated. On the next rising edge of the slow clock, the parked fast clock value (in the upper 64b of an 82b value) is added to the value from the Off-load Calibrator. On subsequent edges while in slow clock mode the slow clock counter increments its count by the value from the Off-load Calibrator.

When transitioning from slow clock to fast clock, the fast clock waits until it samples a rising edge of the slow clock through its synchronizer and then loads the upper 64b of the slow clock value as the fast count value. It then de-asserts the indication that slow clock mode is active. The 32-kHz clock counter no longer counts. The 64-bit MSB will be over-written when the 32-kHz counter is reloaded once conditions are met to enable the 32-kHz TSC counter but the 18-bit LSB is retained and it is not cleared out during the next reload cycle to avoid losing the fractional part of the counter.

After initiating a transition from fast clock to slow clock and parking the fast counter value, the fast counter no longer tracks. This means if a transition back to fast clock is requested before the entry into off-load slow clock mode completes, the Off-loadable Timer must wait until the next slow clock edge to restart. This case effectively performs the fast clock to slow clock and back to fast clock on the same slow clock edge.

12.2.4 Interrupt Mapping

The interrupts associated with the various timers have several interrupt mapping options. When reprogramming the HPET interrupt routing scheme (LEG_RT_CNF bit in the General Config Register), a spurious interrupt may occur. This is because the other source of the interrupt (8254 timer) may be asserted. Software should mask interrupts prior to clearing the LEG_RT_CNF bit.

12.2.4.1 Mapping Option #1 (Legacy Replacement Option)

In this case, the Legacy Replacement Rout bit (LEG_RT_CNF) is set. This forces the mapping found in Table 12-1.

Table 12-1. Legacy Replacement Routing

Timer	8259 Mapping	APIC Mapping	Comment
0	IRQ0	IRQ2	In this case, the 8254 timer will not cause any interrupts
1	IRQ8	IRQ8	In this case, the RTC will not cause any interrupts.
2 and 3	Per IRQ Routing Field.	Per IRQ Routing Field	
4, 5, 6, 7	not available	not available	
Note: The Legacy Option does not preclude delivery of IRQ0/IRQ8 using processor interrupts messages.			

12.2.4.2 Mapping Option #2 (Standard Option)

In this case, the Legacy Replacement Rout bit (LEG_RT_CNF) is 0. Each timer has its own routing control. The interrupts can be routed to various interrupts in the 8259 or I/O APIC. A capabilities field indicates which interrupts are valid options for routing. If a timer is set for edge-triggered mode, the timers should not be shared with any legacy interrupts.

For the PCH, the only supported interrupt values are as follows:

Timer 0 and 1: IRQ20, 21, 22, and 23 (I/O APIC only).

Timer 2: IRQ11 (8259 or I/O APIC) and IRQ20, 21, 22, and 23 (I/O APIC only).

Timer 3: IRQ12 (8259 or I/O APIC) and IRQ 20, 21, 22, and 23 (I/O APIC only).

Note: Interrupts from Timer 4, 5, 6, 7 can only be delivered using processor message interrupts.

12.2.4.3 Mapping Option #3 (Processor Message Option)

In this case, the interrupts are mapped directly to processor messages without going to the 8259 or I/O (x) APIC. To use this mode, the interrupt must be configured to edge-triggered mode. The Tn_PROCMSG_EN_CNF bit must be set to enable this mode.

When the interrupt is delivered to the processor, the message is delivered to the address indicated in the Tn_PROCMSG_INT_ADDR field. The data value for the write cycle is specified in the Tn_PROCMSG_INT_VAL field.

Note: The processor message interrupt delivery option has HIGHER priority and is mutually exclusive to the standard interrupt delivery option. Thus, if the Tn_PROCMSG_EN_CNF bit is set, the interrupts will be delivered directly to the processor, rather than by means of the APIC or 8259.

The processor message interrupt delivery can be used even when the legacy mapping is used.

12.2.5 Periodic Versus Non-Periodic Modes

12.2.5.1 Non-Periodic Mode

Timer 0 is configurable to 32- (default) or 64-bit mode, whereas timers 1:7 only support 32-bit mode.

Warning: Software must be careful when programming the comparator registers. If the value written to the register is not sufficiently far in the future, then the counter may pass the value before it reaches the register and the interrupt will be missed. The BIOS should pass a data structure to the operating system to indicate that the operating system should not attempt to program the periodic timer to a rate faster than 5 microseconds.

All of the timers support non-periodic mode.

Refer to Section 2.3.9.2.1 of the *IA-PC HPET Specification* for more details of this mode.

12.2.5.2 Periodic Mode

Timer 0 is the only timer that supports periodic mode. Refer to Section 2.3.9.2.2 of the *IA-PC HPET Specification* for more details of this mode.

If the software resets the main counter, the value in the comparator's value register needs to reset as well. This can be done by setting the TIMERn_VAL_SET_CNF bit. Again, to avoid race conditions, this should be done with the main counter halted. The following usage model is expected:

1. Software clears the ENABLE_CNF bit to prevent any interrupts.
2. Software Clears the main counter by writing a value of 00h to it.
3. Software sets the TIMER0_VAL_SET_CNF bit.
4. Software writes the new value in the TIMER0_COMPARATOR_VAL register.
5. Software sets the ENABLE_CNF bit to enable interrupts.

The Timer 0 Comparator Value register cannot be programmed reliably by a single 64-bit write in a 32-bit environment, except if only the periodic rate is being changed during run-time. If the actual Timer 0 Comparator Value needs to be reinitialized, then the following software solution will always work, regardless of the environment:

1. Set TIMER0_VAL_SET_CNF bit.
2. Set the lower 32 bits of the Timer0 Comparator Value register.
3. Set TIMER0_VAL_SET_CNF bit.
4. Set the upper 32 bits of the Timer0 Comparator Value register.

12.2.6 Enabling the Timers

The BIOS or operating system PnP code should route the interrupts. This includes the Legacy Rout bit, Interrupt Rout bit (for each timer), and interrupt type (to select the edge or level type for each timer).

The Device Driver code should do the following for an available timer:

1. Set the Overall Enable bit (Offset 10h, bit 0).

2. Set the timer type field (selects one-shot or periodic).
3. Set the interrupt enable.
4. Set the comparator value.

12.2.7 Interrupt Levels

Interrupts directed to the internal 8259s are active high. See Section 20.8, "Advanced Programmable Interrupt Controller (APIC) (D31:F0)" for information regarding the polarity programming of the I/O APIC for detecting internal interrupts.

If the interrupts are mapped to the 8259 or I/O APIC and set for level-triggered mode, they can be shared with legacy interrupts. They may be shared although it is unlikely for the operating system to attempt to do this.

If more than one timer is configured to share the same IRQ (using the TIMERn_INT_ROUT_CNF fields), then the software must configure the timers to level-triggered mode. Edge-triggered interrupts cannot be shared.

12.2.8 Handling Interrupts

Section 2.4.6 of the *IA-PC HPET Specification* describes handling interrupts.

12.2.9 Issues Related to 64-Bit Timers with 32-Bit Processors

Section 2.4.7 of the *IA-PC HPET Specification* describes issues related to 64-bit timers with 32-bit processors.

12.3 HPET Memory Mapped Registers Summary

The timer registers are memory mapped directly (rather than indexed) to allow the CPU to access each register without having to use an index register. This ensures accesses are safe for multi-threaded environments. The timer register space is 1024 bytes. The registers are generally aligned on 64-bit boundaries to simplify implementation with IA64 processors. In the PCH, there are four possible memory address ranges beginning at 1) FED0_0000h, 2) FED0_1000h, 3) FED0_2000h, 4) FED0_3000h. The choice of address range should be selected by assigning the High Performance Event Timer Configuration (HPTC) register fields in the configuration space of the Primary to Sideband Bridge. All registers are implemented in the Primary power well, and all bits are reset by PLTRST#. Reads to reserved registers or bits will return a value of 0. Behavorial Rules:

1. Software can read or write the various bytes in these registers using 32-bit or 64-bit accesses. Software must not attempt to read or write across register boundaries. For example, a 32-bit access should be to offset x0h, x4h, x8h, or xCh. 32-bit accesses should not be to 01h, 02h, 03h, 05h, 06h, 07h, 09h, 0Ah, 0Bh, 0Dh, 0Eh, or 0Fh. Any accesses to these offsets will result in an unexpected behavior, and may result in a master abort. However, these accesses should not result in system hangs. 64-bit accesses can only be to x0h and must not cross 64-bit boundaries.
2. Software should not write to read-only registers.
3. Software should not expect any particular or consistent value when reading reserved registers or bits.

Table 12-2. Summary of HPET Memory Mapped Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	7h	General Capabilities and ID Register (GEN_CAP_ID)—Offset 0h	27BC86B8086A701h
10h	17h	General Config Register (GEN_CFG)—Offset 10h	0h
20h	27h	General Interrupt Status Register (GEN_INT_STS)—Offset 20h	0h
F0h	F7h	Main Counter Value (MAIN_CNTR)—Offset F0h	0h
100h	107h	Timer n Config and Capabilities (TMRn_CNF_CAP)—Offset 100h	F0000000008030h
108h	10Fh	Timer n Comparator Value (TMRn_CMP_VAL)—Offset 108h	FFFFFFFFFFFFFFFFh

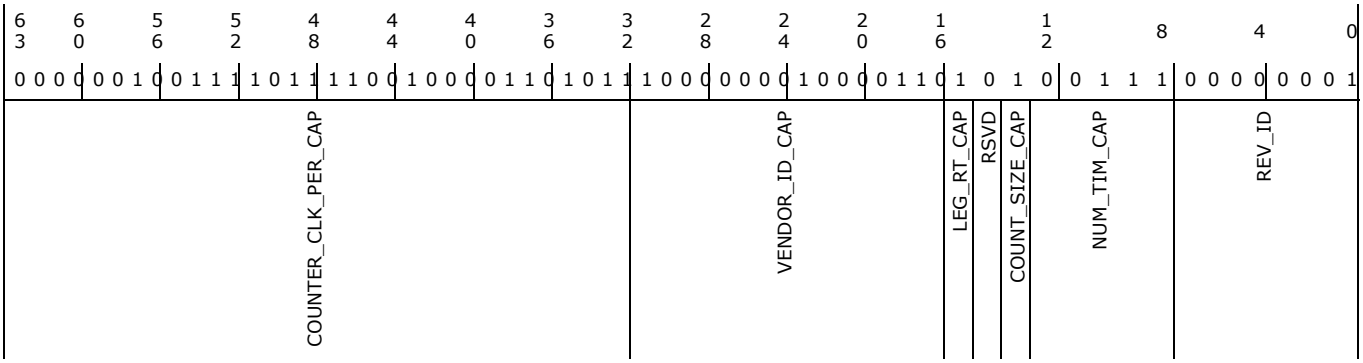
12.3.1 General Capabilities and ID Register (GEN_CAP_ID)—Offset 0h

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 27BC86B8086A701h



Bit Range	Default and Access	Field Name (ID): Description
63:32	27BC86Bh RO	**Main Counter Tick Period (COUNTER_CLK_PER_CAP):** This read-only field indicates the period at which the counter increments in femtoseconds (10^-15 seconds). The PCH HPET timers use a 24 MHz clock, which has a period of 41,666,667 femtoseconds. Therefore this register will always return 027BC86Bh when read.
31:16	8086h RO	**Vendor ID (VENDOR_ID_CAP):** These bits will return 8086h when read to reflect Intel as the vendor.
15	1h RO	**Legacy Rout Capable (LEG_RT_CAP):** This bit will always be 1 when read, indicating support for the Legacy Interrupt Rout.
14	0h RO	Reserved

Bit Range	Default and Access	Field Name (ID): Description
13	1h RO	**Counter Size (COUNT_SIZE_CAP):** This bit will return 1 when read to indicate support for 64-bit counters allowing 64- or 32-bit mode operation.
12:8	7h RO	**Number of Timers (NUM_TIM_CAP):** This value in this field will be 07h to indicate support for 8 timers in the timer block.
7:0	1h RO	**Revision ID (REV_ID):** This field indicates which revision of the function is implemented. Default value will be 01h.

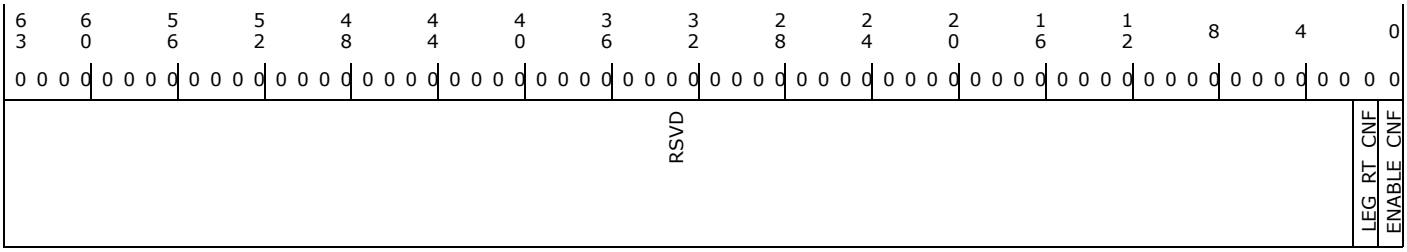
12.3.2 General Config Register (GEN_CFG)—Offset 10h

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
63:2	0h RO	Reserved.
1	0h RW	**Legacy Rout (LEG_RT_CNF):** If the ENABLE_CNF bit and the LEG_RT_CNF bit are both set, the interrupts will be routed as follows: • Timer 0 is routed to IRQ0 in 8259 or IRQ2 in the I/O APIC • Timer 1 is routed to IRQ8 in 8259 or IRQ8 in the I/O APIC • Timer 2-n is routed as per the routing in the timer n Configuration registers. • If the Legacy Replacement Rout bit is set, the individual routing bits for Timers 0 and 1 (APIC) will have no impact. • If the Legacy Replacement Rout bit is not set, the individual routing bits for each of the timers are used. • This bit will default to 0. BIOS can set it to 1 to enable the legacy replacement routing, or 0 to disable the legacy replacement routing.
0	0h RW	**Overall Enable (ENABLE_CNF):** This bit must be set to enable any of the timers to generate interrupts. If this bit is 0, then the main counter will halt (will not increment) and no interrupts will be caused by any of these timers. For level-triggered interrupts, if an interrupt is pending when the ENABLE_CNF bit is changed from 1 to 0, the interrupt status indications (in the various Txx_INT_STS bits) will not be cleared. Software must write to the Txx_INT_STS bits to clear the interrupts. ***Note:*** This bit will default to 0. BIOS can set it to 1 or 0.

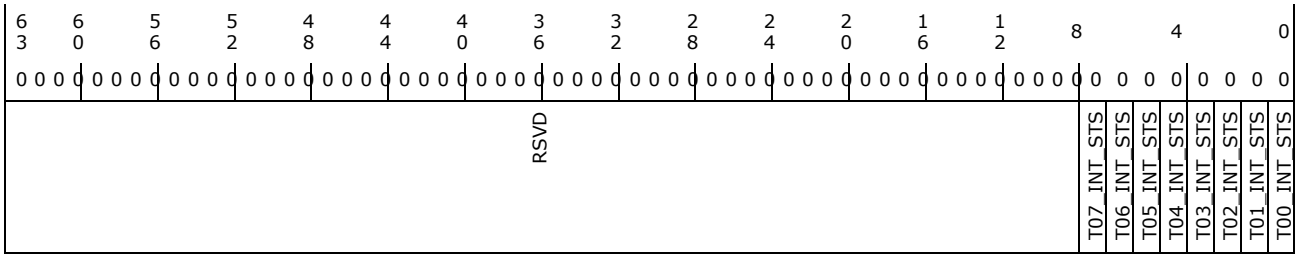
12.3.3 General Interrupt Status Register (GEN_INT_STS)—Offset 20h

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
63:8	0h RO	Reserved
7	0h RW/C	**Timer 7 Interrupt Active (T07_INT_STS):** Same functionality as Timer 0.
6	0h RW/C	**Timer 6 Interrupt Active (T06_INT_STS):** Same functionality as Timer 0.
5	0h RW/C	**Timer 5 Interrupt Active (T05_INT_STS):** Same functionality as Timer 0.
4	0h RW/C	**Timer 4 Interrupt Active (T04_INT_STS):** Same functionality as Timer 0.
3	0h RW/C	**Timer 3 Interrupt Active (T03_INT_STS):** Same functionality as Timer 0.
2	0h RW/C	**Timer 2 Interrupt Active (T02_INT_STS):** Same functionality as Timer 0.
1	0h RW/C	**Timer 1 Interrupt Active (T01_INT_STS):** Same functionality as Timer 0.
0	0h RW/C	**Timer 0 Interrupt Active (T00_INT_STS):** The functionality of this bit depends on whether the edge or level-triggered mode is used for this timer. (default = 0) If set to level-triggered mode: This bit will be set by hardware if the corresponding timer interrupt is active. Once the bit is set, it can be cleared by software writing a 1 to the same bit position. Writes of 0 to this bit will have no effect. If set to edge-triggered mode: This bit should be ignored by software. Software should always write 0 to this bit. ***Note:*** Defaults to 0. In edge triggered mode, this bit will always read as 0 and writes will have no effect.

12.3.4 Main Counter Value (MAIN_CNTR)—Offset F0h

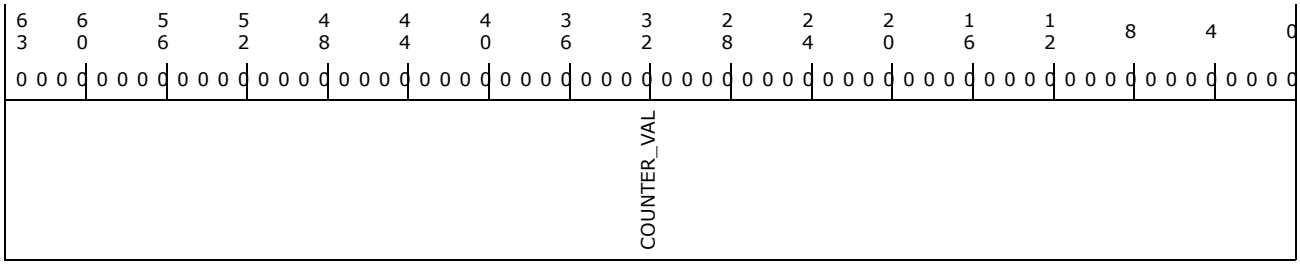
Software can read the various bytes in this register using 32- or 64-bit accesses. The 32-bit accesses may only be done to offset 0F0h or 0F4h. The 64-bit accesses may only be done to 0F0h. Writes to this register should only be done while the counter is halted. Reads to this register return the current value of the main counter. If 32-bit software attempts to read a 64-bit counter, it should first halt the counter. Since this will delay the interrupts for all of the timers, this should be done only if the consequences are understood. It is strongly recommended that 32-bit software only operate the timer in 32-bit mode. Reads to this register are monotonic. No two consecutive reads will return the same value. The second of two reads will always return a larger value (unless the timer has rolled over to 0)

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
63:0	0h RW/V	**Counter Value (COUNTER_VAL):** Reads return the current value of the counter. Writes load the new value to the counter. ***Notes:*** 1. Writes to this register should only be done while the counter is halted. 2. Reads to this register return the current value of the main counter. 3. The 32-bit counters will always return 0 for the upper 32-bits of this register. 4. If 32-bit software attempts to read a 64-bit counter, it should first halt the counter. Since this will delay the interrupts for all of the timers, this should be done only if the consequences are understood. It is strongly recommended that 32-bit software only operate the timer in 32-bit mode. 5. Reads to this register are monotonic. No two consecutive reads will return the same value. The second of two reads will always return a larger value (unless the timer has rolled over to 0)

12.3.5 Timer n Config and Capabilities (TMRn_CNF_CAP)—Offset 100h

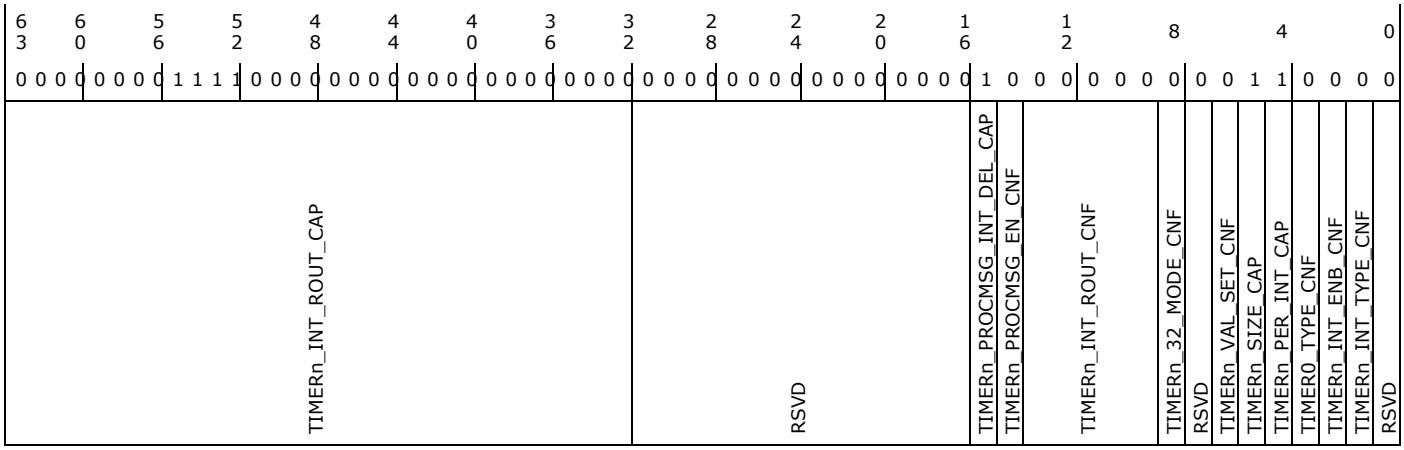
Timer 0: 100–107h,
Timer 1: 120–127h,
Timer 2: 140–147h,
Timer 3: 160–167h,
Timer 4: 180–187h,
Timer 5: 1A0–1A7h,
Timer 6: 1C0–1C7h,
Timer 7: 1E0–1E7h,
The letter n can be 0, 1, 2, 3, 4, 5, 6, or 7 referring to Timer 0, 1, 2, 3, 4, 5, 6, or 7.

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: F0000000008030h



Bit Range	Default and Access	Field Name (ID): Description
63:32	F00000h RO	**Timer n Interrupt Rout (TIMERn_INT_ROUT_CAP):** This 32-bit read-only field indicates to which interrupts in the 8259 or I/O (x) APIC this timers interrupt can be routed to. This is used in conjunction with the TIMERn_INT_ROUT_CNF field. Writes to this field will have no effect. ***Note:*** If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Each bit in this field corresponds to a particular interrupt. For example, if this timers interrupt can be mapped to interrupts 16, 18, 20, 22, or 24, then bits 16, 18, 20, 22, and 24 in this field will be set to 1. All other bits will be 0. Timer 0,1 : Bits 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. Timer 2 : Bits 11, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 11 is used, software should ensure IRQ 11 is not shared with any other devices to guarantee the proper operation of this timer. Timer 3 : Bits 12, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 12 is used, software should ensure IRQ 12 is not shared with any other devices to guarantee the proper operation of this timer. Timer 4-7: This field is always 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
31:16	0h RO	Reserved
15	1h RO	**Timer n Processor Message Interrupt Delivery Capability (TIMERn_PROCMSG_INT_DEL_CAP):** This bit is always read as 1, since the Intel PCH HPET implementation supports the direct processor interrupt delivery.
14	0h RW	**Timer n Processor Message Interrupt Delivery Enable (TIMERn_PROCMSG_EN_CNF):** When set, this will force the interrupts for Timer n to be delivered directly as processor messages, rather than using the 8259 or I/O (x) APIC. In this case, the TIMERn_INT_ROUTE_CNF field in this register will be ignored and the TIMERn_PROCMSG_ROUT register will be used instead. Timer 0, 1, 2, 3: This bit is a read/write bit. Timer 4, 5, 6, 7: This bit is always Read-Only 1 as interrupt from these timers canonly be delivered via direct FSB interrupt messages.
13:9	0h RW	**Timer n Interrupt Route (TIMERn_INT_ROUT_CNF):** This 5-bit field indicates the routing for the interrupt to the 8259 or I/O APIC. A maximum of 32 interrupts are supported. Software writes to this field to select which interrupt in the 8259 or I/O (x)APIC will be used for this timers interrupt. The default value for this register is 00h. If the Legacy Rout bit is set, then Timers 0 and 1 will have a different routing, and this bit field has no effect for those two timers. If the TIMERn_FSB_EN_CNF bit is set, then the interrupt will be delivered directly to the FSB, and this bit field has no effect. If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Software must not program any value other than 0-15 in this field. Software must ensure that the value is valid for a particular timer as indicated by the TIMERn_INT_ROUTE_CAP field for that timer. The PCH logic does not check the validity of the value written. For Timers 4-7, this field is always Read-Only 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
8	0h RW	**Timer n 32-bit Mode (TIMERn_32_MODE_CNF):** Software can set this bit to force a 64-bit timer to behave as a 32-bit timer. This is typically needed if the software is not willing to halt the main counter to read or write a particular timer, and the software not capable of do an atomic 64-bit read to the timer. When TIMER0_32MODE_CNF is set to '1', the hardware counter will essentially be doing 32-bit operation on comparator match and rollovers i.e., the upper 32-bit of the Timer 0 Comparator Value register is ignored. The upper 32-bit of the main counter is not involved in any roll over from lower 32-bit of the main counter and becomes all zero's. For timer 0, this bit will be read/write and default to 0. For timers 1-7, this bit will always read as 0 and writes will have no effect (since these seven timers are 32-bits).
7	0h RO	Reserved
6	0h RO	**Timer n Value Set (TIMERn_VAL_SET_CNF):** Software uses this bit only for timers that have been set to periodic mode. By writing this bit to a 1, the software is then allowed to directly set the timers accumulator. Software does not have to write this bit back to 0 (it automatically clears). This bit will return 0 when read.Software should not write a 1 to this bit position if the timer is set to non-periodic mode. Writes will only have an effect for Timer 0 if it is set to periodic mode. Writes will have no effect for Timers 1-7 as they do not support the periodic mode.
5	1h RO	**Timer n Size (TIMERn_SIZE_CAP):** Read-only Indicator of the timers size capability.1: 64-bits0: 32-bits.The value is 1 (64-bits) for timer 0, and 0 (32-bits) for timers 1-7.
4	1h RO	**Periodic Interrupt Capable (TIMERn_PER_INT_CAP):** If this read-only bit is 1, then the hardware supports a periodic mode for this timers interrupt. The value is 1 (periodic supported) for timer 0, and 0 (not supported) for timers 1-7.

Bit Range	Default and Access	Field Name (ID): Description
3	0h RW	**Timer 0 Type (TIMER0_TYPE_CNF):** Setting this bit to 1 enables the timer to generate a periodic interrupt if it is capable of doing so. If the TIMERn_PER_INT_CAP bit is 0, then this bit will always return 0 when read and writes will have no impact. For timer 0, this bit will be read/write, with default of 0. For timers 1-7, this bit will be read-only, with a fixed value of 0.
2	0h RW	**Timer n Interrupt Enable (TIMERn_INT_ENB_CNF):** Setting this bit to 1 enables the timer to generate a periodic interrupt if it is capable of doing so. If the TIMERn_PER_INT_CAP bit is 0, then this bit will always return 0 when read and writes will have no impact. For timer 0, this bit will be read/write, with default of 0. For timers 1-7, this bit will be read-only, with a fixed value of 0.
1	0h RW	**Timer Interrupt Type (TIMERn_INT_TYPE_CNF):** Determines whether an edge or level interrupt will be used for this timer (when enabled). 0: Edge-triggered. If another interrupt occurs, another edge will be generated. 1: Level-triggered. The interrupt will be held active until it is cleared by writing to the bit in the General Interrupt Status Register. If another interrupt occurs before the interrupt is cleared, the interrupt will remain active. The default value is 0, edge-triggered. The interrupt type for any timer should be set before that timer generates any interrupts. If the interrupt type is changed dynamically, there will be some delay before the new type takes effect. That delay is not specified. Timer 0-3: This bit is a read/write bit as both edge and level triggered modes are supported. Timer 4-7: This bit is always Read-Only 0 as only edge-triggered mode is supported.
0	0h RO	Reserved

12.3.6 Timer n Comparator Value (TMRn_CMP_VAL)—Offset 108h

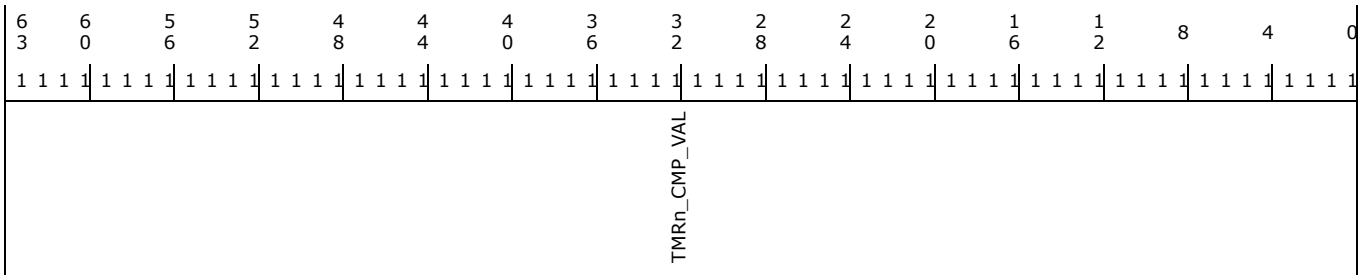
Timer 0: 108h – 10Fh
Timer 1: 128h – 12Fh
Timer 2: 148h – 14Fh
Timer 3: 168h – 16Fh
Timer 4: 188h – 18Fh
Timer 5: 1A8h – 1AFh
Timer 6: 1C8h – 1CFh
Timer 7: 1E8h – 1EFh

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: FFFFFFFFFFFFFFFFh



Bit Range	Default and Access	Field Name (ID): Description
63:0	FFFFFFFFF FFFFFFFh RW/V	**Timer n Comparator Value (TMRn_CMP_VAL):** If the timer is configured to non-periodic mode, when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). The value in this register does not change based on the interrupt being generated. If the timer is configured to periodic mode (supported only for Timer 0), when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). When this time out occurs, the value in this register is increased by the value last written to the register. For example, in periodic mode if the value written to the register is 0000123h: 1. An interrupt will be generated when the main counter reaches 00000123h. 2. The value in this register will then be adjusted by the hardware to 00000246h. 3. Another interrupt will be generated when the main counter reaches 00000246h. 4. The value in this register will then be adjusted by the hardware to 00000369h As each periodic interrupt occurs, the value in this register will increment. When the incremented value is greater than the maximum value possible for this register (FFFFFFFFh for a 32-bit timer or FFFFFFFFFFFFFFFFh for a 64-bit timer), the value will wrap around through 0. For example, if the current value in a 32-bit timer is FFFF0000h and the last value written to this register is 20000, then after the next interrupt the value will change to 00010000h The default value for each timer is all 1s for the bits that are implemented. For example, a 32-bit timer will have a default value of 00000000FFFFFFFFh. A 64-bit timer will have a default value of FFFFFFFFFFFFFFFFh. Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x8h or 1xCh. 64-bit accesses may only be done to 1x8h. Comparator value. Timer 0 is 64-bits wide. Timers 1-7 are 32-bits wide.

§

13 Thermal Management

13.1 Acronyms

Acronyms	Description
DTS	Digital Thermal Sensor
$T_{accuracy}$	Thermal Accuracy
BMC	Baseboard Management Controller

13.2 PCH Thermal Sensor

The PCH incorporates an on-die digital thermal sensor for thermal management.

13.2.1 Modes of Operation

The DTS has two uses when enabled:

1. Provide the PCH temperature in units of 1/2 °C to the BMC. There is a 9-bit field for the temperature, with a range from -50 °C to 205.5 °C.
2. Allow programmed trip points to cause alerts via an interrupt (SCI, SMI, and INTx) or shut down the system (unconditionally transitions the system to S5) with a programmable catastrophic trip point.

13.2.2 Temperature Trip Point

The internal thermal sensor reports three trip points: cool, hot, and catastrophic trip points in the order of increasing temperature.

Crossing the cool trip point when going from higher to lower temperature may generate an interrupt. Crossing the hot trip point going from lower to higher temp may generate an interrupt. Each trip point has control register bits to select what type of interrupt is generated.

Crossing the cool trip point while going from low to higher temperature or crossing the hot trip point while going from high to lower temperature will not cause an interrupt.

When triggered, the catastrophic trip point will transition the system to S5 unconditionally.

In the Thermal Mechanical Design Guide, the standard references for these trip points have another name. In order to make sure the same references are used when comparing the datasheet to the TMDG, here is how the conversions go:

Catastrophic trip point = TEMP_HI

Thermal Alert High = TEMP_MID

Thermal Alert Low = $T_{CONTROL}$

13.2.3 Thermal Sensor Accuracy ($T_{accuracy}$)

$T_{accuracy}$ for the PCH is ±5 °C in the temperature range 50 – 110 °C, ±7 °C for temperatures from 30 °C – 50 °C and ±10 °C for temperatures from -10 – 30 °C. This value is based on product characterization and is not ensured by manufacturing test.

13.2.4 Thermal Reporting to a BMC

To support a platform BMC that is managing the system thermals, the PCH provides the ability for the BMC to read the PCH temperature over SMLink1 and over eSPI interface. The BMC will issue an SMBus read or eSPI OOB Channel request and receives a single byte of data, indicating a temperature between 1 °C and 254 °C, where 255 (0xFF) indicates that the sensor is not enabled yet.

Upon reset, the value driven to the BMC will be either 0xFF or 0x00.This indicates that BIOS has not enabled the reporting yet. When the BMC receives 0xFF or 0x00 for the temperature, it knows that the thermal sensor is not enabled and can assume that the system is in the boot phase with unknown temperature.

After the sensor is enabled, the BMC will receive a value between 0x01 and 0x7F (0 °C to 127 °C). If the BMC ever sees a value between 0x80 and 0xFE, that indicates an error has occurred, since the PCH should have shut down the platform before the temperature ever reached 128 °C (Catastrophic trip point will be below 128 °C). The PCH itself does not monitor the temperature and will not flag any error on the temperature value.

13.2.5 Thermal Trip Signal (PHOT#)

The PCH provides PHOT# signal to indicate that it has exceeded some temperature limit. The limit is set by BIOS. The temperature limit (programmed into the PHL register) is compared to the present temperature. If the present temperature is greater than the PHL value then the pin is asserted.

PHOT# is an O/D output and requires a pull-up on the motherboard.

The PCH evaluates the temperature from the thermal sensor against the programmed temperature limit every second.

13.2.6 Thermal Sensor Programming

Refer to the Intel® C620 Series Chipset BIOS specifications for recommendations and details.

13.3 Thermal Reporting Configuration Registers Summary

Table 13-1. Summary of Thermal Reporting Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	1h	Vendor Identification (VID)—Offset 0h	8086h
2h	3h	Device Identification (DID)—Offset 2h	31h
4h	5h	Command (CMD)—Offset 4h	0h
6h	7h	Status (STS)—Offset 6h	10h
8h	8h	Revision Identification (RID)—Offset 8h	0h
9h	9h	Programming Interface (PI)—Offset 9h	0h
Ah	Ah	Sub Class Code (SCC)—Offset Ah	80h
Bh	Bh	Base Class Code (BCC)—Offset Bh	11h
Ch	Ch	Cache Line Size (CLS)—Offset Ch	0h
Dh	Dh	Latency Timer (LT)—Offset Dh	0h
Eh	Eh	Header Type (HTYPE)—Offset Eh	0h
10h	13h	Thermal Base (TBAR)—Offset 10h	4h
14h	17h	Thermal Base High DWord (TBARH)—Offset 14h	0h
2Ch	2Dh	Subsystem Vendor ID (SVID)—Offset 2Ch	0h
2Eh	2Fh	Subsystem ID (SID)—Offset 2Eh	0h
34h	37h	Capabilities Pointer (CAP_PTR)—Offset 34h	50h
3Ch	3Ch	Interrupt Line (INTLN)—Offset 3Ch	0h
3Dh	3Dh	Interrupt Pin (INTPN)—Offset 3Dh	0h
40h	43h	BIOS Assigned Thermal Base Address (TBARB)—Offset 40h	4h
44h	47h	BIOS Assigned Thermal Base High DWord (TBARBH)—Offset 44h	0h
48h	48h	Control Bits (CB)—Offset 48h	0h
50h	51h	PCI Power Management Capability ID (PID)—Offset 50h	8001h
52h	53h	Power Management Capabilities (PC)—Offset 52h	23h
54h	57h	Power Management Control And Status (PCS)—Offset 54h	8h
80h	81h	Message Signaled Interrupt Identifiers (MID)—Offset 80h	5h
82h	83h	Message Signaled Interrupt Message Control (MC)—Offset 82h	0h
84h	87h	Message Signaled Interrupt Message Address (MA)—Offset 84h	0h
88h	8Bh	Message Signaled Interrupt Message Data (MD)—Offset 88h	0h

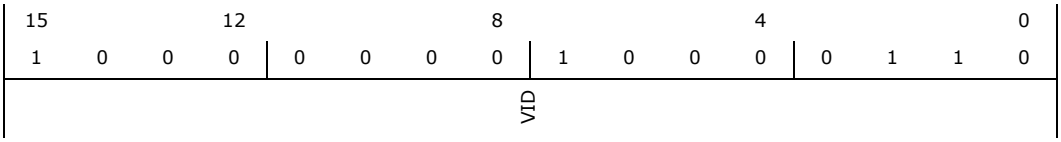
13.3.1 Vendor Identification (VID)—Offset 0h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 2

Default: 8086h



Bit Range	Default and Access	Field Name (ID): Description
15:0	8086h RO	**Vendor ID (VID):** Indicates that Intel is the vendor.

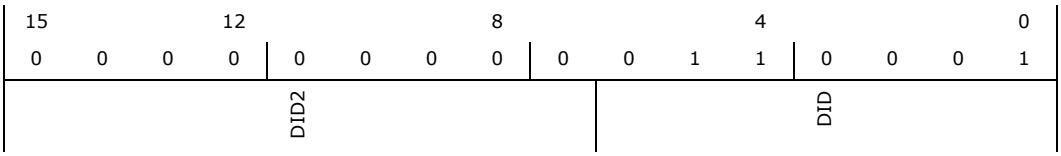
13.3.2 Device Identification (DID)—Offset 2h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 2

Default: 31h



Bit Range	Default and Access	Field Name (ID): Description
15:7	0h RO	**Device ID Part2 (DID2):** Indicates the device number
6:0	31h RO	**Device ID (DID):** Indicates the device number for Thermal controller

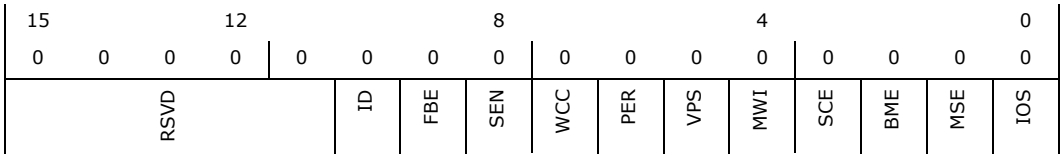
13.3.3 Command (CMD)—Offset 4h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:11	0h RO	Reserved
10	0h RW	**Interrupt Disable (ID):** Enables the device to assert an INTx#. When set, the Thermal logics INTx# signal will be de-asserted. When cleared AND MSI is not enabled, the INTx# signal may be asserted. ***Note:*** This bit has no affect on MSI generation.
9	0h RO	**Fast Back to Back Enable (FBE):** Not implemented. Hardwired to 0.
8	0h RW	**SERR Enable (SEN):** When set to 1 and an error occurs, SERR# is signaled to the system.
7	0h RO	**Wait Cycle Control (WCC):** Not implemented. Hardwired to 0.
6	0h RO	**Parity Error Response (PER):** Not implemented. Hardwired to 0.
5	0h RO	**VGA Palette Snoop (VPS):** Not implemented. Hardwired to 0.
4	0h RO	**Memory Write and Invalidate Enable (MWI):** Not implemented. Hardwired to 0.
3	0h RO	**Special Cycle Enable (SCE):** Not implemented. Hardwired to 0.
2	0h RW	**Bus Master Enable (BME):** When 1, enables
1	0h RW	**Memory Space Enable (MSE):** When set, enables memory space accesses to the Thermal registers.
0	0h RO	**I/O Space (IOS):** The Thermal logic does not implement I/O Space; therefore; this bit is hardwired to 0.

13.3.4 Status (STS)—Offset 6h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 2

Default: 10h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
DPE	SERRS	RMA	RTA	STA	DEVT		MDPE	FBC	RSVD	C66	CLIST	IS	RSVD		

Bit Range	Default and Access	Field Name (ID): Description
15	0h RO	**Detected Parity Error (DPE):** This bit is set whenever a parity error is seen on the internal interface for this function, regardless of the setting of bit 6 in the command register. Software clears this bit by writing a '1' to this bit location. The thermal sensor unit never checks parity.
14	0h RW/1C	**SERR# Status (SERRS):** Not implemented. Hardwired to 0.
13	0h RO	**Received Master Abort (RMA):** Not implemented. Hardwired to 0.
12	0h RO	**Received Target Abort (RTA):** Not implemented. Hardwired to 0.
11	0h RW/1C	**Signaled Target-Abort (STA):** May be asserted on errors
10:9	0h RO	**DEVSEL# Timing Status (DEVT):** Does not apply. Hardwired to 0.
8	0h RO	**Master Data Parity Error (MDPE):** Not implemented. Hardwired to 0.
7	0h RO	**Fast Back to Back Capable (FBC):** Does not apply. Hardwired to 0.
6	0h RO	Reserved
5	0h RO	**66 MHz Capable (C66):** Does not apply. Hardwired to 0.
4	1h RO	**Capabilities List Exists (CLIST):** Indicates that the controller contains a capabilities pointer list. The first item is pointed to by looking at configuration offset 34h.
3	0h RO	**Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit. This bit is a 1 when the INTx# is asserted. This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register). This bit is not set if MSI is enabled.
2:0	0h RO	Reserved.

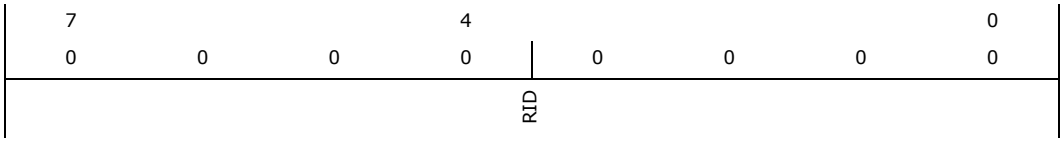
13.3.5 Revision Identification (RID)—Offset 8h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO/V	**Revision ID (RID):** Indicates the device specific revision identifier.

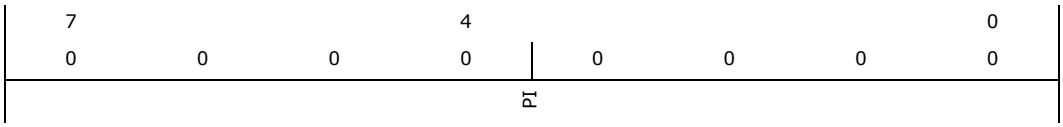
13.3.6 Programming Interface (PI)—Offset 9h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Programming Interface (PI):** PCH Thermal logic has no standard programming interface.

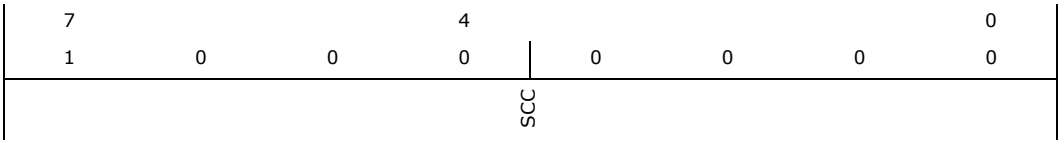
13.3.7 Sub Class Code (SCC)—Offset Ah

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 80h



Bit Range	Default and Access	Field Name (ID): Description
7:0	80h RO	**Sub Class Code (SCC):** Value assigned to PCH Thermal logic.

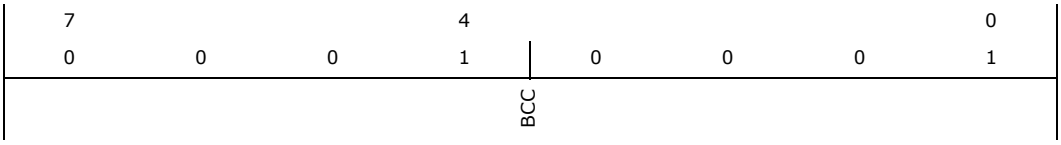
13.3.8 Base Class Code (BCC)—Offset Bh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 11h



Bit Range	Default and Access	Field Name (ID): Description
7:0	11h RO	**Base Class Code (BCC):** Value assigned to PCH Thermal logic.

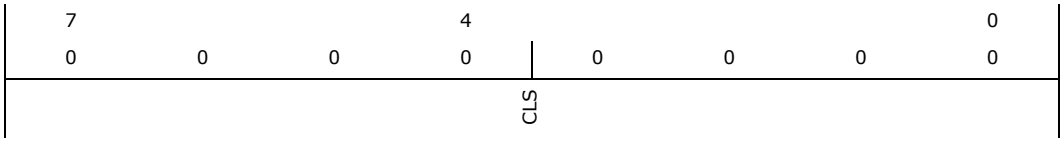
13.3.9 Cache Line Size (CLS)—Offset Ch

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Cache Line Size (CLS):** Doesn't apply to PCI Bus Target-only devices.

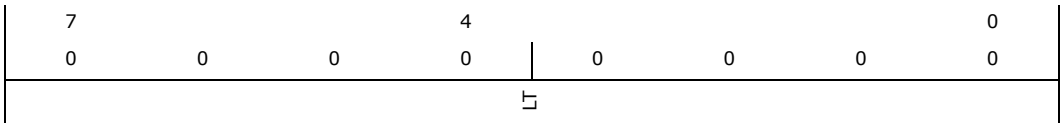
13.3.10 Latency Timer (LT)—Offset Dh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Latency Timer (LT):** Doesn't apply to PCI Bus Target-only devices.

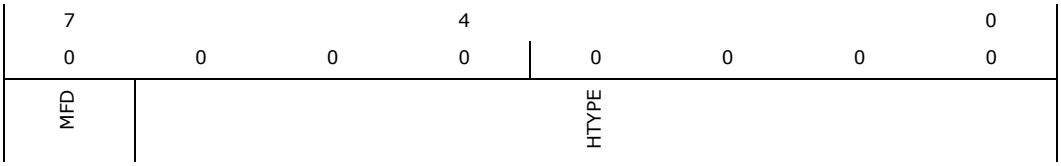
13.3.11 Header Type (HTYPE)—Offset Eh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7	0h RO	**Multi-Function Device (MFD):** This bit is '0' because a multi-function device only needs to be marked as such in Function 0, and the Thermal registers are not in Function 0.
6:0	0h RO	**Header Type (HTYPE):** Implements Type 0 Configuration header.

13.3.12 Thermal Base (TBAR)—Offset 10h

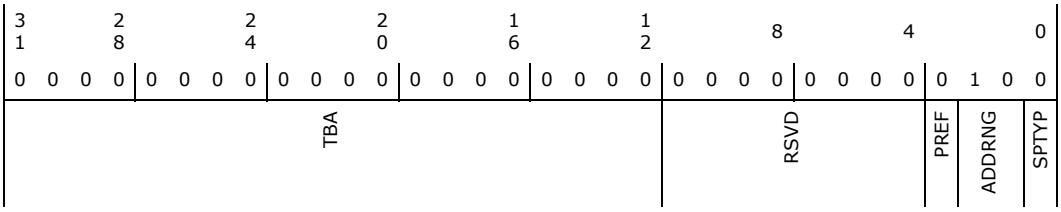
This BAR creates 4 KB of memory space to signify the base address of thermal memory mapped configuration registers. This memory space is active when the Command (CMD) register Memory Space Enable (MSE) bit is set and either TBAR[31:12] or TBARH are programmed to a non-zero address. This BAR is owned by the Operating System, and allows the OS to locate the Thermal registers in system memory space.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 4h



Bit Range	Default and Access	Field Name (ID): Description
31:12	0h RW	**Thermal Base Address (TBA):** Base address for the Thermal logic memory mapped configuration registers. 4 KB bytes are requested by hardwiring bits 11:4 to 0's.
11:4	0h RO	Reserved
3	0h RO	**Prefetchable (PREF):** Indicates that this BAR is NOT prefetchable.
2:1	2h RO	**Address Range (ADDRNG):** Indicates that this BAR can be located anywhere in 64-bit address space.
0	0h RO	**Space Type (SPTYP):** Indicates that this BAR is located in memory space.

13.3.13 Thermal Base High DWord (TBARH)—Offset 14h

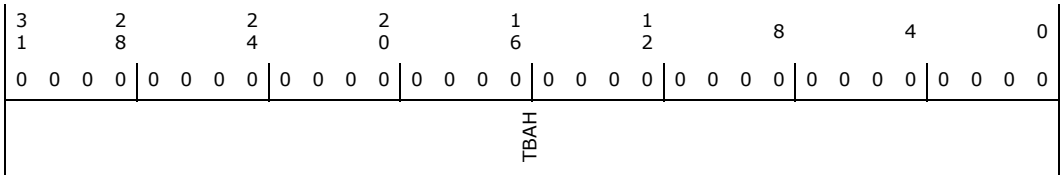
This BAR extension holds the high 32 bits of the 64-bit TBAR. In conjunction with TBAR, it creates 4 KB of memory space to signify the base address of Thermal memory mapped configuration registers.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Thermal Base Address High (TBAH):** TBAR bits [61:32].

13.3.14 Subsystem Vendor ID (SVID)—Offset 2Ch

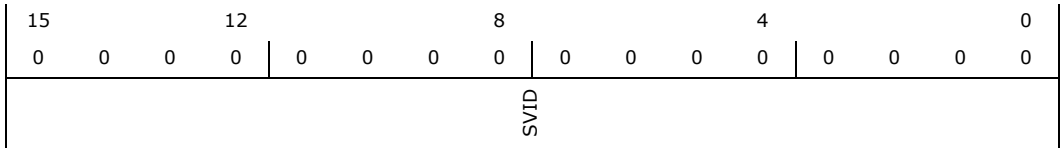
This register should be implemented for any function that could be instantiated more than once in a given system,. The SVID register, in combination with the Subsystem ID register, enables the operating environment to distinguish one subsystem from the other(s).
Software (BIOS) will write the value to this register. After that, the value can be read, but writes to the register will have no effect. The write to this register should be combined with the write to the SID to create one 32-bit write. This register is not affected by $D3_{HOT}$ to D0 reset.

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:0	0h RW/O	**SVID (SVID):** These RWO bits have no PCH functionality.

13.3.15 Subsystem ID (SID)—Offset 2Eh

This register should be implemented for any function that could be instantiated more than once in a given system. The SID register, in combination with the Subsystem Vendor ID register make it possible for the operating environment to distinguish one subsystem from the other(s).

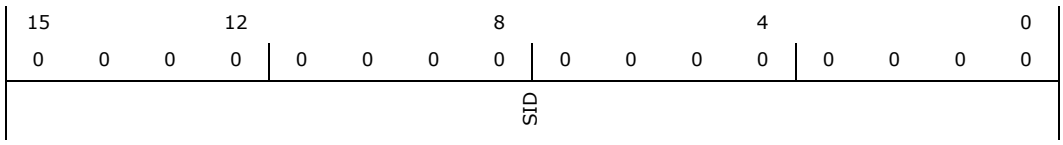
Software (BIOS) will write the value to this register. After that, the value can be read, but writes to the register will have no effect. The write to this register should be combined with the write to the SVID to create one 32-bit write. This register is not affected by $D3_{HOT}$ to D0 reset.

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:0	0h RW/O	**SID (SID):** These RWO bits have no PCH functionality.

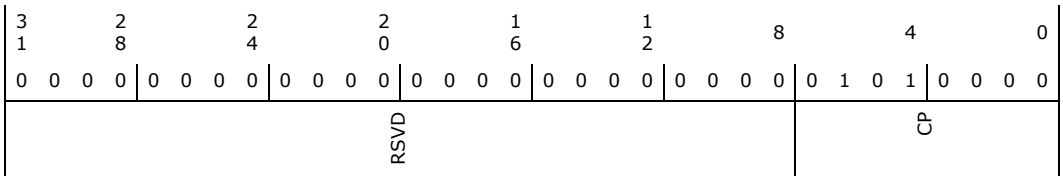
13.3.16 Capabilities Pointer (CAP_PTR)—Offset 34h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 50h



Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved
7:0	50h RO	**Capability Pointer (CP):** Indicates that the first capability pointer offset is offset 50h (Power Management Capability).

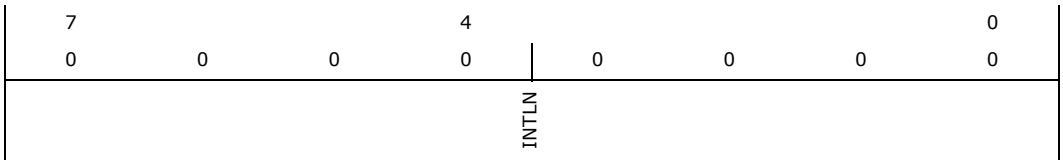
13.3.17 Interrupt Line (INTLN)—Offset 3Ch

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Line (INTLN):** PCH hardware does not use this field directly. It is used to communicate to software the interrupt line that the interrupt pin is connected to.

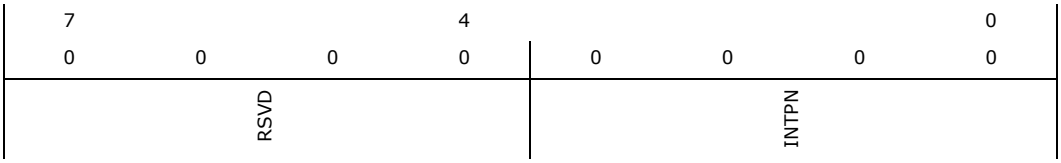
13.3.18 Interrupt Pin (INTPN)—Offset 3Dh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:4	0h RO	Reserved.
3:0	0h RW/O	**Interrupt Pin (INTPN):** This reflects the value of the interrupt pin used by this device.

13.3.19 BIOS Assigned Thermal Base Address (TBARB)—Offset 40h

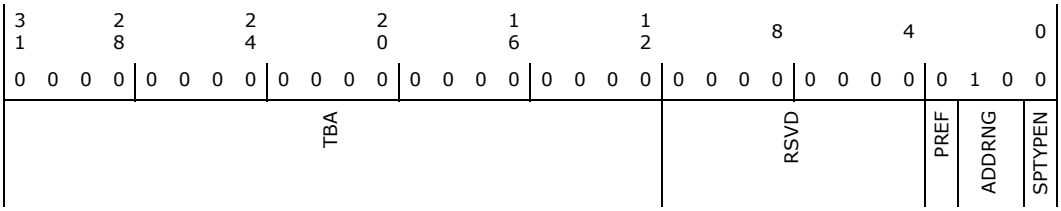
This BAR creates 4 KB of memory space to signify the base address of Thermal memory mapped configuration registers. This memory space is active when TBARB.SPTYPEN is asserted. This BAR is owned by the BIOS, and allows the BIOS to locate the Thermal registers in system memory space. If both TBAR and TBARB are programmed, then the OS and BIOS each have their own independent view of the Thermal registers, and must use the TSIU, TCIU, and TBIU registers to denote Thermal registers ownership/ availability.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 4h



Bit Range	Default and Access	Field Name (ID): Description
31:12	0h RW	**Thermal Base Address (TBA):** Base address for the Thermal logic memory mapped configuration registers. 4KB bytes are requested by hardwiring bits [11:4] to 0's.
11:4	0h RO	Reserved
3	0h RO	**Prefetchable (PREF):** Indicates that this BAR is NOT pre-fetchable.
2:1	2h RO	**Address Range (ADDRNG):** Indicates that this BAR can be located anywhere in 64 bit address space.
0	0h RW	**Space Type Enable (SPTYPEN):** When set to 1b by software, enables the decode of this memory BAR.

13.3.20 BIOS Assigned Thermal Base High DWord (TBARBH)—Offset 44h

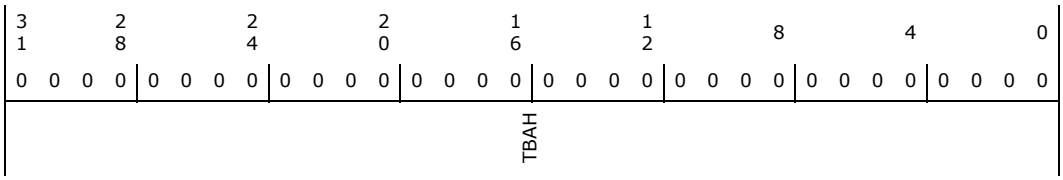
This BAR extension holds the high 32 bits of the 64-bit TBARB.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Thermal Base Address High (TBAH):** TBAR bits [61:32].

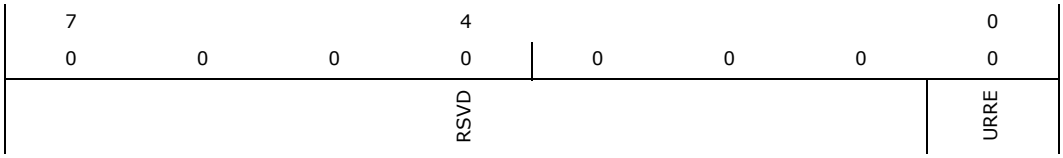
13.3.21 Control Bits (CB)—Offset 48h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:1	0h RO	Reserved
0	0h RW	**UR Reporting Enable (URRE):** When '1', the agent will set the URD bit. If SERR# enable (SEN) is set, then the agent will also send SERR# to the system. ***Note:*** Both URRE and SEN must be set to generate an SERR#.

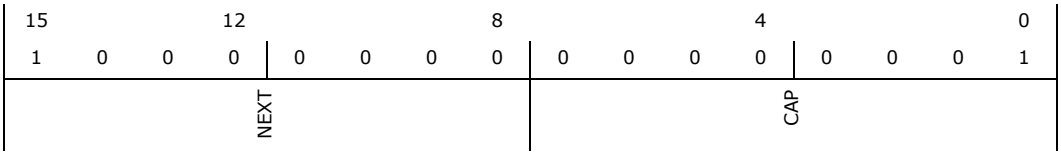
13.3.22 PCI Power Management Capability ID (PID)—Offset 50h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 2

Default: 8001h



Bit Range	Default and Access	Field Name (ID): Description
15:8	80h RO	**Next Capability (NEXT):** Indicates that the next capability is MSI.
7:0	1h RO	**Cap ID (CAP):** Indicates that this pointer is a PCI power management capability.

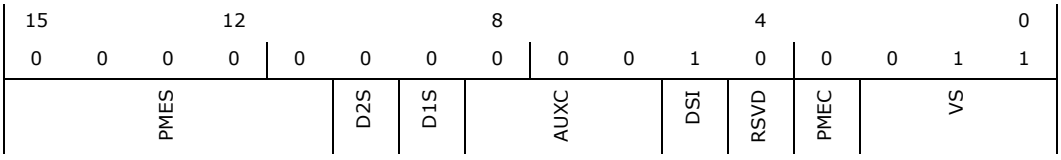
13.3.23 Power Management Capabilities (PC)—Offset 52h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 2

Default: 23h



Bit Range	Default and Access	Field Name (ID): Description
15:11	0h RO	**PME_Support (PMES):** Indicates PME# is not supported.
10	0h RO	**D2_Support (D2S):** The D2 state is not supported.
9	0h RO	**D1_Support (D1S):** The D1 state is not supported.
8:6	0h RO	**Aux_Current (AUXC):** PME# from $D3_{COLD}$ state is not supported, therefore this field is 000b.
5	1h RO	**Device Specific Initialization (DSI):** Indicates that device-specific initialization is required.
4	0h RO	Reserved
3	0h RO	**PME Clock (PMEC):** Does not apply. Hardwired to 0.
2:0	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

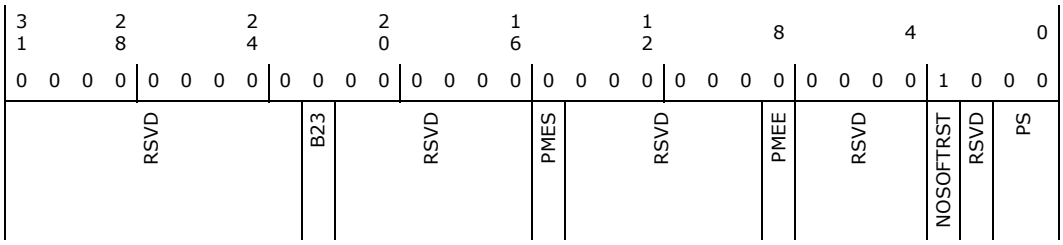
13.3.24 Power Management Control And Status (PCS)—Offset 54h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 8h



Bit Range	Default and Access	Field Name (ID): Description
31:23	0h RO	Reserved
22	0h RO	**B2/B3 Support (B23):** Does not apply. Hardwired to 0.
21:16	0h RO	Reserved
15	0h RO	**PME Status (PMES):** This bit is always zero, since this PCI Function does not generate PME#.
14:9	0h RO	Reserved

Bit Range	Default and Access	Field Name (ID): Description
8	0h RO	**PME Enable (PMEE):** This bit is always zero, since this PCI Function does not generate PME#.
7:4	0h RO	Reserved
3	1h RO	**No Soft Reset (NOSOFTRST):)**, this bit indicates that devices transitioning from $D3_{HOT}$ to D0 because of PowerState commands do not perform an internal reset. Configuration context is preserved. Upon transition from $D3_{HOT}$ to D0 initialized state, no additional operating system intervention is required to preserve Configuration Context belong writing the PowerState bits.
2	0h RO	Reserved
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the Thermal controller and to set a new power state. The values are: 00 = D0 state 11 = $D3_{HOT}$ state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the $D3_{HOT}$ states, the Thermal controller's configuration space is available, but the I/O and memory spaces are not. Additionally, interrupts are blocked. When software changes this value from the $D3_{HOT}$ state to the D0 state, no internal warm (soft) reset is generated.

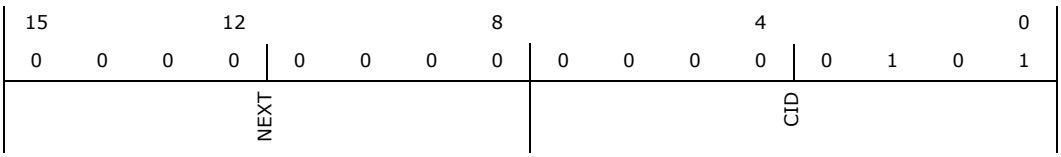
13.3.25 Message Signaled Interrupt Identifiers (MID)—Offset 80h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 2

Default: 5h



Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RO	**Next Pointer (NEXT):** Indicates this is the latest pointer.
7:0	5h RO	**Capability ID (CID):** Capabilities ID indicates MSI.

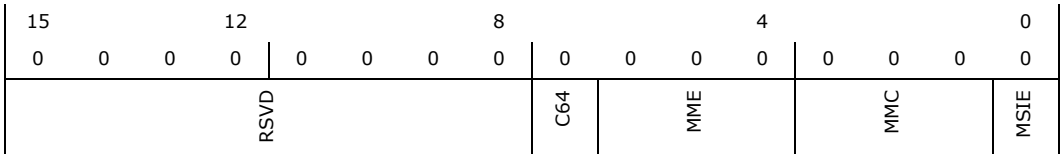
13.3.26 Message Signaled Interrupt Message Control (MC)—Offset 82h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RO	Reserved
7	0h RO	**64 Bit Address Capable (C64):** Capable of generating a 32-bit message only.
6:4	0h RW	**Multiple Message Enable (MME):** These bits are RW for software compatibility, but only one message is ever sent by the root port.
3:1	0h RO	**Multiple Message Capable (MMC):** Only one message is required.
0	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. CMD.BME must be set for an MSI to be generated. If CMD.BME is cleared, and this bit is set, no interrupts (not even pin based) are generated.

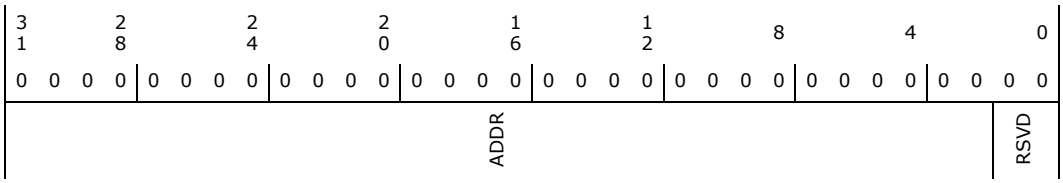
13.3.27 Message Signaled Interrupt Message Address (MA)—Offset 84h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**Address (ADDR):** Lower 32 bits of the system specified message address, always DW aligned.
1:0	0h RO	Reserved

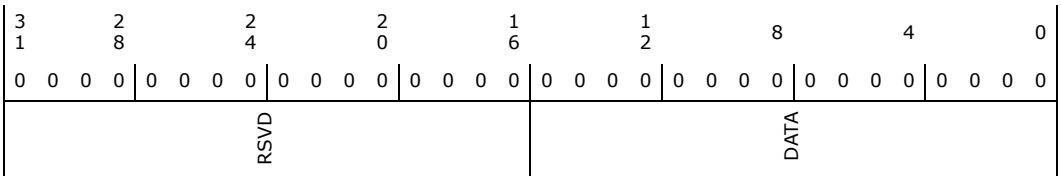
13.3.28 Message Signaled Interrupt Message Data (MD)—Offset 88h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved
15:0	0h RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD[15:0]) during the data phase of the MSI memory write transaction.

13.4 Thermal Reporting Memory Mapped Registers Summary

The Thermal Reporting Registers are located in the memory space mapped by TBAR (OS) and/or TBARB (BIOS), in the offset range from 0h to 0FFh.
All registers are reset by PLTRST#.

Table 13-2. Summary of Thermal Reporting Memory Mapped Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	1h	Temperature (TEMP)—Offset 0h	0h
4h	4h	Thermal Sensor Control (TSC)—Offset 4h	0h
6h	6h	Thermal Sensor Status (TSS)—Offset 6h	0h
8h	8h	Thermal Sensor Enable and Lock (TSEL)—Offset 8h	0h
Ah	Ah	Thermal Sensor Reporting Enable and Lock (TSREL)—Offset Ah	0h
Ch	Ch	Thermal Sensor SMI Control (TSMIC)—Offset Ch	0h
10h	11h	Catastrophic Trip Point (CTT)—Offset 10h	1FFh

Table 13-2. Summary of Thermal Reporting Memory Mapped Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
14h	15h	Thermal Alert High Value (TAHV)—Offset 14h	0h
18h	19h	Thermal Alert Low Value (TALV)—Offset 18h	0h
1Ch	1Dh	Thermal Sensor Power Management (TSPM)—Offset 1Ch	800h
40h	43h	Throttle Levels (TL)—Offset 40h	0h
50h	53h	Throttle Level 2 (TL2)—Offset 50h	0h
60h	61h	PCH Hot Level (PHL)—Offset 60h	0h
62h	62h	PHL Control (PHLC)—Offset 62h	0h
80h	80h	Thermal Alert Status (TAS)—Offset 80h	0h
82h	82h	PCI Interrupt Event Enables (TSPIEN)—Offset 82h	0h
84h	84h	General Purpose Event Enables (TSGPEN)—Offset 84h	0h
F0h	F0h	Thermal Controller Function Disable (TCFD)—Offset F0h	0h

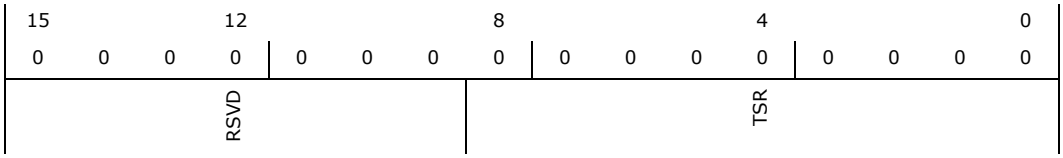
13.4.1 Temperature (TEMP)—Offset 0h

Access Method

Type: MEM Register
(Size: 16 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:9	0h RO	Reserved
8:0	0h RO	**TS Reading (TSR):** The die temperature with resolution of degree 0.5C and an offset of -50C. Thus a reading of 0x121 is 94.5C.

13.4.2 Thermal Sensor Control (TSC)—Offset 4h

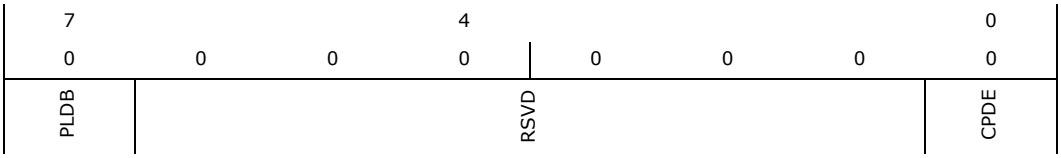
This register controls the operation of the thermal sensor.

Access Method

Type: MEM Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7	0h RW/O/L	**Policy Lock-Down Bit (PLDB):** When written to 1, this bit prevents any more writes to this register (offset 04h) and to CTT (offset 0x10).
6:1	0h RO	Reserved.
0	0h RW/L	**Catastrophic Power-Down Enable (CPDE):** When set to 1, the power management logic (PMC) transitions to the S5 state when a catastrophic temperature is detected by the sensor. The transition to the S5 state must be unconditional (like the Power Button Override Function). Note that the thermal sensor and response logic is in the core/main power well, therefore, detection of a catastrophic temperature is limited to times when this well is powered and out of reset.

13.4.3 Thermal Sensor Status (TSS)—Offset 6h

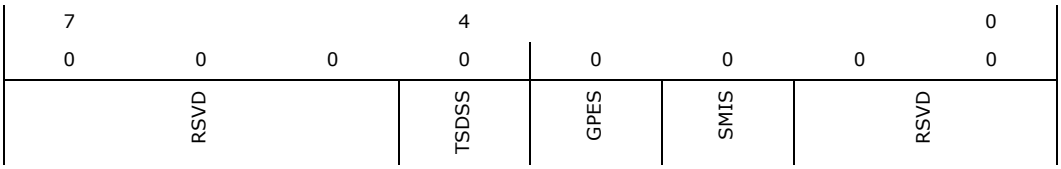
This read only register provides trip point and other status of the thermal sensor.

Access Method

Type: MEM Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:5	0h RO	Reserved.
4	0h RO	**Thermal Sensor Dynamic Shutdown Status (TSDSS):** Thermal Sensor Dynamic Shutdown Status (TSDSS): This bit indicates the status of the thermal sensor circuit when TSEL.ETS=1. 1: Thermal sensor is fully operational. 0: Thermal sensor is in a dynamic shutdown state.
3	0h RW/1C	**GPE Status (GPES):** Set when GPE is enabled for a trip event. SW must write a 1 to this bit to clear the GPE status. Note that GPE can be configured to cause an SMI or SCI. As long as this bit is set, the GPE indication to the global GPE logic is asserted.
2	0h RW/1C	**SMI Status (SMIS):** Set when SMI is enabled for a trip event. SW must write a 1 to this bit to clear the SMI status. As long as this bit is set, the SMI indication to the global SMI logic is asserted.
1:0	0h RO	Reserved

13.4.4 Thermal Sensor Enable and Lock (TSEL)—Offset 8h

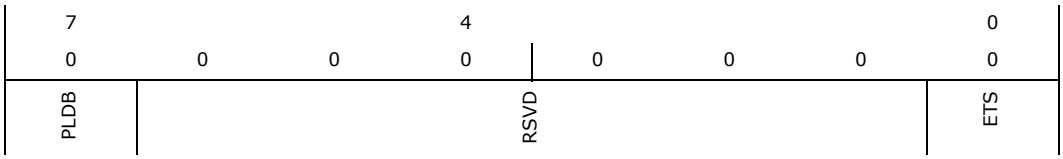
This register controls the operation of the thermal sensor.

Access Method

Type: MEM Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7	0h RW/O/L	**Policy Lock-Down Bit (PLDB):** Policy Lock-Down Bit: When written to 1, this bit prevents any more writes to this register and to TTCB, Test1, Test2, Test3, Test4, Test5, Test6 and Test7 registers.
6:1	0h RO	Reserved
0	0h RW/L	**Enable TS (ETS):** 1: Enables the thermal sensor. Until this bit is set, no thermometer readings or trip events will occur. If SW reads the TEMP register before the sensor is enabled, it will read 0x0. The value of this bit is sent to the thermal sensor. ***Note:*** If the sensor is running and valid temperatures have been captured in TEMP and then ETS is cleared, TEMP will retain its old value. Clearing ETS does not force TEMP to 0x00. 0: Disables the sensor.

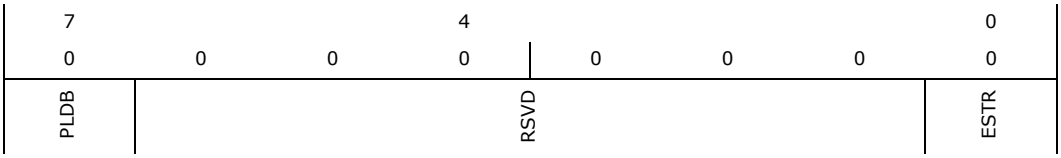
13.4.5 Thermal Sensor Reporting Enable and Lock (TSREL)—Offset Ah

Access Method

Type: MEM Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7	0h RW/O/L	**Policy Lock-Down Bit (PLDB):** Policy Lock-Down Bit: When written to 1, this bit prevents any more writes to this register (offset 0Ah)
6:1	0h RO	Reserved
0	0h RW/L	**Enable SMBus Temperature Reporting (ESTR):** 1: Enables the reporting of the PCH temperature to the SMBus. Note that this must also be set if Intel ME needs access to the PCH temperature. Once enabled this bit should not be cleared by SW. If it is cleared then the EC may get an undefined value. SW has no need to dynamically disable and then re-enable this bit. 0: Disables EC temperature reporting.

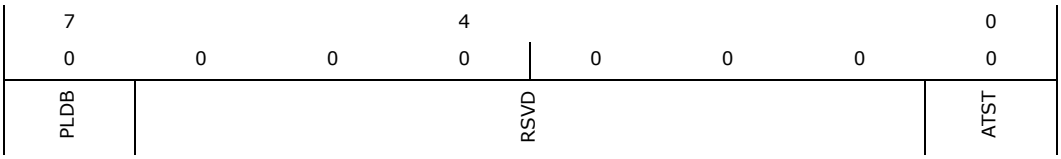
13.4.6 Thermal Sensor SMI Control (TSMIC)—Offset Ch

Access Method

Type: MEM Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7	0h RW/O/L	**Policy Lock-Down Bit (PLDB):** When written to 1, this bit prevents any more writes to this register (offset 0Ch)
6:1	0h RO	Reserved
0	0h RW/L	**SMI Enable on Alert Thermal Sensor Trip (ATST):** 1: Enables SMI# assertions on alert thermal sensor events for either low-to-high or high-to-low events. (Both edges are enabled by this one bit.) 0: Disables SMI# assertions for alert thermal events.

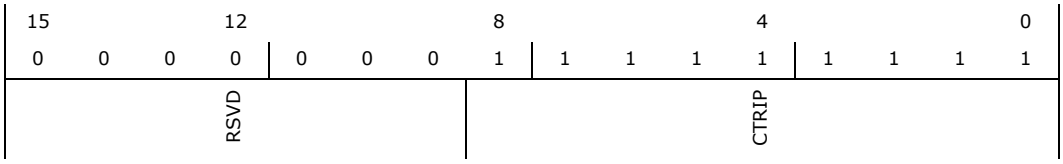
13.4.7 Catastrophic Trip Point (CTT)—Offset 10h

Access Method

Type: MEM Register
(Size: 16 bits)

Device: 20
Function: 2

Default: 1FFh



Bit Range	Default and Access	Field Name (ID): Description
15:9	0h RO	Reserved
8:0	1FFh RW/L	**Catastrophic Temperature TRIP (CTRIP):** When the current temperature reading is = to the value in this register, a catastrophic trip event is signaled. The value of this register must not be changed while TSEL.ETS is set. The value in this register is sent to the thermal sensor. This register is locked by TSC[7].

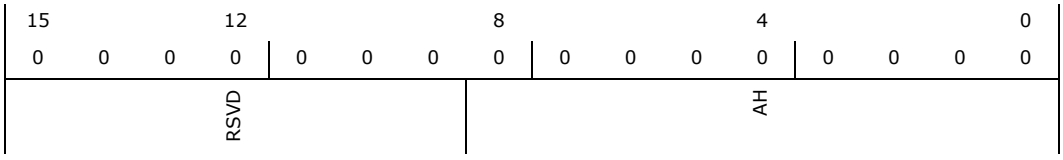
13.4.8 Thermal Alert High Value (TAHV)—Offset 14h

Access Method

Type: MEM Register
(Size: 16 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:9	0h RO	Reserved
8:0	0h RW	**Alert High (AH):** Alert High (AH) - Sets the high value for the alert indication. See the later section for usage. The value of this register must not be changed while TSEL.ETS is set. The value in this register is sent to the thermal sensor. This register is not lockable, so that SW can change the values during runtime.

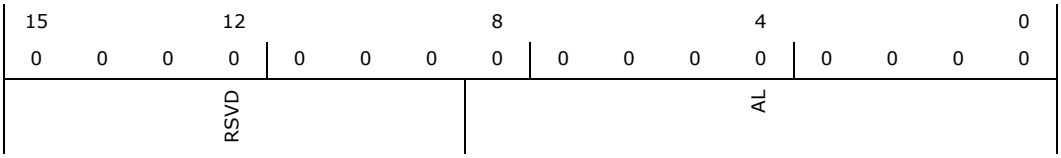
13.4.9 Thermal Alert Low Value (TALV)—Offset 18h

Access Method

Type: MEM Register
(Size: 16 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:9	0h RO	Reserved
8:0	0h RW	**Alert Low (AL):** Sets the low value for the alert indication. See the later section for usage. The value of this register must not be changed while TSEL.ETS is set. The value in this register is sent to the thermal sensor. This register is not lockable, so that SW can change the values during runtime.

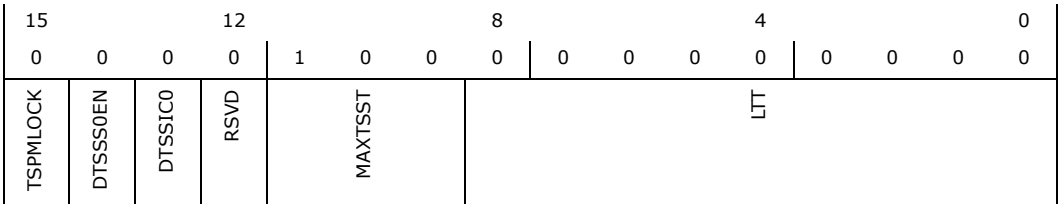
13.4.10 Thermal Sensor Power Management (TSPM)—Offset 1Ch

Access Method

Type: MEM Register
(Size: 16 bits)

Device: 20
Function: 2

Default: 800h



Bit Range	Default and Access	Field Name (ID): Description
15	0h RW/L	**Thermal Sensor Power Management Lock (TSPMLOCK):** Thermal Sensor Power Management Lock (TSPMLOCK): Setting this bit to a 1 causes the rest of the bits in this register to be locked.
14	0h RW/L	**Dynamic Thermal Sensor Shutdown in S0 Idle Enable (DTSSS0EN):** Dynamic Thermal Sensor Shutdown in S0 idle Enable (DTSSS0EN): 1: Dynamic thermal sensor shutdown in S0 idle is enabled. When set to 1, the power management logic shuts down the thermal sensor when the CPU is in a C-state and TEMP.TSR andlt;= LTT.LTT. 0: Dynamic thermal sensor shutdown in S0 idle is disabled.
13	0h RW/L	**Dynamic Thermal Sensor Shutdown in C0 Allowed (DTSSIC0):** Dynamic Thermal Sensor Shutdown in C0 Allowed (DTSSIC0) 0: CPU must be in a non-C0 state to allow PCH thermal sensor shutdown. 1: CPU can be in a C0 or non-C0 state to allow PCH thermal sensor shutdown.
12	0h RO	Reserved
11:9	4h RW/L	**Maximum Thermal Sensor Shutdown Time (MAXTSST):** Maximum Thermal Sensor Shutdown Time (MAXTSST) - sets the maximum time that the thermal sensor will be held in a shutdown state assuming no other wake conditions. This register is used to set the expiration time of a timer that is used to wake up the thermal sensor on expiration. 000: 1 s 001: 2 s 010: 4 s 011: 8 s 100: 16 s 101-111: Reserved
8:0	0h RW	**Low Temp Threshold (LTT):** Low Temp Threshold (LTT) - Sets the low maximum temp value used for dynamic thermal sensor shutdown consideration. See DTSSS0EN for details. This register field is not lockable, so that SW can change the values during runtime.

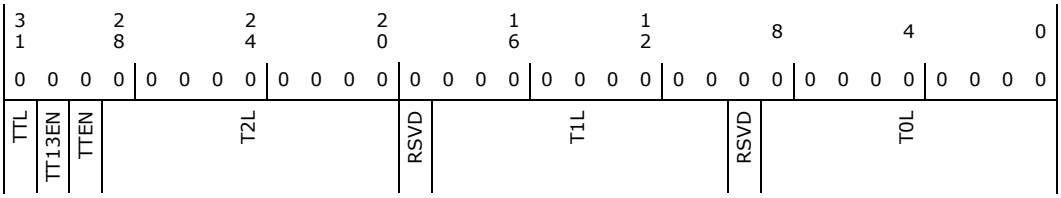
13.4.11 Throttle Levels (TL)—Offset 40h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/L	**TT.Lock (TTL):** When set to 1, this entire register (TL) is locked and remains locked until the next platform reset.
30	0h RW/L	**TT.State13 Enable (TT13EN):** When set to 1, then PMSync state 13 will force at least T2 state.
29	0h RW/L	**TT Enable (TTEN):** When set the thermal throttling states are enabled. At reset, BIOS must set bits 28:0 and then do a separate write to set bit 29 to enable throttling. SW may set bit 31 at the same time it sets bit 29 if it wishes to lock the register. If SW wishes to change the values of 28:0, it must first clear the TTEN bit, then change the values in 28:0, and then re-enable TTEN. It is legal to set bits 31, 30 and 29 with the same write. This bit must not be set unless the thermal sensor is already enabled (set TSC[7]=1 and TSC[3:2] = 10).
28:20	0h RW/L	**T2 Level (T2L):** When TTEN = 1 AND TSE = 1 AND (T2L = TSR[8:0] T1L), then the system is in T2 state. When TTEN = 1 AND TSE = 1 AND (TSR[8:0] T2L), then the system is in T3 state. ***Note:*** The T3 condition overrides PMSync[13] and forces the system to T3 if both cases are true. **Software Note:** T2L must be programmed to a value greater than T1L if TTEN=1.
19	0h RO	Reserved
18:10	0h RW/L	**T1 Level (T1L):** When TTEN = 1 AND TSE = 1 AND (T1L = TSR[8:0] T0L), then the system is in T1 state. **Software Note:** T1L must be programmed to a value greater than T0L if TTEN=1.
9	0h RO	Reserved.
8:0	0h RW/L	**T0 Level (T0L):** When TEMP.TSR[8:0] is less than or equal to T0L OR TT.Enable is 0 OR TSE = 0, then the system is in T0 state.

13.4.12 Throttle Level 2 (TL2)—Offset 50h

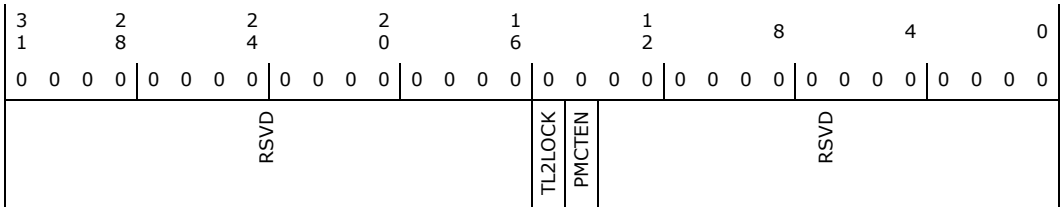
Throttle Level 2

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved
15	0h RW/L	**TL2 lock (TL2LOCK):** TL2.Lock - When set to 1, this entire register (TL2) is locked and remains locked until the next platform reset.
14	0h RW/L	**PMC Throttling Enable (PMCTEN):** PMC Throttling Enable (PMCTEN) - When set to 1 and the PMC is requesting throttling, force at least the T-state that PMC is requesting.
13:0	0h RO	Reserved

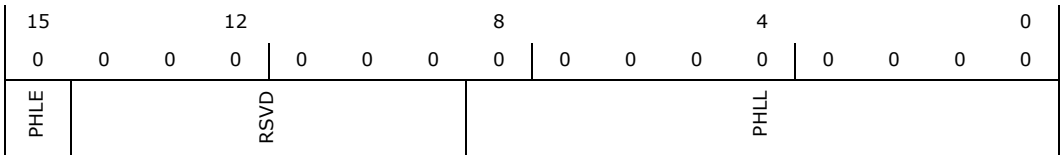
13.4.13 PCH Hot Level (PHL)—Offset 60h

Access Method

Type: MEM Register
(Size: 16 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15	0h RW/L	**PHL Enable (PHLE):** When set and the current temperature reading, TSR, is greater than or equal to PHLL, then the PHOT# pin will be asserted (active low).
14:9	0h RO	Reserved.
8:0	0h RW/L	**PHL Level (PHLL):** Temperature value used for PHOT# pin.

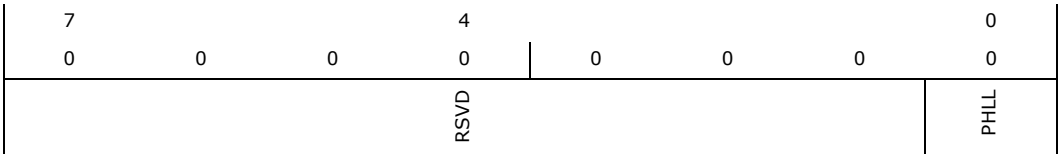
13.4.14 PHL Control (PHLC)—Offset 62h

Access Method

Type: MEM Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:1	0h RO	Reserved
0	0h RW/L	**PHL Lock (PHLL):** When written to a 1, then both PHL and PHLC are locked

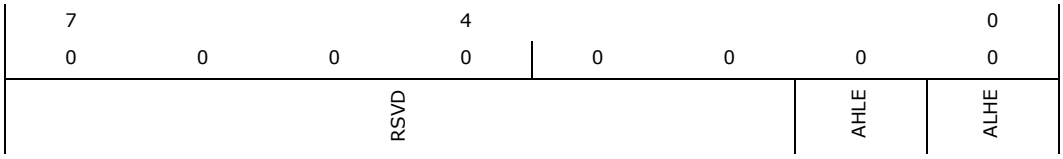
13.4.15 Thermal Alert Status (TAS)—Offset 80h

Access Method

Type: MEM Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RW/1C	**Alert High-to-Low Event (AHLE):** 1: Indicates that a Hot Thermal Sensor trip event occurred based on a lower to higher temperature transition thru the trip point. 0: No trip for this event Software must write a 1 to clear this status bit.
0	0h RW/1C	**Alert Low-to-High Event (ALHE):** 1: Indicates that an Aux Thermal Sensor trip event occurred based on a lower to higher temperature transition thru the trip point. 0: No trip for this event Software must write a 1 to clear this status bit.

13.4.16 PCI Interrupt Event Enables (TSPIEN)—Offset 82h

This register controls the conditions that result in the PCI Interrupt signal from the Thermal Sensor (TS) logic to assert.

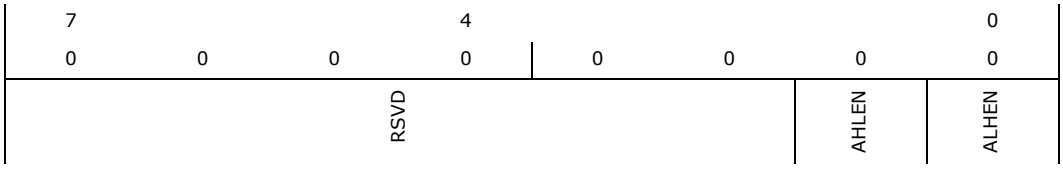
Note: There is a separate enable register per sensor.

Access Method

Type: MEM Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RW	**Alert High-to-Low Enable (AHLEN):** When set to 1, the thermal sensor logic asserts the Thermal logic PCI INTx signal when the corresponding status bit is set in the Thermal Error Status register. When cleared, the corresponding status bit does not result in PCI INTx.
0	0h RW	**Alert Low-to-High Enable (ALHEN):** See the description for bit 1.

13.4.17 General Purpose Event Enables (TSGPEN)—Offset 84h

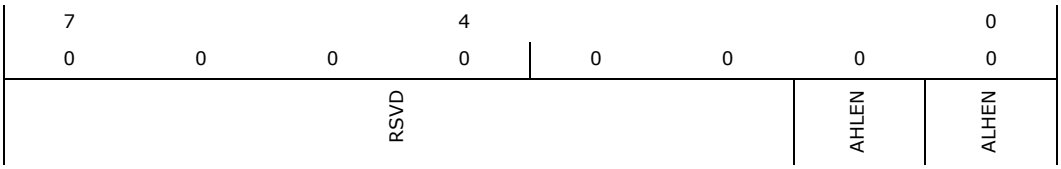
This register controls the conditions that result in the General Purpose Event (GPE) flag (TSS[3]) being set. When the TS GPE signal asserts, the GPE block reports a 1 in the TCOSCI_STS bit.

Access Method

Type: MEM Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RW	**Alert High-to-Low Enable (AHLEN):** When set to 1, the thermal sensor logic asserts its General Purpose Event signal to the GPE block when the corresponding status bit is set in the Thermal Error Status register. When cleared, the corresponding status bit does not result in the GPE signal assertion.
0	0h RW	**Alert Low-to-High Enable (ALHEN):** See the description for bit 1.

13.4.18 Thermal Controller Function Disable (TCFD)—Offset F0h

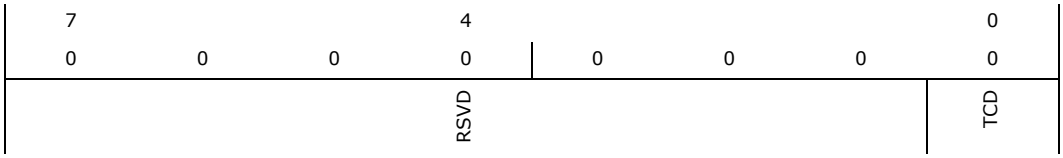
Function Disable bit

Access Method

Type: MEM Register
(Size: 8 bits)

Device: 20
Function: 2

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:1	0h RO	Reserved
0	0h RW	**Thermal Controller Disable (TCD):** Thermal Controller Disable (TCD): When set, the Thermal Controller, is disabled.

§

14 8254 Timers

14.1 Overview

The PCH contains two counters that have fixed uses. All registers and functions associated with the 8254 timers are in the core well. The 8254 unit is clocked by a 14.318 MHz clock derived from 24 MHz crystal clock.

Counter 1 has been removed in this and subsequent generations of PCH. Make sure your software does not need this function.

Counter 0, System Timer

This counter functions as the system timer by controlling the state of IRQ0 and is typically programmed for Mode 3 operation. The counter produces a square wave with a period equal to the product of the counter period (838 ns) and the initial count value. The counter loads the initial count value one counter period after software writes the count value to the counter I/O address. The counter initially asserts IRQ0 and decrements the count value by two each counter period. The counter negates IRQ0 when the count value reaches 0. It then reloads the initial count value and again decrements the initial count value by two each counter period. The counter then asserts IRQ0 when the count value reaches 0, reloads the initial count value, and repeats the cycle, alternately asserting and negating IRQ0.

Counter 2, Speaker Tone

This counter provides the speaker tone and is typically programmed for Mode 3 operation. The counter provides a speaker frequency equal to the counter clock frequency (1.193 MHz) divided by the initial count value. The speaker must be enabled by a write to port 061h (see NMI Status and Control ports).

14.1.1 Timer Programming

The counter/timers are programmed in the following fashion:

1. Write a control word to select a counter.
2. Write an initial count for that counter.
3. Load the least and/or most significant bytes (as required by Control Word Bits 5, 4) of the 16-bit counter.
4. Repeat with other counters.

Only two conventions need to be observed when programming the counters. First, for each counter, the control word must be written before the initial count is written. Second, the initial count must follow the count format specified in the control word (least significant byte only, most significant byte only, or least significant byte, and then most significant byte).

A new initial count may be written to a counter at any time without affecting the counter's programmed mode. Counting is affected as described in the mode definitions. The new count must follow the programmed count format.

If a counter is programmed to read/write two-byte counts, the following precaution applies – a program must not transfer control between writing the first and second byte to another routine which also writes into that same counter. Otherwise, the counter will be loaded with an incorrect count.

The Control Word Register at port 43h controls the operation of all three counters. Several commands are available:

- **Control Word Command.** Specifies which counter to read or write, the operating mode, and the count format (binary or BCD).
- **Counter Latch Command.** Latches the current count so that it can be read by the system. The countdown process continues.
- **Read Back Command.** Reads the count value, programmed mode, the current state of the OUT pins, and the state of the Null Count Flag of the selected counter.

Table 14-1 lists the six operating modes for the interval counters.

Table 14-1. Counter Operating Modes

Mode	Function	Description
0	Out signal on end of count (=0)	Output is 0. When count goes to 0, output goes to 1 and stays at 1 until counter is reprogrammed.
1	Hardware retriggerable one-shot	Output is 0. When count goes to 0, output goes to 1 for one clock time.
2	Rate generator (divide by n counter)	Output is 1. Output goes to 0 for one clock time, then back to 1 and counter is reloaded.
3	Square wave output	Output is 1. Output goes to 0 when counter rolls over, and counter is reloaded. Output goes to 1 when counter rolls over, and counter is reloaded, and so on.
4	Software triggered strobe	Output is 1. Output goes to 0 when count expires for one clock time.
5	Hardware triggered strobe	Output is 1. Output goes to 0 when count expires for one clock time.

14.1.2 Reading from the Interval Timer

It is often desirable to read the value of a counter without disturbing the count in progress. There are three methods for reading the counters—a simple read operation, counter Latch command, and the Read-Back command. Each is explained below.

With the simple read and counter latch command methods, the count must be read according to the programmed format; specifically, if the counter is programmed for two byte counts, two bytes must be read. The two bytes do not have to be read one right after the other. Read, write, or programming operations for other counters may be inserted between them.

14.1.2.1 Simple Read

The first method is to perform a simple read operation. The counter is selected through Port 40h (Counter 0) or 42h (Counter 2).

Note: Performing a direct read from the counter does not return a determinate value, because the counting process is asynchronous to read operations. However, in the case of Counter 2, the count can be stopped by writing to the GATE bit in Port 61h.

14.1.2.2 Counter Latch Command

The Counter Latch command, written to Port 43h, latches the count of a specific counter at the time the command is received. This command is used to ensure that the count read from the counter is accurate, particularly when reading a two-byte count. The count value is then read from each counter's Count register as was programmed by the Control register.

The count is held in the latch until it is read or the counter is reprogrammed. The count is then unlatched. This allows reading the contents of the counters on the fly without affecting counting in progress. Multiple Counter Latch Commands may be used to latch more than one counter. Counter Latch commands do not affect the programmed mode of the counter in any way.

If a Counter is latched and then, some time later, latched again before the count is read, the second Counter Latch command is ignored. The count read is the count at the time the first Counter Latch command was issued.

14.1.2.3 Read Back Command

The Read Back command, written to Port 43h, latches the count value, programmed mode, and current states of the OUT pin and Null Count flag of the selected counter or counters. The value of the counter and its status may then be read by I/O access to the counter address.

The Read Back command may be used to latch multiple counter outputs at one time. This single command is functionally equivalent to several counter latch commands, one for each counter latched. Each counter's latched count is held until it is read or reprogrammed. Once read, a counter is unlatched. The other counters remain latched until they are read. If multiple count Read Back commands are issued to the same counter without reading the count, all but the first are ignored.

The Read Back command may additionally be used to latch status information of selected counters. The status of a counter is accessed by a read from that counter's I/O port address. If multiple counter status latch operations are performed without reading the status, all but the first are ignored.

Both count and status of the selected counters may be latched simultaneously. This is functionally the same as issuing two consecutive, separate Read Back commands. If multiple count and/or status Read Back commands are issued to the same counters without any intervening reads, all but the first are ignored.

If both count and status of a counter are latched, the first read operation from that counter returns the latched status, regardless of which was latched first. The next one or two reads, depending on whether the counter is programmed for one or two type counts, returns the latched count. Subsequent reads return unlatched count.

14.2 8254 Timer Registers Summary

Table 14-2. Summary of 8254 Timer Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
40h	40h	Counter 0 - Interval Timer Status Byte Format Register (C0_ITSBFR)—Offset 40h	C4h
40h	40h	Counter 0 - Counter Access Ports Register (C0_CAPR)—Offset 40h	0h
42h	42h	Counter 2 - Interval Timer Status Byte Format Register (C2_ITSBFR)—Offset 42h	0h
42h	42h	Counter 2 - Counter Access Ports Register (C2_CAPR)—Offset 42h	0h
43h	43h	Timer Control Word Register (TCW)—Offset 43h	0h
43h	43h	Read Back Command (RBC)—Offset 43h	C0h
43h	43h	Counter Latch Command (CLC)—Offset 43h	0h

14.2.1 Counter 0 - Interval Timer Status Byte Format Register (C0_ITSBFR)—Offset 40h

Each counter's status byte can be read following a Read Back Command. If latch status is chosen (bit 4=0, Read Back Command) as a read back option for a given counter, the next read from the counter's Counter Access Ports Register (40h for counter 0 and 42h for counter 2) returns the status byte. The status byte returns the following.

Access Method

Type: I/O Register
(Size: 8 bits)

Device:
Function:

Default: C4h

7			4				0
1	1	0	0	0	1	0	0
COPS	CRSTS	RW_SLT_STS		MD_SLT_STS			CDT_STS

Bit Range	Default and Access	Field Name (ID): Description
7	1h RO	**Counter OUT Pin State (COPS):** When this bit is a 1, the OUT pin of the counter is also a 1. When this bit is a 0, the OUT pin of the counter is also a 0.
6	1h RO	**Count Register Status (CRSTS):** This bit indicates when the last count written to the Count Register (CR) has been loaded into the counting element (CE). The exact time this happens depends on the counter mode, but until the count is loaded into the counting element (CE), the count value will be incorrect. 0 Count has been transferred from CR to CE and is available for reading. 1 Null Count. Count has not been transferred from CR to CE and is not yet available for reading.
5:4	0h RO	**Read/Write Selection Status (RW_SLT_STS):** These reflect the read/write selection made through bits[5:4] of the control register. The binary codes returned during the status read match the codes used to program the counter read/write selection. 00 Counter Latch Command 01 Read/Write Least Significant Byte (LSB) 10 Read/Write Most Significant Byte (MSB) 11 Read/Write LSB then MSB
3:1	2h RO	**Mode Selection Status (MD_SLT_STS):** These bits return the counter mode programming. The binary code returned matches the code used to program the counter mode, as listed under the bit function above. 000 0 Out signal on end of count (=0) 001 1 Hardware retriggerable one-shot x10 2 Rate generator (divide by n counter) x11 3 Square wave output 100 4 Software triggered strobe 101 5 Hardware triggered strobe
0	0h RO	**Countdown Type Status (CDT_STS):** This bit reflects the current countdown type, ether 0 for binary countdown or a 1 for binary coded decimal (BCD) countdown.

14.2.2 Counter 0 - Counter Access Ports Register (C0_CAPR)—Offset 40h

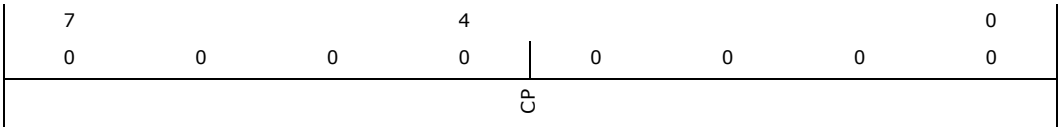
*Address should be 40h

Access Method

Type: I/O Register
(Size: 8 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**Counter Port (CP):** Each counter port address is used to program the 16-bit Count Register. The order of programming, either LSB only, MSB only, or LSB then MSB, is defined with the Interval Counter Control Register at port 43h. The counter port is also used to read the current count from the Count Register, and return the status of the counter programming following a Read Back Command.

14.2.3 Counter 2 - Interval Timer Status Byte Format Register (C2_ITSBFR)—Offset 42h

Same definition as counter 0

14.2.4 Counter 2 - Counter Access Ports Register (C2_CAPR)—Offset 42h

Same definition as Counter 0 - Counter Access Ports Register

14.2.5 Timer Control Word Register (TCW)—Offset 43h

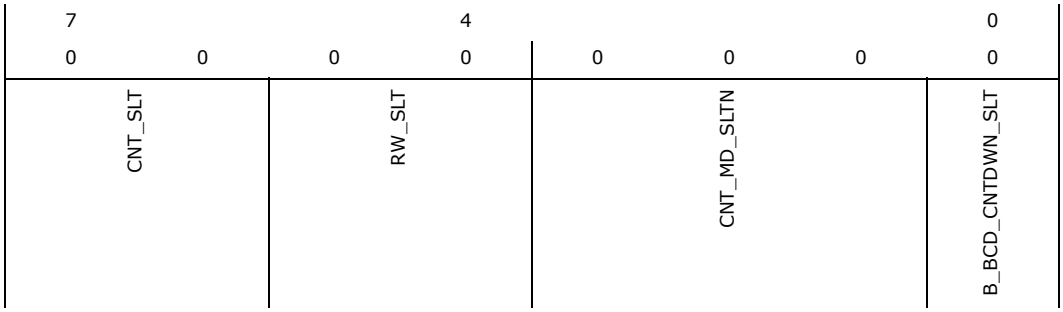
This register is programmed prior to any counter being accessed to specify counter modes. Following reset, the control words for each register are undefined and each counter output is 0. Each timer must be programmed to bring it into a known state. There are two special commands that can be issued to the counters through this register, the Read Back Command and the Counter Latch Command. When these commands are chosen, several bits within this register are redefined.

Access Method

Type: I/O Register
(Size: 8 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:6	0h WO	**Counter Select (CNT_SLT):** The Counter Selection bits select the counter the control word acts upon as shown below. The Read Back Command is selected when bits[7:6] are both 1 00 Counter 0 select 01 Reserved 10 Counter 2 select 11 Read Back Command
5:4	0h WO	**Read/Write Select: (RW_SLT):** These bits are the read/write control bits. The actual counter programming is done through the counter port (40h for counter 0 and 42h for counter 2) 00 Counter Latch Command 01 Read/Write Least Significant Byte (LSB) 10 Read/Write Most Significant Byte (MSB) 11 Read/Write LSB then MSB
3:1	0h WO	**Counter Mode Selection (CNT_MD_SLTN):** These bits select one of six possible modes of operation for the selected counter. 000 0 Out signal on end of count (=0) 001 1 Hardware retriggerable one-shot x10 2 Rate generator (divide by n counter) x11 3 Square wave output 100 4 Software triggered strobe 101 5 Hardware triggered strobe
0	0h WO	**Binary/BCD Countdown Select (B_BCD_CNTDWN_SLT):** 0 Binary countdown is used. The largest possible binary count is 2^16 1 Binary coded decimal (BCD) count is used.The largest possible BCD count is 10^4

14.2.6 Read Back Command (RBC)—Offset 43h

The Read Back Command is used to determine the count value, programmed mode, and current states of the OUT pin and Null count flag of the selected counter or counters. Status and/or count may be latched in any or all of the counters by selecting the counter during the register write. The count and status remain latched until read, and further latch commands are ignored until the count is read.
Both count and status of the selected counters may be latched simultaneously by setting both bit 5 and bit 4 to 0. If both are latched, the first read operation from that counter returns the latched status. The next one or two reads, depending on whether the counter is programmed for one or two byte counts, returns the latched count. Subsequent reads return an unlatched count.

Access Method

Type: I/O Register
(Size: 8 bits)

Device:
Function:

Default: C0h

7				4			0
1	1	0	0	0	0	0	0
RBC		LCSC	LSSC	CNT_2_SLT	RSVD	CNT_0_SLT	RSVD

Bit Range	Default and Access	Field Name (ID): Description
7:6	3h WO	**Read Back Command (RBC):** Must be 11 to select the Read Back Command
5	0h WO	**Latch Count of Selected Counters (LCSC):** 0 Current count value of the selected counters will be latched 1 Current count will not be latched
4	0h WO	**Latch Status of Selected Counters (LSSC):** 0 Status of the selected counters will be latched 1 Status will not be latched
3	0h WO	**Counter 2 Select (CNT_2_SLT):** When set to 1, Counter 2 count and/or status will be latched
2	0h RO	Reserved
1	0h WO	**Counter 0 Select (CNT_0_SLT):** When set to 1, Counter 0 count and/or status will be latched.
0	0h RO	Reserved

14.2.7 Counter Latch Command (CLC)—Offset 43h

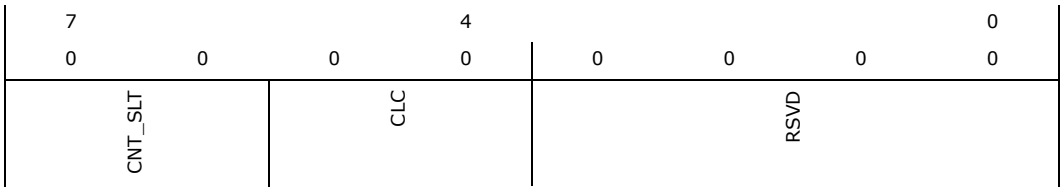
The Counter Latch Command latches the current count value. This command is used to insure that the count read from the counter is accurate. The count value is then read from each counter's count register through the Counter Ports Access Ports Register (40h for counter 0 and 42h for counter 2). The count must be read according to the programmed format i.e., if the counter is programmed for two byte counts, two bytes must be read. The two bytes do not have to be read one right after the other (read, write, or programming operations for other counters may be inserted between the reads). If a counter is latched once and then latched again before the count is read, the second Counter Latch Command is ignored.

Access Method

Type: I/O Register
(Size: 8 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:6	0h WO	**Counter Selection (CNT_SLT):** These bits select the counter for latching. If 11 is written, then the write is interpreted as a read back command. 00 = Counter 0 01 = Reserved 10 = Counter 2
5:4	0h WO	**Counter Latch Command (CLC):** Write 00 to select the Counter Latch Command.
3:0	0h RO	Reserved

15 Integrated High Definition Audio

15.1 Acronyms

Acronyms	Description
HDA	High Definition Audio
PCM	Pulse Code Modulation
SoC	System On Chip

15.2 References

Specification	Location
High Definition Audio Specification	http://www.intel.com/content/www/us/en/standards/high-definition-audio-specification.html

15.3 Overview

The Intel® High Definition Audio (Intel® HD Audio) subsystem is a collection of controller, DSP, memory, and link that provide an audio experience in the platform. The controller, memory, and link form the basic audio controller to provide the streaming of audio from host software to an external audio codec with the host CPU providing the audio enrichment.

15.4 Signal Description

Name	Type	Description
HD Audio Signals		
HDA_RST_N	O	**Intel HD Audio Reset**: Master H/W reset to internal/external codecs.
HDA_SYNCS	O	**Intel HD Audio Sync:** 48-kHz fixed rate frame sync to the codecs. Also used to encode the stream number.
HDA_BLK	O	**Intel HD Audio Bit Clock:** Up to 24-MHz serial data clock generated by the Intel HD Audio controller.
HDA_SDO	O	**Intel HD Audio Serial Data Out:** Serial TDM data output to the codecs. The serial output is double-pumped for a bit rate of up to 48 Mb/s.
HDA_SDI_0	I	**Intel HD Audio Serial Data In 0:** Serial TDM data input from the two codec(s). The serial input is single-pumped for a bit rate of up to 24 Mb/s. These signals contain integrated pull-down resistors, which are enabled while the primary well is powered.
HDA_SDI_1	I	**Intel HD Audio Serial Data In 1:** Serial TDM data input from the two codec(s). The serial input is single-pumped for a bit rate of up to 24 Mb/s. These signals contain integrated pull-down resistors, which are enabled while the primary well is powered.

15.5 Integrated Pull-Ups and Pull-Downs

Table 15-1. Integrated Pull-Ups and Pull-Downs

Signal	Resistor Type	Value (Ω)	Notes
HDA_SYNC	Pull-Down	20K	
HDA_SDO	Pull-Down	20k	
HDA_SDI[1:0]	Pull-Down	20K	
Note: Integrated pull-ups and pull-downs will not be valid until all the voltages have reached a valid level.			

15.6 I/O Signal Planes and States

Table 15-2. I/O Signal Planes and States

Signal Name	Power Plane	During Reset	Immediately after Reset	S3/S4/S5	Deep Sx
HD Audio Interface					
HDA_RST_N	Primary	Driven Low	Driven Low	Driven Low	OFF
HDA_SYNC	Primary	Internal Pull-down	Driven Low	Internal Pull-down	OFF
HDA_BLK	Primary	Driven Low	Driven Low	Driven Low	OFF
HDA_SDO	Primary	Internal Pull-down	Driven Low	Internal Pull-down	OFF
HDA_SDI[1:0]	Primary	Internal Pull-down	Internal Pull-down	Internal Pull-down	OFF
Note: Integrated pull-ups and pull-downs will not be valid until all the voltages have reached a valid level.					

15.7 Features

The Integrated High Definition Audio subsystem features are listed below.

15.7.1 Intel High Definition Audio Controller Capabilities

- PCI / PCI Express controller.
- Supports data transfers, descriptor fetches, and DMA position writes using VC0.
  - VC1 is supported as a backup usage model in case low latency is crucial.
- Independent Bus Master logic for 14 general purpose streams: five input and nine output.
- Supports variable length stream slots.
- Supports up to:
  - 14 streams (five input, nine output)
  - 16 channels per stream
  - 32 bits/sample
  - 192 kHz sample rate
- Supports memory-based command/response transport.
- Supports optional Immediate Command/Response mechanism.
- Supports output and input stream synchronization.
- Supports global time synchronization.

- Supports MSI interrupt delivery.
- Support for ACPI D3 and D0 Device States.
- Supports Function Level Reset (FLR).
  - — Only if exposed as PCI Express device.
- Supports Intel's Power Optimizer power management.
  - — Support 1 ms of buffering with all DMA running with maximum bandwidth.
  - — Support 10 ms of buffering with one output DMA and one input DMA running at two channels, 96 kHz, 16-bit audio.

15.7.2 Intel HD Audio link capabilities

- Two SDI signals to support two external codecs.
- Drives variable frequency (6 MHz to 24 MHz) BCLK to support:
  - — SDO double pumped up to 48 Mb/s
  - — SDI's single pumped up to 24 Mb/s
- Provides cadence for 44.1 kHz-based sample rate output.
- Supports 1.5V, 1.8V and 3.3V modes.

15.8 High Definition Audio (D31:F3) PCI Configuration Registers Summary

Table 15-3. Summary of High Definition Audio (D31:F3) PCI Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	1h	Vendor Identification (VID)—Offset 0h	8086h

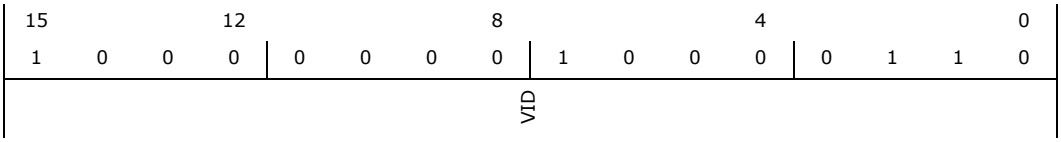
15.8.1 Vendor Identification (VID)—Offset 0h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 3

Default: 8086h



Bit Range	Default and Access	Field Name (ID): Description
15:0	8086h RO	**Vendor ID (VID):** Indicates that Intel is the vendor.

15.8.2 Device ID (DID)—Offset 2h

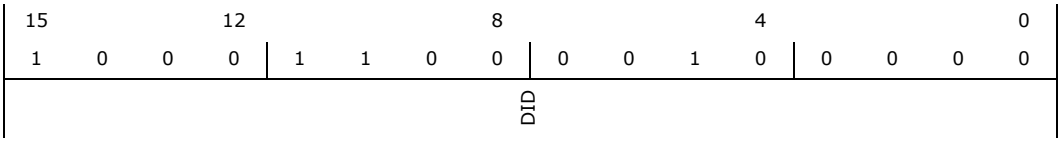
This register is not affected by $D3_{HOT}$ to D0 reset or FLR.

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 3

Default: 8C20h



Bit Range	Default and Access	Field Name (ID): Description
15:0	8C20h RO/V	**Device ID (DID):** Indicates the device number assigned by the SIG. Bits [2:0] of the DID is controlled by fuse. IOSF Sideband Set ID Value message initializes bits [15:7] of this register value, whilst bits [6:0] of this register value are hardcoded. See the Global Device ID table in Register and Memory Mappings CSpec chapter for the DID value.

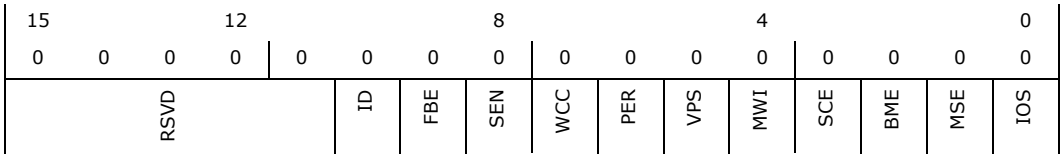
15.8.3 Command (CMD)—Offset 4h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:11	0h RO	Reserved.
10	0h RW	**Interrupt Disable (ID):** Enables the device to assert an INTx#. When set, the Intel® HD Audio controller's INTx# signal will be de-asserted. When cleared, the INTx# signal may be asserted. Note that this bit does not affect the generation of MSIs.
9	0h RO	**Fast Back to Back Enable (FBE):** Not implemented. Hardwired to 0.
8	0h RW	**SERR Enable (SEN):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.
7	0h RO	**Wait Cycle Control (WCC):** Not implemented. Hardwired to 0.
6	0h RW	**Parity Error Response (PER):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.
5	0h RO	**VGA Palette Snoop (VPS):** Not implemented. Hardwired to 0.
4	0h RO	**Memory Write and Invalidate Enable (MWI):** Not implemented. Hardwired to 0.
3	0h RO	**Special Cycle Enable (SCE):** Not implemented. Hardwired to 0.
2	0h RW	**Bus Master Enable (BME):** 1 = Enable, 0 = Disable. Controls standard PCI Express bus mastering capabilities for Memory and I/O, reads and writes. ***Note:*** This also controls MSI generation since MSI are essentially Memory writes.
1	0h RW	**Memory Space Enable (MSE):** When set, enables memory space accesses to the Intel HD Audio controller.
0	0h RO	**I/O Space (IOS):** The Intel HD Audio controller does not implement I/O Space, therefore this bit is hardwired to 0.

15.8.4 Status (STS)—Offset 6h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 3

Default: 10h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
DPE	SERRS	RMA	RTA	STA	DEVT		MDPE	FBC	RSVD	C66	CLIST	IS	RSVD		

Bit Range	Default and Access	Field Name (ID): Description
15	0h RO	**Detected Parity Error (DPE):** Not implemented. Hardwired to 0.
14	0h RO	**SERR# Status (SERRS):** Not implemented. Hardwired to 0.
13	0h RW/1C/V	**Received Master Abort (RMA):** If the completion status received from IOSF is UR, this bit is set. SW writes a 1 to this bit to clear it.
12	0h RW/1C/V	**Received Target Abort (RTA):** If the completion status received from IOSF is CA, this bit is set. SW writes a 1 to this bit to clear it.
11	0h RO	**Signaled Target-Abort (STA):** Not implemented. Hardwired to 0.
10:9	0h RO	**DEVSEL# Timing Status (DEVT):** Does not apply. Hardwired to 0.
8	0h RO	**Master Data Parity Error (MDPE):** Not implemented. Hardwired to 0.
7	0h RO	**Fast Back to Back Capable (FBC):** Does not apply. Hardwired to 0.
6	0h RO	Reserved
5	0h RO	**66 MHz Capable (C66):** Does not apply. Hardwired to 0.
4	1h RO	**Capabilities List Exists (CLIST):** Indicates that the controller contains a capabilities pointer list. The first item is pointed to by looking at configuration offset 34h.
3	0h RO/V	**Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit. This bit is a 1 when the INTx# is asserted. This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register). Note that this bit is not set by an MSI.
2:0	0h RO	Reserved

15.8.5 Revision Identification (RID)—Offset 8h

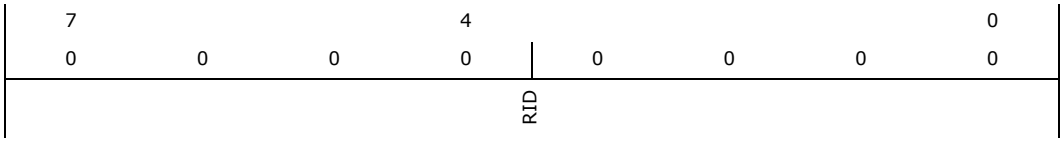
This register is not affected by $D3_{HOT}$ to D0 reset or FLR.

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO/V	**Revision ID (RID):** Indicates the device specific revision identifier. IOSF Sideband Set ID Value message initializes this register value.

15.8.6 Programming Interface (PI)—Offset 9h

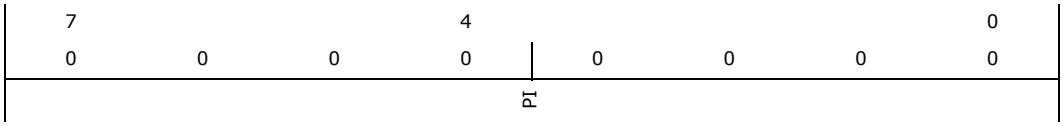
This register is not affected by $D3_{HOT}$ to D0 reset or FLR.

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW/L	**Programming Interface (PI):** Value assigned to the Intel HD Audio subsystem. Locked when FNCFG.BCLD = 1.

15.8.7 Sub Class Code (SCC)—Offset Ah

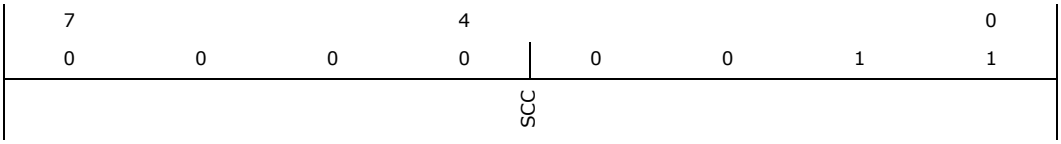
This register is not affected by $D3_{HOT}$ to D0 reset or FLR.

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 3

Default: 3h



Bit Range	Default and Access	Field Name (ID): Description
7:0	3h RW/L	**Sub Class Code (SCC):** This indicates the device is an Intel HD Audio audio device, in the context of a multimedia device. Locked when FNCFG.BCLD = 1.

15.8.8 Base Class Code (BCC)—Offset Bh

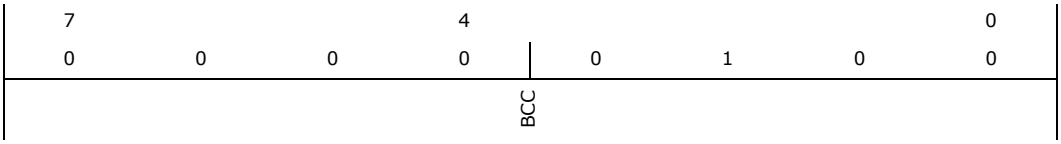
This register is not affected by $D3_{HOT}$ to D0 reset or FLR.

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 3

Default: 4h



Bit Range	Default and Access	Field Name (ID): Description
7:0	4h RW/L	**Base Class Code (BCC):** This register indicates that the function implements a multimedia device. Locked when FNCFG.BCLD = 1.

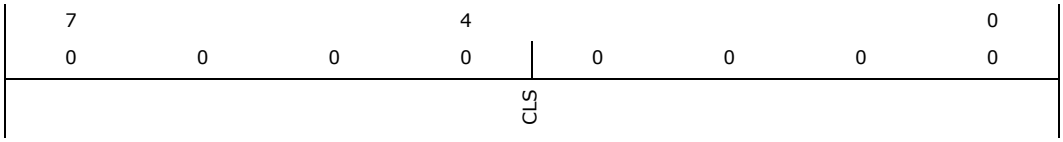
15.8.9 Cache Line Size (CLS)—Offset Ch

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**Cache Line Size (CLS):** Does not apply to PCI Express. *PCI Express Specification* requires this to be implemented as a R/W register but has no functional impact on the PCH.

15.8.10 Latency Timer (LT)—Offset Dh

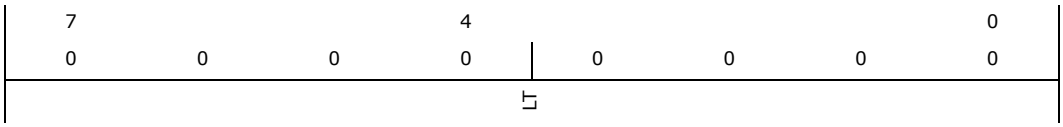
RO. Hardwired to 00.

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW/L	**Latency Timer (LT):** Does not apply to PCI Express. RO as 00h if PCI Express. If configured to appear as PCI device, maintain RW for Legacy PCI SW compliancy. Locked when FNCFG.HDASPCID = 0.

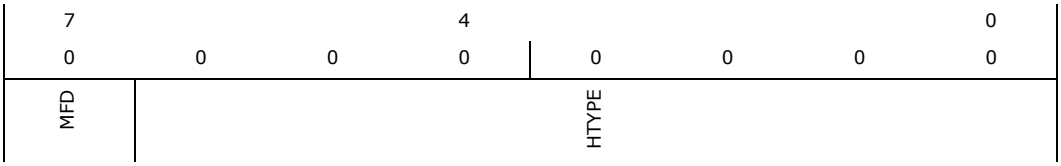
15.8.11 Header Type (HTYPE)—Offset Eh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7	0h RW/L	**Multi Function Device (MFD):** Value of 0 indicates a single function device. Value of 1 indicates a multi function device. Locked when FNCFG.BCLD = 1.
6:0	0h RO	**Header Type (HTYPE):** Implements Type 0 Configuration header.

15.8.12 Intel HD Audio Base Lower Address (HDALBA)—Offset 10h

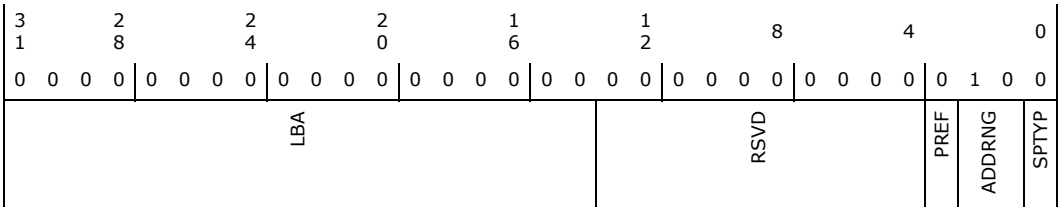
This BAR creates a selected size of memory space to signify the base address of the Intel HD Audio memory mapped configuration registers depending on implementation.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 4h



Bit Range	Default and Access	Field Name (ID): Description
31:14	0h RW	**Lower Base Address (LBA):** Base address for the Intel HD Audio subsystem s memory mapped configuration registers. 16 KB are requested by hardwiring bits [13:4] to 0s.
13:4	0h RO	Reserved

Bit Range	Default and Access	Field Name (ID): Description
3	0h RO	**Prefetchable (PREF):** Indicates that this BAR is NOT pre-fetchable.
2:1	2h RO	**Address Range (ADDRNG):** Indicates that this BAR can be located anywhere in 64-bit address space.
0	0h RO	**Space Type (SPTYP):** Indicates that this BAR is located in memory space.

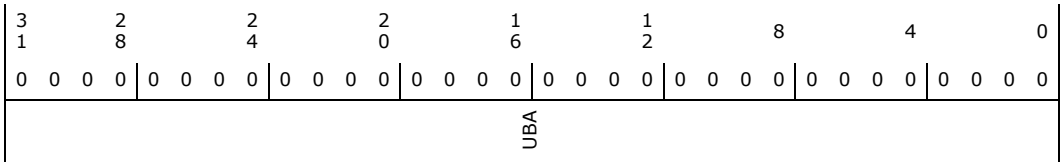
15.8.13 Intel HD Audio Base Upper Address (HDAUBA)—Offset 14h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Intel HD Audio Upper Base Address (UBA):** Upper 32 bits of the base address for the Intel HD Audio controller's memory mapped configuration registers.

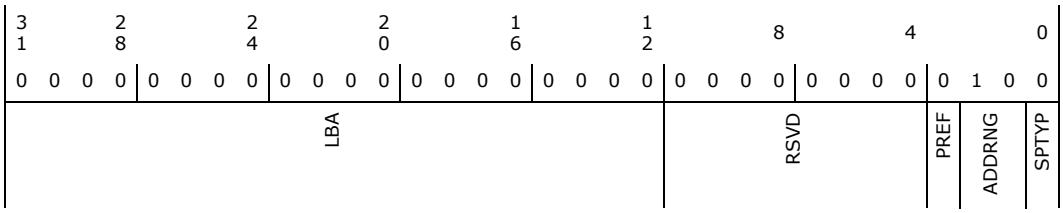
15.8.14 Shadowed PCI Configuration Lower Base Address (SPCLBA)—Offset 18h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 4h



Bit Range	Default and Access	Field Name (ID): Description
31:12	0h RW/L	**Lower Base Address (LBA):** Base address for the PCI Configuration register shadowed to memory mapped. 4 KB is requested by hardwiring bits [11:4] to 0s. Locked when PCICFGCTL0.SPCBAD = 1.
11:4	0h RO	Reserved
3	0h RO	**Prefetchable (PREF):** Indicates that this BAR is NOT pre-fetchable.
2:1	2h RO/V	**Address Range (ADDRNG):** Indicates that this BAR can be located anywhere in 64-bit address space.
0	0h RO	**Space Type (SPTYP):** Indicates that this BAR is located in memory space.

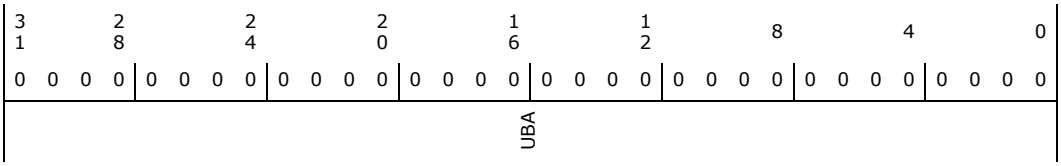
15.8.15 Shadowed PCI Configuration Upper Base Address (SPCUBA)—Offset 1Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/L	**Upper Base Address (UBA):** Upper 32 bits of the Base address for the PCI Configuration register shadowed to memory mapped. Locked when PCICFGCTL0.SPCBAD = 1.

15.8.16 Subsystem Vendor ID (SVID)—Offset 2Ch

This register should be implemented for any function that could be instantiated more than once in a given system, for example, a system with two audio subsystems, one down on the motherboard and the other plugged into a PCI expansion slot, should have the SVID register implemented. The SVID register, in combination with the Subsystem ID register, enables the operating environment to distinguish one audio subsystem from the other(s).

Software (BIOS) will write the value to this register. After that, the value can be read, but writes to the register will have no effect. The write to this register should be combined with the write to the SID to create one 32-bit write. This register is not affected by $D3_{HOT}$ to D0 reset or FLR.

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 3

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
15:0	0h RW/L	**SVID (SVID):** These RW bits have no functionality. Locked when FNCFG.BCLD = 1.

15.8.17 Subsystem ID (SID)—Offset 2Eh

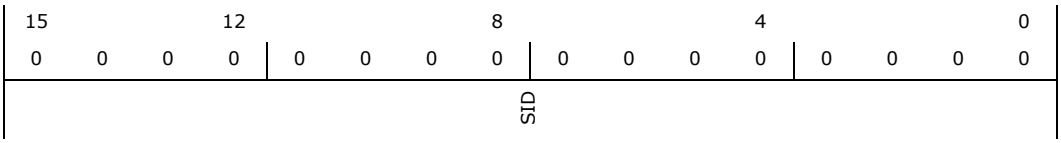
This register should be implemented for any function that could be instantiated more than once in a given system, for example, a system with two audio subsystems, one down on the motherboard and the other plugged into a PCI expansion slot. The SID register, in combination with the Subsystem Vendor ID register make it possible for the operating environment to distinguish one audio subsystem from the other(s). Software (BIOS) will write the value to this register. After that, the value can be read, but writes to the register will have no effect. The write to this register should be combined with the write to the SVID to create one 32-bit write. This register is not affected by $D3_{HOT}$ to D0 reset or FLR.

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:0	0h RW/L	**SID (SID):** These RW bits have no functionality. Locked when FNCFG.BCLD = 1.

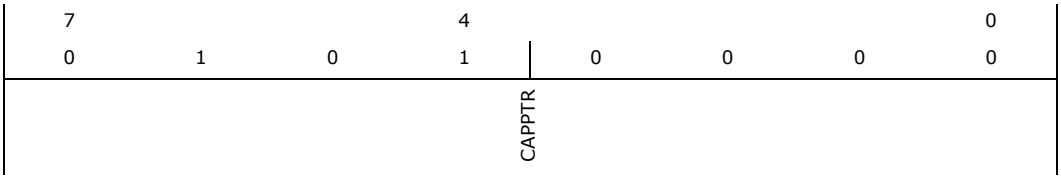
15.8.18 Capability Pointer (CAPPTR)—Offset 30h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 3

Default: 50h



Bit Range	Default and Access	Field Name (ID): Description
7:0	50h RO	**Capability Pointer (CAPPTR):** Indicates that the first capability pointer offset is offset 50h (Power Management Capability).

15.8.19 Interrupt Line (INTLN)—Offset 31h

This register is not affected by FLR.

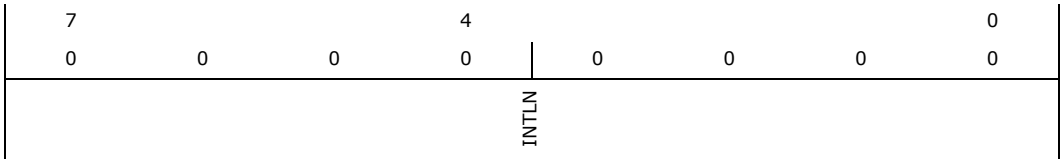
Implementation Notes: Due to legacy implementation of the INTLN field being implemented as reset by $D3_{HOT}$ to D0 Reset but not FLR and already work well with existing SW (despite the FLR section, in the *PCIe Specification* does not have this register in the preservation list), this legacy implementation remains no change and documented here as reset by D3ONLY, which is a deviation from D3RST definition by excluding FLR.

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Line (INTLN):** Hardware does not use this field directly. It is used to communicate to software the interrupt line that the interrupt pin is connected to.

15.8.20 Interrupt Pin (INTPN)—Offset 32h

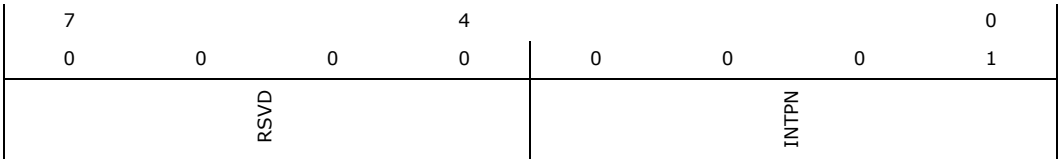
This register is not affected by $D3_{HOT}$ to D0 reset or FLR.

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 3

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
7:4	0h RO	Reserved
3:0	1h RW/L	**Interrupt Pin (INTPN):** Identifies the interrupt pin the function uses. 0h: No interrupt pin 1h: INTA 2h: INTB 3h: INTC 4h: INTD 5h Fh: reserved Locked when FNCFG.BCLD = 1.

15.8.21 Power Gating Control (PGCTL)—Offset 44h

D3PGD are meant for the Intel HD Audio driver software to control whether the Intel HD Audio subsystem should be power gated or not in D3.

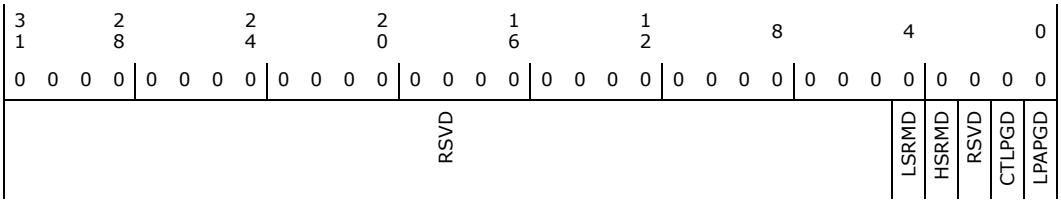
Note: The power gating will only be initiated when out of platform reset, if conditions are met.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:5	0h RO	Reserved
4	0h RW	**LP SRAM Retention Module Disable (LSRMD):** Register is used to disable the LP SRAM retention mode capability of the L2 SRAMs.
3	0h RW	**HP SRAM Retention Module Disable (HSRMD):** Register is used to disable the HP SRAM retention mode capability of the L2 SRAMs.
2	0h RO	Reserved
1	0h RW	**D3 Power Gating Disable (CTLPGD):** Register is used to disable the power gating capability during D3 state.
0	0h RW	**Low Power Audio Power Gating Disable (LPAPGD):** Register is used to disable the power gating capability of the Primary well (gated-controller) domain.

15.8.22 Clock Gating Control (CGCTL)—Offset 48h

The trunk clock gating enable and local clock gating enables are meant for the BIOS or driver to enable or disable the HW capability to detect idle condition and clock gate accordingly. HW should treat these clock gate enable register bits as 0 if FNCFG.CGD = 1 or FUSVAL.CGD = 1.

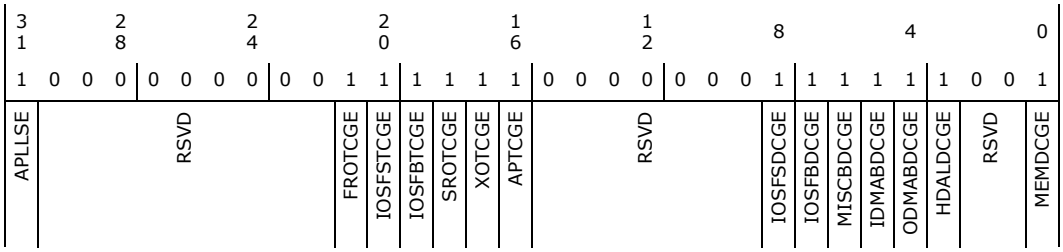
Note: The clock gating will only be initiated when out of platform reset, if conditions are met.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 803F01F9h



Bit Range	Default and Access	Field Name (ID): Description
31	1h RW	**Audio PLL Shutdown Enable (APLLSE):** Set to 1 to enable PLL shutdown after trunk clock gating.
30:22	0h RO	Reserved
21	1h RW	**Fast RING Oscillator Trunk Clock Gating Enable (FROTCGE):** Set to 1 to enable trunk clock gating. If enabled, HW will trunk clock gate when no logic are using this clock (i.e., all local clock gating condition is true).
20	1h RW	**IOSF Sideband Trunk Gate Enable (IOSFSTCGE):** Enable IOSF trunk clock gating functionality on IOSF interface. When set, IOSF Sideband interface clock request can de-assert to allow trunk clock gating.

Bit Range	Default and Access	Field Name (ID): Description
19	1h RW	**IOSF Backbone Trunk Gate Enable (IOSFBTCGE):** Enable IOSF trunk clock gating functionality on IOSF interface. When set, IOSF Primary interface clock request can de-assert to allow trunk clock gating.
18	1h RW	**Slow RING Oscillator Trunk Clock Gating Enable (SROTCGE):** Set to 1 to enable trunk clock gating. If enabled, HW will trunk clock gate when no logic are using this clock (i.e., all local clock gating condition is true).
17	1h RW	**XTAL Oscillator Trunk Clock Gating Enable (XOTCGE):** Set to 1 to enable trunk clock gating. If enabled, HW will trunk clock gate when no logic are using this clock (i.e., all local clock gating condition is true).
16	1h RW	**Audio PLL Trunk Clock Gating Enable (APTCGE):** Set to 1 to enable trunk clock gating. If enabled, HW will trunk clock gate when no logic are using this clock (i.e., all local clock gating condition is true).
15:9	0h RO	Reserved
8	1h RW	**IOSF Sideband Dynamic Clock Gate Enable (IOSFSDCGE):** Enable IOSF dynamic clock gating functionality inside IOSF interface. When set, IOSF Sideband clock gating functionality is enabled.
7	1h RW	**IOSF Backbone Dynamic Clock Gate Enable (IOSFBDCGE):** Enable IOSF dynamic clock gating functionality inside IOSF interface. When set, IOSF Primary clock gating functionality is enabled.
6	1h RW	**Miscellaneous Backbone Dynamic Clock Gating Enable (MISCBDCGE):** This controls dynamic clock gating of backbone (Command/data) clocks to the rest of the Intel HD Audio controller (i.e. other than the IOSF, Input DMA engine, and Output DMA engine). When this bit is asserted, dynamic clock gating logic is enabled for backbone clocks to the rest of the Intel HD Audio controller.
5	1h RW	**IDMA Backbone Dynamic Clock Gating Enable (IDMABDCGE):** This controls dynamic clock gating of backbone (Command/data) clocks to each Input DMA engine. When this bit is asserted, dynamic clock gating logic is enabled for backbone clocks to each Input DMA engine.
4	1h RW	**ODMA Backbone Dynamic Clock Gating Enable (ODMABDCGE):** This controls dynamic clock gating of backbone (Command/data) clocks to each Output DMA engines. When this bit is asserted, dynamic clock gating logic is enabled for backbone clocks to each Output DMA engine.
3	1h RW	**HD Audio Link Dynamic Clock Gating Enable (HDALDCGE):** This controls dynamic clock gating of bitclk to Link Layer and each Input/Output DMA engine. When this bit is asserted, dynamic clock gating logic is enabled for bitclk.
2:1	0h RO	Reserved
0	1h RW	**Memory Dynamic Clock Gating Enable (MEMDCGE):** When set to 1, it allows HW to automatically detect for idle condition and clock gate Memory block. When clear to 0, it disables this HW auto detect idle clock gating.

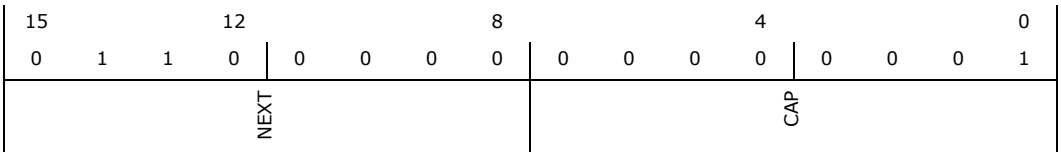
15.8.23 PCI Power Management Capability ID (PID)—Offset 50h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 3

Default: 6001h



Bit Range	Default and Access	Field Name (ID): Description
15:8	60h RW/L	**Next Capability (NEXT):** Points to the next capability structure (MSI). Locked when FNCFG.BCLD = 1.
7:0	1h RO	**Cap ID (CAP):** Indicates that this pointer is a PCI power management capability.

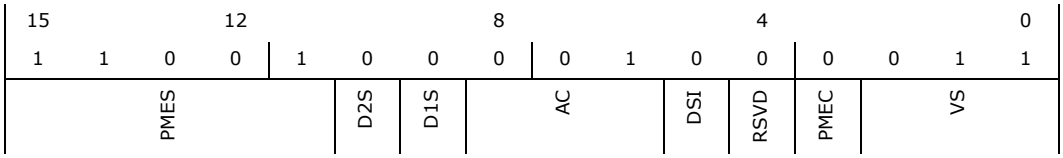
15.8.24 Power Management Capabilities (PC)—Offset 52h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 3

Default: C843h



Bit Range	Default and Access	Field Name (ID): Description
15:11	19h RW/L	**PME_Support (PMES):** Indicates PME# can be generated from D3 and D0 states. Programmable by BIOS for the option to declare SUS well wake is supported or not: 19h (SUS well wake supported) or 09h (SUS well wake not supported). Locked when FNCFG.BCLD = 1.
10	0h RO	**D2_Support (D2S):** The D2 state is not supported.
9	0h RO	**D1_Support (D1S):** The D1 state is not supported.
8:6	1h RW/L	**Aux_Current (AC):** Reports 55 mA maximum Suspend well current required when in the $D3_{COLD}$ state. Programmable by BIOS for the option to declare SUS well wake is supported or not: 001b (SUS well wake supported) or 000b (SUS well wake not supported). Locked when FNCFG.BCLD = 1.
5	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
4	0h RO	Reserved
3	0h RO	**PME Clock (PMEC):** Does not apply. Hardwired to 0.
2:0	3h RW/L	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification. Programmable by BIOS to older revision if compatibility issue is found. Locked when FNCFG.BCLD = 1.

15.8.25 Power Management Control And Status (PCS)—Offset 54h

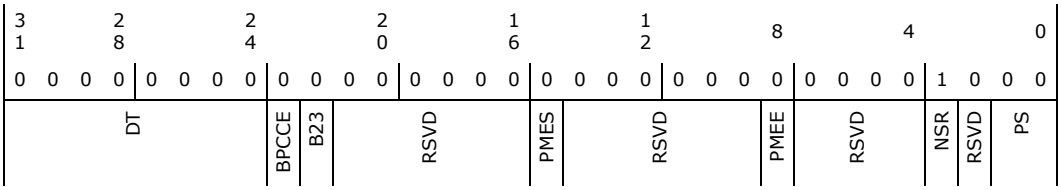
PMES and PMEE bits reside in Resume well, and reset by resume reset.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 8h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	**Data (DT):** Does not apply. Hardwired to 0s.
23	0h RO	**Bus Power/Clock Control Enable (BPCCE):** Does not apply. Hardwired to 0.
22	0h RO	**B2/B3 Support (B23):** Does not apply. Hardwired to 0.
21:16	0h RO	Reserved
15	0h RW/1C/V	**PME Status (PMES):** This bit is set when the Intel HD Audio controller would normally assert the PME# signal independent of the state of the PME bit. This bit is cleared on a power-on reset. Software must not make assumptions about the reset state of this bit and must set it appropriately.
14:9	0h RO	Reserved
8	0h RW	**PME Enable (PMEE):** When set, and if corresponding PMES is also set, the Intel HD Audio subsystem send PME to PMC. This bit is cleared on a power-on reset. Software must not make assumptions about the reset state of this bit and must set it appropriately.
7:4	0h RO	Reserved
3	1h RW/L	**No Soft Reset (NSR):** When set (1), this bit indicates that devices transitioning from $D3_{HOT}$ to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the $D3_{HOT}$ to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. When clear (0), devices do perform an internal reset upon transitioning from $D3_{HOT}$ to D0 via software control of the PowerState bits. Configuration Context is lost when performing the soft reset. Upon transition from the $D3_{HOT}$ to the D0 state, full reinitialization sequence is needed to return the device to D0 Initialized. Regardless of this bit, devices that transition from $D3_{HOT}$ to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled. Locked when FNCFG.BCLD = 1.
2	0h RO	Reserved

Bit Range	Default and Access	Field Name (ID): Description
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the Intel HD Audio subsystem and to set a new power state. The values are: 00 D0 state 11 $D3_{HOT}$ state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the $D3_{HOT}$ states, the Intel HD Audio subsystem s configuration space is available, but the I/O and memory spaces are not. Additionally, interrupts are blocked. When software changes this value from the $D3_{HOT}$ state to the D0 state, an internal warm (soft) reset is generated, and software must re-initialize the function.

15.8.26 MSI Capability ID (MID)—Offset 60h

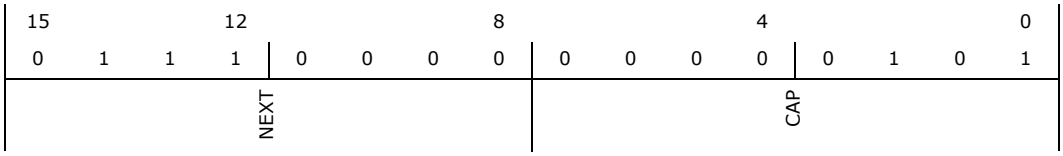
NEXT field is not affected by $D3_{HOT}$ to D0 reset or FLR.

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 3

Default: 7005h



Bit Range	Default and Access	Field Name (ID): Description
15:8	70h RO/V	**Next Capability (NEXT):** Points to the PCI Express capability structure. The value of this field depends on the FNCFG.HDASPCID bit. When FNCFG.HDASPCID is 0, this field has a value of 70h where it points to the PCI Express capability structure. When FNCFG.HDASPCID bit is 1, this field has a value of 00h to indicate that this is the last capability structure in the list.
7:0	5h RO	**Cap ID (CAP):** Indicates that this pointer is a MSI capability.

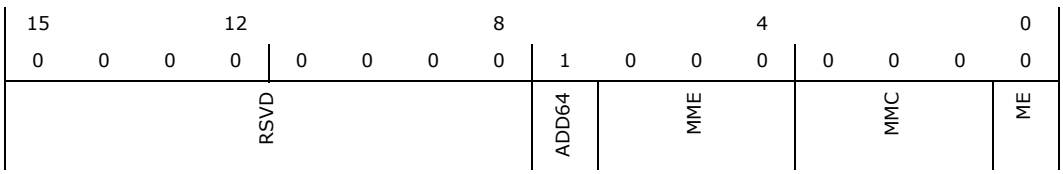
15.8.27 Message Signal Interrupt Message Control (MMC)—Offset 62h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 3

Default: 80h



Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RO	Reserved
7	1h RO	**64b Address Capability (ADD64):** RO. Hardwired to 1. Indicates the ability to generate a 64-bit message address.
6:4	0h RO	**Multiple Message Enable (MME):** Normally this is a R/W register. However, since only 1 message is supported, these bits are hardwired to 000 = 1 message.
3:1	0h RO	**Multiple Message Capable (MMC):** Hardwired to 0 indicating request for 1 message.
0	0h RW	**MSI Enable (ME):** R/W. 0 = An MSI may not be generated. 1 = an MSI will be generated instead of an INTx signal.

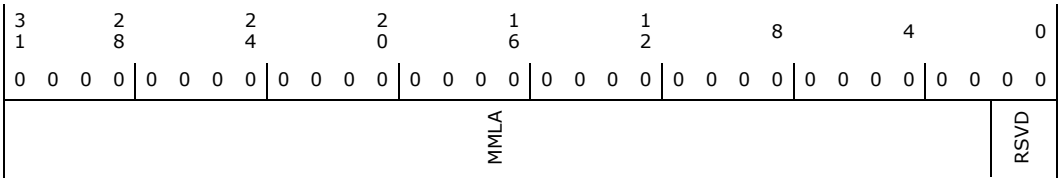
15.8.28 MSI Message Lower Address (MMLA)—Offset 64h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**MSI Message Lower Address (MMLA):** Lower Address used for MSI Message.
1:0	0h RO	Reserved

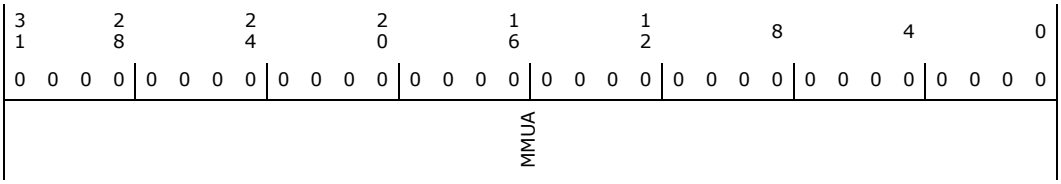
15.8.29 MSI Message Upper Address (MMUA)—Offset 68h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI Message Upper Address (MMUA):** Upper 32 bits of address used for MSI Message.

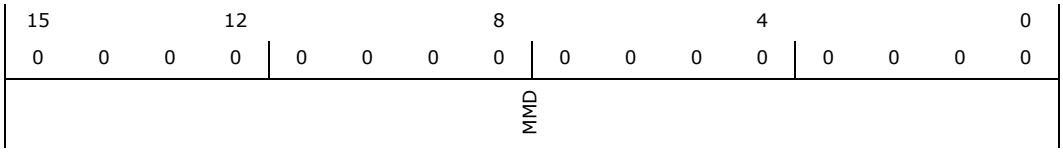
15.8.30 Message Signal Interrupt Capability ID Register (MMD)—Offset 6Ch

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:0	0h RW	**MSI Message Data (MMD):** Data used for MSI Message.

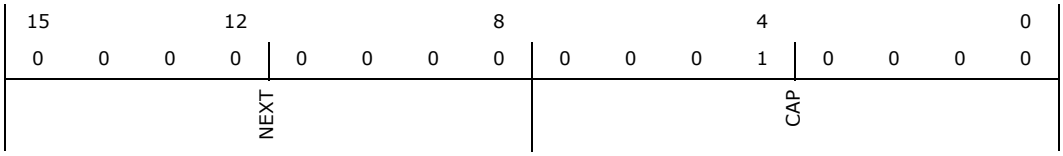
15.8.31 PCI Express Capability ID (PXID)—Offset 70h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 3

Default: 10h



Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RO	**Next Capability (NEXT):** Indicates that this is the last capability structure in the list.
7:0	10h RO	**Cap ID (CAP):** Indicates that this pointer is a PCI Express capability structure.

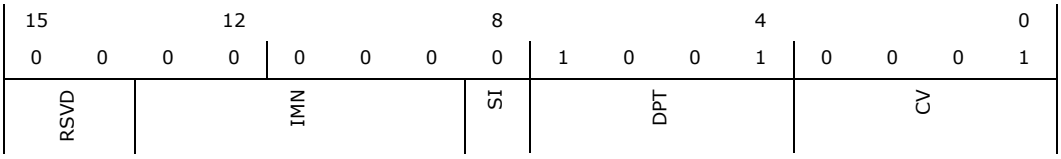
15.8.32 PCI Express Capabilities (PXC)—Offset 72h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 3

Default: 91h



Bit Range	Default and Access	Field Name (ID): Description
15:14	0h RO	Reserved
13:9	0h RO	**Interrupt Message Number (IMN):** Hardwired to 0.
8	0h RO	**Slot Implemented (SI):** Hardwired to 0.
7:4	9h RO	**Device/Port Type (DPT):** Indicates that this is a Root Complex Integrated Endpoint Device.
3:0	1h RO	**Capability Version (CV):** Indicates version #1 PCI Express capability.

15.8.33 Device Capabilities (DEVCAP)—Offset 74h

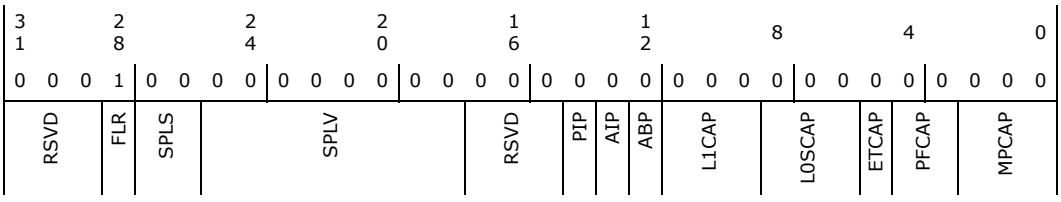
This register is not affected by $D3_{HOT}$ to D0 reset or FLR.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 10000000h



Bit Range	Default and Access	Field Name (ID): Description
31:29	0h RO	Reserved
28	1h RW/L	**Functional Level Reset (FLR):** A 1 indicates that the Intel HD Audio subsystem supports the Function Level Reset capability. Locked when FNCFG.BCLD = 1.
27:26	0h RO	**Captured Slot Power Limit Scale (SPLS):** Hardwired to 0.
25:18	0h RO	**Captured Slot Power Limit Value (SPLV):** Hardwired to 0.
17:15	0h RO	Reserved
14	0h RO	**Power Indicator Present (PIP):** Hardwired to 0.
13	0h RO	**Attention Indicator Present (AIP):** Hardwired to 0.
12	0h RO	**Attention Button Present (ABP):** Hardwired to 0.
11:9	0h RW/L	**Endpoint L1 Acceptable Latency (L1CAP):** This bit field is defined in the PCI Express Specification as RO. At this time it is risky to assign a hardwired value to this bit field. Making it RW would cause a WHQL failure. By making it RW/L it will appear as RO to WHQL testing while allowing the BIOS to write a value at boot that is determined by post silicon system testing. Locked when FNCFG.BCLD = 1.
8:6	0h RW/L	**Endpoint L0s Acceptable Latency (L0SCAP):** This bit field is defined in the PCI Express Specification as RO. At this time it is risky to assign a hardwired value to this bit field. Making it RW would cause a WHQL failure. By making it RW/L it will appear as RO to WHQL testing while allowing the BIOS to write a value at boot that is determined by post silicon system testing. Locked when FNCFG.BCLD = 1.
5	0h RO	**Extended Tag Field Support (ETCAP):** Indicates 5 bit tag supported.
4:3	0h RO	**Phantom Functions Supported (PFCAP):** Indicates phantom functions not supported.
2:0	0h RO	**Max Payload Size Supported (MPCAP):** Indicates 128B maximum payload size capability.

15.8.34 Device Control (DEVC)—Offset 78h

NSNPEN bit is not affected by $D3_{HOT}$ to D0 reset or FLR.

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 3

Default: 2800h

15			12				8				4				0
0	0	1	0	1	0	0	0	0	0	0	0	0	0	0	0
IF	MRRS			NSNPEN	AUXPEN	PFEN	ETEN	MAXPAY			ROEN	URREN	FEREN	NFEREN	CEREN

Bit Range	Default and Access	Field Name (ID): Description
15	0h WO	**Initiate FLR (IF):** Used to initiate FLR transition. A write of 1 initiates FLR transition. Since hardware must not respond to any cycles until FLR completion, the read value by software from this bit is 0.
14:12	2h RW	**Max Read Request Size (MRRS):** This field sets the maximum Read Request size for the Function as a Requester. The Function must not generate Read Requests with size exceeding the set value. Defined encodings for this field are: 000: 128 B 001: 256 B 010: 512 B 011: 1024 B 100: 2048 B 101: 4096 B 110 â?? 111: Reserved
11	1h RW	**Enable No Snoop (NSNPEN):** When set to 1 (or EM2.FNSNPEN = 1) the Intel HD Audio controller is permitted to set the No Snoop bit in the Requester Attributes of a bus master transaction. In this case VC0, VCp, or VC1 may be used for isochronous transfers. When set to 0 (and EM2.FNSNPEN = 0) the Intel HD Audio controller will not set the No Snoop bit. In the case isochronous transfers will not use VC1(VCi) even if it is enabled since VC1 is never snooped. Isochronous transfers will use either VCp or VC0. This bit is not affected by $D3_{HOT}$ to D0 reset or FLR.
10	0h RO	**Auxiliary (AUX) Power PM Enable (AUXPEN):** Hardwired to 0 indicating Intel HD Audio device does not draw AUX power.
9	0h RO	**Phantom Functions Enable (PFEN):** Hardwired to 0 disabling phantom functions.
8	0h RO	**Extended Tag Field Enable (ETEN):** Hardwired to 0 enabling 5-bit tag.
7:5	0h RO	**Max Payload Size (MAXPAY):** Hardwired to 000 indicating 128 B.
4	0h RO	**Enable Relaxed Ordering (ROEN):** Hardwired to 0 disabling relaxed ordering.
3	0h RW	**Unsupported Request Reporting Enable (URREN):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.
2	0h RW	**Fatal Error Reporting Enable (FEREN):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.
1	0h RW	**Non-Fatal Error Reporting Enable (NFEREN):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.
0	0h RW	**Correctable Error Reporting Enable (CEREN):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.

15.8.35 Device Status (DEVS)—Offset 7Ah

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 3

Default: 10h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
RSVD										TXP	AUXDET	URDET	FEDET	NFEDET	CEDET

Bit Range	Default and Access	Field Name (ID): Description
15:6	0h RO	Reserved
5	0h RO/V	**Transactions Pending (TXP):** A 1 indicates that the Intel HD Audio controller has issued Non-Posted requests which have not been completed. A 0 indicates that Completions for all Non-Posted Requests have been received.
4	1h RW/L	**AUX Power Detected (AUXDET):** Hardwired to 1 indicating the device is connected to Suspend power. Programmable by BIOS for the option to declare SUS well wake is supported or not: 1b (SUS well wake supported) or 0b (SUS well wake not supported). Locked when FNCFG.BCLD = 1.
3	0h RO	**Unsupported Request Detected (URDET):** Not implemented. Hardwired to 0.
2	0h RO	**Fatal Error Detected (FEDET):** Not implemented. Hardwired to 0.
1	0h RO	**Non-Fatal Error Detected (NFEDET):** Not implemented. Hardwired to 0.
0	0h RO	**Correctable Error Detected (CEDET):** Not implemented. Hardwired to 0.

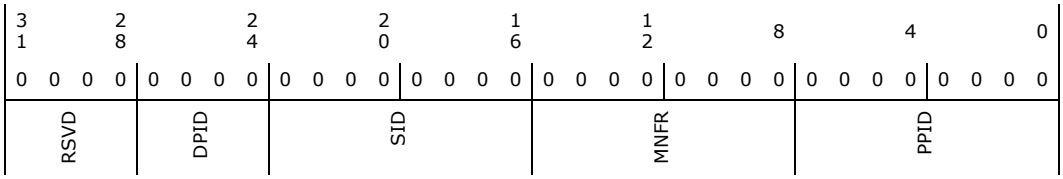
15.8.36 Manufacturing Process (MANID)—Offset F8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RO	Reserved
27:24	0h RO/V	**Dot Portion Process ID (DPID):** Indicating the dot portion of the process ID. IOSF Sideband Set ID Value message initializes this register value.
23:16	0h RO/V	**Stepping ID (SID):** This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate stepping when the Revision ID may not change. IOSF Sideband Set ID Value message initializes this register value.
15:8	0h RO/V	**Manufacturer (MNFR):** Indicating the manufacturer ID. IOSF Sideband Set ID Value message initializes this register value.
7:0	0h RO/V	**Process Portion Process ID (PPID):** Indicating the process portion of the process ID. IOSF Sideband Set ID Value message initializes this register value.

15.8.37 Virtual Channel Enhanced Capability Header (VCCAP)—Offset 100h

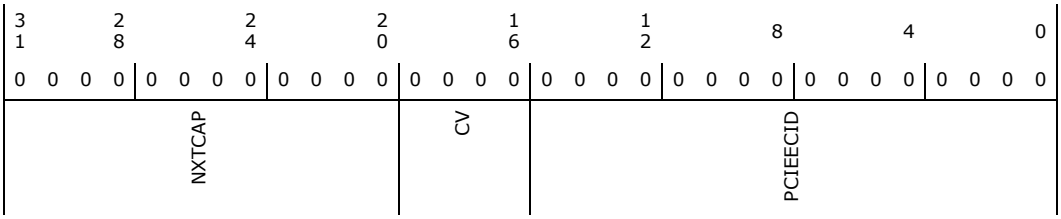
This register is not affected by $D3_{HOT}$ to D0 reset or FLR.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:20	0h RW/L	**Next Capability Offset (NXTCAP):** Points to the next capability header, which is the Root Complex Link Declaration Enhanced Capability Header. This register is RW/L to support removing the Root Complex Topology Capability from the PCI Express Extended Capability List. For systems which support the Root Complex Topology Capability Structure, boot BIOS should write a 130h to this register, otherwise boot BIOS should write a 000h to this register. Locked when FNCFG.BCLD = 1.
19:16	0h RW/L	**Capability Version (CV):** This register is RW/L to support removing the PCI Express Extended Capabilities from the Intel HD Audio subsystem. For systems which support the PCI Express Virtual Channel capability and the Root Complex Topology Capability Structure, boot BIOS should write a 1h to this register, otherwise boot BIOS should write a 0h to this register. Locked when FNCFG.BCLD = 1.
15:0	0h RW/L	**PCI Express Extended Capability ID (PCIEECID):** This register is RW/L to support removing the PCI Express Extended Capabilities from the Intel HD Audio subsysterm. For systems which support the PCI Express Virtual Channel capability and the Root Complex Topology Capability Structure, boot BIOS should write a 0002h to this register, otherwise boot BIOS should write a 0000h to this register. Locked when FNCFG.BCLD = 1.

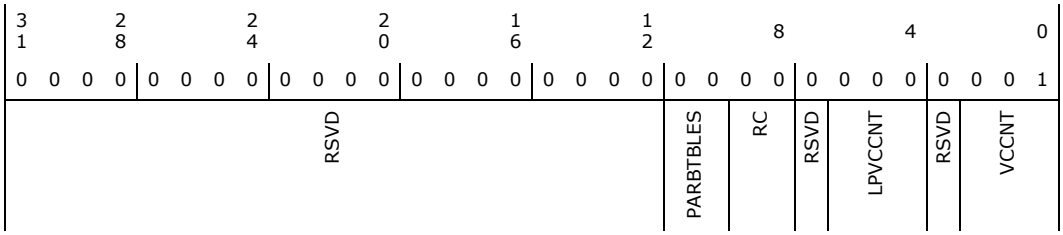
15.8.38 Port VC Capability Register 1 (PVCCAP1)—Offset 104h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
31:12	0h RO	Reserved
11:10	0h RO	**Port Arbitration Table Entry Size (PARBTBLES):** This is an endpoint device therefore this field is hardwired to 0s.
9:8	0h RO	**Reference Clock (RC):** This is an endpoint device therefore this field is hardwired to 0s.
7	0h RO	Reserved.
6:4	0h RO	**Low Priority Extended VC Count (LPVCCNT):** Indicates that only VC0 belongs to the low-priority VC group.
3	0h RO	Reserved
2:0	1h RO	**Extended VC Count (VCCNT):** Indicates that one extended VC (in addition to VC0) is supported by the Intel(r) HD Audio controller.

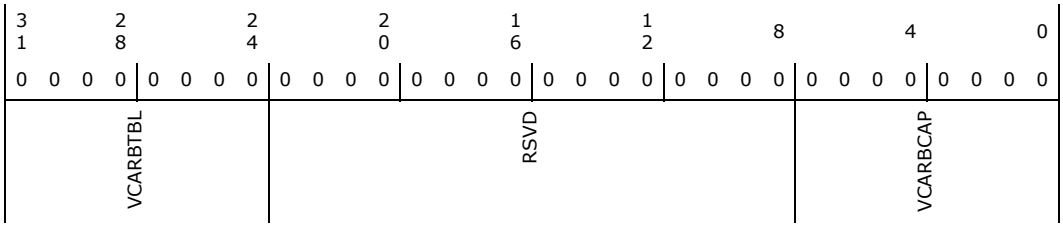
15.8.39 Port VC Capability Register 2 (PVCCAP2)—Offset 108h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	**VC Arbitration Table Offset (VCARBTBL):** Hardwired to 0 indicating that a VC Arbitration Table is not present.
23:8	0h RO	Reserved
7:0	0h RO	**VC Arbitration Capability (VCARBCAP):** Hardwired to 0 s. These bits are not applicable since the Intel HD Audio controller reports a 0 in the Low Priority Extended VC Count field.

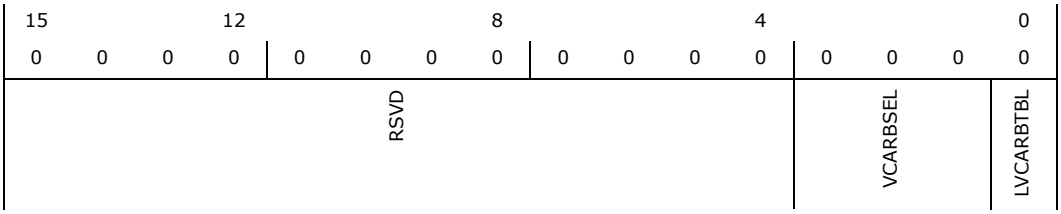
15.8.40 Port VC Control Register (PVCCTL)—Offset 10Ch

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:4	0h RO	Reserved
3:1	0h RO	**VC Arbitration Select (VCARBSEL):** Hardwired to 0s. Normally these bits are RW. But these bits are not applicable since the Intel HD Audio controller reports a 0 in the Low Priority Extended VC Count field.
0	0h RO	**Load VC Arbitration Table (LVCARBTBL):** Hardwired to 0 since an arbitration table is not present.

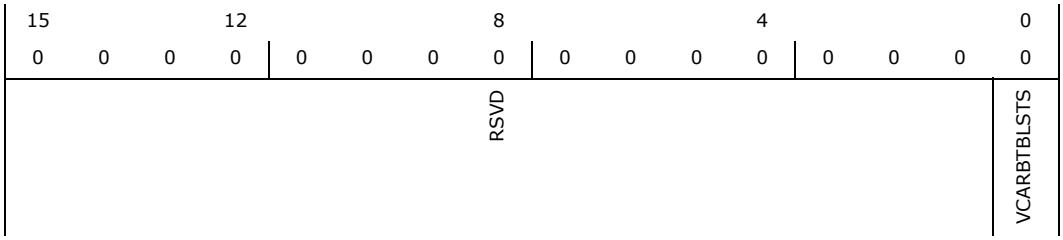
15.8.41 Port VC Status Register (PVCSTS)—Offset 10Eh

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:1	0h RO	Reserved
0	0h RO	**VC Arbitration Table Status (VCARBTBLSTS):** Hardwired to 0 since the VC Arbitration Table is not present.

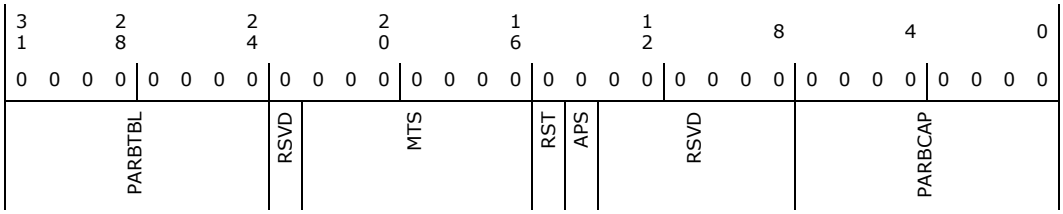
15.8.42 VC0 Resource Capability Register (VC0CAP)—Offset 110h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	**Port Arbitration Table Offset (PARBTBL):** Hardwired to 0 since this field is not valid for endpoint devices.
23	0h RO	Reserved
22:16	0h RO	**Maximum Time Slots (MTS):** Hardwired to 0 since this field is not valid for endpoint devices.
15	0h RO	**Reject Snoop Transactions (RST):** Hardwired to 0 since this field is not valid for endpoint devices.

Bit Range	Default and Access	Field Name (ID): Description
14	0h RO	**Advanced Packet Switching (APS):** Hardwired to 0 since this field is not valid for endpoint devices.
13:8	0h RO	Reserved
7:0	0h RO	**Port Arbitration Capability (PARBCAP):** Hardwired to 0 since this field is not valid for endpoint devices.

15.8.43 VC0 Resource Control Register (VC0CTL)—Offset 114h

VC0MAP(7:1) field is not affected by FLR.

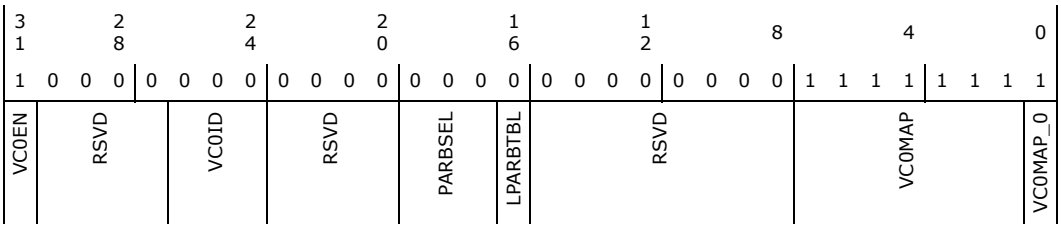
Implementation Notes: Due to legacy implementation of the VC0MAP field being implemented as reset by $D3_{HOT}$ to D0 Reset but not FLR and already work well with existing SW (and there is no clear definition in the PCI and PCIe Specification whether it should be reset by $D3_{HOT}$ to D0 Reset or not), this legacy implementation remains no change and documented here as reset by D3ONLY, which is a deviation from D3RST definition by excluding FLR.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 800000FFh



Bit Range	Default and Access	Field Name (ID): Description
31	1h RO	**VC0 Enable (VC0EN):** Hardwired to 1 for VC0.
30:27	0h RO	Reserved
26:24	0h RO	**VC0 ID (VC0ID):** Hardwired to 0 since the first VC is always assigned as VC0.
23:20	0h RO	Reserved
19:17	0h RO	**Port Arbitration Select (PARBSEL):** Hardwired to 0 since this field is not valid for endpoint devices.
16	0h RO	**Load Port Arbitration Table (LPARBTBL):** Hardwired to 0 since this field is not valid for endpoint devices.

Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RO	Reserved
7:1	7Fh RW	**TC/VC0 Map (VC0MAP):** Bits [7:1] are implemented as R/W bits. This field is not used by the hardware, but it is RW to avoid confusing software.
0	1h RO	**TC/VC0 Map (VC0MAP_0):** Bit 0 is hardwired to 1 since TC0 is always mapped to VC0.

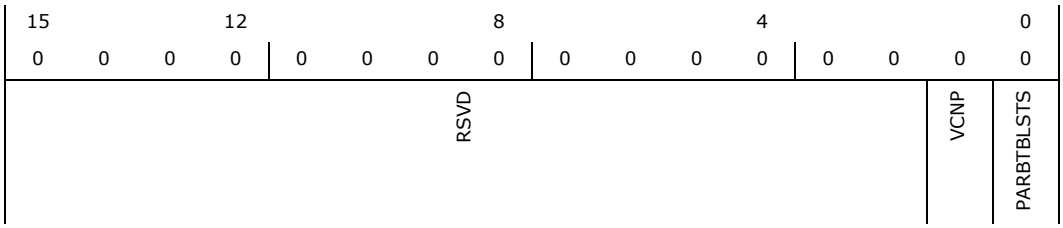
15.8.44 VC0 Resource Status Register (VC0STS)—Offset 11Ah

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:2	0h RO	Reserved
1	0h RO	**VC0 Negotiation Pending (VCNP):** This bit does not apply to the integrated Intel HD Audio device and is therefore hardwired to 0.
0	0h RO	**Port Arbitration Table Status (PARBTBLSTS):** Hardwired to 0 since this field is not valid for endpoint devices.

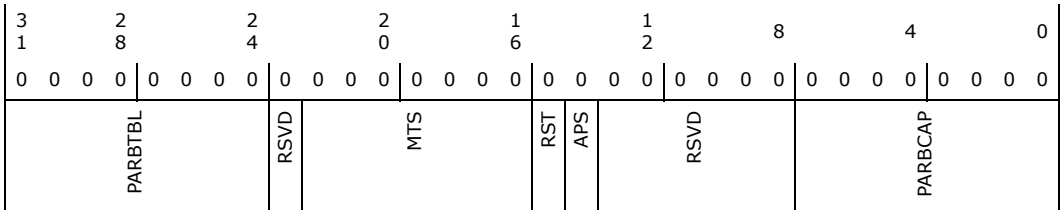
15.8.45 VCi Resource Capability Register (VCiCAP)—Offset 11Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	**Port Arbitration Table Offset (PARBTBL):** Hardwired to 0 since this field is not valid for endpoint devices.
23	0h RO	Reserved
22:16	0h RO	**Maximum Time Slots (MTS):** Hardwired to 0 since this field is not valid for endpoint devices.
15	0h RO	**Reject Snoop Transactions (RST):** Hardwired to 0 since this field is not valid for endpoint devices.
14	0h RO	**Advanced Packet Switching (APS):** Hardwired to 0 since this field is not valid for endpoint devices.
13:8	0h RO	Reserved
7:0	0h RO	**Port Arbitration Capability (PARBCAP):** Hardwired to 0 since this field is not valid for endpoint devices.

15.8.46 VCi Resource Control Register (VCiCTL)—Offset 120h

VCiEN bit and VCiID field are not affected by $D3_{HOT}$ to D0 Reset or FLR. VCiM(7:1) field is not affected by FLR.

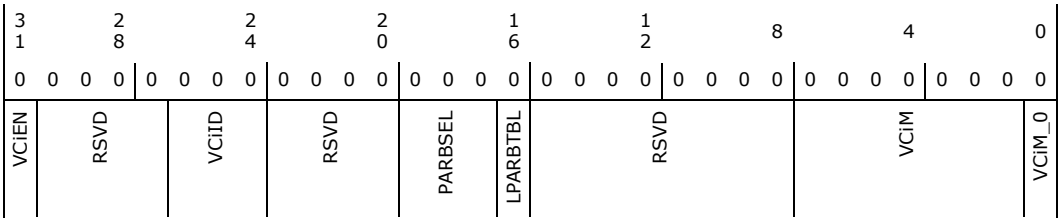
Implementation Notes: Due to legacy implementation of the VCiM field being implemented as reset by $D3_{HOT}$ to D0 Reset but not FLR and already work well with existing SW (and there is no clear definition in the PCI and PCIe Specification whether it should be reset by $D3_{HOT}$ to D0 Reset or not), this legacy implementation remains no change and documented here as reset by D3ONLY, which is a deviation from D3RST definition by excluding FLR.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW	**VCi Enable (VCiEN):** When set to 1, VCi is enabled. This bit is not affected by $D3_{HOT}$ to D0 reset.
30:27	0h RO	Reserved
26:24	0h RW	**VCi ID (VCiID):** This fields assigns a VC ID to the VCi resource. This field is not used by the PCH hardware, but it is RW to avoid confusing software. These bits are not affected by $D3_{HOT}$ to D0 reset.
23:20	0h RO	Reserved
19:17	0h RO	**Port Arbitration Select (PARBSEL):** Hardwired to 0 since this field is not valid for endpoint devices.
16	0h RO	**Load Port Arbitration Table (LPARBTBL):** Hardwired to 0 since this field is not valid for endpoint devices.
15:8	0h RO	Reserved
7:1	0h RW	**TC/VCi Map (VCiM):** This field indicates the TCs that are mapped to the VCi resource. Bits [7:1] are implemented as RW bits. This field is not used by the hardware, but it is RW to avoid confusing software.
0	0h RO	**TC/VCi Map (VCiM_0):** This field indicates the TCs that are mapped to the VCi resource. Bit 0 is hardwired to 0 indicating it can not be mapped to VCi. This field is not used by the hardware.

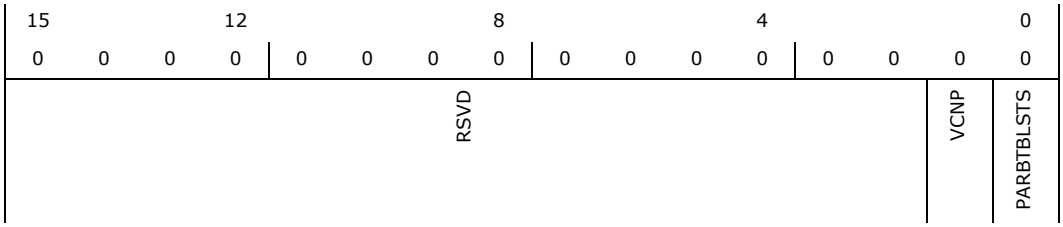
15.8.47 VCi Resource Status Register (VCiSTS)—Offset 126h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:2	0h RO	Reserved
1	0h RO	**VCi Negotiation Pending (VCNP):** This bit does not apply to the integrated Intel HD Audio subsystem and is therefore hardwired to 0.
0	0h RO	**Port Arbitration Table Status (PARBTBLSTS):** Hardwired to 0 since this field is not valid for endpoint devices.

15.8.48 Root Complex Link Declaration Enhanced (RCCAP)—Offset 130h

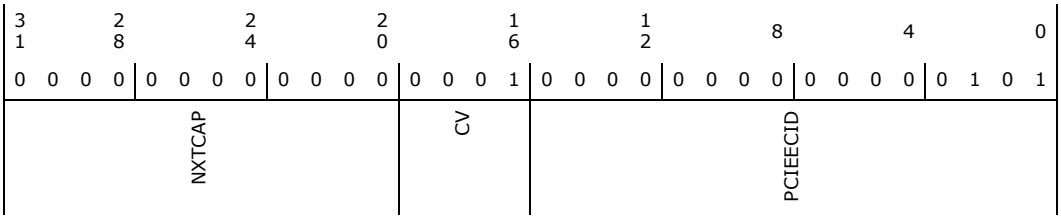
Capability Header

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 10005h



Bit Range	Default and Access	Field Name (ID): Description
31:20	0h RO	**Next Capability Offset (NXTCAP):** Indicates this is the last capability.
19:16	1h RO	**Capability Version (CV)**
15:0	5h RO	**PCI Express Extended Capability ID (PCIEECID)**

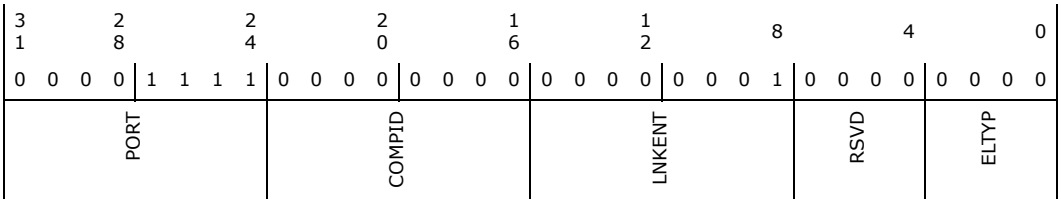
15.8.49 Element Self Description (ESD)—Offset 134h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: F000100h



Bit Range	Default and Access	Field Name (ID): Description
31:24	Fh RO	**Port Number (PORT):** Intel HD Audio assigned as Port #15.
23:16	0h RW/L	**Component ID (COMPID):** Indicates the component ID assigned to this element by software. This is written once by platform BIOS and is locked until a platform reset. Locked when FNCFG.BCLD = 1.
15:8	1h RO	**Number of Link Entries (LNKENT):** The Intel HD Audio controller only connects to one device, the SOC egress port. Therefore this field reports a value of 1.
7:4	0h RO	Reserved
3:0	0h RO	**Element Type (ELTYP):** The Intel HD Audio controller is an Integrated Root Complex Device. Therefore this field reports a value of 0h.

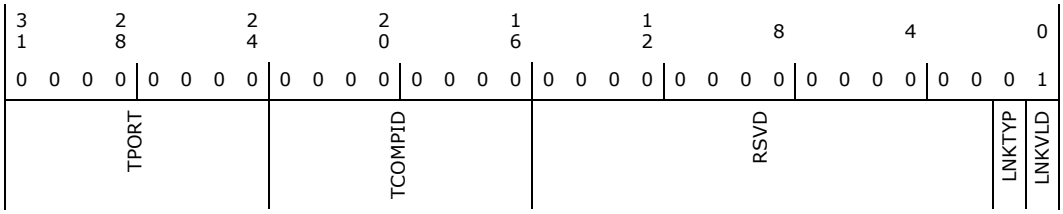
15.8.50 Link 1 Description (L1DESC)—Offset 140h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	**Target Port Number (TPORT):** The Intel HD Audio controller targets the SOC RCRB egress port, which is port #0.
23:16	0h RW/L	**Target Component ID (TCOMPID):** This field is programmed by platform BIOS to match the component ID of the SOC RCRB that is attached to this RCRB Locked when FNCFG.BCLD = 1.
15:2	0h RO	Reserved
1	0h RO	**Link Type (LNKTYP):** Indicates Type 0.
0	1h RO	**Link Valid (LNKVLD):** Hardwired to 1.

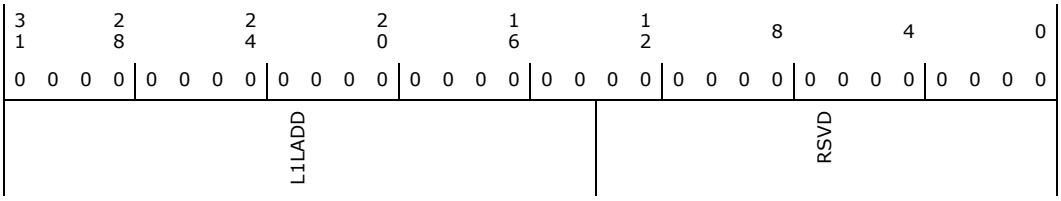
15.8.51 Link 1 Lower Address (L1LADD)—Offset 148h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:14	0h RO/V	**Link 1 Lower Address (L1LADD):** Hardwired to match the RCBA register value in the PCI-LPC bridge.
13:0	0h RO	Reserved

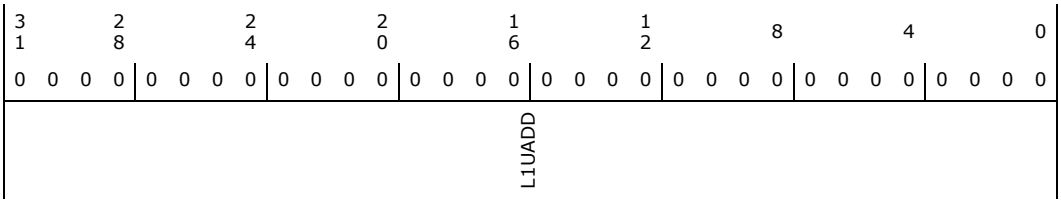
15.8.52 Link 1 Upper Address (L1UADD)—Offset 14Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 3

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**Link 1 Upper Address (L1UADD):** Hardwired to match the RCBA register value in the PCI-LPC bridge.

§

16 Processor Interface

16.1 Acronyms

Acronyms	Description
PECI	Platform Environmental Control Interface

16.2 Overview

The sideband signals are used for the communication between the processor and PCH.

16.3 Signal Description

Name	Type	Description
PROC_PWRGD	O	Signal to the processor to indicate its primary power is good.
THRMTRIP#	I	Signal from the processor to indicate that thermal overheating has occurred.
PECI	I/O	Single-wire serial bus for accessing processor digital thermometer.
PM_SYNC	O	Power Management Sync: State exchange from the PCH to the Processor
PM_SYNC2	O	Power Management Sync: State exchange from the PCH to the Processor. Use this pin when there are more than 2 sockets.
PLTRST_CPU_N	O	Platform reset to processor.
GPP_E3_CPU_GP0	I	PM_SYNC CPU GPIO Signal
GPP_E7_CPU_GP1	I	PM_SYNC CPU GPIO Signal
GPP_B3_CPU_GP2	I	PM_SYNC CPU GPIO Signal
GPP_B4_CPU_GP3	I	PM_SYNC CPU GPIO Signal

16.4 Integrated Pull-Ups and Pull-Downs

None.

16.5 I/O Signal Planes and States

Signal Name	Power Plane	During Reset	Immediately after Reset	S3/S4/S5	Deep Sx
PROC_PWRGD	Primary	Driven Low	Driven High	Off	Off
THERMTRIP#	Primary	Undriven	Undriven	Off	Off
PECI	Primary	Undriven	Undriven	Off	Off
PM_SYNC	Primary	Driven Low	Driven Low	Off	Off
PM_SYNC2	Primary	Driven Low	Driven Low	Off	Off
PLTRST_CPU_N	Primary	Driven Low	Driven High	Off	Off
CPU_GP[3:0]	Primary	Undriven	Undriven	Undriven	Off

16.6 Functional Description

PROC_PWRGD out to the processor indicates that the primary power is ramped up and stable.

If THERMTRIP# goes active, the CPU is indicating an overheat condition, and the PCH will immediately transition to an S5 state.

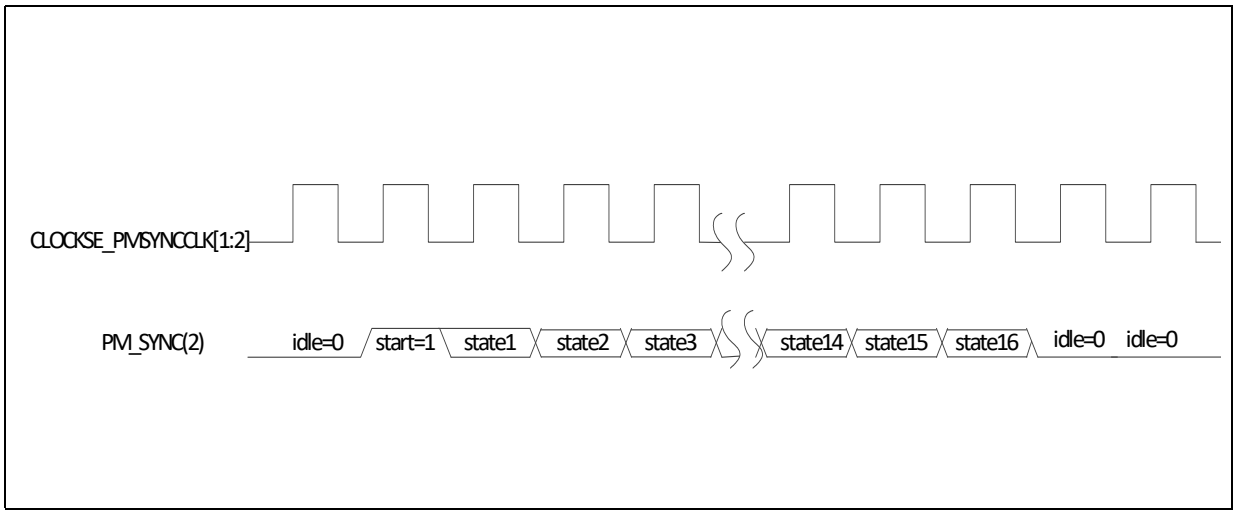
The CPU_GP[3:0] are signals whose states are reflected in the certain bits in the message stream of the PM_SYNC signals connecting the processors. They provide an easy way of transmitting a certain state or information to all CPUs simultaneously. CPU_GP0 can be used to trigger ADR. There are 4 GPIOs in the PM_Sync message. Each CPU_GP can be mapped to 2 of the GPIOS.

PM_SYNC and PM_SYNC2 are used to provide an early warning to the processor that a global reset is in progress and that the memory contents should be saved and placed in self refresh.

The PM_SYNC and PM_SYNC2 signals are just copies of each other. Because of the loading on these pins, they can not drive to more than two CPUs. The same for CLOCKSE_PMSYNCCLK1 and CLOCKSE_PMSYNCCLK2. There is also no relationship between any CLOCKSE_PMSYNCCLK and PM_SYNC signal. CLOCKSE_PMSYNCCLK1 can go with either PM_SYNC or PM_SYNC2, and the same can be said for CLOCKSE_PMSYNCCLK2

Traffic on PM_SYNC is unidirectional, it only goes from the PCH to the CPU. There is no communication from CPU to PCH over PM_SYNC. When the bus is idle, PM_SYNC is low. The start of any communication is having PM_SYNC be clocked in as high. Next are the 16 bits of information. At the end of this, if a "1" is clocked in, another 16 bit of information are coming. If the bus is going to idle, then PM_SYNC needs to be low for 2 clocks before it can go high again.

Figure 16-1. PM_SYNC protocol



PLTRST_CPU_N is the platform reset to the processor. This is a low voltage signal that only drives a single processor.

16.7 Processor Interface Memory Registers Summary

Table 16-1. Summary of Processor Interface Memory Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
61h	61h	NMI Status and Control (NMI_STS_CNT)—Offset 61h	0h
70h	70h	NMI Enable (and Real Time Clock Index) (NMI_EN)—Offset 70h	80h
92h	92h	Init Register (PORT92)—Offset 92h	0h
CF9h	CF9h	Reset Control Register (RST_CNT)—Offset CF9h	0h

16.7.1 NMI Status and Control (NMI_STS_CNT)—Offset 61h

Access Method

Type: I/O Register
(Size: 8 bits)

Device:
Function:

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
SERR_NMI_STS	IOCHK_NMI_STS	TMR2_OUT_STS	RSVD	IOCHK_NMI_EN	PCI_SERR_EN	SPKR_DAT_EN	TIM_CNT2_EN

Bit Range	Default and Access	Field Name (ID): Description
7	0h RO	**SERR# NMI Source Status (SERR_NMI_STS):** This bit is set by any of the sources of the internal SERR on the PCH backbone, this includes SERR assertions forwarded from the secondary PCI bus, error from a PCIe port, Do_SERR or standard PCIe error message from DMI, or internal Bus 0 functions that generate SERR#. Bit 2 must be cleared in this register in order for this bit to be set. This interrupt source is enabled by setting bit 2 to 0. To reset the interrupt, set bit 2 to 1 and then set it to 0. This bit is read-only. When writing to port 61h, this bit must be 0.
6	0h RO	**IOCHK# NMI Source Status (IOCHK_NMI_STS):** This bit is set if an ISA agent (via SERIRQ) asserts IOCHK# and bit 3 is cleared in this register. This interrupt source is enabled by setting bit 3 to 0. To reset the interrupt, set bit 3 to 1 and then set it to 0. This bit is read-only. When writing to port 61h, this bit must be a 0.
5	0h RO	**Timer Counter 2 OUT Status (TMR2_OUT_STS):** This bit reflects the current state of the 8254 counter 2 output. Counter 2 must be programmed following any PCI reset for this bit to have a determinate value. When writing to port 61h, this bit must be a 0.
4	0h RO	Reserved
3	0h RW	**IOCHK# NMI Enable (IOCHK_NMI_EN):** When this bit is a 1, IOCHK# NMIs are disabled and cleared. When this bit is a 0, IOCHK# NMIs are enabled.

Bit Range	Default and Access	Field Name (ID): Description
2	0h RW	**PCI SERR# Enable (PCI_SERR_EN):** When this bit is a 1, the SERR# NMIs are disabled and cleared. When this bit is a 0, SERR# NMIs are enabled.
1	0h RW	**Speaker Data Enable (SPKR_DAT_EN):** When this bit is a 0, the SPKR output is a 0. When this bit is a 1, the SPKR output is equivalent to the Counter 2 OUT signal value.
0	0h RW	**Timer Counter 2 Enable (TIM_CNT2_EN):** When this bit is a 0, Counter 2 counting is disabled. Counting is enabled when this bit is 1.

16.7.2 NMI Enable (and Real Time Clock Index) (NMI_EN)—Offset 70h

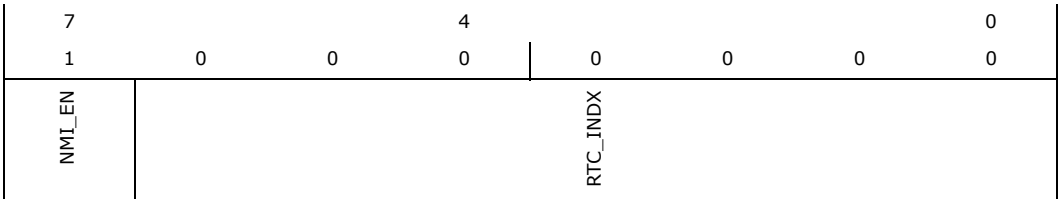
This register is write-only for normal operation. In Alt-Access mode, this register can be read to find the NMI Enable status and the RTC index value. *WO for normal operation, RW if Alternate access mode is enabled. Use RW because there is no equivalent register access attribute in RDL.

Access Method

Type: I/O Register
(Size: 8 bits)

Device:
Function:

Default: 80h



Bit Range	Default and Access	Field Name (ID): Description
7	1h RW	**NMI_EN# (NMI_EN):** When this bit is a 1, all NMI sources are disabled. When this bit is a 0, NMI sources are enabled.
6:0	0h RW	**Real Time Clock Index (Address) (RTC_INDX):** This data goes to the RTC to select which register or CMOS RAM address is being accessed.

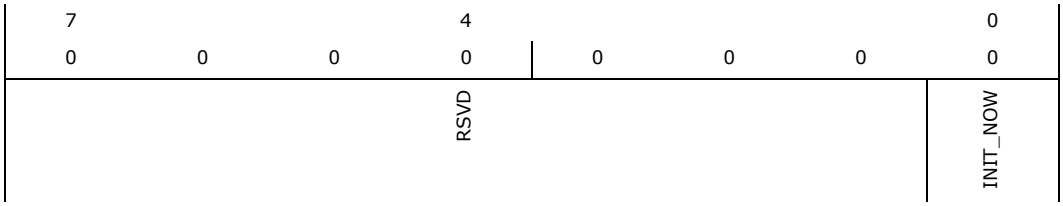
16.7.3 Init Register (PORT92)—Offset 92h

Access Method

Type: I/O Register
(Size: 8 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:1	0h RO	Reserved
0	0h RW	**INIT_NOW (INIT_NOW):** When this bit transitions from a 0 to a 1, the PCH will force INIT# active for 16 PCI clocks.

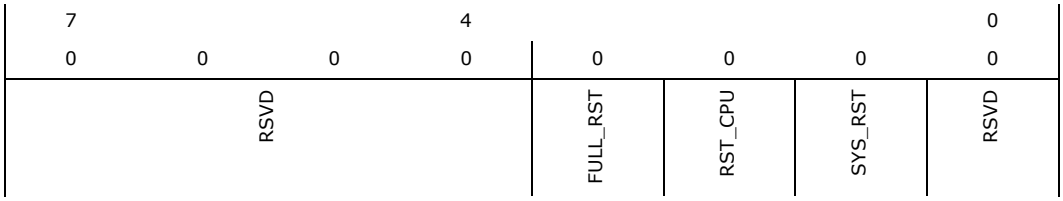
16.7.4 Reset Control Register (RST_CNT)—Offset CF9h

Access Method

Type: I/O Register
(Size: 8 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:4	0h RO	Reserved.
3	0h RW	**Full Reset (FULL_RST):** When this bit is set to 1 and bit 1 is set to 1 (indicating Hard Reset, not Soft Reset), and the RST_CPU bit (bit 2) is written from 0 to 1, the PCH will do a full reset, including driving SLP_S3#, SLP_S4# and SLP_S5# active (low) for at least 3 (and no more than 5) seconds. When this bit is set, it also causes the full power cycle (SLP_S3/4/5# assertion) in response to SYSRESET#, PWROK#, and Watchdog timer reset sources.

Bit Range	Default and Access	Field Name (ID): Description
2	0h RW	**Reset CPU (RST_CPU):** This bit will cause either a hard or soft reset to the CPU depending on the state of the SYS_RST bit (bit 1 in this same register). The software will cause the reset by setting bit 2 from a 0 to a 1.
1	0h RW	**System Reset (SYS_RST):** This bit determines the type of reset caused via RST_CPU (bit 2 of this register). If SYS_RST is 0 when RST_CPU goes from 0 to 1, then the PCH will force INIT# active for 16 PCI clocks. If SYS_RST is 1 when RST_CPU goes from 0 to 1, then the PCH will force PCI reset active for about 1 ms, however the SLP_S3#, SLP_S4# and SLP_S5# signals assertion is dependent on the value of the FULL_RST (bit3 of this register).
0	0h RO	Reserved

17 Enhanced Serial Peripheral Interface

17.1 Acronyms

Acronyms	Description
eSPI	Enhanced Serial Peripheral Interface
EC	Embedded Controller
MAFS	Master Attached Flash Sharing
MAFCC	Master Attached Flash Channel Controller
SAFS	Slave Attached Flash Sharing
SAFCC	Slave Attached Flash Channel Controller
SAFS	Slave Attached Flash Sharing
OOB	Out-of-Band
TAR	Turn-around cycle

17.2 References

Specification	Location
Enhanced Serial Peripheral Interface Specifications	https://downloadcenter.intel.com/Detail_Desc.aspx?agr=Y&DwnldID=22112

17.3 Overview

The PCH provides the eSPI to support connection of a BMC/EC/SIO to the platform.

The interface supports 1.8V only and connects to a maximum of two eSPI devices. This interface is not shared and distinct from the SPI bus interface used for flash device and TPM.

The LPC and eSPI interfaces are mutually exclusive. Both use the same pins, but on power-up, a HW strap determines if the eSPI or the LPC bus is operational. Once selected, it’s not possible to change to the other interface.

17.4 Signal Description

Name	Type	Description
GPP_A9_CLKOUT_LPC0_ESPI_CLK	O	**ESPI Clock:** eSPI clock output from the PCH to slave device.
GPP_A1_LAD0_ESPI_IO0	I/O	**ESPI Data Signal 0:** Bi-directional pin used to transfer data between the PCH and eSPI slave device.
GPP_A2_LAD1_ESPI_IO1	I/O	**ESPI Data Signal 1:** Bi-directional pin used to transfer data between the PCH and eSPI slave device
GPP_A3_LAD2_ESPI_IO2	I/O	**ESPI Data Signal 2:** Bi-directional pin used to transfer data between the PCH and eSPI slave device
GPP_A4_LAD3_ESPI_IO3	I/O	**ESPI Data Signal 3:** Bi-directional pin used to transfer data between the PCH and eSPI slave device
GPP_A5_LFRAME#_ESPI_CS_N	O	**ESPI Chip Select 0:** Driving CS# signal low to select eSPI slave for the transaction.
GPP_A6_SERIRQ_ESPI_CS1_N	O	**ESPI Chip Select 1:** Driving CS# signal low to select eSPI slave for the transaction.
GPP_A7_PIRQA#_ESPI_ALERT0_N	I	**ESPI Alert 0:** Alert signal from eSPI slave to the PCH. ***Note:*** If only a single Slave is connected, the eSPI Compatibility Specification requires that the Slave must operate with in-band Alert# signaling in order to free up the GPIO pin required for the discrete Alert# pin.
GPP_A0_RCIN#_ESPI_ALERT1_N	I	**ESPI Alert 1:** Alert signal from eSPI slave to the PCH. ***Note:*** If only a single Slave is connected, the eSPI Compatibility Specification requires that the Slave must operate with in-band Alert# signaling in order to free up the GPIO pin required for the discrete Alert# pin.
GPP_A14_ESPI_RESET_N	O	**ESPI Reset:** Reset signal from the PCH to eSPI slave.

17.5 Integrated Pull-Ups and Pull-Downs

Signal	Resistor Type	Value	Notes
ESPI_CLK	Pull-down	9K - 50K	
ESPI_IO[3:0]	Pull-up	15K - 40K	
ESPI_ CS [1:0]#	Pull-up	15K - 40K	
ESPI_ALERT [1:0]#	Pull-up	15K - 40K	
Note: Integrated pull-ups and pull-downs will not be valid until all the voltages have reached a valid level.			

17.6 I/O Signal Planes and States

Signal Name	Power Plane	During Reset	Immediately After Reset	S3/S4/S5	Deep Sx
ESPI_CLK	Primary	Internal Pull-down	Driven Low	Driven Low	Off
ESPI_IO [3:0]	Primary	Internal Pull-up	Internal Pull-up	Internal Pull-up	Off
ESPI_ CS [1:0]#	Primary	Internal Pull-up	Driven High	Driven High	Off
ESPI_ALERT [1:0]#	Primary	Internal Pull-up	Driven High	Driven High	Off
ESPI_ RESET#	Primary	Driven Low	Driven High	Driven High	Off

17.7 Functional Description

17.7.1 Features

The PCH eSPI controller supports the following features:

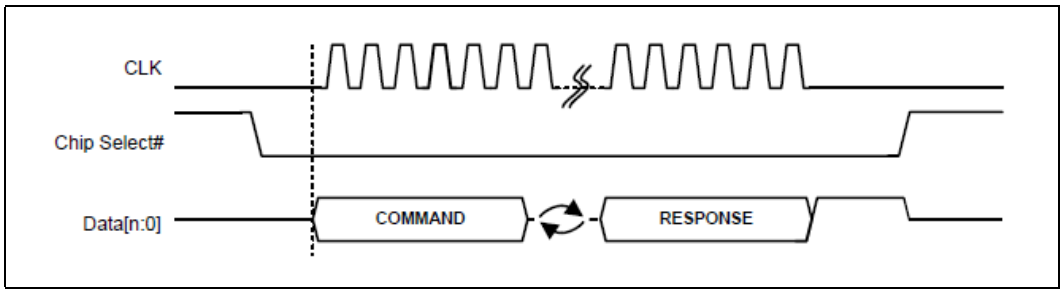
- Master mode only, allowing two slave devices to be connected to the PCH
- Master attached flash sharing and slave attached flash sharing.
- 1.8V support only
- Up to quad mode support
- In-band messages for communication between the PCH and slave devices to eliminate side-band signals
- Real time SPI flash sharing, allowing real time operational access by the PCH and eSPI device
- Transmitting RTC time/date to the slave device upon request.

he PCH eSPI supports two ALERT# pins to support alerts from two supported slave devices to the PCH. However, if only a single slave is connected, the eSPI Compatibility Specification requires that the Slave must operate with in-band Alert# signaling in order to free up the GPIO pin required for the discrete Alert# pin.

17.7.2 Protocols

Below is an overview of the basic eSPI protocol. Refer to the latest eSPI Specification for more detail (see Section 17.2).

Figure 17-1. Basic eSPI Protocol



An eSPI transaction consists of a Command phase driven by the master, a TAR phase, and a Response phase driven by the slave.

A transaction is initiated by the PCH through the assertion of CS#, starting the clock and driving the command onto the data bus. The clock remains toggling until the complete response phase has been received from the slave.

The serial clock must be low at the assertion edge of the CS# while ESPI_RESET# has been de-asserted. The first data is driven out from the PCH while the serial clock is still low and sampled on the rising edge of the clock by the slave. Subsequent data is driven on the falling edge of the clock from the PCH and sampled on the rising edge of the clock by the slave. Data from the slave is driven out on the falling edge of the clock and is sampled on a falling edge of the clock by the PCH.

All transactions on eSPI are in eight bit multiples.

17.7.3 WAIT States from eSPI Slave

There are situations when the slave cannot predict the length of the command packet from the master (PCH). For non-posted transactions, the slave is allowed to respond with a limited number of WAIT states.

A WAIT state is a one byte response code. They must be the first set of response bytes from the slave after the TAR cycles.

17.7.4 In-Band Link Reset

In case the eSPI link may end up in an undefined state (for example when a CRC error is received from the slave in a response to a Set_Configuration command), the PCH issues an In-Band Reset command which resets the eSPI link to the default configuration. This allows the controller to re-initialize the link and reconfigure the slave.

17.7.5 Slave Discovery

The PCH eSPI interface is enabled via a hard pin strap, ESPI_EN. If this strap is asserted (high) at RSMRST# deassertion, the eSPI controller is enabled and assumes that a slave is connected to the interface. The controller does not perform any other discovery to confirm the presence of the slave connection. There is a soft strap to indicate whether a second slave device is present or not.

If the ESPI_EN HW strap is de-asserted (low), the eSPI controller will gate all its clocks and put itself to sleep.

17.7.6 Channels and Supported Transactions

An eSPI channel provides a means to allow multiple independent flows of traffic to share the same physical bus. Refer to the eSPI specification for more detail.

Each of the channels has its dedicated resources such as queue and flow control. There is no ordering requirement between traffic from different channels.

The number of types of channels supported by a particular eSPI slave is discovered through the GET_CONFIGURATION command issued by the PCH to the eSPI slave during initialization.

Table 17-1 summarizes the eSPI channels and supported transactions.

Table 17-1. eSPI Channels and Supported Transactions

CH #	Channel	Posted Cycles Supported	Non-Posted Cycles Supported
0	Peripheral	Memory Write, Completions	Memory Read, I/O Read/Write
1	Virtual Wire	Virtual Wire GET/PUT	N/A
2	Out-of-Band Message	SMBus Packet GET/PUT	N/A
3	Flash Access	N/A	Flash Read, Write, Erase
N/A	General	Register Accesses	N/A

17.7.6.1 Peripheral Channel (Channel 0) Overview

The Peripheral channel performs the following Functions:

- Target for PCI Device D31:F0: The eSPI controller duplicates the legacy LPC PCI Configuration space registers. These registers are mostly accessed via the BIOS, though some are accessed via the OS as well.
- Tunnel all Host to eSPI slave (EC/SIO) debug device accesses: these are the accesses that used to go over the LPC bus. These include various programmable and fixed I/O ranges as well as programmable Memory ranges. The programmable ranges and their enables reside in the PCI Configuration space.
- Tunnel all accesses from the eSPI slave to the Host. These include Memory Reads and Writes.

17.7.6.2 Virtual Wire Channel (Channel 1) Overview

The Virtual Wire channel uses a standard message format to communicate several types of signals between the components on the platform.

- Sideband and GPIO Pins: System events and other dedicated signals between the PCH and eSPI slave. These signals are tunneled between the two components over eSPI.
- Serial IRQ Interrupts: Interrupts are tunneled from the eSPI slave to the PCH. Both edge and triggered interrupts are supported.

17.7.6.2.1 eSPI Virtual Wires (VW)

Table 17-2 summarizes the behaviors of the PCH virtual wires in eSPI mode.

Table 17-2. eSPI Virtual Wires (VW) (Sheet 1 of 2)

Virtual Wire	PCH Pin Direction	Comments
SUS_PWRDN_ACK	Output	PCH pin is a GPIO when eSPI is enabled. eSPI controller receives as VW message.
SUS_WARN#	Output	PCH pin is a GPIO when eSPI is enabled. eSPI controller receives as VW message.
SUS_ACK#	Input	PCH pin is a GPIO when eSPI is enabled. eSPI controller receives as VW message.
PME#	Input	PCH pin is a GPIO when eSPI is enabled. PCH received as virtual VW from eSPI
WAKE#	Input	PCH pin is a GPIO when eSPI is enabled. PCH received as Assert _SCI or Deassert_SCI from eSPI. It will be WAKE enabled SCI if received in Sx.
SMI#	Input	PCH pin is a GPIO when eSPI is enabled. PCH receives as Assert_SMI or Deassert_SMI message from eSPI.
SCI#	N/A	Not a PCH pin. PCH receives as Assert_SCI or Deassert_SCI message from eSPI.
SLP_A#	Output	PCH pins are retained (native mode) even when eSPI is enabled. When these signals need to change state to indicate the system state, they are first sent as VW to eSPI which transmits an eSPI VW packet to the slave.

Table 17-2. eSPI Virtual Wires (VW) (Sheet 2 of 2)

Virtual Wire	PCH Pin Direction	Comments
SLP_S3# / SLP_S4# / SLP_S5# / SLP_GBE#	Output	PCH pins are retained (native mode) even when eSPI is enabled. When these signals need to change state to indicate the system state, they are first sent as VW to eSPI which transmits an eSPI VW packet to the slave. ***Note:*** These signals are reset on DPWOK which is a deeper reset than ESPI_RESET#. As a result, these signals can be High or Low when RSMRST# and ESPI_RESET# assert. However, they do not change state once in Deep Sx (RSMRST# asserted). The slave must maintain the states of these wires, which stay static, while the PCH is in Deep Sx.
PLTRST#	Output	Platform Reset: Comment to indicate Platform Reset Assertion
Reset CPU INIT# (RCIN)	Input	Keyboard Controller CPU Reset: Sent to request a CPU reset on behalf of the keyboard controller.
ERROR_NONFATAL	Input	Sent when a non-fatal error is detected.
ERROR_FATAL	Input	Sent when a fatal error is detected.
SLAVE_BOOT_LOAD_DONE	Input	Sent when the BMC has completed it's boot process as an indication to eSPI-MC to continue with the G3 to S0 exit. The eSPI Master waits for the assertion of this virtual wire before proceeding with the SLP_S5# deassertion. The intent is that it is never changed except on a G3 exit - it is reset on a G3 entry.
SLAVE_BOOT_LOAD_STATUS	Input	Sent upon completion of the Slave Boot Load from the attached flash. A stat of 1 indicates that the boot code load was successful and that the integrity of the image is intact.
HOST_RESET_WARN	Output	Sent from the MC just before the Host is about to enter reset. Upon receiving, the BMC must flush and quiesce its upstream Peripheral Channel request queues and assert HOST_RESET_ACK VWire. The MC subsequently completes any outstanding posted transactions or completions and then disables the Peripheral Channel via a write to the Slave's Configuration Register.
HOST_REST_ACT	Input	ACK for the HOST_RESET_WARN message
OOB_RESET_WARN	Output	Sent from the MC just before the OOB processor is about to enter reset. Upon receiving, the BMC must flush and quiesce its OOB Channel upstream request queues and assert OOB_RESET_ACK VWire. The-MC subsequently completes any outstanding posted transactions or completions and then disables the OOB Channel via a write to the Slave's Configuration Register.
OOB_RESET_ACK	Input	ACT for OOB_RESET_ACK
HOST_C10	Output	Indicates that the host CPU has entered deep power down state C10 or deeper.
IRQ [0 – NIRQMAX]	Input	Serial Interrupt Request: This message conveys the serial interrupt protocol.
SMIOUT#	Output	Sent by the master as indication that an SMI# event has occurred. The 0 to 1 on this virtual wire corresponds to the assertion and deassertion of the SMI# to the CPU, respectively.
NMIOUT#	Output	Sent by the master as indication that an NMI# event has occurred. The 0 to 1 on this virtual wire corresponds to the assertion and deassertion of the NMI# to the CPU, respectively.

17.7.6.2.2 Interrupt Events

The eSPI supports both level and edge-triggered interrupt. Refer to the eSPI Specification for details on the theory of operation for interrupts over eSPI.

The PCH eSPI controller will issue a message to the PCH interrupt controller when it receives an IRQ group in its VW packet, indicating a state change for that IRQ line number.

The eSPI slave can send multiple VW IRQ index groups in a single eSPI packet, up to the Operating Maximum VW Count programmed in its Virtual Wire Capabilities and Configuration Channel.

The eSPI controller acts only as a transport for all interrupt events generated from the slave. It does not maintain interrupt state, polarity or enable for any of the interrupt events.

17.7.6.3 Out-of-Band Channel (Channel 2) Overview

The Out-of-Band channel performs the following Functions:

- Tunnel MCTP Packets between the Intel ME and eSPI slave device: The Intel ME communicates MCTP messages to/from the device by embedding those packets over the eSPI protocol. This eliminates the SMBus connection between the PCH and the slave device which was used to communicate the MCTP messages in prior PCH generations. The eSPI controller simply acts as a message transport and forwards the packets between the Intel ME and eSPI device.
- Tunnel PCH Temperature Data to the eSPI slave: The eSPI controller stores the PCH temperature data internally and sends it to the slave using a posted OOB message when a request is made to a specific destination address.
- Tunnel PCH RTC Time and Date Bytes to the eSPI slave: the eSPI controller captures this data internally at periodic intervals from the PCH RTC controller and sends it to the slave device using a posted OOB message when a request is made to a specific destination address.

17.7.6.3.1 PCH Temperature Data Over eSPI OOB Channel

The eSPI controller supports the transmitting of PCH thermal data to the eSPI slave. The thermal data consists of one byte of PCH temperature data which is transmitted periodically (~1 ms) from the thermal sensor unit.

The packet formats for the temperature request from the eSPI slave and the PCH response back are shown in Figure 17-2 and Figure 17-3.

Figure 17-2. eSPI Slave Request to PCH for PCH Temperature

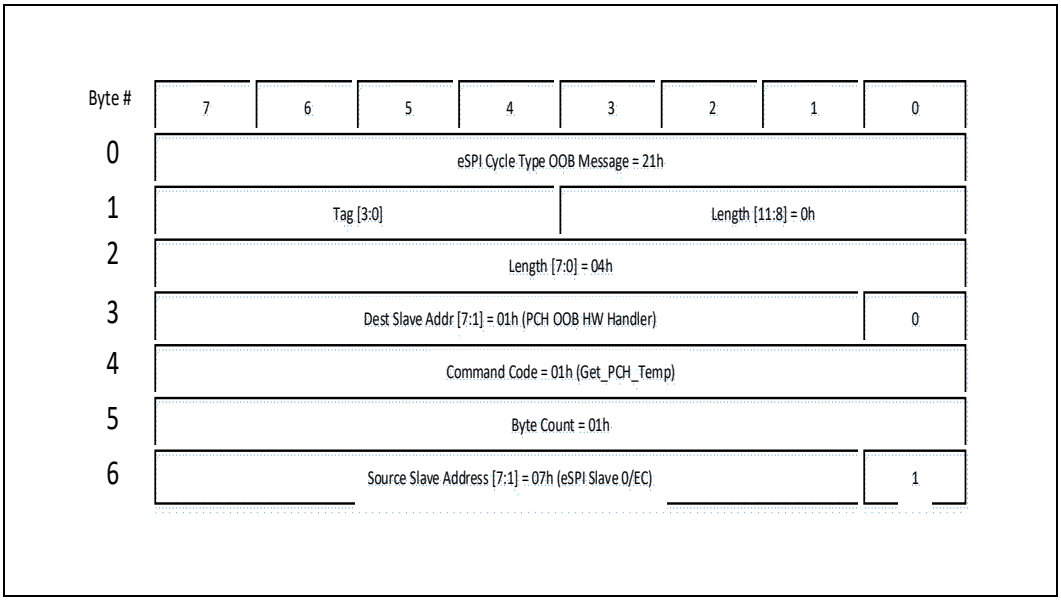


Figure 17-3. PCH Response to eSPI Slave with PCH Temperature

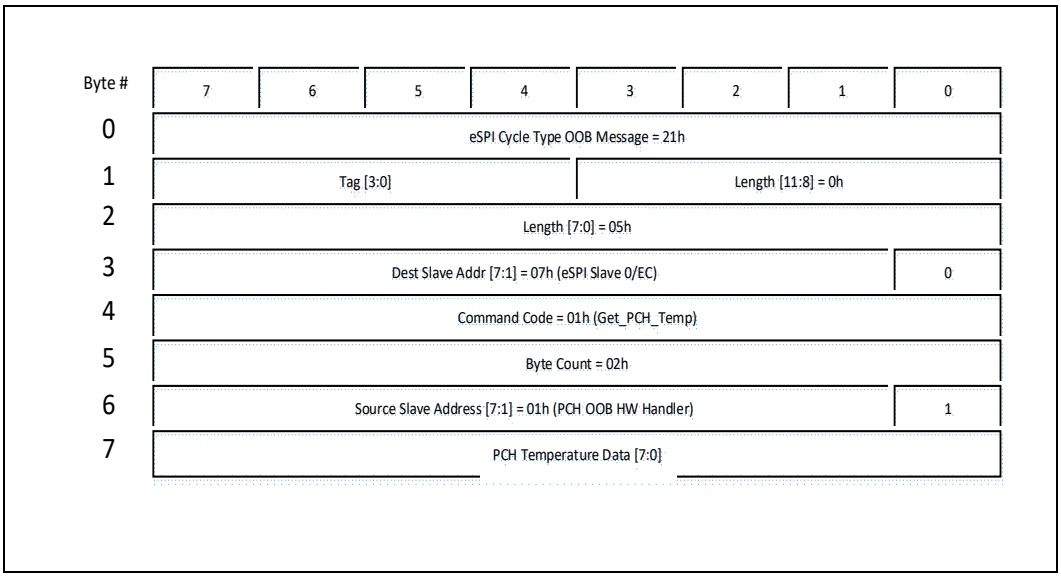


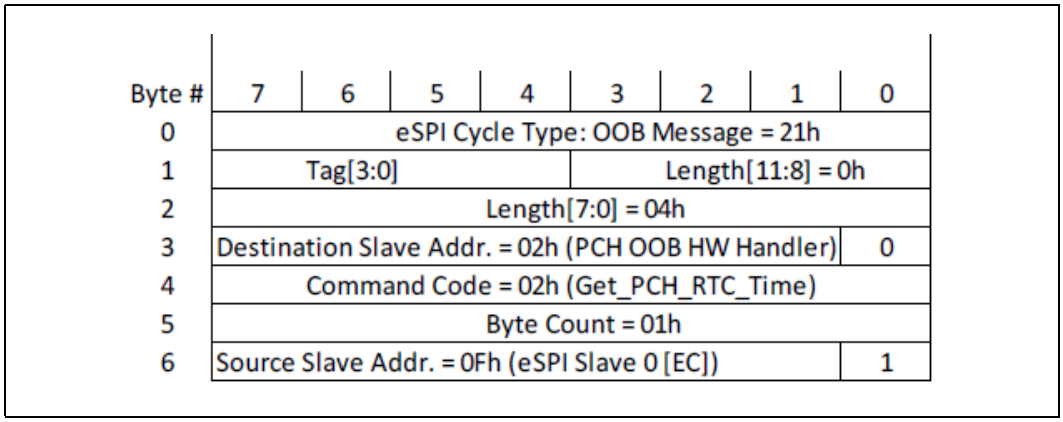
17.7.6.3.2 PCH RTC Time/Date to EC Over eSPI OOB Channel

The PCH eSPI controller supports the transmitting of PCH RTC time/date to the eSPI slave. This allows the eSPI slave to synchronize with the PCH RTC system time. Moreover, using the OOB message channel allows reading of the internal time when the system is in Sx states.

The RTC time consists of seven bytes: seconds, minutes, hours, day of week, day of month, month and year. The controller provides all the time/date bytes together in a single OOB message packet. This avoids the boundary condition of possible roll over on the RTC time bytes if each of the hours, minutes, and seconds bytes is read separately.

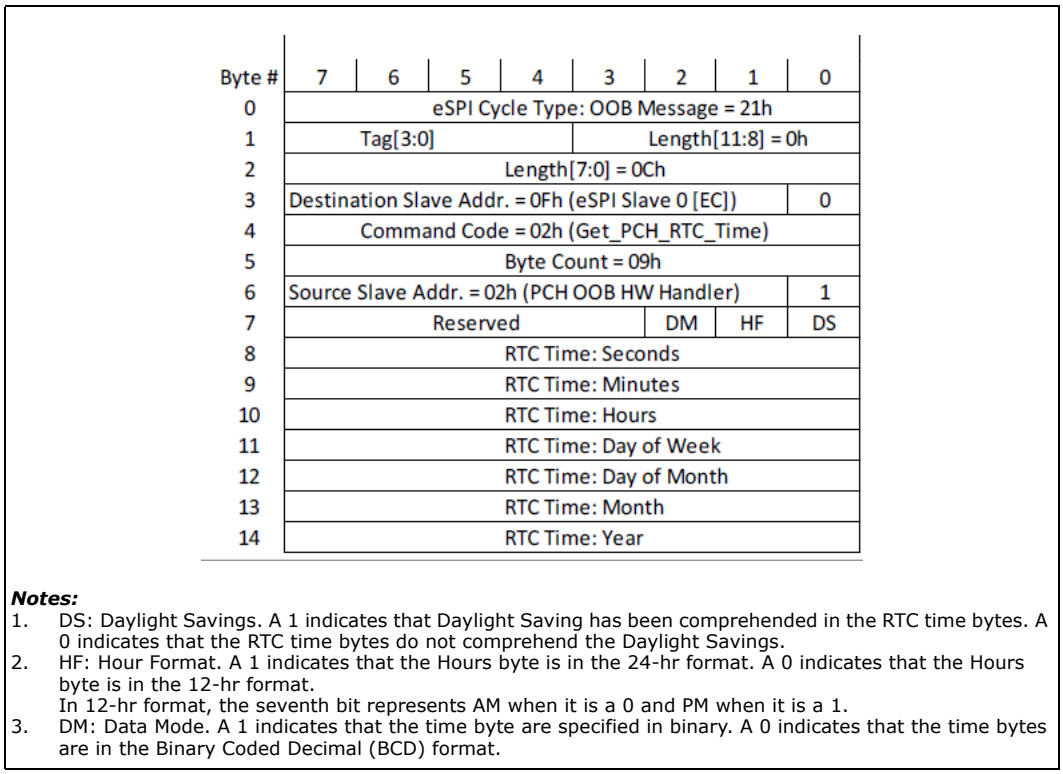
The packet formats for the RTC time/date request from the eSPI slave and the PCH response back to the device are shown in Figure 17-4 and Figure 17-5.

Figure 17-4. eSPI Slave Request to PCH for PCH RTC Time



Byte #	7	6	5	4	3	2	1	0
0	eSPI Cycle Type: OOB Message = 21h							
1	Tag[3:0]				Length[11:8] = 0h			
2	Length[7:0] = 04h							
3	Destination Slave Addr. = 02h (PCH OOB HW Handler)							0
4	Command Code = 02h (Get_PCH_RTC_Time)							
5	Byte Count = 01h							
6	Source Slave Addr. = 0Fh (eSPI Slave 0 [EC])							1

Figure 17-5. PCH Response to eSPI Slave with RTC Time



Byte #	7	6	5	4	3	2	1	0
0	eSPI Cycle Type: OOB Message = 21h							
1	Tag[3:0]				Length[11:8] = 0h			
2	Length[7:0] = 0Ch							
3	Destination Slave Addr. = 0Fh (eSPI Slave 0 [EC])							0
4	Command Code = 02h (Get_PCH_RTC_Time)							
5	Byte Count = 09h							
6	Source Slave Addr. = 02h (PCH OOB HW Handler)							1
7	Reserved					DM	HF	DS
8	RTC Time: Seconds							
9	RTC Time: Minutes							
10	RTC Time: Hours							
11	RTC Time: Day of Week							
12	RTC Time: Day of Month							
13	RTC Time: Month							
14	RTC Time: Year							

Notes:
1. DS: Daylight Savings. A 1 indicates that Daylight Saving has been comprehended in the RTC time bytes. A 0 indicates that the RTC time bytes do not comprehend the Daylight Savings.
2. HF: Hour Format. A 1 indicates that the Hours byte is in the 24-hr format. A 0 indicates that the Hours byte is in the 12-hr format.
   In 12-hr format, the seventh bit represents AM when it is a 0 and PM when it is a 1.
3. DM: Data Mode. A 1 indicates that the time byte are specified in binary. A 0 indicates that the time bytes are in the Binary Coded Decimal (BCD) format.

17.7.6.4 Flash Access Channel (Channel 3) Overview

Note: Slave Attached Flash Sharing (SAFS) is platform dependent on whether it's supported or not. Check your platform supported feature list.

The MAFCC tunnels flash accesses from eSPI slave to the PCH flash controller. The MAFCC simply provides Flash Cycle Type, Address, Length, Payload (for writes) to the flash controller. The flash controller is responsible for all the low level flash operations to perform the requested command and provides a return data/status back to the MAFCC, which then tunnels it back to the eSPI slave in a separate completion packet.

17.7.6.4.1 Master Attached Flash Channel Controller (MAFCC) Flash Operations and Addressing

The EC is allocated a dedicated region within the eSPI Master-Attached flash device. The EC has default read, write, and erase access to this region.

The EC can also access any other flash region as permitted by the Flash Descriptor settings. As such, the EC uses linear addresses, valid up to the maximum supported flash size, to access the flash.

The MAFCC supports flash read, write, and erase operations only.

17.8 Enhanced SPI (eSPI) Configuration Registers Summary

Table 17-3. Summary of Enhanced SPI (eSPI) Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Identifiers (ESPI_DID_VID)—Offset 0h	8086h
4h	7h	Device Status and Command (ESPI_STS_CMD)—Offset 4h	403h
8h	Bh	Class Code and Revision ID (ESPI_CC_RID)—Offset 8h	6010000h
Ch	Fh	BIST, Header Type, Primary Latency Timer, Cache Line Size (ESPI_BIST_HTYPE_PLT_CLS)—Offset Ch	800000h
2Ch	2Fh	Sub System Identifiers (ESPI_SS)—Offset 2Ch	0h
34h	37h	Capability List Pointer (ESPI_CAPP)—Offset 34h	E0h
80h	83h	I/O Decode Ranges and I/O Enables (ESPI_IOD_IOE)—Offset 80h	0h
84h	87h	LPC Generic I/O Range #1 (ESPI_LGIR1)—Offset 84h	0h
88h	8Bh	LPC Generic I/O Range #2 (ESPI_LGIR2)—Offset 88h	0h
8Ch	8Fh	LPC Generic I/O Range #3 (ESPI_LGIR3)—Offset 8Ch	0h
90h	93h	LPC Generic I/O Range #4 (ESPI_LGIR4)—Offset 90h	0h
94h	97h	USB Legacy Keyboard/Mouse Control (ESPI_ULKMC)—Offset 94h	0h
98h	9Bh	LPC Generic Memory Range (ESPI_LGMR)—Offset 98h	0h
A0h	A3h	eSPI CS1# I/O Routing enables (PCCS1IORE)- Offset A0h	0h
A4h	A7h	eSPI CS1# Generic I/O Range #1 (PCCS1GIR1) - Offset A4h	0h
A8h	ABh	eSPI CS1# Generic Memory Range (PCCS1GMR1) - Offset A8h	0h
D0h	D3h	eSPI CS1# I/O Routing Enables (PCCS1IORE) - Offset A0h	0h
D4h	D7h	FWH ID Select #2 (ESPI_FS2)—Offset D4h	0h
D8h	DBh	BIOS Decode Enable (ESPI_BDE)—Offset D8h	FFCFh
DCh	DFh	BIOS Control (ESPI_BC)—Offset DCh	20h

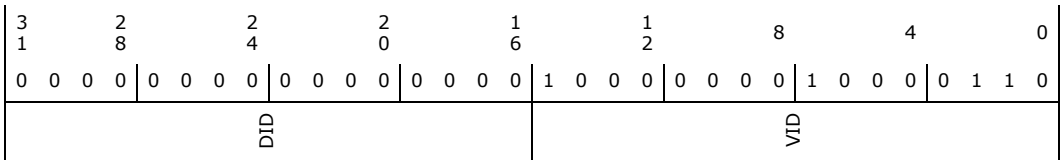
17.8.1 Identifiers (ESPI_DID_VID)—Offset 0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 8086h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO/V	**Device Identification (DID):** Indicates the Device ID of the controller.
15:0	8086h RO	**Vendor Identification (VID):** Indicates Intel.

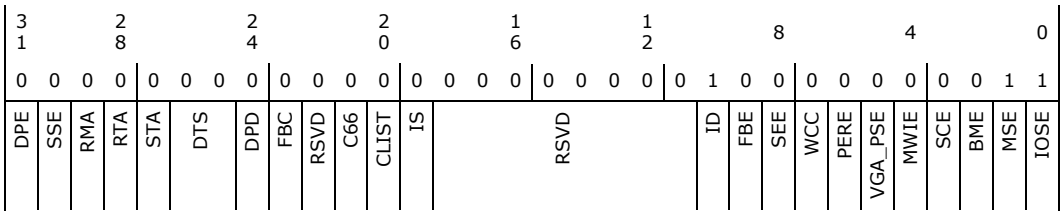
17.8.2 Device Status and Command (ESPI_STS_CMD)—Offset 4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 403h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/1C/V	**Detected Parity Error (DPE):** Set when the bridge detects a parity error on the internal backbone. This bit gets set even if CMD.PERE is not set.
30	0h RW/1C/V	**Signaled System Error (SSE):** Set when the LPC bridge signals a system error to the internal SERR# logic.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the bridge receives a completion with unsupported request status.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the bridge receives a completion with completer abort status.
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set when the bridge generates a completion packet with target abort status.
26:25	0h RO	**DEVSEL# Timing Status (DTS):** Indicates medium timing, although this has no meaning on the HW.
24	0h RW/1C/V	**Data Parity Error Detected (DPD):** Set when the bridge receives a completion packet from the backbone from a previous request, and detects a parity error, and CMD.PERE is set.
23	0h RO	**Fast Back to Back Capable (FBC):** Reserved - bit has no meaning on the HW.
22	0h RO	Reserved

Bit Range	Default and Access	Field Name (ID): Description
21	0h RO	**66 MHz Capable (C66):** Reserved - bit has no meaning on the HW.
20	0h RO	**Capabilities List (CLIST):** There is a capabilities list in the LPC bridge.
19	0h RO	**Interrupt Status (IS):** The LPC bridge does not generate interrupts.
18:11	0h RO	Reserved
10	1h RO	**Interrupt Disable (ID):** The LPC bridge has no interrupts to disable.
9	0h RO	**Fast Back to Back Enable (FBE):** Reserved as 0 per PCI Express Specification.
8	0h RW	**SERR# Enable (SEE):** The LPC bridge generates SERR# if this bit is set.
7	0h RO	**Wait Cycle Control (WCC):** Reserved as 0 per PCI Express Specification.
6	0h RW	**Parity Error Response Enable (PERE):** When this bit is set to 1, it enables the LPC bridge to response to parity errors detected.
5	0h RO	**VGA Palette Snoop (VGA_PSE):** Reserved as 0 per the *PCI Express Specification*.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Reserved as 0 per the *PCI Express Specification*.
3	0h RO	**Special Cycle Enable (SCE):** Reserved as 0 per the *PCI Express Specification*.
2	0h RW	**Bus Master Enable (BME):** Bus Masters cannot be disabled.
1	1h RO	**Memory Space Enable (MSE):** Memory space cannot be disabled on LPC.
0	1h RO	**I/O Space Enable (IOSE):** I/O space cannot be disabled on LPC.

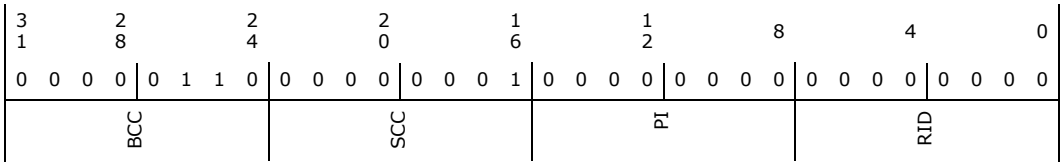
17.8.3 Class Code and Revision ID (ESPI_CC_RID)—Offset 8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 6010000h



Bit Range	Default and Access	Field Name (ID): Description
31:24	6h RO	**Base Class Code (BCC):** Indicates the device is a bridge device.
23:16	1h RO	**Sub-Class Code (SCC):** Indicates the device a PCI to ISA bridge.
15:8	0h RO	**Programming Interface (PI):** The LPC bridge has no programming interface.
7:0	0h RO/V	**Revision ID (RID):** Indicates the part revision.

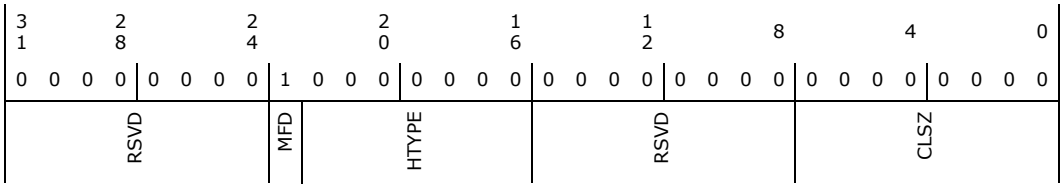
17.8.4 BIST, Header Type, Primary Latency Timer, Cache Line Size (ESPI_BIST_HTYPE_PLT_CLS)—Offset Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 800000h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved
23	1h RO	**Multi-function Device (MFD):** This bit is 1 to indicate a multifunction device.

Bit Range	Default and Access	Field Name (ID): Description
22:16	0h RO	**Header Type (HTYPE):** Identifies the header layout of the configuration space, which is a generic device.
15:8	0h RO	Reserved
7:0	0h RO	**Cacheline Size (CLSZ):** Cacheline Size

17.8.5 Sub System Identifiers (ESPI_SS)—Offset 2Ch

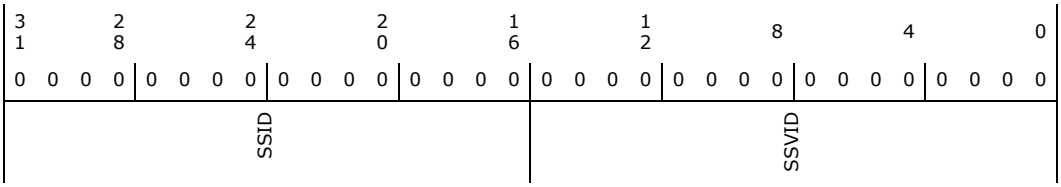
This register is initialized to logic 0 by the assertion of PLTRST#. This register can be written only once after PLTRST# de-assertion.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** This is written by the BIOS. No hardware action taken on this value.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** This is written by the BIOS. No hardware action taken on this value.

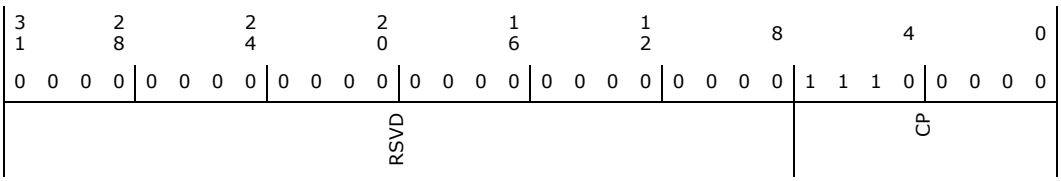
17.8.6 Capability List Pointer (ESPI_CAPP)—Offset 34h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: E0h



Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved
7:0	E0h RO	**Capability Pointer (CP):** Indicates the offset of the first Capability Item.

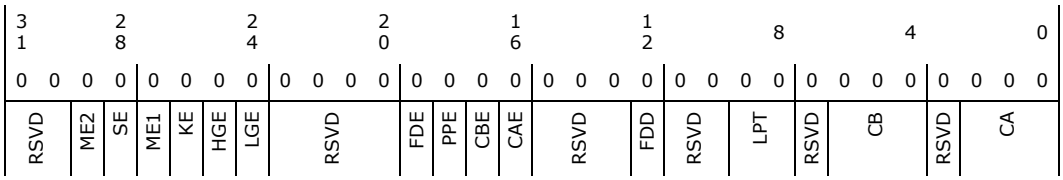
17.8.7 I/O Decode Ranges and I/O Enables (ESPI_IOD_IOE)—Offset 80h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:30	0h RO	Reserved
29	0h RW	**Microcontroller Enable #2 (ME2):** Enables decoding of I/O locations 4Eh and 4Fh to LPC.
28	0h RW	**Super I/O Enable (SE):** Enables decoding of I/O locations 2Eh and 2Fh to LPC.
27	0h RW	**Microcontroller Enable #1 (ME1):** Enables decoding of I/O locations 62h and 66h to LPC.
26	0h RW	**Keyboard Enable (KE):** Enables decoding of the keyboard I/O locations 60h and 64h to LPC.
25	0h RW	**High Gameport Enable (HGE):** Enables decoding of the I/O locations 208h to 20Fh to LPC.
24	0h RW	**Low Gameport Enable (LGE):** Enables decoding of the I/O locations 200h to 207h to LPC.
23:20	0h RO	Reserved
19	0h RW	**Floppy Drive Enable (FDE):** Enables decoding of the FDD range to LPC. Range is selected by LIOD.FDE.
18	0h RW	**Parallel Port Enable (PPE):** Enables decoding of the LPT range to LPC. Range is selected by LIOD.LPT.
17	0h RW	**Com Port B Enable (CBE):** Enables decoding of the COMB range to LPC. Range is selected by LIOD.CB.
16	0h RW	**Com Port A Enable (CAE):** Enables decoding of the COMA range to LPC. Range is selected by LIOD.CA.

Bit Range	Default and Access	Field Name (ID): Description
15:13	0h RO	Reserved
12	0h RW	**FDD Range (FDD):** The following table describes which range to decode for the FDD Port Bits Decode Range: 0 3F0h - 3F5h, 3F7h (Primary) 1 370h - 375h, 377h (Secondary)
11:10	0h RO	Reserved
9:8	0h RW	**LPT Range (LPT):** The following table describes which range to decode for the LPT Port: Bits Decode Range: 00 378h - 37Fh and 778h - 77Fh 01 278h - 27Fh (port 279h is read only) and 678h - 67Fh 10 3BCh - 3BEh and 7BCh - 7BEh 11 Reserved
7	0h RO	Reserved
6:4	0h RW	**ComB Range (CB):** The following table describes which range to decode for the COMB Port: Bits Decode Range 000 3F8h - 3FFh (COM 1) 001 2F8h - 2FFh (COM 2) 010 220h - 227h 011 228h - 22Fh 100 238h - 23Fh 101 2E8h - 2EFh (COM 4) 110 338h - 33Fh 111 3E8h - 3EFh (COM 3)

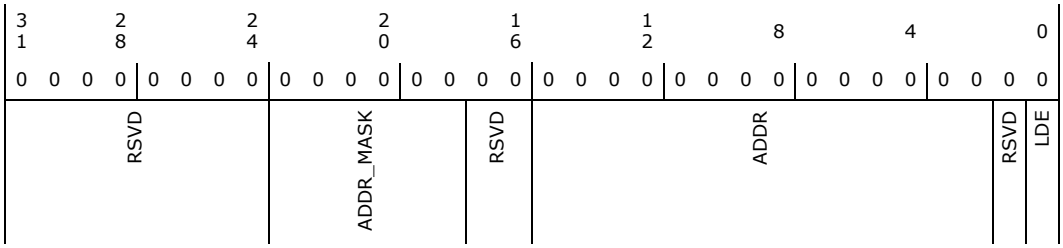
17.8.8 LPC Generic I/O Range #1 (ESPI_LGIR1)—Offset 84h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved
23:18	0h RW	**Address[7:2] Mask (ADDR_MASK):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	Reserved
15:2	0h RW	**Address[15:2] (ADDR):** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level.
1	0h RO	Reserved
0	0h RW	**LPC Decode Enable (LDE):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

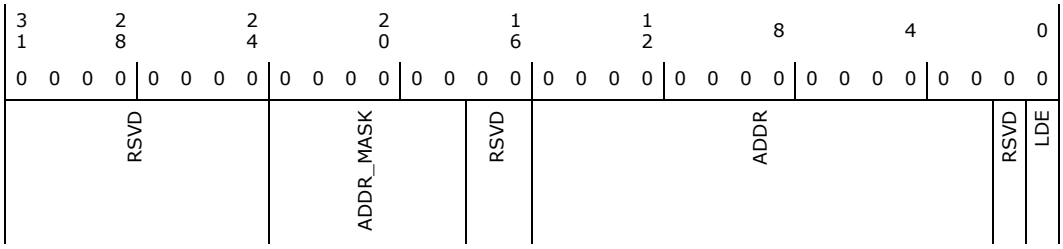
17.8.9 LPC Generic I/O Range #2 (ESPI_LGIR2)—Offset 88h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved
23:18	0h RW	**Address[7:2] Mask (ADDR_MASK):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	Reserved
15:2	0h RW	**Address[15:2] (ADDR):** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level.
1	0h RO	Reserved
0	0h RW	**LPC Decode Enable (LDE):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

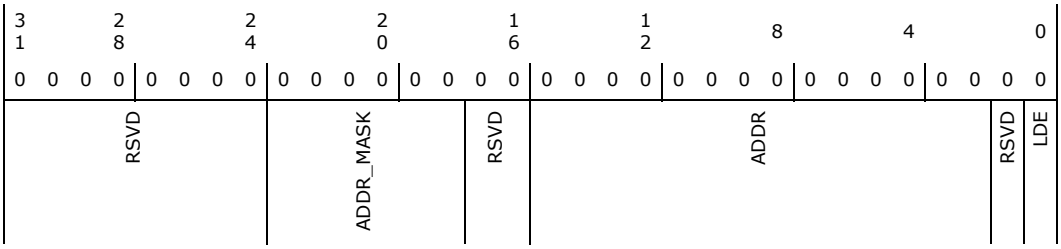
17.8.10 LPC Generic I/O Range #3 (ESPI_LGIR3)—Offset 8Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved
23:18	0h RW	**Address[7:2] Mask (ADDR_MASK):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	Reserved
15:2	0h RW	**Address[15:2] (ADDR):** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level.
1	0h RO	Reserved
0	0h RW	**LPC Decode Enable (LDE):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

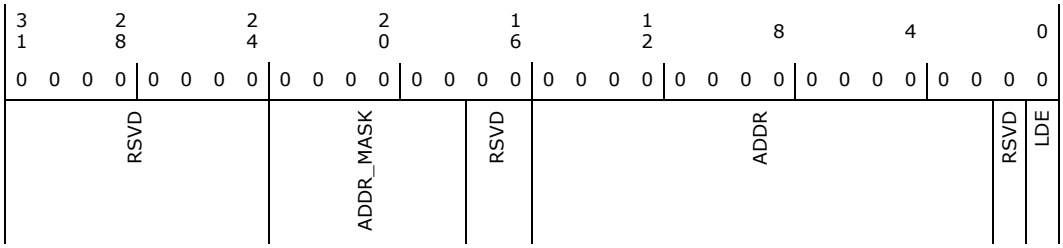
17.8.11 LPC Generic I/O Range #4 (ESPI_LGIR4)—Offset 90h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved
23:18	0h RW	**Address[7:2] Mask (ADDR_MASK):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	Reserved
15:2	0h RW	**Address[15:2] (ADDR):** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level.
1	0h RO	Reserved
0	0h RW	**LPC Decode Enable (LDE):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

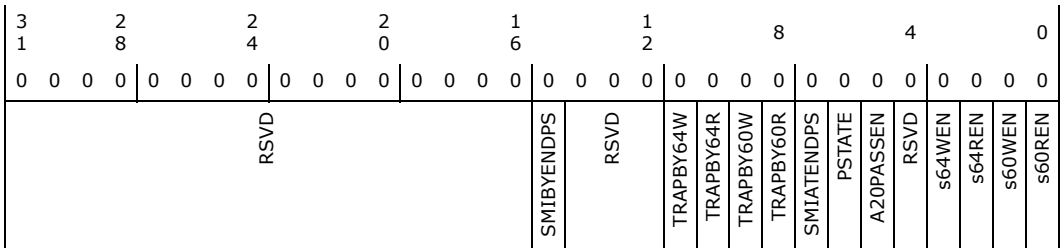
17.8.12 USB Legacy Keyboard/Mouse Control (ESPI_ULKMC)—Offset 94h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved
15	0h RW/1C/V	**SMI Caused by End of Pass-through (SMIBYENDPS):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the bit 7, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
14:12	0h RO	Reserved
11	0h RW/1C/V	**SMI Caused by Port 64 Write (TRAPBY64W):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the bit 3, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch. Note that the A20Gate Pass-Through Logic allows specific port 64h Writes to complete without setting this bit.
10	0h RW/1C/V	**SMI Caused by Port 64 Read (TRAPBY64R):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the bit 2, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
9	0h RW/1C/V	**SMI Caused by Port 60 Write (TRAPBY60W):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the bit 1, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch. Note that the A20Gate Pass-Through Logic allows specific port 60h Writes to complete without setting this bit.
8	0h RW/1C/V	**SMI Caused by Port 60 Read (TRAPBY60R):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the bit 0, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
7	0h RW	**SMI at End of Pass-through Enable (SMIATENDPS):** May need to cause SMI at the end of a pass-through. Can occur if an SMI is generated in the middle of a pass through, and needs to be serviced later.
6	0h RO/V	**Pass Through State (PSTATE):** This read-only bit indicates that the state machine is in the middle of an A20GATE pass-through sequence. If software needs to reset this bit, it should set Bit 5 0.
5	0h RW	**A20Gate Pass-Through Enable (A20PASSEN):** When enabled, allows A20GATE sequence Pass-Through function. When enabled, a specific cycle sequence involving writes to port 60h and port 64h does not result in the setting of the SMI status bits.SMI# will not be generated, even if the various enable bits are set.
4	0h RO	Reserved
3	0h RW	**SMI on Port 64 Writes Enable (s64WEN):** When set, a 1 in bit 11 will cause an SMI event.
2	0h RW	**SMI on Port 64 Reads Enable (s64REN):** When set, a 1 in bit 10 will cause an SMI event.
1	0h RW	**SMI on Port 60 Writes Enable (s60WEN):** When set, a 1 in bit 9 will cause an SMI event.
0	0h RW	**SMI on Port 60 Reads Enable (s60REN):** When set, a 1 in bit 8 will cause an SMI event.

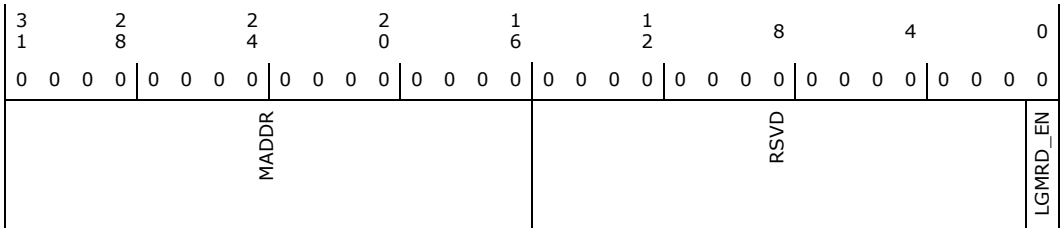
17.8.13 LPC Generic Memory Range (ESPI_LGMR)—Offset 98h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW	**Memory Address[31:16] (MADDR):** This field specifies a 64 KB memory block anywhere in the 4 GB memory space that will be decoded to LPC as standard LPC Memory Cycle if enabled.
15:1	0h RO	Reserved
0	0h RW	**LPC Memory Range Decode Enable (LGMRD_EN):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

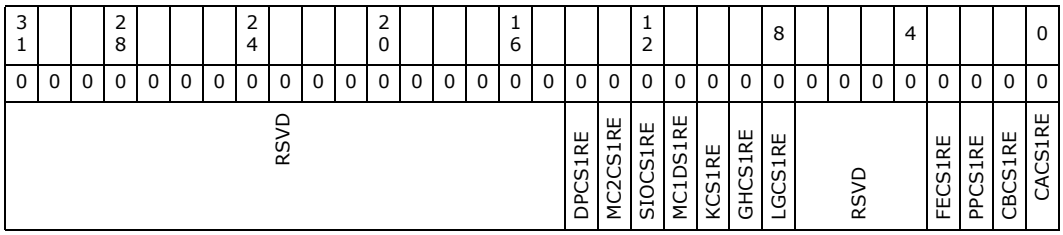
17.8.14 eSPI CS1# I/O Routing Enables (PCCS1IORE) - Offset A0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:15	0h RO	**Reserved**
14	0b RW/L	**Debug Port CS#1 Routing enable #2 (DPCS1RE)**: Enables the routing of I/O locations 80h, 84-86h, 88h, 8C-8Eh, 90h, 94-96h, 98h, 9C-9Eh to eSPI CS#1.
13	0h RW	**Microcontroller #2 CS#1 Routing Enable (MC2CS1RE)**: Enables the routing of I/O locations 4Eh and 4Fh to eSPI CS#1.
12	0b RW/L	**Super I/O CS#1 Routing Enabling (SIOCS1RE)**: Enables the routing of I/O locations 2Eh and 2Fh to eSPI CS#1.
11	0b RW/L	**Microcontroller #1 CS#1 Routing Enable (MC1CS1RE)**: Enables the routing of I/O locations 62h and 66h to eSPI CS#1.
10	0b RW/L	**Keyboard CS#1 Routing Enable (KCS1RE):** Enables the routing of I/O locations 60h and 64h to eSPI CS#1.
9	0b RW/L	**High Gameport CS#1 Routing Enable (HGCS1RE)**: Enables the routing of I/O locations 208h-20Fh to eSPI CS#1.
8	0b RW/L	**Low Gameport CS#1 Routing Enable (LGCS1RE)**: Enables the routing of I/O locations 200h-207h to eSPI CS#1.
7:4	0h RO	**Reserved**
3	0b RW/L	**Floppy Drive CS1# Routing Enable (FDCS1RE)**: Enables the routing of the FDD range to eSPI CS#1. The range is selected by PCIODR.FDE.
2	0b RW/L	**Parallel PortCS1# Routing Enable (PPCS1RE)**: Enables the routing of the LPT range to eSPI CS#1. The range is selected by PCIODR.LPT.
1	0b RW/L	**Com Port B CS1# Routing Enable (CBCS1RE)**: Enables the routing of the COMB range to eSPI CS#1. The range is selected by PCIODR.CB.
0	0b RW/L	**Com Port A CS1# Routing Enable (CACS1RE)**: Enables the routing of the COMA range to eSPI CS#1. The range is selected by PCIODR.C.

Note: PCIODE (Offset 82h) enables a given range. If that is zero, all access to that range are U/R'ed, irrespective of the settings for that range in this register. So PCIODE should be set/checked first. If a given range is enabled in PCIODE, then this register (PCCS1IORE) is used to select which eSPI slave device to route the transactions to. If a second eSPI slave device is not present, then PCCS1IORE is ignored and all I/O transactions are targeted to any range enabled in PCIODE are routed to CS0#.

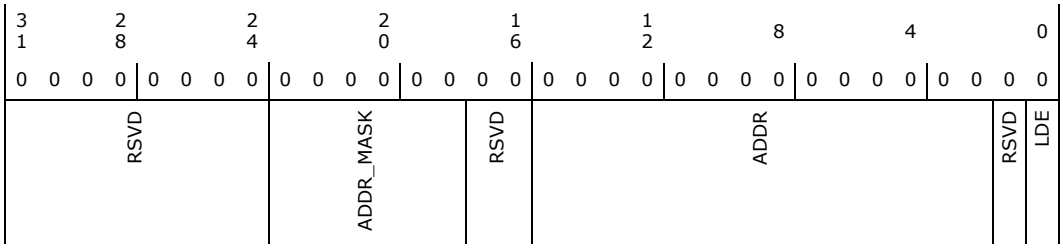
17.8.15 eSPI CS #1 Generic I/O Range (PCCS1GIR1)—Offset A4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved
23:18	0h RW	**Address[7:2] Mask (ADDR_MASK):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	Reserved
15:2	0h RW	**Address[15:2] (ADDR):** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level.
1	0h RO	Reserved
0	0h RW	**LPC (eSPI) Decode Enable (LDE):** When this bit is set to 1, then the range specified in this register is enabled for decoding to eSPI.

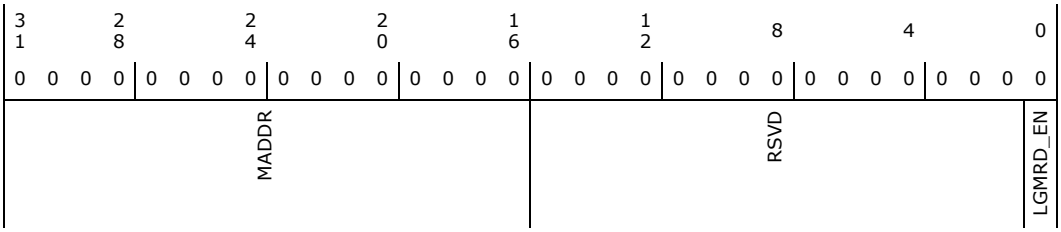
17.8.16 eSPI CS#1 Generic Memory Range (PCCS1GMR1)—Offset A8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW	**Memory Address[31:16] (MADDR):** This field specifies a 64 KB memory block anywhere in the 4 GB memory space that will be decoded to eSPI as standard LPC Memory Cycle if enabled.
15:1	0h RO	Reserved
0	0h RW	**LPC (eSPI) Memory Range Decode Enable (LGMRD_EN):** When this bit is set to 1, then the range specified in this register is enabled for decoding to eSPI.

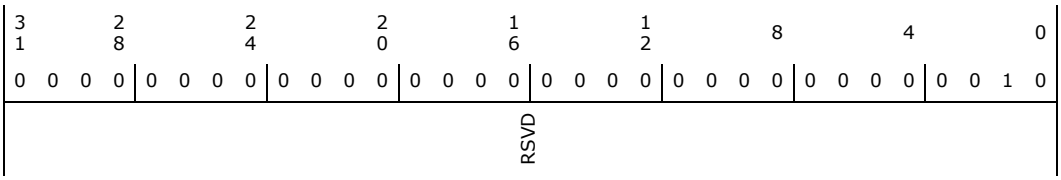
17.8.17 FWH ID Select #1 (ESPI_FS1)—Offset D0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 00000000h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO	**Reserved:** eSPI Peripheral Channel does not support Legacy LPC FWH.

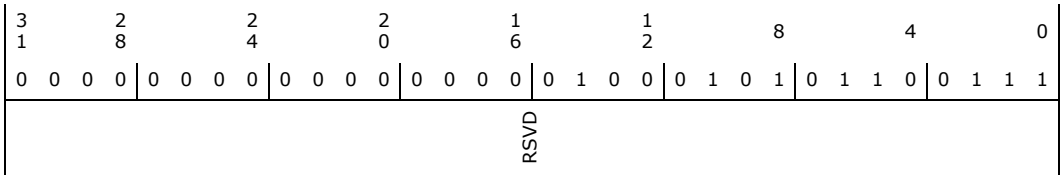
17.8.18 FWH ID Select #2 (ESPI_FS2)—Offset D4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 000000000h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO	Reserved. eSPI Peripheral channel does not support Legacy LPC FWH.

17.8.19 BIOS Decode Enable (ESPI_BDE)—Offset D8h

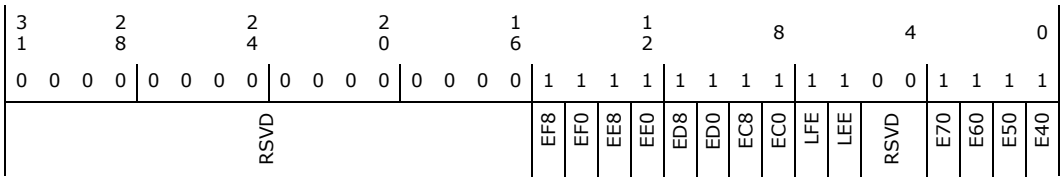
Note: This register effects the BIOS decode regardless of whether the BIOS is resident on LPC or SPI. The concept of Feature Space does not apply to SPI-based flash. PCH simply decodes these ranges as memory accesses when enabled for the SPI flash interface.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: FFCFh



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved
15	1h RO	**F8-FF Enable (EF8):** Enables decoding of 512K of the following BIOS range: Data space: FFF80000h - FFFFFFFFh Feature space: FFB80000h - FFBFFFFFh.
14	1h RW	**F0-F8 Enable (EF0):** Enables decoding of 512K of the following BIOS range: Data space: FFF00000h - FFF7FFFFh Feature space: FFB00000h - FFB7FFFFh.
13	1h RW	**E8-EF Enable (EE8):** Enables decoding of 512K of the following BIOS range: Data space: FFE80000h - FFEFFFFFh Feature space: FFA80000h - FFAFFFFFh.

Bit Range	Default and Access	Field Name (ID): Description
12	1h RW	**E0-E8 Enable (EE0):** Enables decoding of 512K of the following BIOS range: Data space: FFE00000h - FFE7FFFFh Feature Space: FFA00000h - FFA7FFFFh.
11	1h RW	**D8-DF Enable (ED8):** Enables decoding of 512K of the following BIOS range: Data space: FFD80000h - FFDFFFFFh Feature space: FF980000h - FF9FFFFFh.
10	1h RW	**D0-D7 Enable (ED0):** Enables decoding of 512K of the following BIOS range: Data space: FFD00000h - FFD7FFFFh Feature space: FF900000h - FF97FFFFh.
9	1h RW	**C8-CF Enable (EC8):** Enables decoding of 512K of the following BIOS range: Data space: FFC80000h - FFCFFFFFh Feature space: FF880000h - FF8FFFFFh.
8	1h RW	**C0-C7 Enable (EC0):** Enables decoding of 512K of the following BIOS range: Data space: FFC00000h - FFC7FFFFh Feature space: FF800000h - FF87FFFFh.
7	1h RW	**Legacy F Segment Enable (LFE):** This enables the decoding of the legacy 64 KB range at F0000h - FFFFFh. Note that decode for the BIOS legacy F segment is enabled by the LFE bit only, it is not affected by the GEN_PMCON_1.iA64_EN bit.
6	1h RW	**Legacy E Segment Enable (LEE):** This enables the decoding of the legacy 64 KB range at E0000h - EFFFFh. Note that decode for the BIOS legacy E segment is enabled by the LEE bit only, it is not affected by the GEN_PMCON_1.iA64_EN bit.
5:4	0h RO	Reserved
3	1h RW	**70-7F Enable (E70):** Enables decoding of 1 MB of the following BIOS range: Data space: FF700000h - FF7FFFFFh Feature space: FF300000h - FF3FFFFFh.
2	1h RW	**60-6F Enable (E60):** Enables decoding of 1 MB of the following BIOS range: Data space: FF600000h - FF6FFFFFh Feature Space: FF200000h - FF2FFFFFh.
1	1h RW	**50-5F Enable (E50):** Enables decoding of 1 MB of the following BIOS range: Data space: FF500000h - FF5FFFFFh Feature space: FF100000h - FF1FFFFFh.
0	1h RW	**40-4F Enable (E40):** Enables decoding of 1 MB of the following BIOS range: Data space: FF400000h - FF4FFFFFh Feature space: FF000000h - FF0FFFFFh.

17.8.20 BIOS Control (ESPI_BC)—Offset DCh

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 20h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
RSVD																BWRE	BWRS	RSVD	BWPDS	BILD	BBS	EISS	TS	RSVD	ESPI	LE	WPD				

Bit Range	Default and Access	Field Name (ID): Description
31:12	0h RO	Reserved
11	0h RW/L	**BIOS Write Reporting (Async-SMI) Enable (BWRE):** 1'b0: Disable reporting of BIOS Write event. 1'b1: Enable reporting of BIOS Write event (PCBC.BWRS = 1) using Async-SMI.
10	0h RW/1C/V	**BIOS Write Status (BWRS):** HW sets this bit if a memory write access is detected to a protected BIOS range. 1'b0: Memory write to the BIOS region not attempted or attempted with PCBC.WPD = 1. 1'b1: A memory write transaction to the BIOS region has been received with PCBC.WPD = 0. ***Notes:*** An Async-SMI message is generated to report this event if PCBC.BWRE is set. SW must write a 1 to this bit to clear it, which will also deassert the Async-SMI, if PCBC.BWRE is set.
9	0h RO	Reserved
8	0h RW/1C/V	**BIOS Write Protect Disable Status (BWPDS):** When set, prevents BC.TS and BC.BBS from being changed. This bit can only be written from 0 to 1 once. BIOS. ***Note:*** This bit is not backed up in the RTC well. This bit should also be set in the BUC register in the RTC device to record the last state of this value following a cold reset.
7	0h RW/L	**BIOS Interface Lock-Down (BILD):** When set, prevents BC.TS and BC.BBS from being changed. This bit can only be written from 0 to 1 once. BIOS. ***Note:*** This bit is not backed up in the RTC well. This bit should also be set in the BUC register in the RTC device to record the last state of this value following a cold reset.
6	0h RW/V/L	**Boot BIOS Strap (BBS):** This field determines the destination of accesses to the BIOS memory range. For the default, see the Functional Strap section of Signal Description chapter for details. Bits Description 0 SPI 1 LPC When SPI or LPC is selected, the range that is decoded is further qualified by other configuration bits described in the respective sections. The value in this field can be overwritten by software as long as the BIOS Interface Lock-Down is not set.
5	1h RW/L	**Enable InSMM.STS (EISS):** When this bit is set, the BIOS region is not writable until SMM sets the InSMM.STS bit. Today BIOS Flash is writable if WPD is a 1. If this bit (5) is set, then WPD must be a 1 and InSMM.STS (0xFED3_0880(0)) must be 1 also. If this bit (5) is clear, then BIOS is writable based only on WPD = 1 and the InSMM.STS is a don't care.
4	0h RO/V	**Top Swap (TS):** When set, PCH will invert either A16, A17, or A18 for cycles going to the BIOS space (but not the Feature space) in the FWH. When cleared, PCH will not invert A16. If booting from LPC (FWH) or eSPI, then the Boot Block Size is fixed at 64KB and A16 is inverted if Top Swap is enabled. If booting from SPI, then the BOOT_BLOCK_SIZE soft strap determines if A16, A17, or A18 should be inverted if Top Swap is enabled. If the Top-Swap strap is asserted, then this bit cannot be cleared by software. The strap jumper should be removed and the system rebooted. ***Note:*** This bit provides a read-only path to view the state of the Top Swap strap. It is backed up and driven from the RTC well. The BIOS will need to program the corresponding register in the RTC well, which will be reflected in this register.
3	0h RO	Reserved

Bit Range	Default and Access	Field Name (ID): Description
2	0h RO/V	**eSPI Enable Pin Strap (ESPI):** This field determines the destination of accesses to the D31:F0 and related Fixed and Variable I/O and Memory decode ranges, including BIOS memory range. 0 = LPC is the D31:F0 target. 1 = eSPI is the D31:F0 target. ***Notes:*** This field cannot be overwritten by software (unlike the PCBC.BBS field). This bit is also reflected in the LPC (D31:F0) and SPI Flash (D31:F5) PCI Configuration register Offset DCh.
1	0h RW/L	**Lock Enable (LE):** When set, setting the WP bit will cause SMI. When cleared, setting the WP bit will not cause SMI. Once set, this bit can only be cleared by a PLTRST#. When this bit is set, EISS - bit (5) of this register is locked down.
0	0h RW	**Write Protect Disable (WPD):** When set, access to the BIOS space is enabled for both read and write cycles to BIOS. When cleared, only read cycles are permitted to the FWH or SPI flash. When this bit is written from a 0 to a 1 and the LE bit is also set, an SMI# is generated. This ensures that only SMM code can update the BIOS.

17.9 eSPI PCR Registers Summary

These registers are within the PCH Private Configuration Space which is accessible through the PCH Sideband Interface. They can be accessed via (SBREG_BAR + PortID + Register Offset).

Table 17-4. Summary of eSPI Additional Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
4000h	4003h	eSPI Slave Configuration and Link Control (SLV_CFG_REG_CTL)—Offset 4000h	0h
4004h	4007h	eSPI Slave Configuration Register Data (SLV_CFG_REG_DATA)—Offset 4004h	0h
4020h	4023h	Peripheral Channel Error for Slave 0 (PCERR_SLV0)—Offset 4020h	0h
4030h	4033h	Virtual Wire Channel Error for Channel 0 (VWERR_SLV0)—Offset 4030h	0h
4040h	4043h	Flash Access Channel Error for Slave 0 (FCERR_SLV0)—Offset 4040h	0h
4050h	4053h	Link Error for Slave 0 (LNKERR_SL0)—Offset 4050h	FF00h

17.9.1 eSPI Slave Configuration and Link Control (SLV_CFG_REG_CTL)—Offset 4000h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
SCRE	SCRS			SBLCL	RSVD						SID		RSVD	SCRT	RSVD					SCRA											

Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/1S/V	**Slave Configuration Register Access Enable (SCRE):** Writing a 1 to this field triggers an access (SCRT) to a Slave Config Register ('Go'). ***Notes:*** Hardware clears this bit to 0 (and sets the SCRS field) when the transaction has completed on the eSPI bus. In the case of a configuration/status register read, the data is valid only after this bit has been cleared by HW. The SCRE is effective only if SCRS is clear.
30:28	0h RW/1C/V	**Slave Configuration Register Access Status (SCRS):** This field is set by upon the completion of a configuration register access (SCRE). Software must clear this field by writing all 1s before initiating another Slave configuration register access (SCRE). 0h: Status not valid 1h: Slave No_Response 2h: Slave Response CRC Error 3h: Slave Response Fatal Error 4h: Slave Response Non-Fatal Error 5h – 6h: Reserved 7h: No errors (transaction completed successfully)
27	0h RW/1S	**SB eSPI Link Configuration Lock (SBLCL):** When set, eSPI controller prevents writes (i.e., SET_CONFIGURATION) to any eSPI Specification defined Slave Capabilities and Configuration registers in the reserved register address range (0h – 7FFh). Access to Slave implementation specific configuration registers outside this range are not impacted by this lock bit and are always available – access protections to such registers are Slave implementation dependent. ***Notes:*** This bit cannot be written to 0 once it has been set to 1. It can only be cleared by PLTRST# assertion. The lock is automatically disabled if and while the LNKERR_SLV0.SLCRR register bit is asserted (upon an eSPI link Fatal Error condition) to allow BIOS (or another SW agent) to attempt to recover the link. This bit has no effect when PLTRST# is asserted. **BIOS Note:** The BIOS must ensure that this bit is set to 1 after initial eSPI link configuration is over to prevent any further (unintentional or malicious) changes to the eSPI link configuration.
26:21	0h RO	Reserved
20:19	0h RW	**Slave ID (SID):** eSPI Slave ID (CS#) to which the Slave Configuration Register Access (SCRT) is directed. 00: eSPI Slave 0 (EC/BMC) 01: eSPI Slave 1 (for Server SKU only and when a when a second eSPI Slave device is present) 10 – 2'b11: Reserved
18	0h RO	Reserved
17:16	0h RW	**Slave Configuration Register Access Type (SCRT):** 00: Slave Configuration register read from address SCRA[11:0] (GET_CONFIG)(br) 01: Slave Configuration register write to address SCRA[11:0] (SET_CONFIG)(br) 10: Slave Status register read (GET_STATUS)(br) 11: In-Band Reset. ***Notes:*** Writes to Slave Configuration registers in the reserved address range (0h – 7FFh) are gated by the SBLCL bit. Setting this field to 10 triggers a Get_Status command to the Slave. In this case, the SCRA field is ignored and only the lower 16-bits of the returned data (SLV_CFG_REG_DATA[15:0]) are valid. Setting this field to 11 triggers an In-Band Reset command to the Slave. In this case, the SCRA field is ignored and no data is returned. This command resets the link for the targeted Slave to a default configuration. Software is responsible for reinitializing the link to optimized (higher performance) settings using these registers.
15:12	0h RO	Reserved
11:0	0h RW	**Slave Configuration Register Address (SCRA)**

17.9.6 Link Error for Slave 0 (LNKERR_SL0)—Offset 4050h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: FF00h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1	0	0	0	0	0	0	0	0
SLCRR	RSVD									LFET1E	LFET1S	LFET1C					LFET1CTYP								LFET1CMD							

Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/1C/V	**eSPI Link and Slave Channel Recovery Required (SLCRR):** HW sets this bit when it has detected a Type 1 Fatal Error condition, for any channel (LFET1C is non-zero). Setting of this bit will trigger an error handling sequence by the eSPI controller followed by the suspension of all HW initiated transactions on the eSPI link with the Slave. SW must clear this bit (by writing a 1 to it) after it has taken all necessary actions to recover the link. This indicates the eSPI controller to resume HW initiated transactions with the Slave. If this bit is set, it impedes transactions from going on in either CS0 or CS1. So an error on CS0 can stop transactions on CS1 and vice Versa
30:23	0h RO	Reserved
22:21	0h RW	**Fatal Error Type 1 Reporting Enable (LFET1E):** 00: Disable Fatal Error Type 1 Reporting 01: Reserved 10: Enable Fatal Error Type 1 Reporting as SERR (SB Do_SErr message). 11: Enable Fatal Error Type 1 Reporting as SMI (SB Assert_SMI message). ***Notes:*** SERR enable is also qualified by PCCMD.SEE (Offset 04h) when PLTRST# is deasserted. SERR also sets PCSTS.SSE (Offset 06h) when PLTRST# is deasserted. SMI/SERR messages are not generated if the Host is in reset (PLTRST# asserted). When this error is reported, SW must also inspect and handle the SLCRR field.
20	0h RW/1C/V	**Fatal Error Type 1 Reporting Status (LFET1S):** This field is set by hardware if a Link Fatal Error Type 1 condition is detected on the eSPI link (any transaction). Software must clear this bit by writing a 1 to it. 0: No Link Fatal Error Type 1 detected 1: Fatal Error Type 1 detected (LFET1C has a non-zero value. ***Notes:*** Clearing this unlocks the LFET1C field and triggers an SB Deassert_SMI message if LFET1E is set to SMI. Setting of this bit is independent of the enable to generate a SMI/SERR (LFET1E).
19:16	0h RO/V	**Link Fatal Type 1 cause (LFET1C):** 0h: No error 1h: Slave Response Code: NO_RESPONSE [Type 1] 2h: Slave Response Code: FATAL_ERROR [Type 1] 3h: Slave Response Code: CRC_ERROR [Type 1] 4h: Invalid Slave Response Code (w.r.t. to Command) [Type 1] 5h: Invalid Slave Cycle Type (w.r.t. to Command) [Type 1] 6h – Fh: Reserved ***Notes:*** This field is updated after a transaction (any channel) is completed if the LFET1S bit is clear. A non-zero value in this field also causes the SLCRR bit to be set.
15:8	FFh RO/V	**Link Fatal Error Type 1 Cycle Type (LFET1CTYP):** When LFET1C is set, this field reflects the Cycle Type for the transaction that encountered the Fatal Error Type 1. If no valid Cycle Type exists w.r.t. the Command (LFET1CMD), this field is set to FFh to indicate that it should be ignored. ***Note:*** This field is updated after a transaction (any channel) is completed if the LFET1S bit is clear.
7:0	0h RO/V	**Link Fatal Error Type 1 Command (LFET1CMD):** When LFET1C is set, this field reflects the Command for the transaction that encountered the Fatal Error Type 1. ***Note:*** This field is updated after a transaction (any channel) is completed if the LFET1S bit is clear.

18 General Purpose Input and Output

18.1 Acronyms

Acronyms	Description
GPI	General Purpose Input
GPO	General Purpose Output
GPIO	General Purpose Input/Output
GPP	General Purpose I/O in Primary Well
GPD	General Purpose I/O in Deep Sleep Well
DSW	Deep Sleep Well

18.2 References

None.

18.3 Overview Integrated Pull-Ups and Pull-Downs

GPIOs have weak internal pull-up/pull-down resistors which are off by default, with the exception of those noted. The internal PU/PD can be programmed (PU/PD/None) by BIOS after reset. In Endpoint Mode, with no BIOS to reconfigure the GPIOs, they stay at their defaults.

Note: Integrated pull-ups and pull-downs will not be valid until all the voltages have reached a valid level.

18.4 Overview

The PCH General Purpose Input/Output signals are grouped into multiple groups (e.g., GPP_A, GPP_B, etc.) and are powered by either the PCH Primary well or Deep Sleep well. Most of these pin groups has a dedicated power pin that can be set to either 1.8V or 3.3V with the exception of GPP_I, GPP_L and GPD. GPP_L is powered by VCCPRIM_1P05 due to the need for the power to the native testability pins. GPP_I has 10GbE native functions on it, so these need to be 3.3V. GPD is powered by 3.3V DSW. All pins within the same group (including the native functionality that is multiplexed with the GPIO) operate at the same voltage determined by the power supplied to the power pins.

All PCH GPIOs can be configured as input or output signals. Many GPIOs are multiplexed with other functions. With FITC, you determine whether IE, Intel ME or the Host owns the GPIO. If the Host owns it, then the native vs GPIO selection is done via BIOS. The host configuration registers are displayed further on down in this chapter.

SCI and IOxAPIC interrupt capability is available on all GPIOs. NMI and SMI capability is available on selected GPIOs only.

Table 18-1. GPIO Group Summary

GPIO Group	Power Pins	Voltage
Primary Well Group A (GPP_A)	VCCPGPPA	1.8V or 3.3V
Primary Well Group B (GPP_B)	VCCPGPPB	1.8V or 3.3V
Primary Well Group C (GPP_C)	VCCPGPPC	1.8V or 3.3V
Primary Well Group D (GPP_D)	VCCPGPPD	1.8V or 3.3V
Primary Well Group E (GPP_E)	VCCPGPPE	1.8V or 3.3V
Primary Well Group F (GPP_F)	VCCPGPPF	1.8V or 3.3V
Primary Well Group G (GPP_G)	VCCPGPPG	1.8V or 3.3V
Primary Well Group H(GPP_H)	VCCPGPPH	1.8V or 3.3V
Primary Well Group I (GPP_I)	VCC_3P3	3.3V
Primary Well Group J (GPP_J)	VCCPGPPD	1.8V or 3.3V
Primary Well Group K (GPP_K)	VCCPGPPD	1.8V or 3.3V
Primary Well Group L (GPP_L)	VCCPRIM_1P05	1.05v
Deep Sleep Well Group (GPD)	VCCDSW_3P3	3.3V

18.5 Signal Description

Table 16-1 summarizes the GPIO implementation in the PCH.

GPP_L14	NO	NO	YES	TESTCH1_D3 (Mode1)	TESTCH1_D3	No	
GPP_L15	NO	NO	YES	TESTCH1_D4 (Mode1)	TESTCH1_D4	No	
GPP_L16	NO	NO	YES	TESTCH1_D5 (Mode1)	TESTCH1_D5	No	
GPP_L17	NO	NO	YES	TESTCH1_D6 (Mode1)	TESTCH1_D6	No	
GPP_L18	NO	NO	YES	TESTCH1_D7 (Mode1)	TESTCH1_D7	No	
GPP_L19	NO	NO	YES	TESTCH1_CLK (Mode1)	TESTCH1_CLK	No	
GPIO In Deep Sleep Power Well (3.3V Only)							
GPD0	NO	NO	YES	POWER_DEBUG_N	POWER_DEBUG_N	No	
GPD1	NO	NO	YES	ACPRESENT (Mode1)	ACPRESENT	No	
GPD2	NO	NO	YES	GBE_WAKE# (Mode1)	GBE_WAKE#	No	
GPD3	20K PU	YES	YES	PWRBTN# (Mode1)	PWRBTN#	No	Bit 28 (PB_DIS) of the PM_CFG2 register must be set to 1b in order for this pin to be used as a GPIO.
GPD4	NO	NO	YES	SLP_S3# (Mode1)	SLP_S3#	No	
GPD5	NO	NO	YES	SLP_S4# (Mode1)	SLP_S4#	No	
GPD6	NO	NO	YES	SLP_A# (Mode1)	SLP_A#	No	
GPD7	NO	NO	YES	RSVD (Mode1)	RSVD	No	Default is 1.
GPD8	NO	NO	YES	SUSCLK (Mode1)	SUSCLK	No	
GPD9	NO	NO	YES	reserved	reserved	No	Default is 0.
GPD10	NO	NO	YES	SLP_S5# (Mode1)	SLP_S5#	No	
GPD11	NO	NO	YES	GBEPHY (Mode1)	GBEPHY	No	
GPIO RCOMP Pins							

Table 18-2. General Purpose I/O Signals (Sheet 10 of 10)

Name	Internal Pull-Up/ Pull-Down (Note 1)	De-Glitch (Note 2)		Multiplexed With	Default	NMI or SMI Capable	Note
		Input	Output				
GPIO_RCOMP3_3	NA	NA	NA	NA	NA	NA	RCOMP for 3.3V. This is pin BY25.
GPIO_RCOMP_1P8_3_3	NA	NA	NA	NA	NA	NA	RCOMP for 1.8 and 3.3V. This is pin AM4.

Notes:
1. All GPIOs have weak internal pull-up or pull-down resistors but the resistors are off by default unless noted in this column.
2. De-glitch signal has a 20K Ohm pull-down during the pin power sequencing with the exception of the GPP_B0_CORE_VID0, and GPP_B1_CORE_VID1 which have 20K pull-ups on them.
3. LPC mode and eSPI mode are determined by HW ESPI Enable Strap. See the pin strap section for more detail.
4. There are up to 3 non-GPIO Modes possible. BIOS refers to these as Mode1, Mode2, Mode3 and the use of the terms here is to equate which function is selected when BIOS selects a mode for the GPIO.
5. For GPIOS whose default is a RSVD function, the BIOS should reconfigure these pins to GPIOs or have them as no connects.

18.6 GPIO Community 0 Registers Summary

Community 0 Registers are for GPP_A, GPP_B and GPP_F groups.

Table 18-3. Summary of GPIO Community 0 Registers (Sheet 1 of 5)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
Ch	Fh	Pad Base Address (PADBAR)—Offset Ch	00000400h
10h	13h	Miscellaneous Configuration (MISCCFG)—Offset 10h	00051000h
20h	23h	Pad Ownership (PAD_OWN_GPP_A_0)—Offset 20h	00000000h
24h	27h	Pad Ownership (PAD_OWN_GPP_A_1)—Offset 24h	00000000h
28h	2Bh	Pad Ownership (PAD_OWN_GPP_A_2)—Offset 28h	00000000h
2C	2F	Pad Ownership (PAD_OWN_GPP_B_0)—Offset 2Ch	00000000h
30	33	Pad Ownership (PAD_OWN_GPP_B_1)—Offset 30h	00000000h
34	37	Pad Ownership (PAD_OWN_GPP_B_2)—Offset 34h	00000000h
38	3B	Pad Ownership (PAD_OWN_GPP_F_0)—Offset 38h	00000000h
3C	3F	Pad Ownership (PAD_OWN_GPP_F_1)—Offset 3Ch	00000000h
40	43	Pad Ownership (PAD_OWN_GPP_F_2)—Offset 40h	00000000h
60h	63	Pad Configuration Lock (PADCFGLOCK_GPP_A)—Offset 60h	00000000h
64	67	Pad Configuration Lock (PADCFGLOCKTX_GPP_A)—Offset 64h	00000000h
68	6B	Pad Configuration Lock (PADCFGLOCK_GPP_B)—Offset 68h	00000000h
6C	6F	Pad Configuration Lock (PADCFGLOCKTX_GPP_B)—Offset 6Ch	00000000h
70	73	Pad Configuration Lock (PADCFGLOCK_GPP_F)—Offset 70h	00000000h
74	77	Pad Configuration Lock (PADCFGLOCKTX_GPP_F)—Offset 74h	00000000h
80h	83h	Host Software Pad Ownership (HOSTSW_OWN_GPP_A)—Offset 80h	00000000h
84h	87h	Host Software Pad Ownership (HOSTSW_OWN_GPP_B)—Offset 84h	00000000h
88	8Bh	Host Software Pad Ownership (HOSTSW_OWN_GPP_F)—Offset 88h	00000000h
100h	103h	GPI Interrupt Status (GPI_IS_GPP_A)—Offset 100h	00000000h
104h	107h	GPI Interrupt Status (GPI_IS_GPP_B)—Offset 104h	00000000h
108h	10Bh	GPI Interrupt Status (GPI_IS_GPP_F)—Offset 108h	00000000h
110h	113h	GPI Interrupt Enable (GPI_IE_GPP_A)—Offset 110h	00000000h
114h	117h	GPI Interrupt Enable (GPI_IE_GPP_B)—Offset 114h	00000000h

Table 18-3. Summary of GPIO Community 0 Registers (Sheet 2 of 5)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
118h	11Ch	GPI Interrupt Enable (GPI_IE_GPP_F)—Offset 118h	00000000h
120h	123h	GPI General Purpose Events Status (GPI_GPE_STS_GPP_A)—Offset 120h	00000000h
124h	127h	GPI General Purpose Events Status (GPI_GPE_STS_GPP_B)—Offset 124h	00000000h
128h	12Ch	GPI General Purpose Events Status (GPI_GPE_STS_GPP_F)—Offset 128h	00000000h
130h	133h	GPI General Purpose Events Enable (GPI_GPE_EN_GPP_A)—Offset 130h	00000000h
134h	137h	GPI General Purpose Events Enable (GPI_GPE_EN_GPP_B)—Offset 134h	00000000h
138h	13Bh	GPI General Purpose Events Enable (GPI_GPE_EN_GPP_F)—Offset 133h	00000000h
144h	147h	SMI Status (GPI_SMI_STS_GPP_B)—Offset 144h	00000000h
154h	157h	SMI Enable (GPI_SMI_EN_GPP_B)—Offset 154h	00000000h
164h	167h	NMI Status (GPI_NMI_STS_GPP_B)—Offset 164h	00000000h
174h	177h	NMI Enable (GPI_NMI_EN_GPP_B)—Offset 174h	00000000h
400h	403h	Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_0)—Offset 400h	44000700h
404h	407h	Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_0)—Offset 404h	00000018h
408h	40Bh	Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_1)—Offset 408h	44000700h
40Ch	40Fh	Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_1)—Offset 40Ch	000003C9
410h	413h	Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_2)—Offset 410h	44000700h
414h	417h	Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_2)—Offset 414h	00003C1A
418h	41Bh	Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_3)—Offset 418h	44000700h
41Ch	41Fh	Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_3)—Offset 41Ch	00003C1B
420h	423h	Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_4)—Offset 420h	44000700h
424h	427h	Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_4)—Offset 424h	00003C1C
428h	42Bh	Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_5)—Offset 428h	44000700h
42Ch	42Fh	Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_5)—Offset 42Ch	0000001D
430h	433h	Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_6)—Offset 430h	44000700h
434h	437h	Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_6)—Offset 434h	0000001Eh
438h	43Bh	Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_7)—Offset 438h	44000700h
43Ch	43Fh	Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_7)—Offset 43Ch	0000001Fh
440h	443h	Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_8)—Offset 440h	44000700h
444h	447h	Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_8)—Offset 444h	00000020h
448h	44Bh	Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_9)—Offset 448h	44000700h
44Ch	44Fh	Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_9)—Offset 44Ch	00001021h
450h	453h	Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_10)—Offset 450h	44000700h
454h	457h	Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_10)—Offset 454h	00001022h
458h	45Bh	Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_11)—Offset 458h	44000700h
45Ch	45Fh	Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_11)—Offset 45Ch	00003023
460h	463h	Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_12)—Offset 460h	44000300h
464h	467h	Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_12)—Offset 464h	00000024
468h	46Bh	Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_13)—Offset 468h	44000700h
46Ch	46Fh	Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_13)—Offset 46Ch	00000025
470h	473h	Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_14)—Offset 470h	44000300h
474h	477h	Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_14)—Offset 474h	00000026

Table 18-3. Summary of GPIO Community 0 Registers (Sheet 3 of 5)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
478h	47Bh	Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_15)—Offset 478h	44000700h
47Ch	47Fh	Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_15)—Offset 47Ch	00003027h
480h	483h	Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_16)—Offset 480h	44000700h

0	0h RW	**GPI General Purpose Events Enable (GPI_GPE_EN_GPP_F_0):** This bit is used to enable/disable the generation of GPE to cause SCI and/or wake when the corresponding GPI_GPE_STS bit is set. 0 = Disable GPE generation 1 = Enable GPE generation ***Note:*** The pad must also be routed for GPE functionality in order for GPE to be generated i.e., the corresponding GPIRoutSCI must be set to 1.

18.6.33 SMI Status (GPI_SMI_STS_GPP_B)—Offset 144h

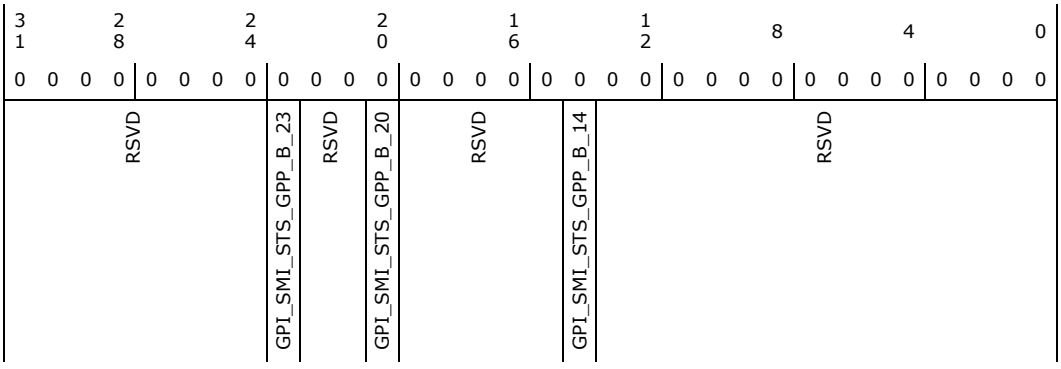
Register bits in this register are implemented for GPP_B signals that have SMI capability only. Other bits are reserved and RO.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved
23	0h RW1C	**GPI SMI Status (GPI_SMI_STS_GPP_B_23):** Same description as bit 14.
22:21	0h RO	Reserved
20	0h RW1C	**GPI SMI Status (GPI_SMI_STS_GPP_B_20):** Same description as bit 14.
19:15	0h RO	Reserved
14	0h RW1C	**GPI SMI Status (GPI_SMI_STS_GPP_B_14):** This bit is set to 1 by hardware when a level event (See RxEdCfg,RxInv) is detected, and all the following conditions are true: - The corresponding pad is used in GPIO input mode. - The corresponding PAD_OWN[2:0] is '000' (i.e., ACPI GPIO Mode). If the following conditions are true, then an SMI will be generated if the GPI_SMI_STS bit is set: 1. The corresponding bit in the GPI_SMI_EN register is set. 2. The corresponding pad's GPIROUTSMI is set. Writing a value of 1 will clear the bit while writing a value of 0 has no effect. 0 = There is no SMI event. 1 = There is an SMI event. The state of GPI_SMI_EN does not prevent the setting of GPI_SMI_STS. Defaults for these bits are dependent on the state of the GPI pads.
13:0	0h RO	Reserved

18.6.34 SMI Enable (GPI_SMI_EN_GPP_B)—Offset 154h

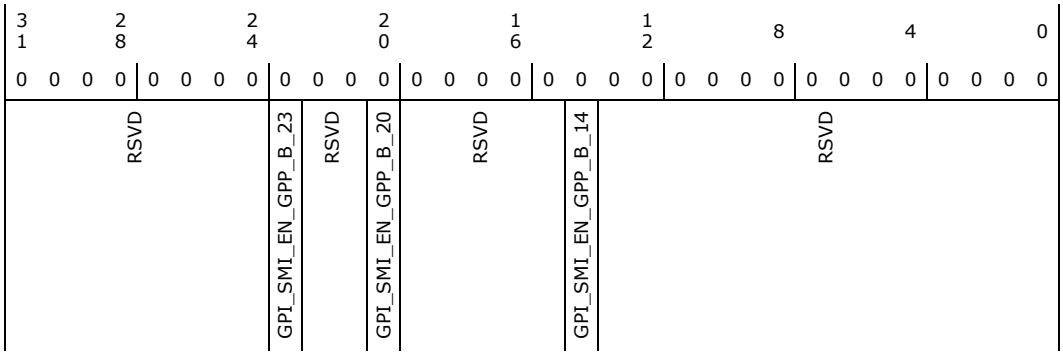
Register bits in this register are implemented for GPP_B signals that have SMI capability only. Other bits are reserved and RO.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved
23	0h RW	**GPI SMI Enable (GPI_SMI_EN_GPP_B_23):** Same description as bit 14.
22:21	0h RO	Reserved
20	0h RW	**GPI SMI Enable (GPI_SMI_EN_GPP_B_20):** Same description as bit 14.
19:15	0h RO	Reserved
14	0h RW	**GPI SMI Enable (GPI_SMI_EN_GPP_B_14):** This bit is used to enable/disable the generation of SMI when the corresponding GPI_SMI_STS bit is set. The pad must also be routed for SMI functionality in order for SMI to be generated, i.e., the corresponding GPIROUTSMI must be set to 1. 0 = Disable SMI generation 1 = Enable SMI generation ***Note:*** Each of the bit is lock-able dependent on the associated Pad Configuration register PadCfgLock setting. For example, if the PadCfgLock of pad0 is 1, bit 0 of this bit is locked down to read-only.
13:0	0h RO	Reserved

18.6.35 NMI Status (GPI_NMI_STS_GPP_B)—Offset 164h

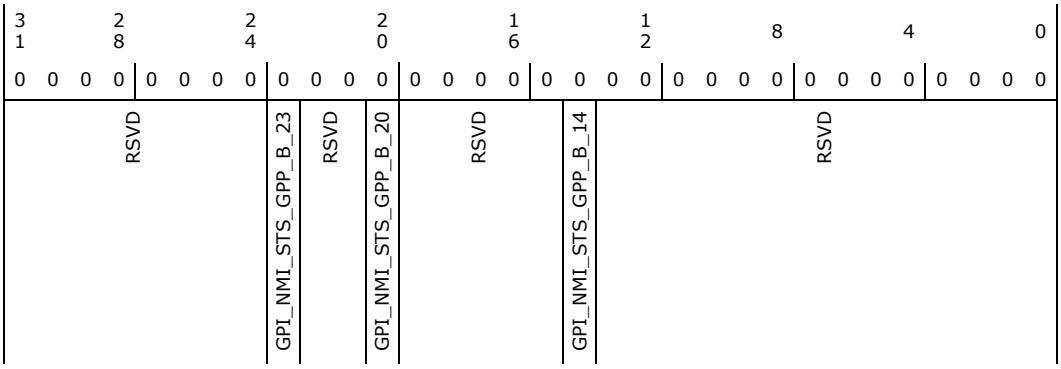
Register bits in this register are implemented for GPP_B signals that have NMI capability only. Other bits are reserved and RO.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved
23	0h RW1C	**GPI NMI Status (GPI_NMI_STS_GPP_B_23):** Same description as bit 14.
22:21	0h RO	Reserved
20	0h RW1C	**GPI NMI Status (GPI_NMI_STS_GPP_B_20):** Same description as bit 14.
19:15	0h RO	Reserved
14	0h RW1C	**GPI NMI Status (GPI_NMI_STS_GPP_B_14):** This bit is set to 1 by hardware when an edge event is detected (See RxEdCfg, RxInv) on pad and all the following conditions are true: - The corresponding pad is used in GPIO input mode (PMode). - The corresponding GPIONMIRout is set to 1, i.e., programmed to route as NMI. - The corresponding GPIOOwn[2:0] is '000' (i.e. ACPI GPIO Mode). - The corresponding GPI_NMI_EN is set. Writing a value of 1 will clear the bit while writing a value of 0 has no effect. 0 = There is no NMI event. 1 = There is an NMI event.
13:0	0h RO	Reserved

18.6.36 NMI Enable (GPI_NMI_EN_GPP_B)—Offset 174h

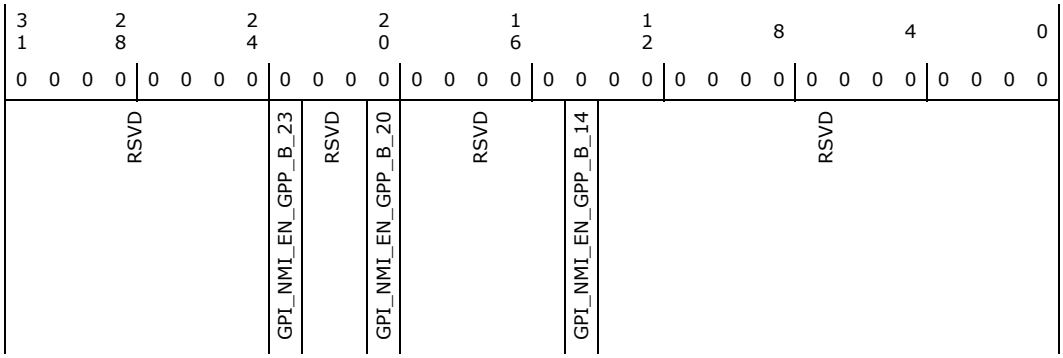
Register bits in this register are implemented for GPP_B signals that have NMI capability only. Other bits are reserved and RO.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved
23	0h RW	**GPI NMI Enable (GPI_NMI_EN_GPP_B_23):** Same description as bit 14.
22:21	0h RO	Reserved
20	0h RW	**GPI NMI Enable (GPI_NMI_EN_GPP_B_20):** Same description as bit 14.
19:15	0h RO	Reserved
14	0h RW	**GPI NMI Enable (GPI_NMI_EN_GPP_B_14):** This bit is used to enable/disable the generation of NMI when the corresponding GPI_NMI_STS bit is set and its GPIROUTNMI is set. 0 = Disable NMI generation 1 = Enable NMI generation Each bit is lock-able dependent on the associated Pad Configuration register PadCfgLock setting. For example, if the PadCfgLock of pad0 is 1, bit 0 of this bit is locked down to read-only.
13:0	0h RO	Reserved

18.6.37 Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_0)—Offset 400h

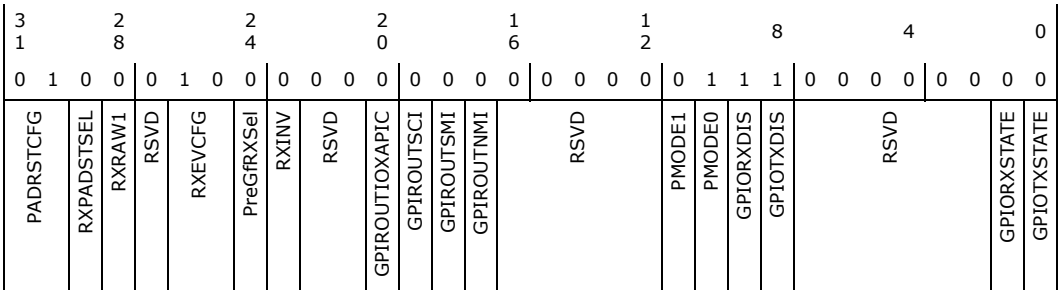
This register applies to GPP_A0.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000700h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0s in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

18.6.38 Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_0)—Offset 404h

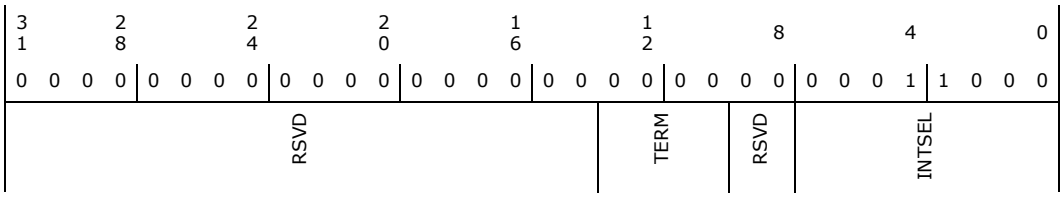
This register applies to GPP_A0.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 18h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	18h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

18.6.39 Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_1)—Offset 408h

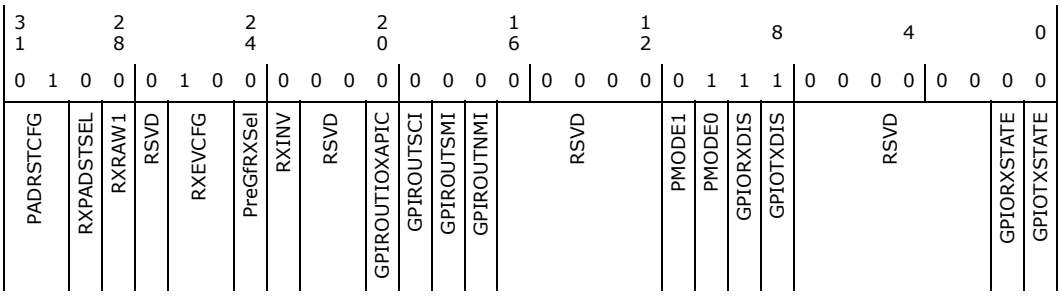
This register applies to GPP_A1.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000700h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ. 1 = Routing can cause peripheral IRQ. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

18.6.40 Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_1)—Offset 40Ch

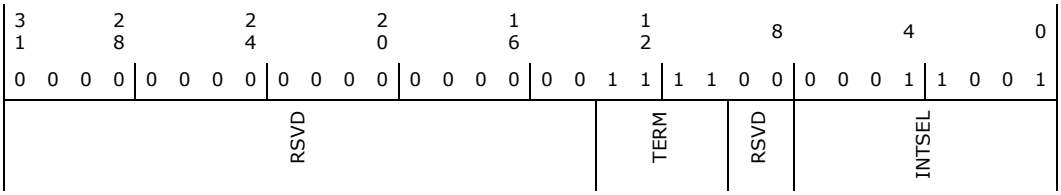
This register applies to GPP_A1.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 00003C19h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	Fh RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1010: 5k pu 1100: 20k pu 1111: Native controller selected in Pad mode All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	19h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

18.6.41 Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_2)—Offset 410h

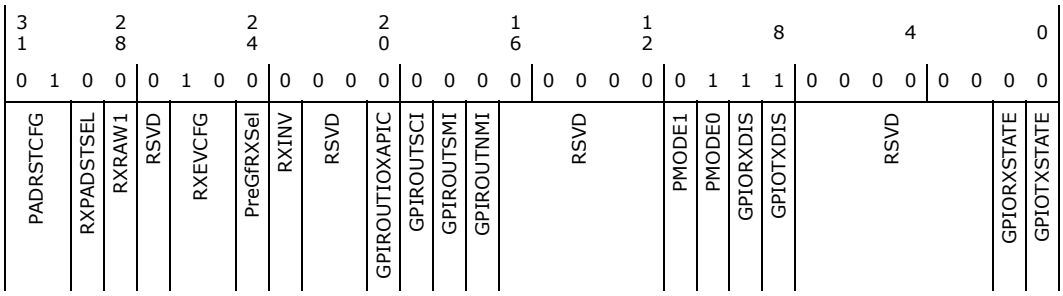
This register applies to GPP_A2.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000700h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	Reserved

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

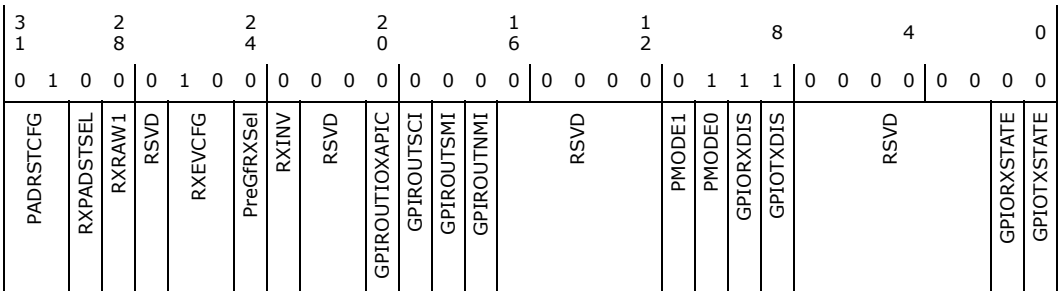
Default: 44000700h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

18.6.48 Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_5)—Offset 42Ch

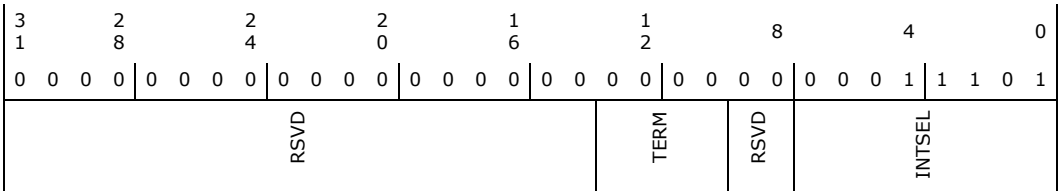
This register applies to GPP_A5.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 1Dh



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	1Dh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

18.6.49 Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_6)—Offset 430h

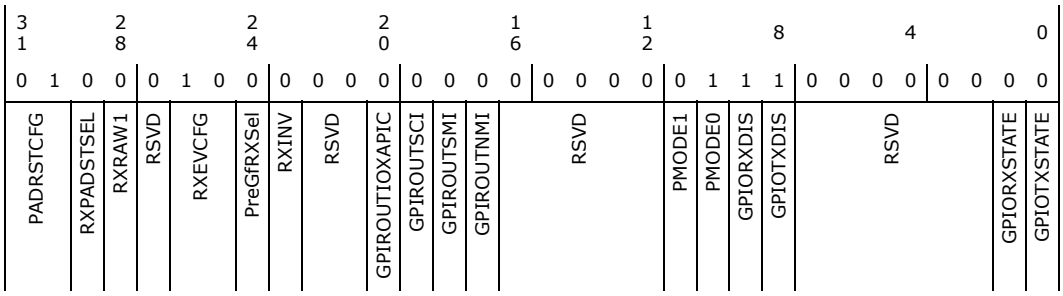
This register applies to GPP_A6.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000700h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

18.6.50 Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_6)—Offset 434h

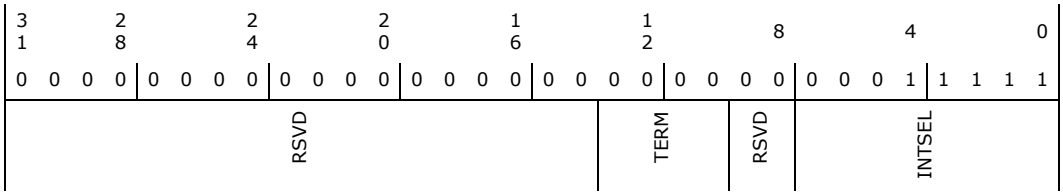
This register applies to GPP_A6

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 1Eh



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. 24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ. 1 = Routing can cause peripheral IRQ. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

18.6.54 Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_8)—Offset 444h

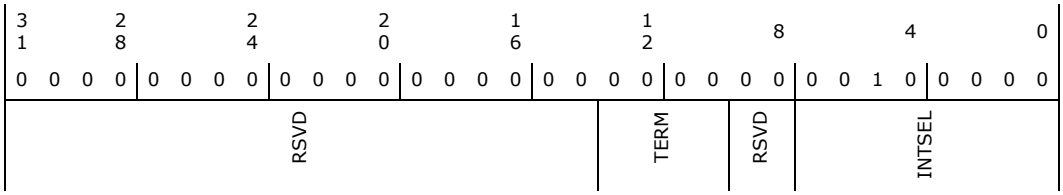
This register applies to GPP_A8.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 20h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	20h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

18.6.55 Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_9)—Offset 448h

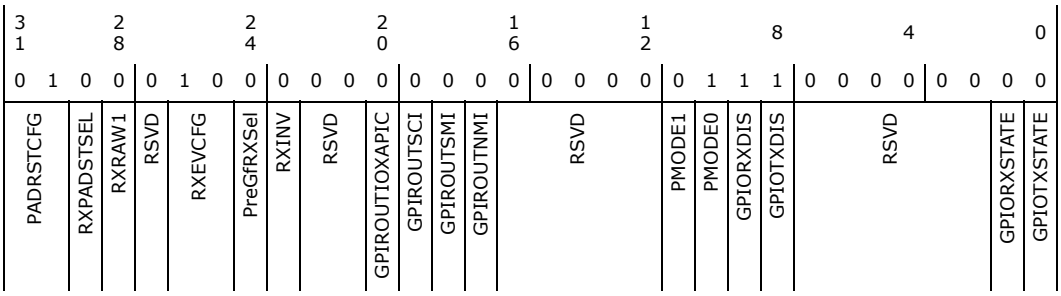
This register applies to GPP_A9.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000700h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ. 1 = Routing can cause peripheral IRQ. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e., Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ. 1 = Routing can cause peripheral IRQ. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

18.6.62 Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_12)—Offset 464h

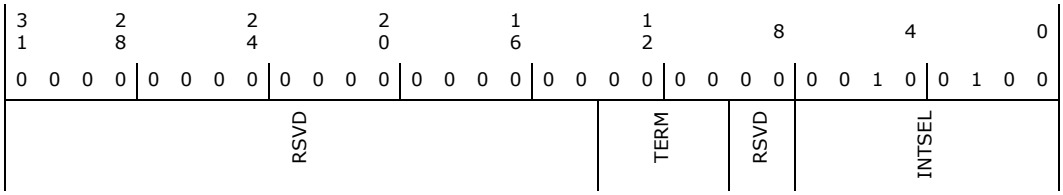
This register applies to GPP_A12.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 24h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	24h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

18.6.68 Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_15)—Offset 47Ch

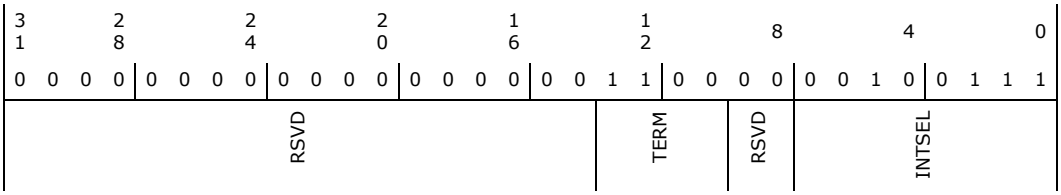
This register applies to GPP_A15.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 00003027h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	1100b RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	27h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

18.6.69 Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_16)—Offset 480h

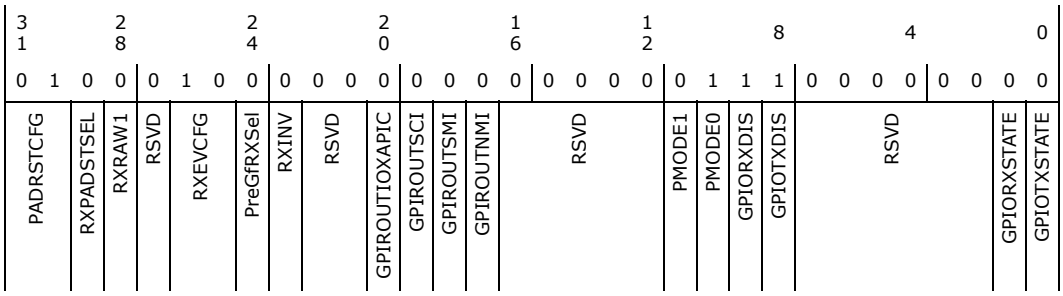
This register applies to GPP_A16.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000700h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e., Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved.
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ. 1 = Routing can cause peripheral IRQ. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

18.6.76 Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_19)—Offset 49Ch

This register applies to GPP_A19.

Access Method

Type: MSG Register

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

18.6.82 Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_22)—Offset 4B4h

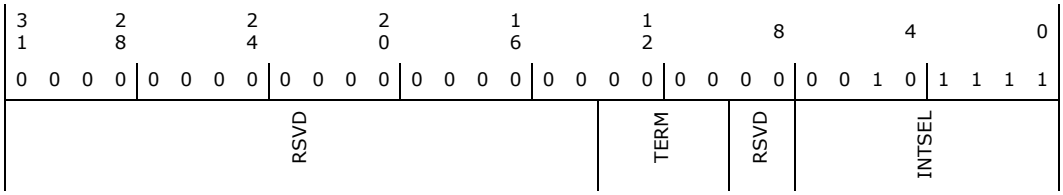
This register applies to GPP_A22.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 2Eh



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	2Eh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

18.6.83 Pad Configuration DW0 (PAD_CFG_DW0_GPP_A_23)—Offset 4B8h

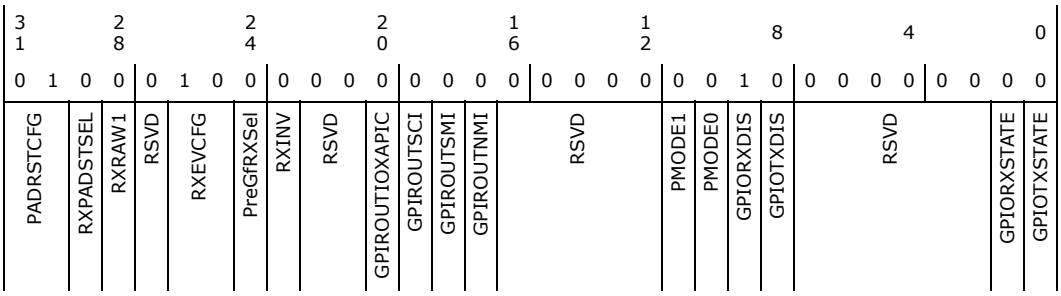
This register applies to GPP_A23.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000200h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	0b RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

18.6.84 Pad Configuration DW1 (PAD_CFG_DW1_GPP_A_23)—Offset 4BCh

This register applies to GPP_A23.

This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	35h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

18.6.97 Pad Configuration DW0 (PAD_CFG_DW0_GPP_B_6)—Offset 4F0h

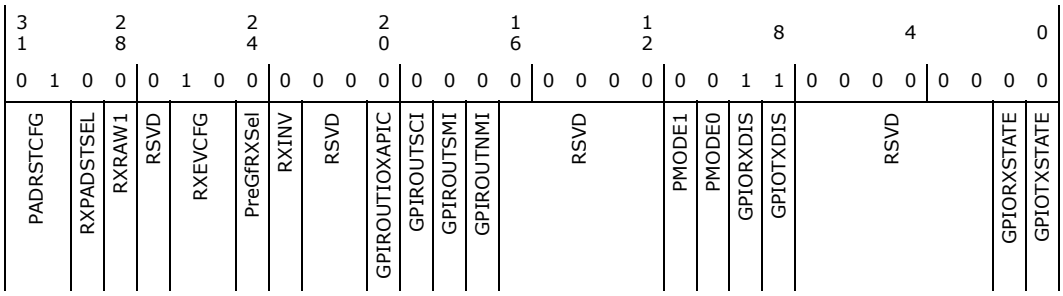
This register applies to GPP_B6.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000300h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

18.6.104 Pad Configuration DW1 (PAD_CFG_DW1_GPP_B_9)—Offset 50Ch

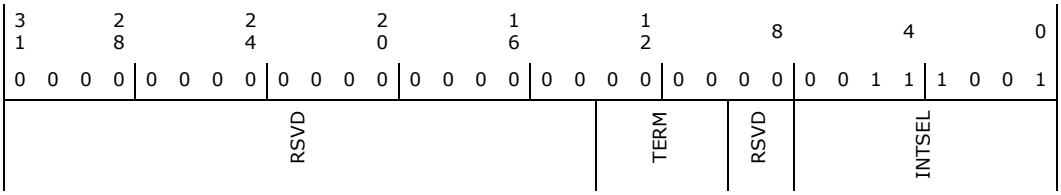
This register applies to GPP_B9.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 39h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	39h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

18.6.105 Pad Configuration DW0 (PAD_CFG_DW0_GPP_B_10)—Offset 510h

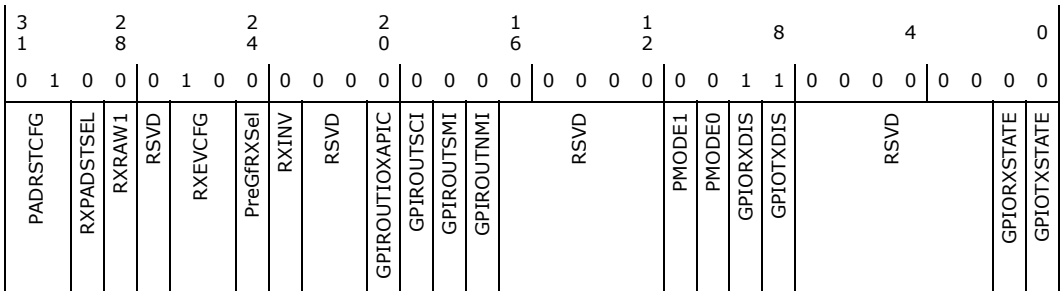
This register applies to GPP_B10.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000300h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

7:0	3Ch RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

18.6.111 Pad Configuration DW0 (PAD_CFG_DW0_GPP_B_13)—Offset 528h

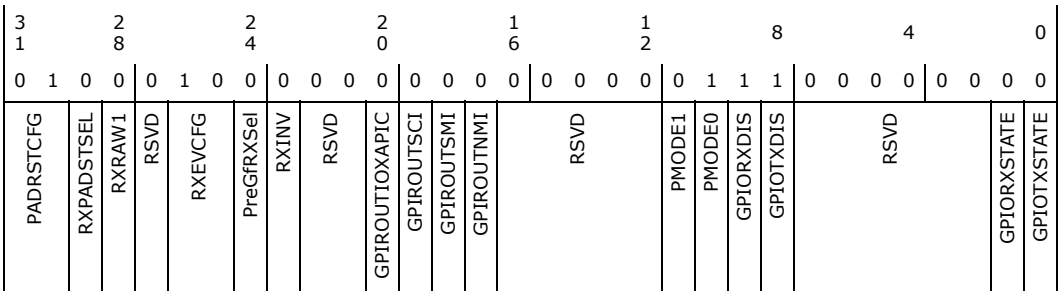
This register applies to GPP_B13.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000700h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

18.6.118 Pad Configuration DW1 (PAD_CFG_DW1_GPP_B_16)—Offset 544h

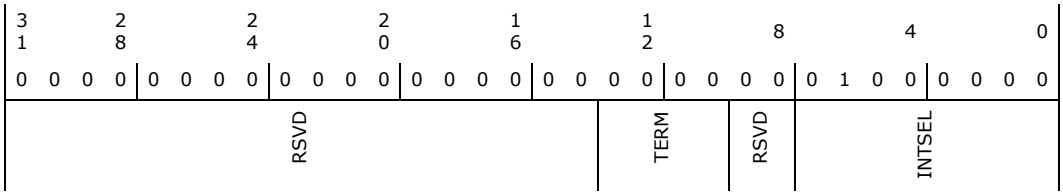
This register applies to GPP_B16.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 40h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	40h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

18.6.119 Pad Configuration DW0 (PAD_CFG_DW0_GPP_B_17)—Offset 548h

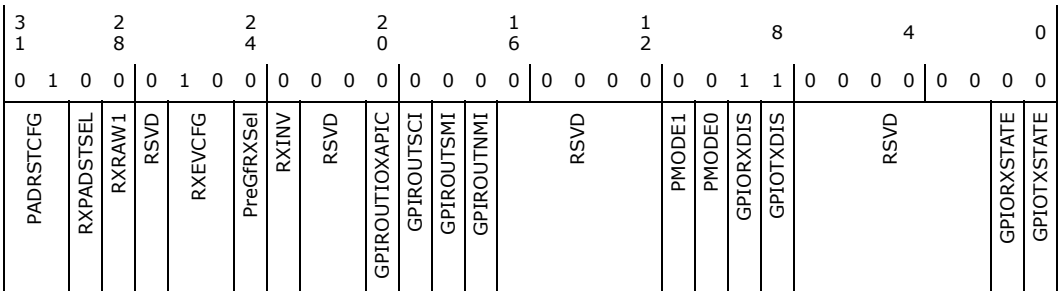
This register applies to GPP_B17.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000300h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

18.6.126 Pad Configuration DW1 (PAD_CFG_DW1_GPP_B_20)—Offset 564h

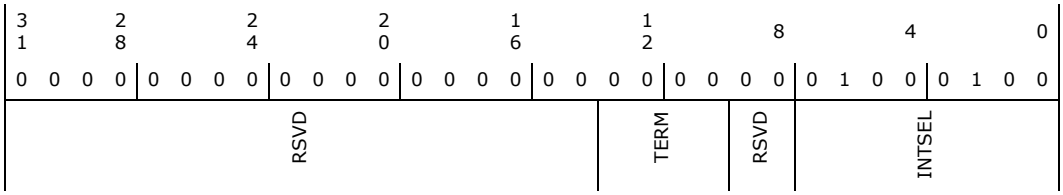
This register applies to GPP_B20.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	44h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	0b RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

18.6.132 Pad Configuration DW1 (PAD_CFG_DW1_GPP_B_23)—Offset 57Ch

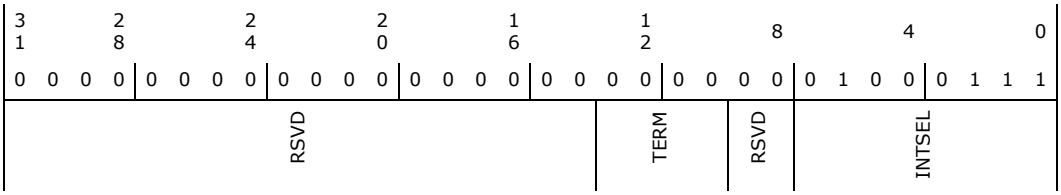
This register applies to GPP_B23.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 47h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	47h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

18.6.133 Pad Configuration DW0 (PAD_CFG_DW0_GPP_F_0)—Offset 580h

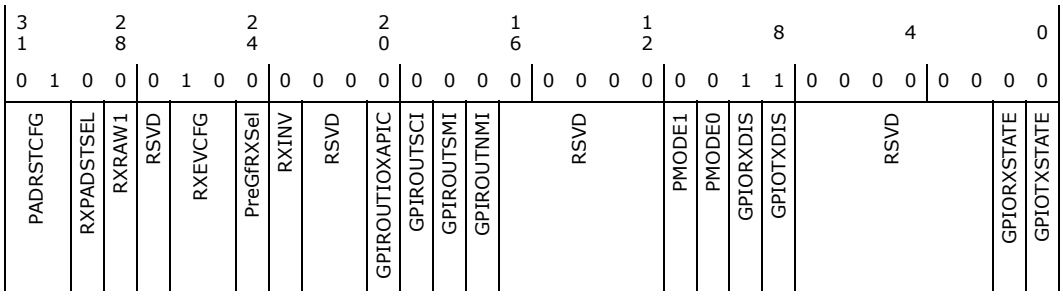
This register applies to GPP_F0.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000300h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

18.6.140 Pad Configuration DW1 (PAD_CFG_DW1_GPP_F_3)—Offset 59Ch

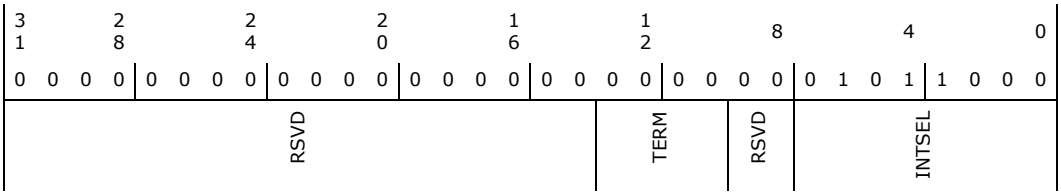
This register applies to GPP_F3.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 58h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	58h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

18.6.146 Pad Configuration DW1 (PAD_CFG_DW1_GPP_F_6)—Offset 5B4h

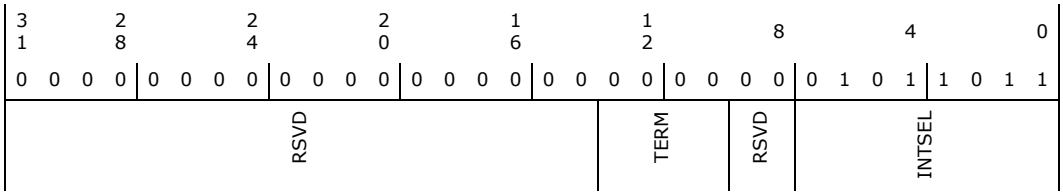
This register applies to GPP_F6.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 5Bh



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	5Bh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

18.6.147 Pad Configuration DW0 (PAD_CFG_DW0_GPP_F_7)—Offset 5B8h

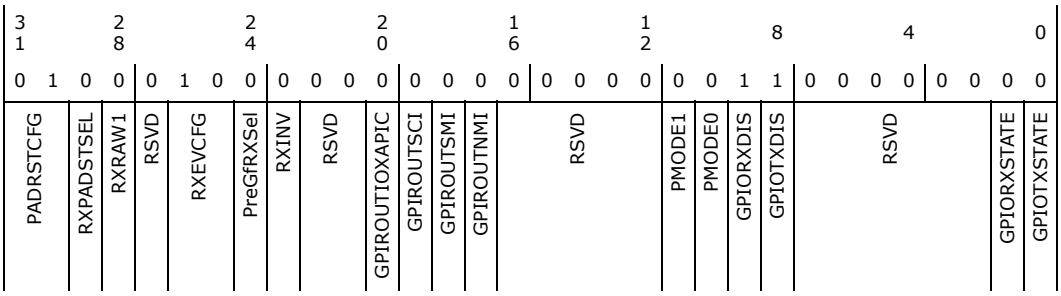
This register applies to GPP_F7.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000300h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

18.6.148 Pad Configuration DW1 (PAD_CFG_DW1_GPP_F_7)—Offset 5BCh

This register applies to GPP_F7.

This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

18.6.154 Pad Configuration DW1 (PAD_CFG_DW1_GPP_F_10)—Offset 5D4h

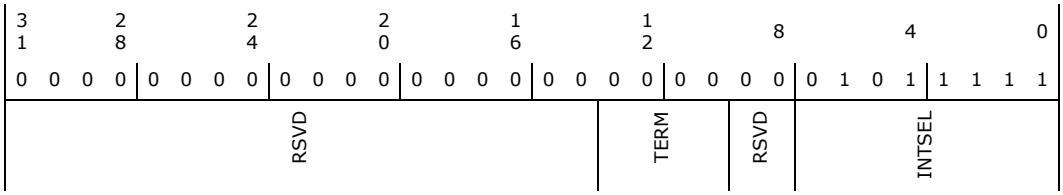
This register applies to GPP_F10.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 5Fh



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	5Fh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	62h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

18.6.161 Pad Configuration DW0 (PAD_CFG_DW0_GPP_F_14)—Offset 5F0h

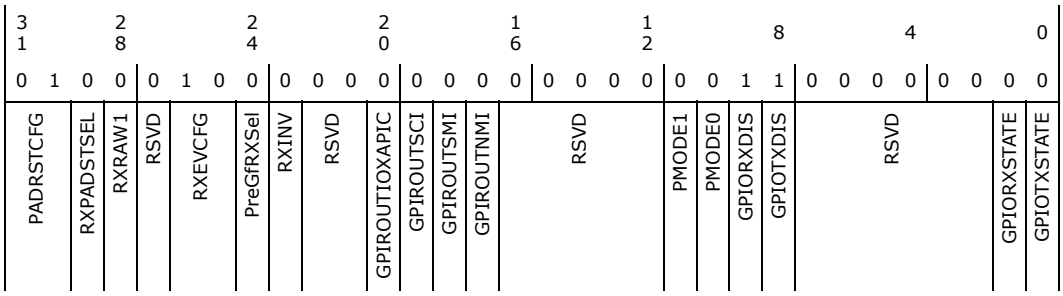
This register applies to GPP_F14.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000300h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

18.6.168 Pad Configuration DW1 (PAD_CFG_DW1_GPP_F_17)—Offset 60Ch

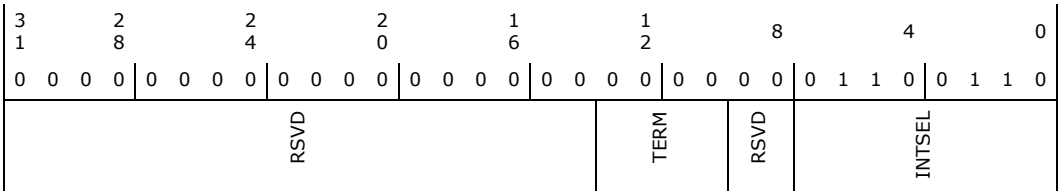
This register applies to GPP_F17.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 66h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	66h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

18.6.169 Pad Configuration DW0 (PAD_CFG_DW0_GPP_F_18)—Offset 610h

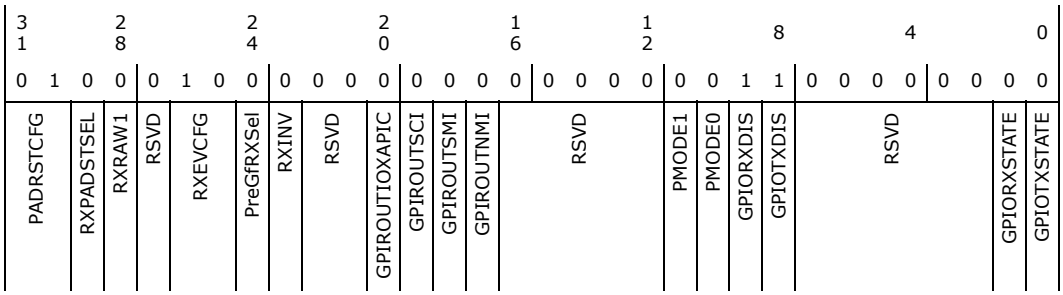
This register applies to GPP_F18.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000300h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	69h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

18.6.175 Pad Configuration DW0 (PAD_CFG_DW0_GPP_F_21)—Offset 628h

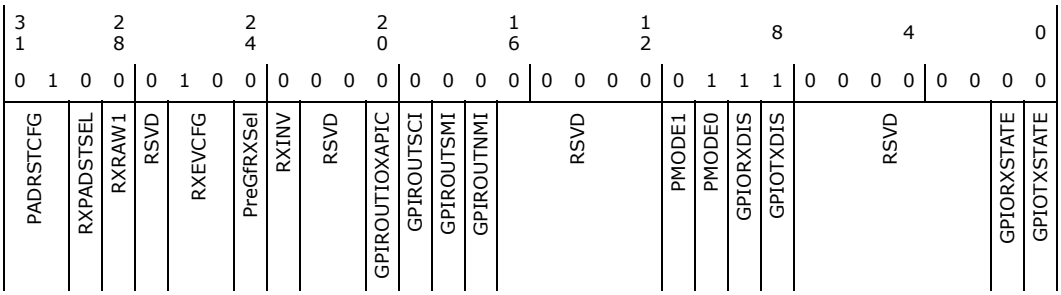
This register applies to GPP_F21.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000700h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

18.6.176 Pad Configuration DW1 (PAD_CFG_DW1_GPP_F_21)—Offset 62Ch

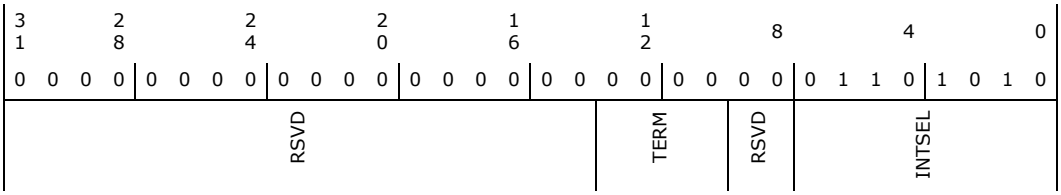
This register applies to GPP_F21.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 6Ah



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	6Ah RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max. IOxAPIC IRQ supported

18.6.177 Pad Configuration DW0 (PAD_CFG_DW0_GPP_F_22)—Offset 630h

This register applies to GPP_F22.

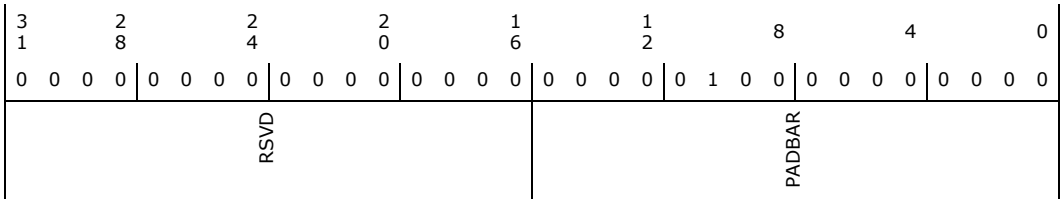
18.7.1 Pad Base Address (PADBAR)—Offset Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 400h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved
15:0	400h RO	**Pad Base Address (PADBAR):** This field provides the starting byte-align address of Pad0 register sets. It is meant for software to discover from where the very first Pad register (i.e. Pad0 register) starts to compute the next Pad address offsets.

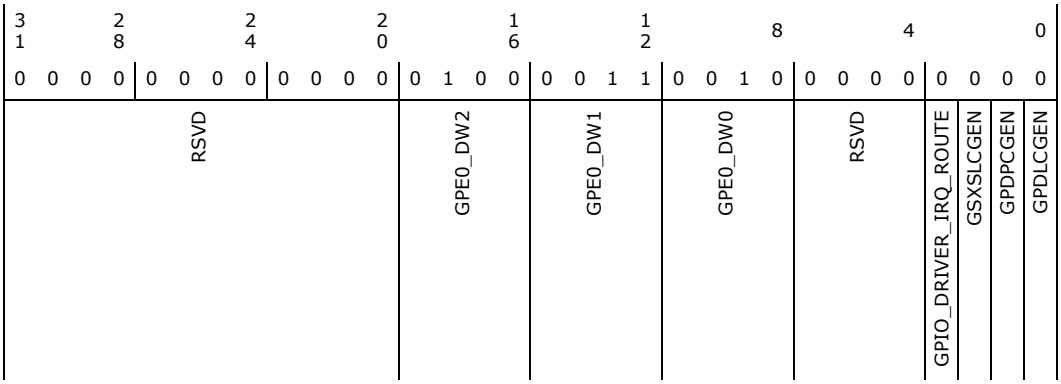
18.7.2 Miscellaneous Configuration (MISCCFG)—Offset 10h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 43200h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	Reserved

2	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPP_E_2):** Applied to GPP_E2. Same description as bit 0.
1	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPP_E_1):** Applied to GPP_E1. Same description as bit 0.
0	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPP_E_0):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) When PadCfgLockTx is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lock down.

18.7.32 SMI Status (GPI_SMI_STS_GPP_C_0)—Offset 140h

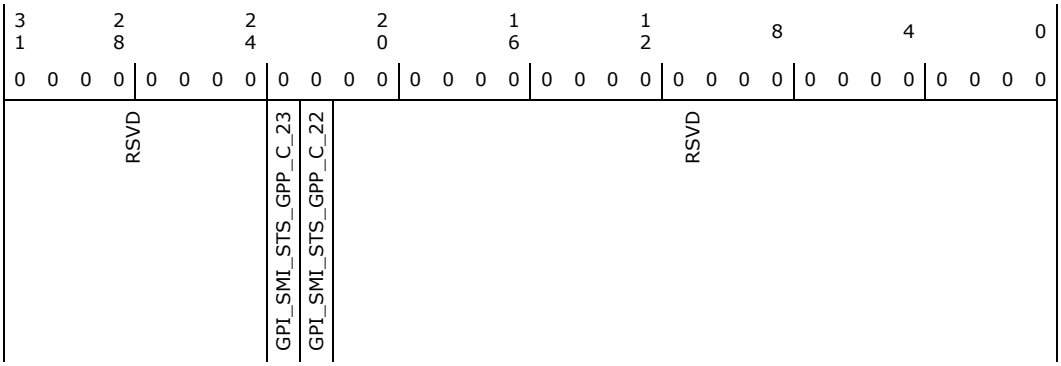
Register bits in this register are implemented for GPP_C signals that have SMI capability only. Other bits are reserved and RO.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved
23	0h RW1C	**GPI SMI Status (GPI_SMI_STS_GPP_C_23):** Same description as bit 22.
22	0h RW1C	**GPI SMI Status (GPI_SMI_STS_GPP_C_22):** This bit is set to 1 by hardware when a level event (See RxEdCfg,RxInv) is detected, and all the following conditions are true: - The corresponding pad is used in GPIO input mode - The corresponding PAD_OWN[2:0] is '000' (i.e. ACPI GPIO Mode). If the following conditions are true, then an SMI will be generated if the GPI_SMI_STS bit is set: 1. The corresponding bit in the GPI_SMI_EN register is set 2. The corresponding pad's GPIROUTSMI is set Writing a value of 1 will clear the bit while writing a value of 0 has no effect. 0 = There is no SMI event 1 = There is an SMI event The state of GPI_SMI_EN does not prevent the setting of GPI_SMI_STS. Defaults for these bits are dependent on the state of the GPI pads.
21:0	0h RO	Reserved.

18.7.33 SMI Status (GPI_SMI_STS_GPP_D_0)—Offset 144h

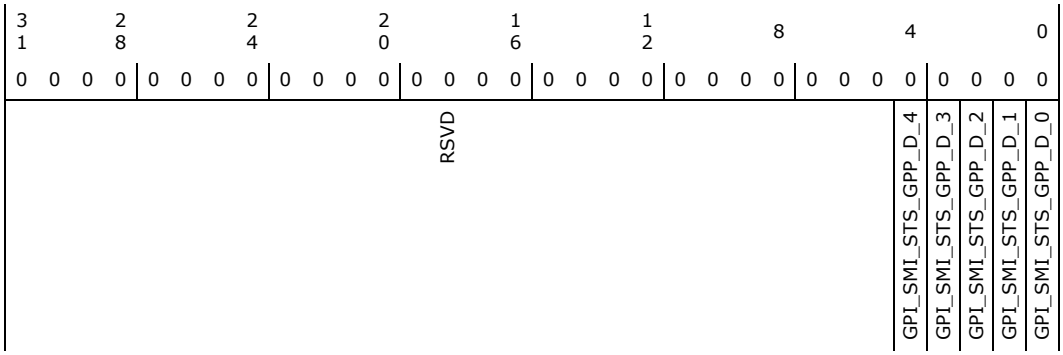
Register bits in this register are implemented for GPP_D signals that have SMI capability only. Other bits are reserved and RO.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description

E.g. if the PadCfgLock of pad0 is '1', bit0 of this bit is locked down to read-only.

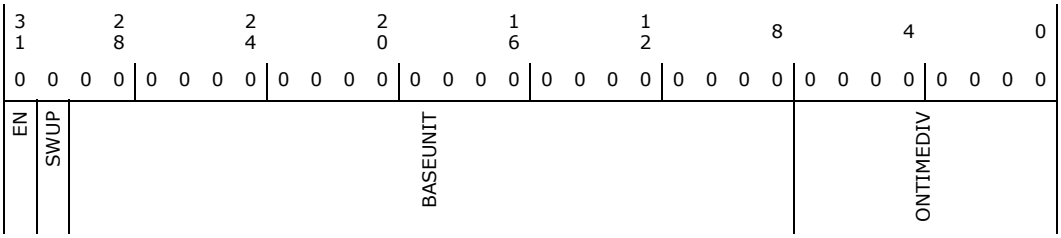
18.7.44 PWM Control (PWMC)—Offset 204h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable (EN):** 0 = Disable PWM Output 1 = Enable PWM Output
30	0h RW	**Software Update (SWUP):** Indication that there is an update to PWM settings pending. SW sets this bit to 1 when updating the PWM_base_unit or PWM_on_time_divisor fields. The PWM module will apply the new settings at the end of the current cycle and reset this bit. 0 = No updates pending 1 = Update pending
29:8	0h RW	**Base Unit (BASEUNIT):** Unsigned 8 integer bits, 14 fraction bits. Used to determine PWM output frequency. The PWM base frequency for the PCH is 32.768 kHz.
7:0	0h RW	**On Time Divisor (ONTIMEDIV):** On Time Divisor (OnTimeDiv) PWM duty cycle = PWM_on-time_divisor/256.

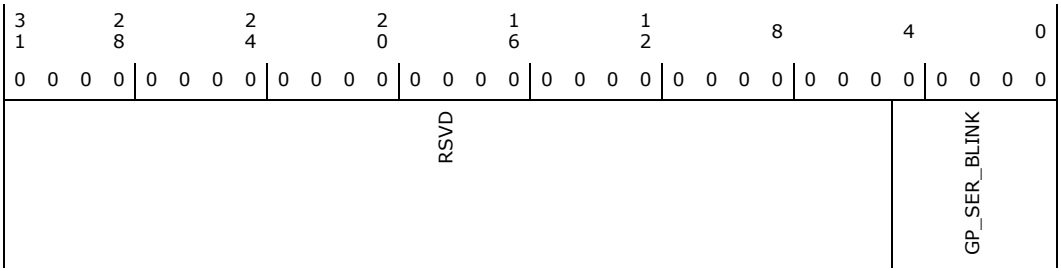
18.7.45 GPIO Serial Blink Enable (GP_SER_BLINK)—Offset 20Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	Reserved
4:0	0h RW	**GP SER BLINK (GP_SER_BLINK):** The setting of this bit has no effect if the corresponding GPIO is programmed as an input, if the corresponding GPIO has the PWM enabled, or if Serial Blink capability does not exist. This bit should be set to a 1 before output buffer is enabled. When set to a '0', the corresponding GPIO will function normally. This bit should be set to a 1 while the corresponding PMode bit is set to 0h (GPIO Mode). Setting the PMode bit to other value (non-GPIO Mode) after the GP_SER_BLINK bit ensures PCH will not drive a 1 on the pin as an output. When this corresponding bit is set to a 1 and the pin is configured to output mode, the serial blink capability is enabled and the programmed message is serialized out through an open-drain buffer configuration. The value of the corresponding GPIOTxState bit remains unchanged and does not impact the serial blink capability in any way. Writes to this register have no effect when the corresponding pin is configured in native mode and the read value returned is undefined. Bit0 = GPP_D0 Bit1 = GPP_D1 Bit2 = GPP_D2 Bit3 = GPP_D3 Bit4 = GPP_D4

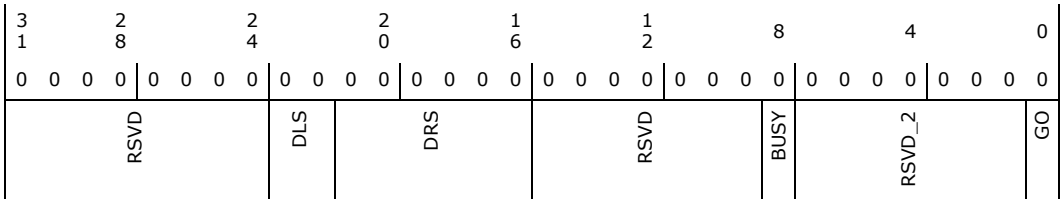
18.7.46 GPIO Serial Blink Command/Status (GP_SER_CMDSTS)—Offset 210h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved
23:22	0h RW	**Data Length Select (DLS):** This read/write field determines the number of bytes to serialize on GPIO 00: Serialize bits 7:0 of GP_GB_DATA (1 byte) 01: Serialize bits 15:0 of GP_GB_DATA (2 bytes) 10: Undefined - Software must not write this value 11: Serialize bits 31:0 of GP_GB_DATA (4 bytes) Software should not modify the value in this register unless the Busy bit
21:16	0h RW	**Data Rate Select (DRS):** Data Rate Select (DRS): This read/write field selects the number of 333.34 ns (4 clock periods 12 MHz clock) time intervals to count between Manchester data transitions. The default of 8h results in a 2666.67 ns minimum time between transitions. A value of 0h in this register produces undefined behavior. Software should not modify the value in this register unless the Busy bit is clear.
15:9	0h RO	Reserved

Bit Range	Default & Access	Field Name (ID): Description
8	0h RO	**Busy (BUSY):** Busy: This read-only status bit is the hardware indication that a serialization is in progress. Hardware sets this bit to 1 based on the Go bit being set. Hardware clears this bit when the Go bit is cleared by the hardware.
7:1	0h RO	**Reserved (RSVD_2)**
0	0h RW	**Go (GO):** Go: This bit is set to 1 by software to start the serialization process. Hardware clears the bit after the serialized data is sent. Writes of 0 to this register have no effect. Software should not write this bit to 1 unless the Busy status bit is cleared.

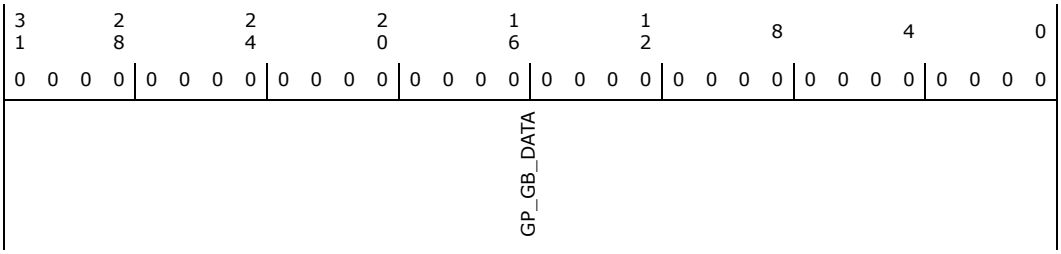
18.7.47 GPIO Serial Blink Data (GP_SER_DATA)—Offset 214h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GP Serial Blink Data (GP_GB_DATA):** GP_GB_DATA This read-write register contains the data serialized out. The number of bits shifted out is selected through the DLS field in the GP_GB_CMDSTS register. This register should not be modified by software when the Busy bit is set.

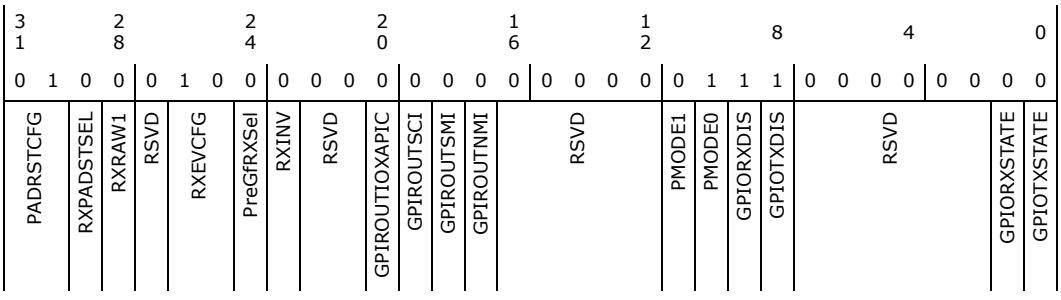
18.7.48 Pad Configuration DW0 (PAD_CFG_DW0_GPP_C_0)—Offset 400h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000700h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

18.7.49 Pad Configuration DW1 (PAD_CFG_DW1_GPP_C_0)—Offset 404h

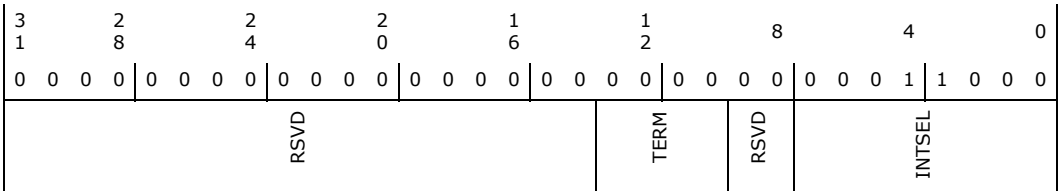
This register applies to GPP_C0.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 18h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	18h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	1Ah RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

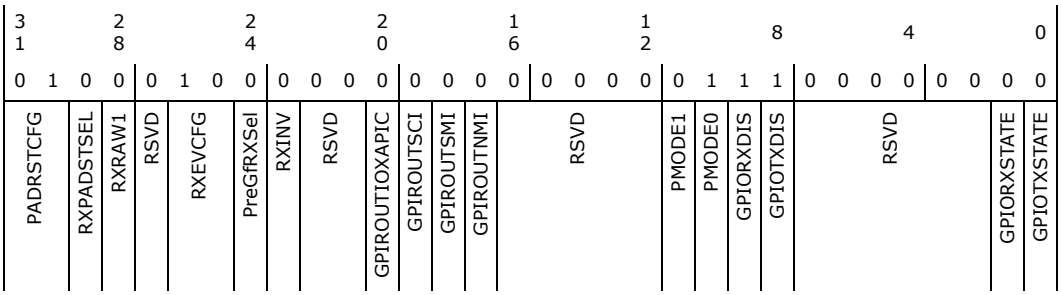
18.7.54 Pad Configuration DW0 (PAD_CFG_DW0_GPP_C_3)—Offset 418h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000700h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved**
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

(Size: 32 bits)

Device:
Function:

Default: 44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

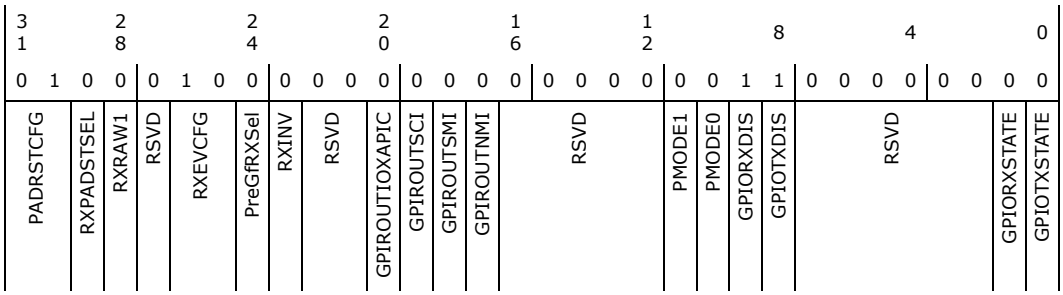
Default: 44000300h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

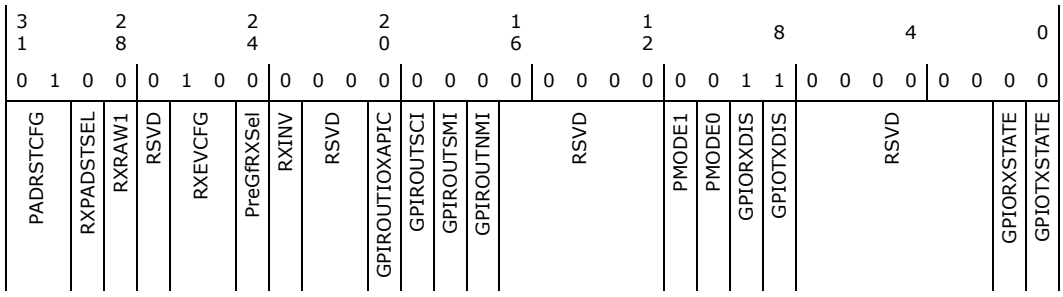
Default: 44000300h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.

(Size: 32 bits)

Device:
Function:

Default: 36h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	36h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

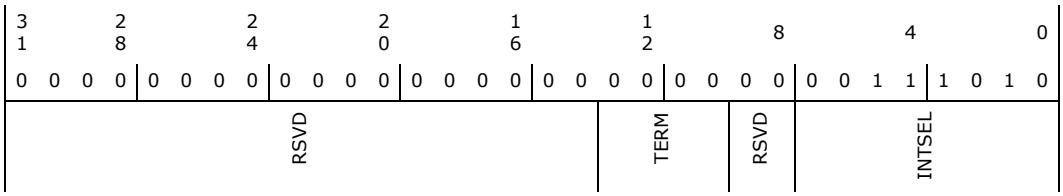
18.7.117 Pad Configuration DW1 (PAD_CFG_DW1_GPP_D_10)—Offset 514h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 3Ah



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	3Ah RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad;i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

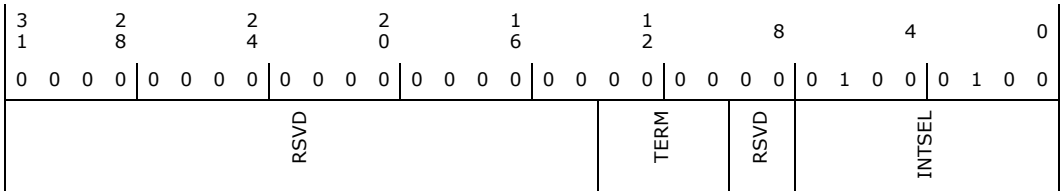
18.7.137 Pad Configuration DW1 (PAD_CFG_DW1_GPP_D_20)—Offset 564h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	44h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

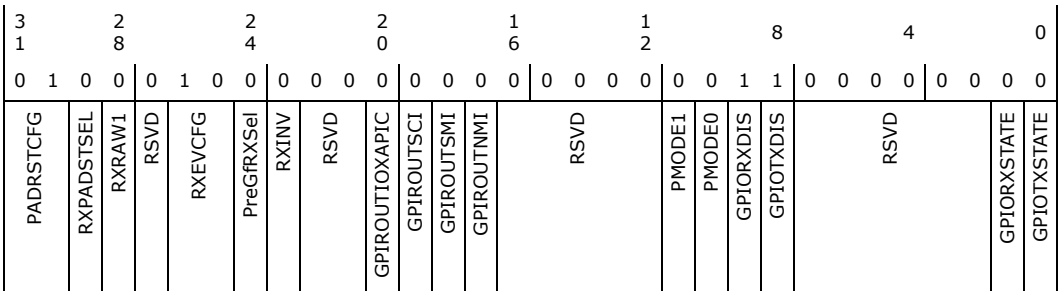
18.7.138 Pad Configuration DW0 (PAD_CFG_DW0_GPP_D_21)—Offset 568h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000300h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.
