0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

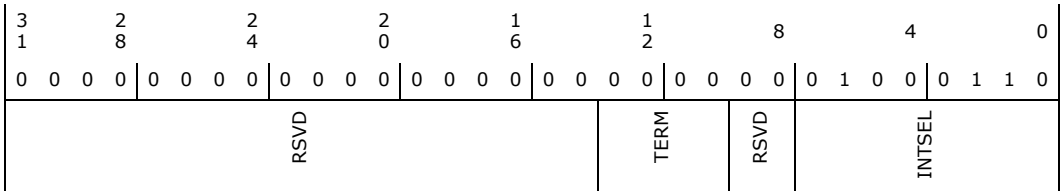
18.7.141 Pad Configuration DW1 (PAD_CFG_DW1_GPP_D_22)—Offset 574h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 46h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	46h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

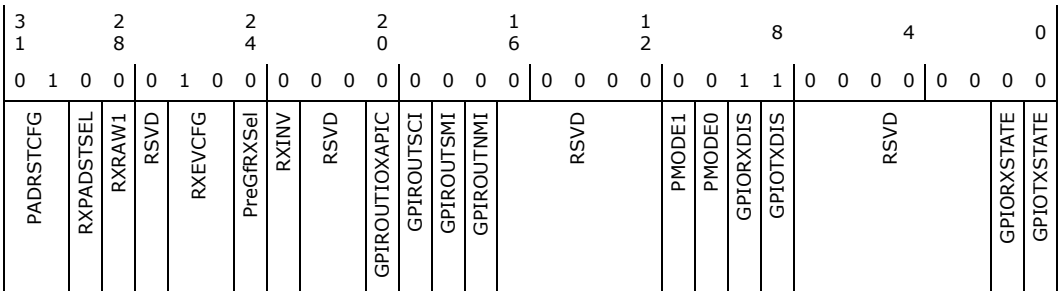
18.7.142 Pad Configuration DW0 (PAD_CFG_DW0_GPP_D_23)—Offset 578h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000300h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

18.7.149 Pad Configuration DW1 (PAD_CFG_DW1_GPP_E_2)—Offset 594h

Access Method

Type: MSG Register
(Size: 32 bits)

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved

Bit Range	Default & Access	Field Name (ID): Description
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad.

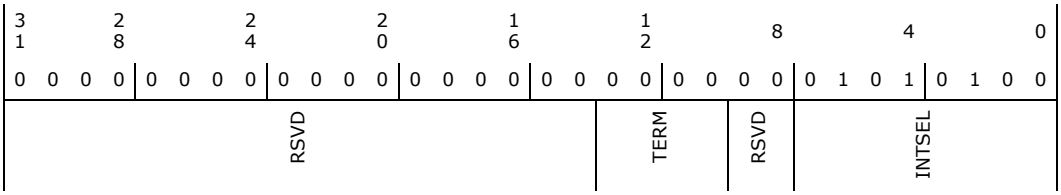
18.7.169 Pad Configuration DW1 (PAD_CFG_DW1_GPP_E_12)—Offset 5E4h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 54h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	54h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

18.8 GPIO Community 2 Registers Summary

Community 2 Registers are for GPP_DSW group.

Table 18-5. Summary of GPIO Community 2 Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
Ch	Fh	Pad Base Address (PADBAR)—Offset Ch	00000400h
10h	13h	Miscellaneous Configuration (MISCCFG)—Offset 10h	00043900h
20h	23h	Pad Ownership (PAD_OWN_GPD_0)—Offset 20h	00000000h
24h	27h	Pad Ownership (PAD_OWN_GPD_1)—Offset 24h	00000000h
60h	63h	Pad Configuration Lock (PADCFGLOCK_GPD_0)—Offset 60h	00000000h
64h	67h	Pad Configuration Lock (PADCFGLOCKTX_GPD_0)—Offset 64h	00000000h
80h	83h	Host Software Pad Ownership (HOSTSW_OWN_GPD_0)—Offset D0h	00000000h
100h	103h	GPI Interrupt Status (GPI_IS_GPD_0)—Offset 100h	00000000h
110h	113h	GPI Interrupt Enable (GPI_IE_GPD_0)—Offset 110h	00000000h
120h	123h	GPI General Purpose Events Status (GPI_GPE_STS_GPD_0)—Offset 120h	00000000h
130h	133h	GPI General Purpose Events Enable (GPI_GPE_EN_GPD_0)—Offset 130h	00000000h
400h	403h	Pad Configuration DW0 (PAD_CFG_DW0_GPD_0)—Offset 400h	4000700h
404h	407h	Pad Configuration DW1 (PAD_CFG_DW1_GPD_0)—Offset 404h	00000018h
408h	40Bh	Pad Configuration DW0 (PAD_CFG_DW0_GPD_1)—Offset 408h	4000700h
40Ch	40Fh	Pad Configuration DW1 (PAD_CFG_DW1_GPD_1)—Offset 40Ch	00003C19h
410h	413h	Pad Configuration DW0 (PAD_CFG_DW0_GPD_2)—Offset 410h	4000700h
414h	417h	Pad Configuration DW1 (PAD_CFG_DW1_GPD_2)—Offset 414h	00003C1Ah
418h	41Bh	Pad Configuration DW0 (PAD_CFG_DW0_GPD_3)—Offset 418h	4000700h
41Ch	41Fh	Pad Configuration DW1 (PAD_CFG_DW1_GPD_3)—Offset 41Ch	00003C1Bh
420h	423h	Pad Configuration DW0 (PAD_CFG_DW0_GPD_4)—Offset 420h	4000600h
424h	427h	Pad Configuration DW1 (PAD_CFG_DW1_GPD_4)—Offset 424h	0000001Ch
428h	42Bh	Pad Configuration DW0 (PAD_CFG_DW0_GPD_5)—Offset 428h	4000600h
42Ch	42Fh	Pad Configuration DW1 (PAD_CFG_DW1_GPD_5)—Offset 42Ch	0000001Dh
430h	433h	Pad Configuration DW0 (PAD_CFG_DW0_GPD_6)—Offset 430h	4000600h
434h	437h	Pad Configuration DW1 (PAD_CFG_DW1_GPD_6)—Offset 434h	0000001Eh
438h	43Bh	Pad Configuration DW0 (PAD_CFG_DW0_GPD_7)—Offset 438h	4000601h
43Ch	43Fh	Pad Configuration DW1 (PAD_CFG_DW1_GPD_7)—Offset 43Ch	0000001Fh
440h	443h	Pad Configuration DW0 (PAD_CFG_DW0_GPD_8)—Offset 440h	4000700h
444h	447h	Pad Configuration DW1 (PAD_CFG_DW1_GPD_8)—Offset 444h	00000020h
448h	44Bh	Pad Configuration DW0 (PAD_CFG_DW0_GPD_9)—Offset 448h	4000600h
44Ch	44Fh	Pad Configuration DW1 (PAD_CFG_DW1_GPD_9)—Offset 44Ch	00000021h
450h	453h	Pad Configuration DW0 (PAD_CFG_DW0_GPD_10)—Offset 450h	4000600h
454h	457h	Pad Configuration DW1 (PAD_CFG_DW1_GPD_10)—Offset 454h	00000022h
458h	45Bh	Pad Configuration DW0 (PAD_CFG_DW0_GPD_11)—Offset 458h	4000600h
45Ch	45Fh	Pad Configuration DW1 (PAD_CFG_DW1_GPD_11)—Offset 45Ch	00000023h

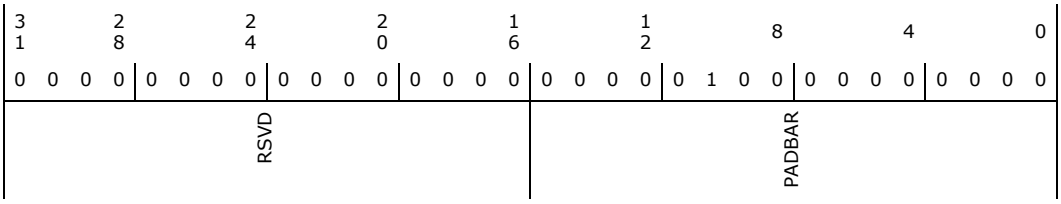
18.8.1 Pad Base Address (PADBAR)—Offset Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 400h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved
15:0	400h RO	**Pad Base Address (PADBAR):** This field provides the starting byte-align address of Pad0 register sets. It is meant for software to discover from where the very first Pad register (i.e., Pad0 register) starts to compute the next Pad address offsets.

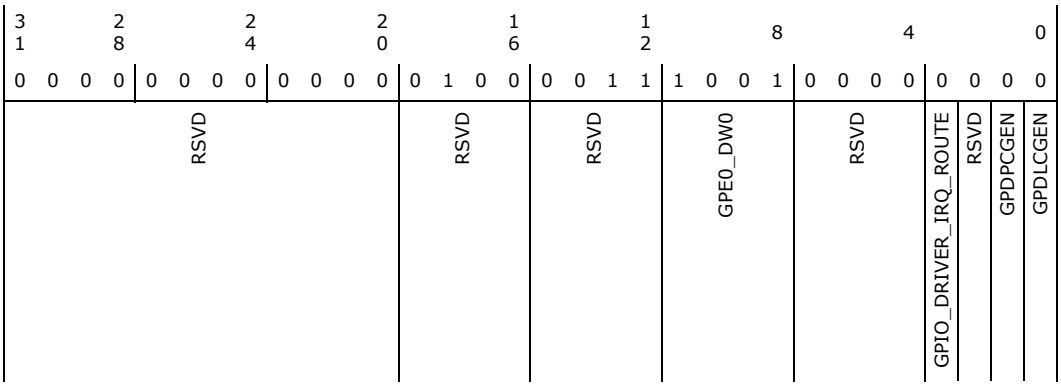
18.8.2 Miscellaneous Configuration (MISCCFG)—Offset 10h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 00043900h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	Reserved
19:16	4h RO	Reserved
15:12	3h RO	Reserved

Bit Range	Default & Access	Field Name (ID): Description
11:8	9h RO	**GPIO Group to GPE_DW0 assignment encoding (GPE0_DW0):** This register assigns a specific GPIO Group to the ACPI GPE0[31:0]. 0h = GPP_A[23:0] mapped to GPE[23:0] and GPE[31:24] is not used 1h = GPP_B[23:0] mapped to GPE[23:0] and GPE[31:24] is not used 2h = GPP_C[23:0] mapped to GPE[23:0] and GPE[31:24] is not used] 3h = GPP_D[23:0] mapped to GPE[23:0] and GPE[31:24] is not used 4h = GPP_E[12:0] mapped to GPE[12:0] and GPE[31:13] is not used 5h = GPP_F[23:0] mapped to GPE[23:0] and GPE[31:24] is not used 6h = GPP_G[23:0] mapped to GPE[23:0] and GPE[31:24] is not used 7h = GPP_H[23:0] mapped to GPE[23:0] and GPE[31:24] is not used 8h = GPP_I[10:0] mapped to GPE[10:0] and GPE[31:11] is not used 9h = GPD[11:0] mapped to GPE[11:0] and GPE[31:12] is not used Ah= GPP_J[23:0] mapped to GPE[23:0] and GPE[31:24] not used Bh= GPP_K[11:0]mapped to GPE[11:0] and GPE[31:12] is not use
7:4	0h RO	Reserved
3	0h RW	**GPIO Driver IRQ Route (GPIO_DRIVER_IRQ_ROUTE):** GPIO Driver IRQ_ROUTE[1:0]: Specifies the APIC IRQ globally for all pads within the current community (GPI_IS with corresponding GPI_IE enable). 0 = IRQ14 1 = IRQ15
2	0h RO	Reserved
1	0h RW	**GPIO Dynamic Partition Clock Gating Enable (GPDPCGEN):** Specifies whether the GPIO Community should take part in partition clock gating 0 = Disable participation in dynamic partition clock gating 1 = Enable participation in dynamic partition clock gating.
0	0h RW	**GPIO Dynamic Local Clock Gating Enable (GPDLCGEN):** Specifies whether the GPIO Community should perform local clock gating. 0 = Disable dynamic local clock gating 1 = Enable dynamic local clock gating

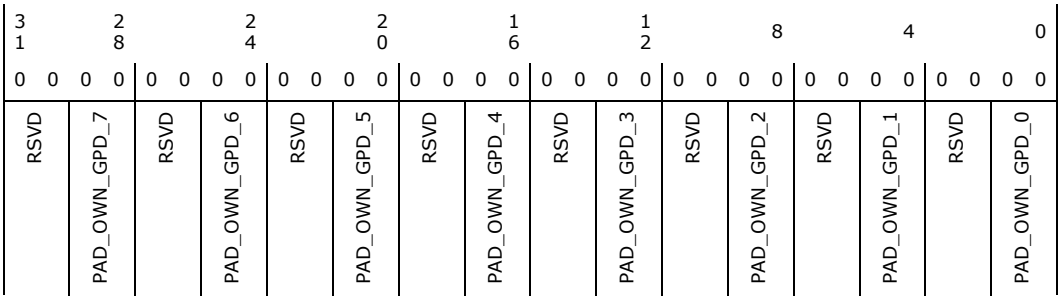
18.8.3 Pad Ownership (PAD_OWN_GPD_0)—Offset 20h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved
29:28	0h RO	**Pad Ownership (PAD_OWN_GPD_7):** Same description as bit 0, except that the bit field applies to GPD_7.
27:26	0h RO	Reserved
25:24	0h RO	**Pad Ownership (PAD_OWN_GPD_6):** Same description as bit 0, except that the bit field applies to GPD_6.
23:22	0h RO	Reserved
21:20	0h RO	**Pad Ownership (PAD_OWN_GPD_5):** Same description as bit 0, except that the bit field applies to GPD_5.
19:18	0h RO	Reserved
17:16	0h RO	**Pad Ownership (PAD_OWN_GPD_4):** Same description as bit 0, except that the bit field applies to GPD_4.
15:14	0h RO	Reserved
13:12	0h RO	**Pad Ownership (PAD_OWN_GPD_3):** Same description as bit 0, except that the bit field applies to GPD_3.
11:10	0h RO	Reserved
9:8	0h RO	**Pad Ownership (PAD_OWN_GPD_2):** Same description as bit 0, except that the bit field applies to GPD_2.
7:6	0h RO	Reserved

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**Pad Ownership (PAD_OWN_GPD_1):** Same description as bit 0, except that the bit field applies to GPD_1.
3:2	0h RO	Reserved
1:0	0h RO	**Pad Ownership (PAD_OWN_GPD_0):** 00 = Host GPIO ACPI Mode or GPIO Driver Mode. Host software (ACPI or GPIO Driver) has ownership of the pad. In Host GPIO Driver Mode (refer to HOSTSW_OWN), GPIO input event update is limited to GPI_STS update only. Otherwise in Host ACPI Mode, updates are limited to GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS. 01 = ME GPIO Mode. ME has ownership of the pad. 10 = Reserved 11 = IE GPIO Mode. IE has ownership of the pad

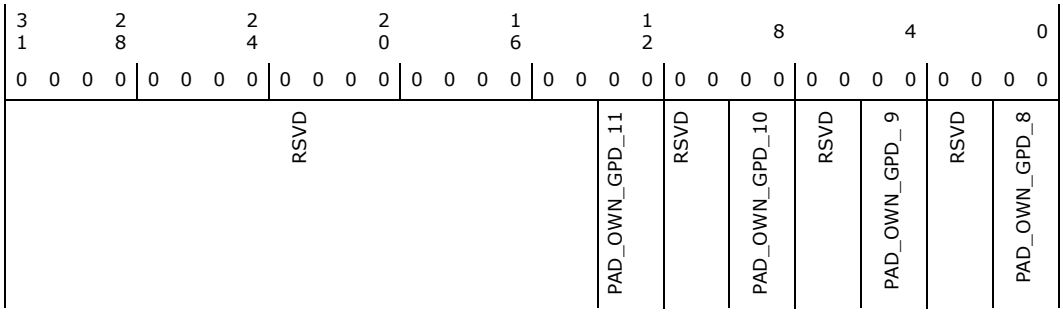
18.8.4 Pad Ownership (PAD_OWN_GPD_1)—Offset 24h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0000h RO	Reserved
13:12	0h RO	**Pad Ownership (PAD_OWN_GPD_11):** Same description as bit 0, except that the bit field applies to GPD_3.
11:10	0h RO	Reserved
9:8	0h RO	**Pad Ownership (PAD_OWN_GPD_10):** Same description as bit 0, except that the bit field applies to GPD_2.
7:6	0h RO	Reserved

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**Pad Ownership (PAD_OWN_GPD_9):** Same description as bit 0, except that the bit field applies to GPD_1.
3:2	0h RO	Reserved
1:0	0h RO	**Pad Ownership (PAD_OWN_GPD_8):** 00 = Host GPIO ACPI Mode or GPIO Driver Mode. Host software (ACPI or GPIO Driver) has ownership of the pad. In Host GPIO Driver Mode (refer to HOSTSW_OWN), GPIO input event update is limited to GPI_STS update only. Otherwise in Host ACPI Mode, updates are limited to GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS. 01 = ME GPIO Mode. ME has ownership of the pad. 10 = Reserved 11 = IE GPIO Mode. IE has ownership of the pad

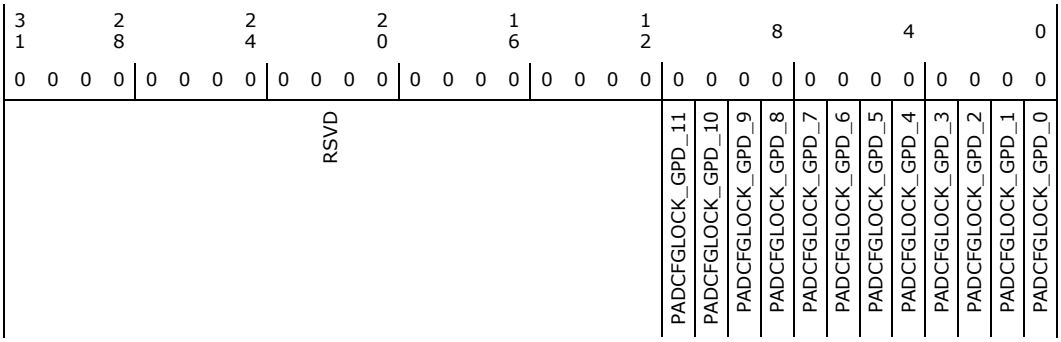
18.8.5 Pad Configuration Lock (PADCFGLOCK_GPD_0)—Offset 60h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	Reserved
11	0h RW	**Pad Config Lock (PADCFGLOCK_GPD_11):** Applied to GPD_11. Same description as bit 0.
10	0h RW	**Pad Config Lock (PADCFGLOCK_GPD_10):** Applied to GPD_2. Same description as bit 0.
9	0h RW	**Pad Config Lock (PADCFGLOCK_GPD_9):** Applied to GPD_2. Same description as bit 0.
8	0h RW	**Pad Config Lock (PADCFGLOCK_GPD_8):** Applied to GPD_8. Same description as bit 0.
7	0h RW	**Pad Config Lock (PADCFGLOCK_GPD_7):** Applied to GPD_7. Same description as bit 0.
6	0h RW	**Pad Config Lock (PADCFGLOCK_GPD_6):** Applied to GPD_6. Same description as bit 0.
5	0h RW	**Pad Config Lock (PADCFGLOCK_GPD_5):** Applied to GPD_5. Same description as bit 0.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**Pad Config Lock (PADCFGLOCK_GPD_4):** Applied to GPD_4. Same description as bit 0.
3	0h RW	**Pad Config Lock (PADCFGLOCK_GPD_3):** Applied to GPD_3. Same description as bit 0.
2	0h RW	**Pad Config Lock (PADCFGLOCK_GPD_2):** Applied to GPD_2. Same description as bit 0.
1	0h RW	**Pad Config Lock (PADCFGLOCK_GPD_1):** Applied to GPD_2. Same description as bit 0.
0	0h RW	**Pad Config Lock (PADCFGLOCK_GPD_0):** Pad Configuration Lock locks specific register fields in the GPP specific registers from being configured. The registers affected become Read-Only and software writes to these registers have no effect. 0 = Unlock 1 = Lock the following register fields as read-only (RO): - Pad Configuration registers (exclude GPIOTXState) - GPI_NMI_EN Register (if implemented) - GPI_SMI_EN Register (if implemented) - GPI_GPE_EN Register (if implemented) When PadCfgLock is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lock down.

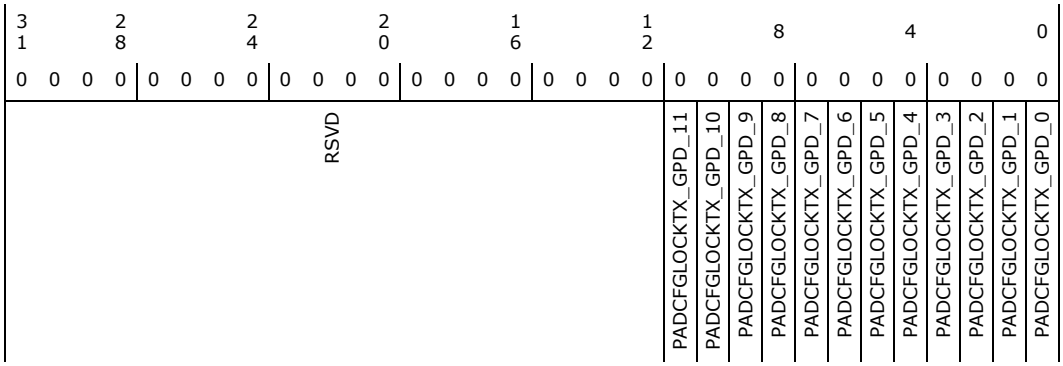
18.8.6 Pad Configuration Lock (PADCFGLOCKTX_GPD_0)—Offset 64h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	Reserved
11	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPD_11):** Applied to GPD_11. Same description as bit 0.
10	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPD_10):** Applied to GPD_10. Same description as bit 0.
9	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPD_9):** Applied to GPD_9. Same description as bit 0.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPD_8):** Applied to GPD_8. Same description as bit 0.
7	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPD_7):** Applied to GPD_7. Same description as bit 0.
6	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPD_6):** Applied to GPD_6. Same description as bit 0.
5	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPD_5):** Applied to GPD_5. Same description as bit 0.
4	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPD_4):** Applied to GPD_4. Same description as bit 0.
3	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPD_3):** Applied to GPD_3. Same description as bit 0.
2	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPD_2):** Applied to GPD_2. Same description as bit 0.
1	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPD_1):** Applied to GPD_1. Same description as bit 0.
0	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPD_0):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) When PadCfgLockTx is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lock down.

1	0h RW1C	**GPI General Purpose Events Status (GPI_GPE_STS_GPD_1):** Applied to GPD_1. Same description as bit 0.
0	0h RW1C	**GPI General Purpose Events Status (GPI_GPE_STS_GPD_0):** These bits are set any time the corresponding GPIO pad is set up as an input, under host ownership and the corresponding GPIO signal is high (or low if the corresponding RXINV bit is set). If the corresponding enable bit is set in the GPI_GPE_EN register, then when the GPI_GPE_STS bit is set: - If the system is in an S3-S5 state, the event will also wake the system. - If the system is in an S0 state (or upon waking back to an S0 state), an SCI will be caused, depending on the GPIRoutSCI bit for the corresponding pad. These bits are sticky bits and are cleared by writing a 1 back to this bit position. The state of GPI_GPE_EN does not prevent the setting of GPI_GPE_STS.

18.8.11 GPI General Purpose Events Enable (GPI_GPE_EN_GPD_0)—Offset 130h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See description of Pad Mode bit 0.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

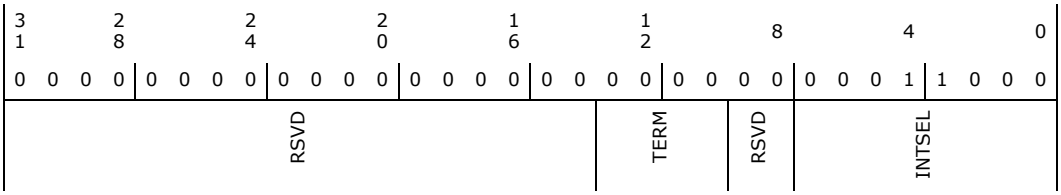
18.8.13 Pad Configuration DW1 (PAD_CFG_DW1_GPD_0)—Offset 404h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 18h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved.
7:0	18h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

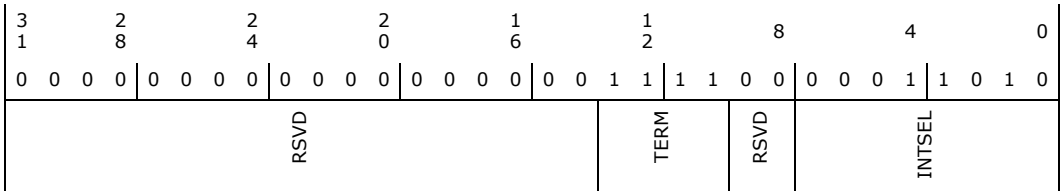
18.8.17 Pad Configuration DW1 (PAD_CFG_DW1_GPD_2)—Offset 414h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 00003C1Ah



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu 1111: Native controller selected by Pad Mode controls the termination. All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	1Ah RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

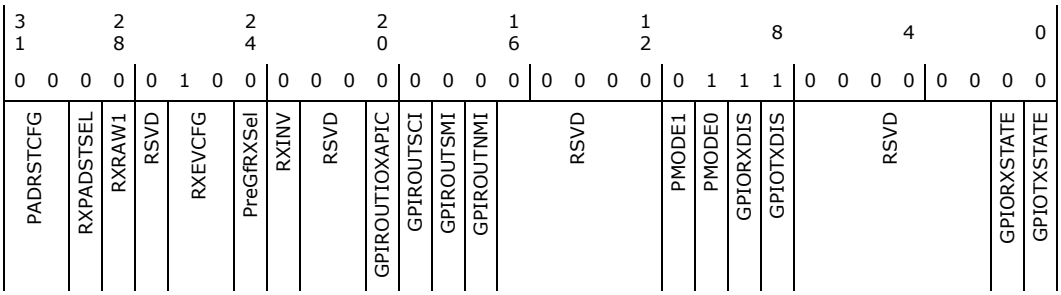
18.8.18 Pad Configuration DW0 (PAD_CFG_DW0_GPD_3)—Offset 418h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 04000700h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See description of Pad Mode bit 0.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See description of Pad Mode bit 0.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	0b RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	21h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

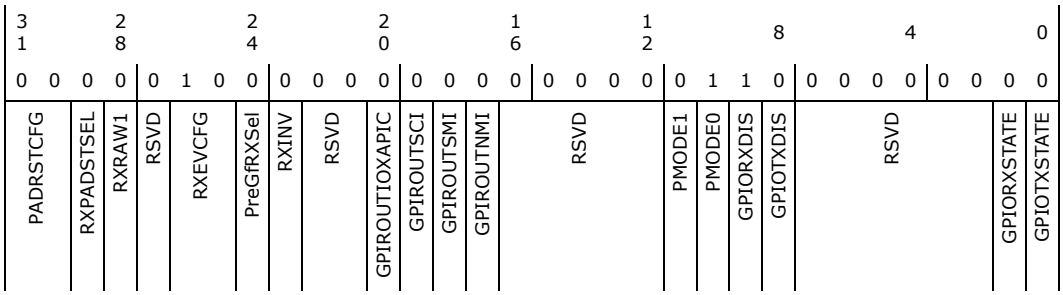
18.8.32 Pad Configuration DW0 (PAD_CFG_DW0_GPD_10)—Offset 450h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 4000600h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See description of Pad Mode bit 0.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	0b RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

18.8.33 Pad Configuration DW1 (PAD_CFG_DW1_GPD_10)—Offset 454h

Access Method

1	0h RW1C	**GPI General Purpose Events Status (GPI_GPE_STS_GPP_I_1):** Applied to GPP_I1. Same description as bit 0.
0	0h RW1C	**GPI General Purpose Events Status (GPI_GPE_STS_GPP_I_0):** These bits are set any time the corresponding GPIO pad is set up as an input, under host ownership and the corresponding GPIO signal is high (or low if the corresponding RXINV bit is set). If the corresponding enable bit is set in the GPI_GPE_EN register, then when the GPI_GPE_STS bit is set: - If the system is in an S3-S5 state, the event will also wake the system. - If the system is in an S0 state (or upon waking back to an S0 state), an SCI will be caused, depending on the GPIRoutSCI bit for the corresponding pad. These bits are sticky bits and are cleared by writing a 1 back to this bit position. The state of GPI_GPE_EN does not prevent the setting of GPI_GPE_STS.

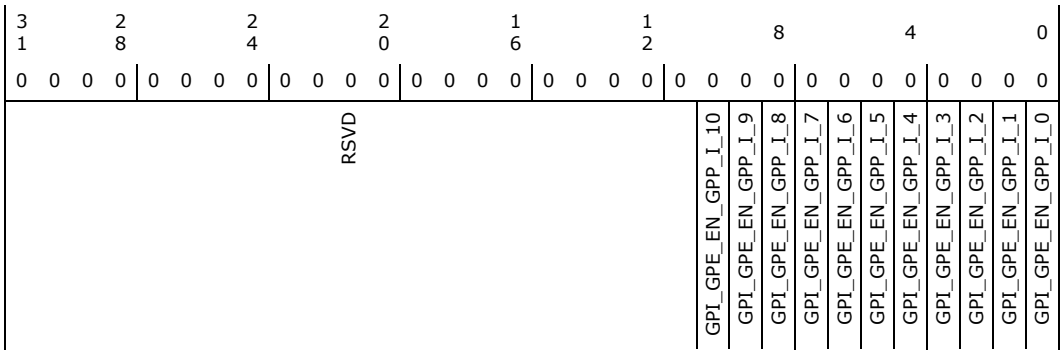
18.9.11 GPI General Purpose Events Enable (GPI_GPE_EN_GPP_I_0)—Offset 130h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	Reserved
10	0h RW	**GPI General Purpose Events Enable (GPI_GPE_EN_GPP_I_10):** Applied to GPP_I10. Same description as bit 0.
9	0h RW	**GPI General Purpose Events Enable (GPI_GPE_EN_GPP_I_9):** Applied to GPP_I9. Same description as bit 0.
8	0h RW	**GPI General Purpose Events Enable (GPI_GPE_EN_GPP_I_8):** Applied to GPP_I8. Same description as bit 0.
7	0h RW	**GPI General Purpose Events Enable (GPI_GPE_EN_GPP_I_7):** Applied to GPP_I7. Same description as bit 0.
6	0h RW	**GPI General Purpose Events Enable (GPI_GPE_EN_GPP_I_6):** Applied to GPP_I6. Same description as bit 0.
5	0h RW	**GPI General Purpose Events Enable (GPI_GPE_EN_GPP_I_5):** Applied to GPP_I5. Same description as bit 0.
4	0h RW	**GPI General Purpose Events Enable (GPI_GPE_EN_GPP_I_4):** Applied to GPP_I4. Same description as bit 0.
3	0h RW	**GPI General Purpose Events Enable (GPI_GPE_EN_GPP_I_3):** Applied to GPP_I3. Same description as bit 0.
2	0h RW	**GPI General Purpose Events Enable (GPI_GPE_EN_GPP_I_2):** Applied to GPP_I2. Same description as bit 0.
1	0h RW	**GPI General Purpose Events Enable (GPI_GPE_EN_GPP_I_1):** Applied to GPP_I1. Same description as bit 0.
0	0h RW	**GPI General Purpose Events Enable (GPI_GPE_EN_GPP_I_0):** This bit is used to enable/disable the generation of GPE to cause SCI and/or wake when the corresponding GPI_GPE_STS bit is set. 0 = disable GPE generation 1 = enable GPE generation ***Note:*** The pad must also be routed for GPE functionality in order for GPE to be generated, i.e. the corresponding GPIRoutSCI must be set to '1'.

18.9.12 SMI Status (GPI_SMI_STS_GPP_I_0)—Offset 140h

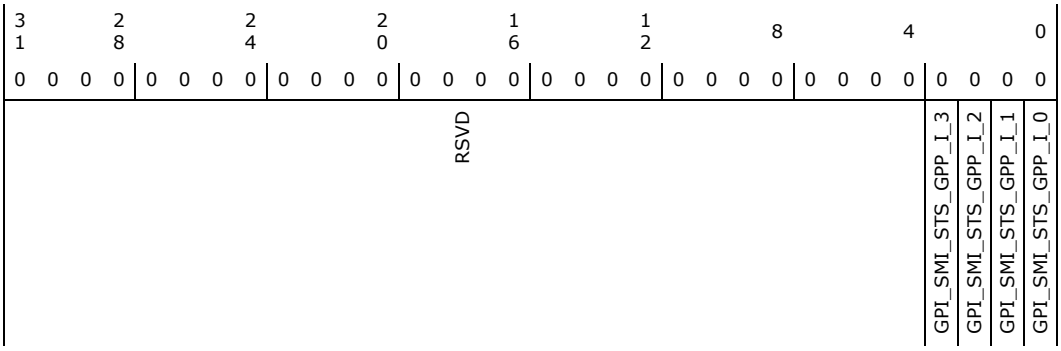
Register bits in this register are implemented for GPP_I signals that have SMI capability only. Other bits are reserved and RO.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved
3	0h RW1C	**GPI SMI Status (GPI_SMI_STS_GPP_I_3):** Applied to GPP_I3. Same description as bit 0.
2	0h RW1C	**GPI SMI Status (GPI_SMI_STS_GPP_I_2):** Applied to GPP_I2. Same description as bit 0.
1	0h RW1C	**GPI SMI Status (GPI_SMI_STS_GPP_I_1):** Applied to GPP_I1. Same description as bit 0.
0	0h RW1C	**GPI SMI Status (GPI_SMI_STS_GPP_I_0):** This bit is set to 1 by hardware when a level event (See RxEdCfg,RxInv) is detected, and all the following conditions are true: - The corresponding pad is used in GPIO input mode - The corresponding PAD_OWN[2:0] is '000' (i.e. ACPI GPIO Mode). If the following conditions are true, then an SMI will be generated if the GPI_SMI_STS bit is set: 1. The corresponding bit in the GPI_SMI_EN register is set 2. The corresponding pad's GPIROUTSMI is set Writing a value of 1 will clear the bit while writing a value of 0 has no effect. 0 = There is no SMI event 1 = There is an SMI event The state of GPI_SMI_EN does not prevent the setting of GPI_SMI_STS. Defaults for these bits are dependent on the state of the GPI pads.

18.9.13 SMI Enable (GPI_SMI_EN_GPP_I_0)—Offset 150h

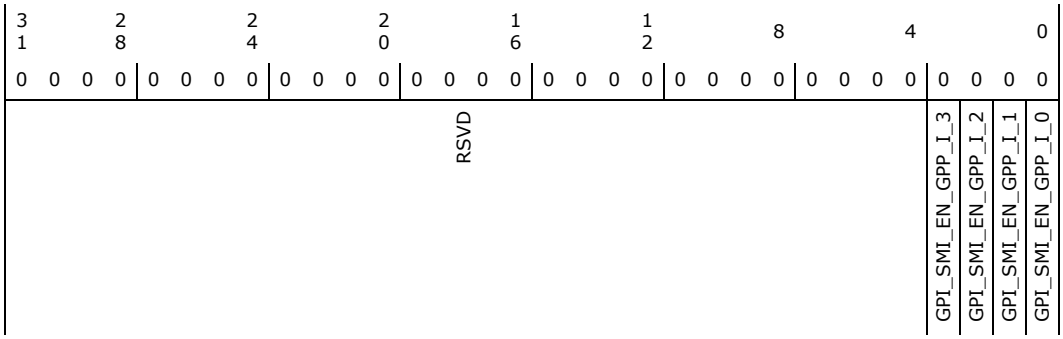
Register bits in this register are implemented for GPP_I signals that have SMI capability only. Other bits are reserved and RO.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved
3	0h RW	**GPI SMI Enable (GPI_SMI_EN_GPP_I_3):** Applied to GPP_I3. Same description as bit 0.
2	0h RW	**GPI SMI Enable (GPI_SMI_EN_GPP_I_2):** Applied to GPP_I2. Same description as bit 0.
1	0h RW	**GPI SMI Enable (GPI_SMI_EN_GPP_I_1):** Applied to GPP_I1. Same description as bit 0.
0	0h RW	**GPI SMI Enable (GPI_SMI_EN_GPP_I_0):** This bit is used to enable/disable the generation of SMI when the corresponding GPI_SMI_STS bit is set. The pad must also be routed for SMI functionality in order for SMI to be generated, i.e. the corresponding GPIROUTSMI must be set to '1'. 0 = disable SMI generation 1 = enable SMI generation ***Note:*** Each of the bit is lock-able dependent on the associated Pad Configuration register PadCfgLock setting. E.g. if the PadCfgLock of pad0 is '1', bit0 of this bit is locked down to read-only.

18.9.14 NMI Status (GPI_NMI_STS_GPP_I_0)—Offset 160h

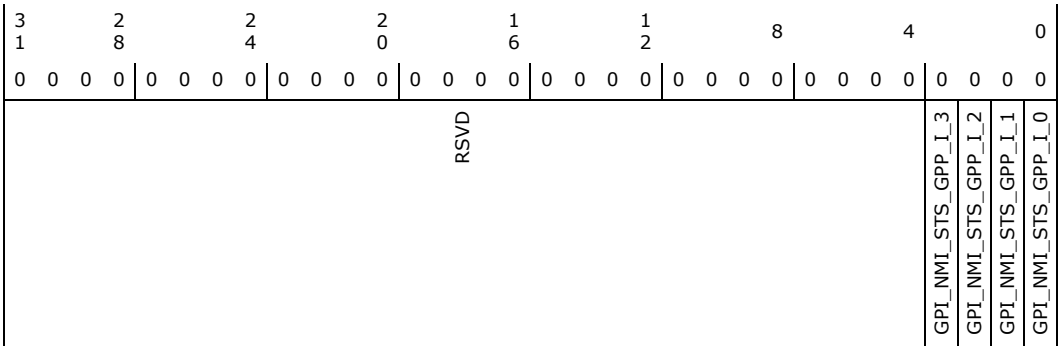
Register bits in this register are implemented for GPP_I signals that have NMI capability only. Other bits are reserved and RO.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved
3	0h RW1C	**GPI NMI Status (GPI_NMI_STS_GPP_I_3):** Applied to GPP_I3. Same description as bit 0.
2	0h RW1C	**GPI NMI Status (GPI_NMI_STS_GPP_I_2):** Applied to GPP_I2. Same description as bit 0.
1	0h RW1C	**GPI NMI Status (GPI_NMI_STS_GPP_I_1):** Applied to GPP_I1. Same description as bit 0.
0	0h RW1C	**GPI NMI Status (GPI_NMI_STS_GPP_I_0):** This bit is set to 1 by hardware when an edge event is detected (See RxEdCfg, RxInv) on pad and all the following conditions are true: - The corresponding pad is used in GPIO input mode (PMode) - The corresponding GPIONMIRout is set to 1, i.e. programmed to route as NMI - The corresponding GPIOOwn[2:0] is '000' (i.e. ACPI GPIO Mode). - The corresponding GPI_NMI_EN is set Writing a value of 1 will clear the bit while writing a value of 0 has no effect. 0 = There is no NMI event 1 = There is an NMI event

18.9.15 NMI Enable (GPI_NMI_EN_GPP_I_0)—Offset 170h

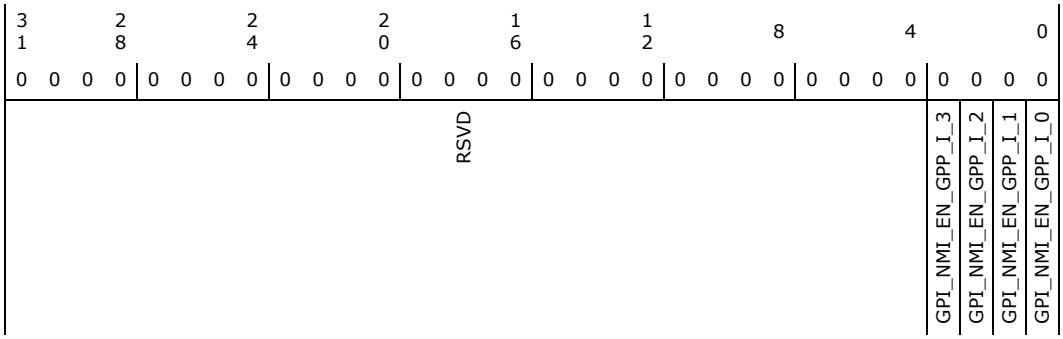
Register bits in this register are implemented for GPP_I signals that have NMI capability only. Other bits are reserved and RO.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved
3	0h RW	**GPI NMI Enable (GPI_NMI_EN_GPP_I_3):** Applied to GPP_I3. Same description as bit 0.
2	0h RW	**GPI NMI Enable (GPI_NMI_EN_GPP_I_2):** Applied to GPP_I2. Same description as bit 0.
1	0h RW	**GPI NMI Enable (GPI_NMI_EN_GPP_I_1):** Applied to GPP_I1. Same description as bit 0.
0	0h RW	**GPI NMI Enable (GPI_NMI_EN_GPP_I_0):** This bit is used to enable/disable the generation of NMI when the corresponding GPI_NMI_STS bit is set and its GPIROUTNMI is set. 0 = disable NMI generation 1 = enable NMI generation Each bit is lock-able dependent on the associated Pad Configuration register PadCfgLock setting. E.g. if the PadCfgLock of pad0 is '1', bit0 of this bit is locked down to read-only.

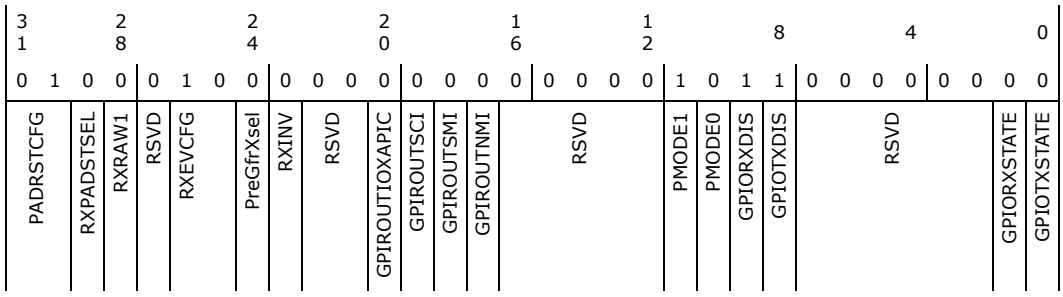
18.9.16 Pad Configuration DW0 (PAD_CFG_DW0_GPP_I_0)—Offset 400h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000B00h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	1b RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s) This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

Default: 1Fh

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	1Fh RO	**Interrupt Select (INTSEL):** The Interrupt Select indicates which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

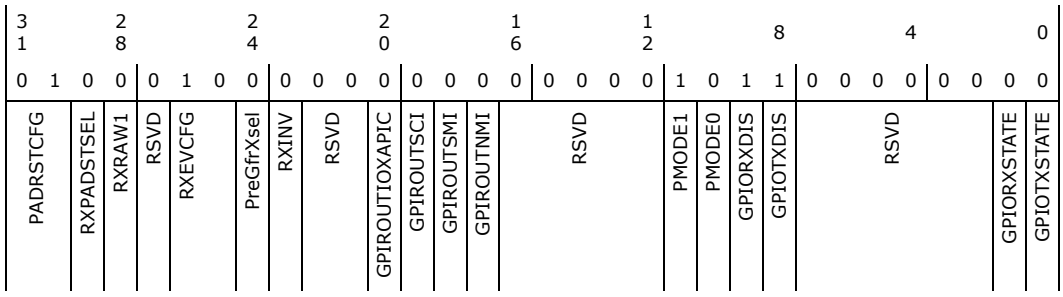
18.9.32 Pad Configuration DW0 (PAD_CFG_DW0_GPP_I_8)—Offset 440h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000B00h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s) This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	1b RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect. Default value can be found based on the Default functionality of the pad.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.

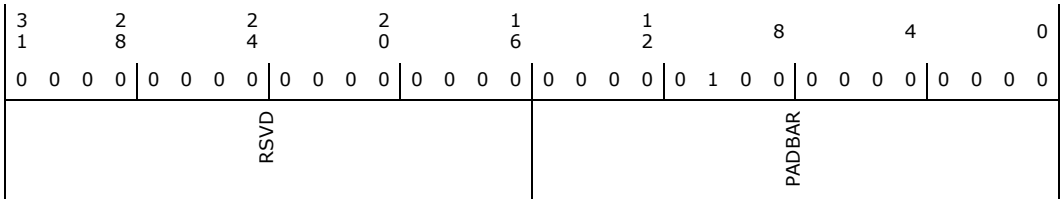
18.10.1 Pad Base Address (PADBAR)—Offset Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 400h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved
15:0	400h RO	**Pad Base Address (PADBAR):** This field provides the starting byte-align address of Pad0 register sets. It is meant for software to discover from where the very first Pad register (i.e. Pad0 register) starts to compute the next Pad address offsets.

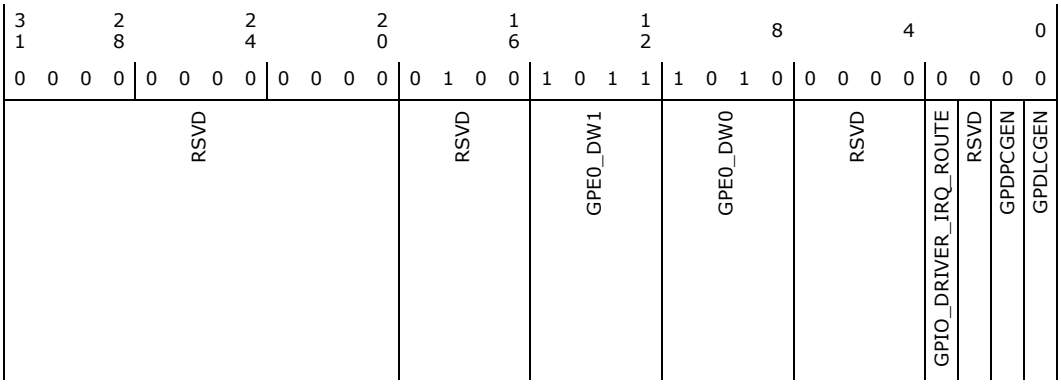
18.10.2 Miscellaneous Configuration (MISCCFG)—Offset 10h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0004BA00h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	Reserved.
19:16	4h RO	Reserved
15:12	Bh RO	**GPIO Group to GPE_DW0 assignment encoding (GPE0_DW1):** This register assigns a specific GPIO Group to the ACPI GPE0[63:32]. 1h = GPP_B[23:0] mapped to GPE[55:32] and GPE[63:56] is not used 2h = GPP_C[23:0] mapped to GPE[55:32] and GPE[63:56] is not used] 3h = GPP_D[23:0] mapped to GPE[55:32] and GPE[63:56] is not used 4h = GPP_E[12:0] mapped to GPE[44:32] and GPE[63:45] is not used 5h = GPP_F[23:0] mapped to GPE[55:32] and GPE[63:56] is not used 6h = GPP_G[23:0] mapped to GPE[55:32] and GPE[63:56] is not used 7h = GPP_H[23:0] mapped to GPE[55:32] and GPE[63:56] is not used 8h = GPP_I[10:0] mapped to GPE[42:32] and GPE[63:43] is not used 9h = GPD[11:0] mapped to GPE[43:32] and GPE[63:44] is not used Ah= GPP_J[23:0] mapped to GPE[55:32] and GPE[63:56] not used Bh= GPP_K[11:0]mapped to GPE[43:32] and GPE[63:44] is not used

31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

18.10.23 Pad Configuration DW1 (PAD_CFG_DW1_GPP_J_0)—Offset 404h

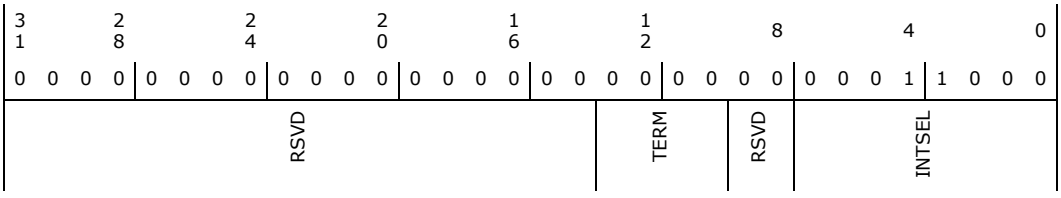
This register applies to GPP_J0.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 18h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	18h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

18.10.29 Pad Configuration DW1 (PAD_CFG_DW1_GPP_J_3)—Offset 41Ch

This register applies to GPP_J3.

Access Method

If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

18.10.35 Pad Configuration DW1 (PAD_CFG_DW1_GPP_J_6)—Offset 434h

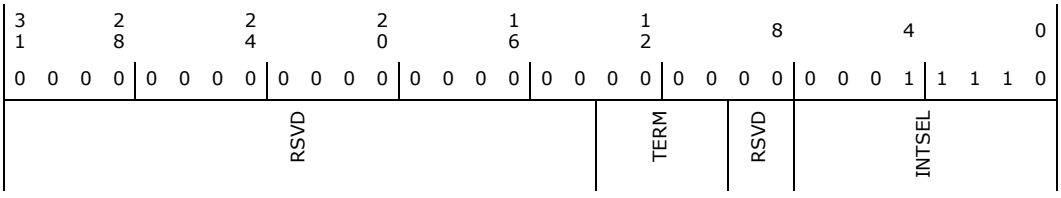
This register applies to GPP_J6.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 1Eh



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	1Eh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	21h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

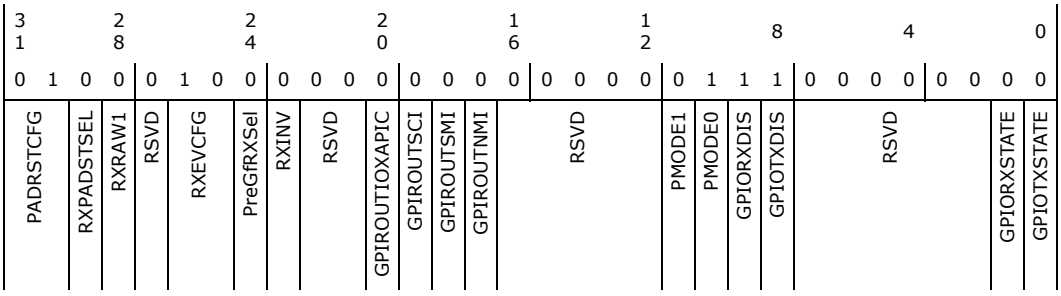
18.10.42 Pad Configuration DW0 (PAD_CFG_DW0_GPP_J_10)—Offset 450h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000700h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SC ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

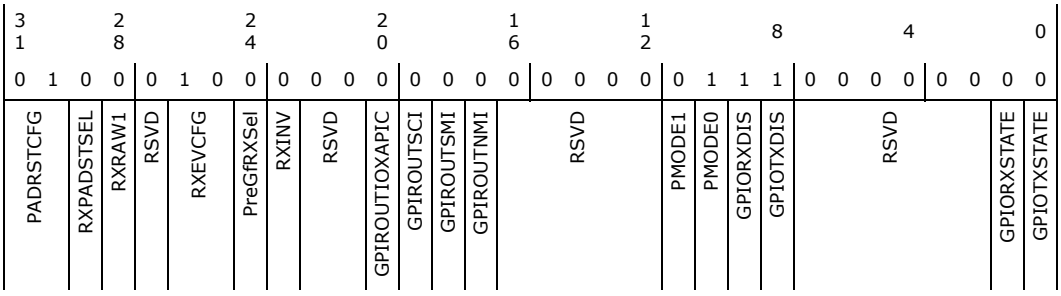
18.10.62 Pad Configuration DW0 (PAD_CFG_DW0_GPP_J_20)—Offset 4A0h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000700h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

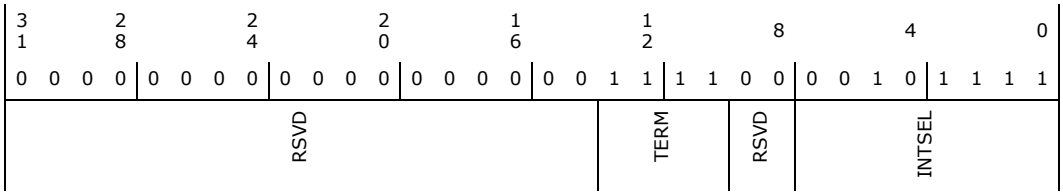
Default: 00003C2Fh



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	1111b RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu 1111: Native function selected by Pad Mode determines termination. All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	2Fh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

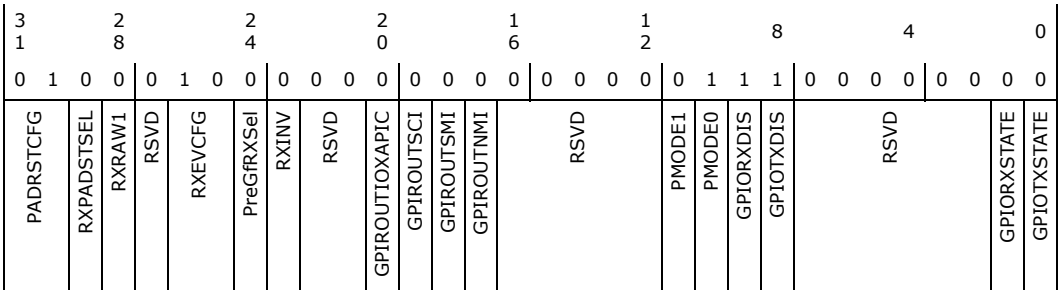
18.10.70 Pad Configuration DW0 (PAD_CFG_DW0_GPP_K_0)—Offset 4C0h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000700h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

18.10.83 Pad Configuration DW1 (PAD_CFG_DW1_GPP_K_6)—Offset 4F4h

This register applies to GPP_K6.

Access Method

Type: MSG Register

The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

18.10.89 Pad Configuration DW1 (PAD_CFG_DW1_GPP_K_9)—Offset 50Ch

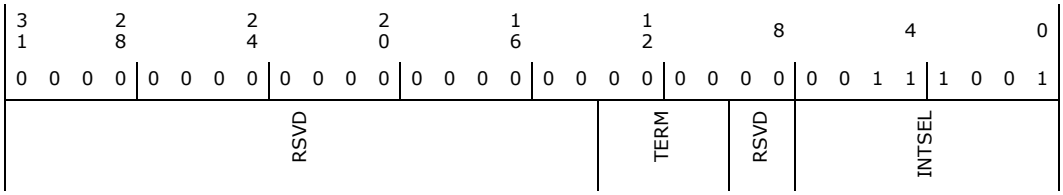
This register applies to GPP_K9.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 39h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved
7:0	39h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

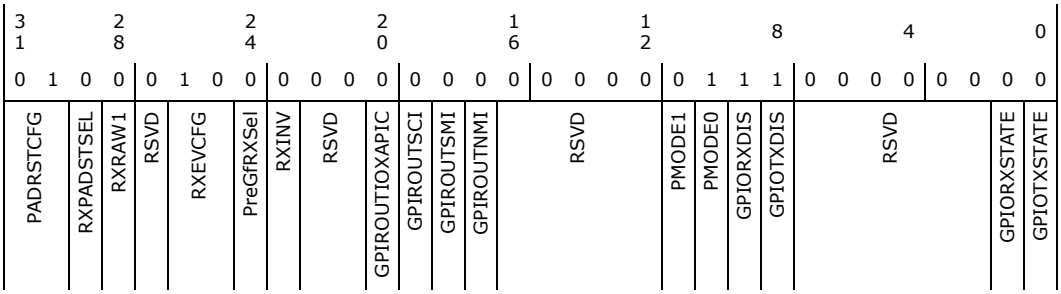
18.10.90 Pad Configuration DW0 (PAD_CFG_DW0_GPP_K_10)—Offset 510h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000700h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit lock-down These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e., Hi-Z.
7:2	0h RO	Reserved
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

18.10.91 Pad Configuration DW1 (PAD_CFG_DW1_GPP_K_10)—Offset 514h

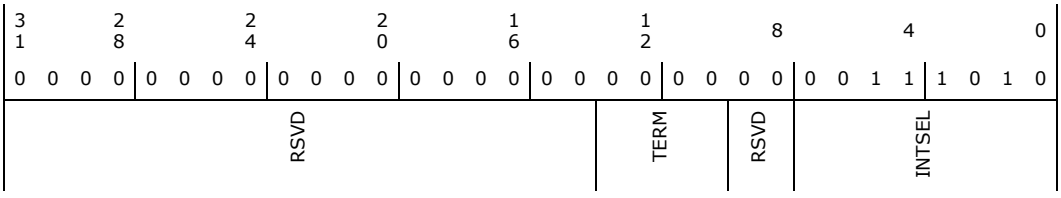
This register applies to GPP_K10.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 3Ah



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved

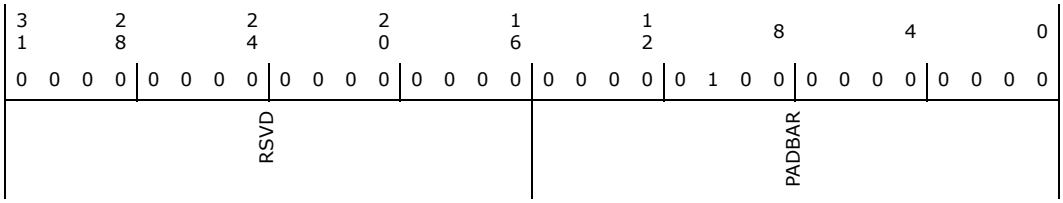
18.11.1 Pad Base Address (PADBAR)—Offset Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 400h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	400h RO	**Pad Base Address (PADBAR):** This field provides the starting byte-align address of Pad0 register sets. It is meant for software to discover from where the very first Pad register (i.e. Pad0 register) starts to compute the next Pad address offsets.

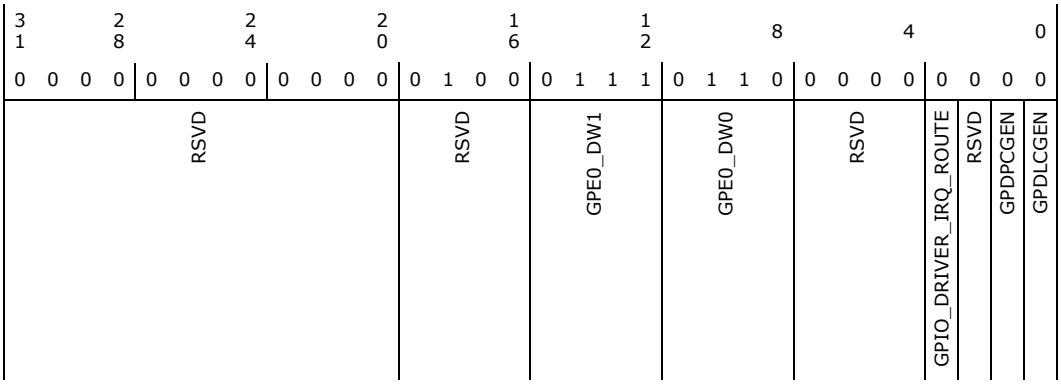
18.11.2 Miscellaneous Configuration (MISCCFG)—Offset 10h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 00007600h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	Reserved.
19:16	Ch RO	Reserved
15:12	7h RO	**GPIO Group to GPE_DW0 assignment encoding (GPE0_DW1):** This register assigns a specific GPIO Group to the ACPI GPE0[63:32]. 1h = GPP_B[23:0] mapped to GPE[55:32] and GPE[63:56] is not used 2h = GPP_C[23:0] mapped to GPE[55:32] and GPE[63:56] is not used] 3h = GPP_D[23:0] mapped to GPE[55:32] and GPE[63:56] is not used 4h = GPP_E[12:0] mapped to GPE[44:32] and GPE[63:45] is not used 5h = GPP_F[23:0] mapped to GPE[55:32] and GPE[63:56] is not used 6h = GPP_G[23:0] mapped to GPE[55:32] and GPE[63:56] is not used 7h = GPP_H[23:0] mapped to GPE[55:32] and GPE[63:56] is not used 8h = GPP_I[10:0] mapped to GPE[42:32] and GPE[63:43] is not used 9h = GPD[11:0] mapped to GPE[43:32] and GPE[63:44] is not used Ah= GPP_J[23:0] mapped to GPE[55:32] and GPE[63:56] not used Bh= GPP_K[11:0]mapped to GPE[43:32] and GPE[63:44] is not used
11:8	6h RO	**GPIO Group to GPE_DW0 assignment encoding (GPE0_DW0):** This register assigns a specific GPIO Group to the ACPI GPE0[31:0]. 0h = GPP_A[23:0] mapped to GPE[23:0] and GPE[31:24] is not used 1h = GPP_B[23:0] mapped to GPE[23:0] and GPE[31:24] is not used 2h = GPP_C[23:0] mapped to GPE[23:0] and GPE[31:24] is not used] 3h = GPP_D[23:0] mapped to GPE[23:0] and GPE[31:24] is not used 4h = GPP_E[12:0] mapped to GPE[12:0] and GPE[31:13] is not used 5h = GPP_F[23:0] mapped to GPE[23:0] and GPE[31:24] is not used 6h = GPP_G[23:0] mapped to GPE[23:0] and GPE[31:24] is not used 7h = GPP_H[23:0] mapped to GPE[23:0] and GPE[31:24] is not used 8h = GPP_I[10:0] mapped to GPE[10:0] and GPE[31:11] is not used 9h = GPD[11:0] mapped to GPE[11:0] and GPE[31:12] is not used Ah= GPP_J[23:0] mapped to GPE[23:0] and GPE[31:24] not used Bh= GPP_K[11:0]mapped to GPE[11:0] and GPE[31:12] is not used

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	Reserved
3	0h RW	**GPIO Driver IRQ Route (GPIO_DRIVER_IRQ_ROUTE):** Specifies the APIC IRQ globally for all pads within the current community (GPI_IS with corresponding GPI_IE enable). 0 = IRQ14 1 = IRQ15
2	0h RO	Reserved
1	0h RW	**GPIO Dynamic Partition Clock Gating Enable (GPDPCGEN):** Specifies whether the GPIO Community should take part in partition clock gating 0 = Disable participation in dynamic partition clock gating 1 = Enable participation in dynamic partition clock gating
0	0h RW	**GPIO Dynamic Local Clock Gating Enable (GPDLCGEN):** Specifies whether the GPIO Community should perform local clock gating. 0 = Disable dynamic local clock gating 1 = Enable dynamic local clock gating

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved.
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved.
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	Reserved.
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved

Bit Range	Default & Access	Field Name (ID): Description
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved.
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved.
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved.
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	Reserved.
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved.
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved.
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved.
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	Reserved.
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved.
7:0	2Dh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

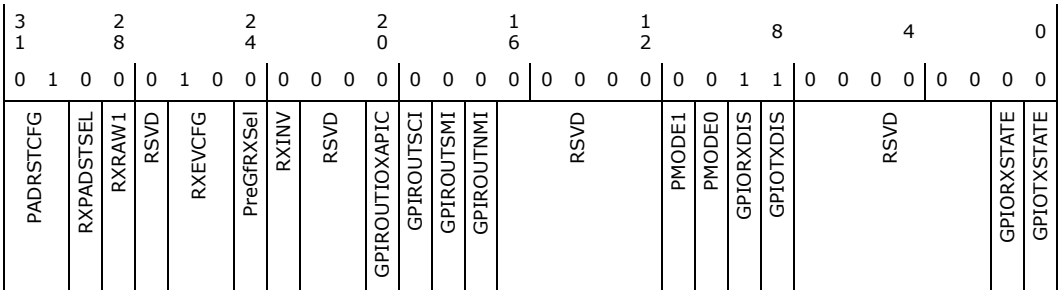
18.11.59 Pad Configuration DW0 (PAD_CFG_DW0_GPP_G_13)—Offset 468h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000300h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved

Bit Range	Default & Access	Field Name (ID): Description
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved.
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved.
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved.
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	Reserved.
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved.
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved.
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved.
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	Reserved.
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	Reserved.
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

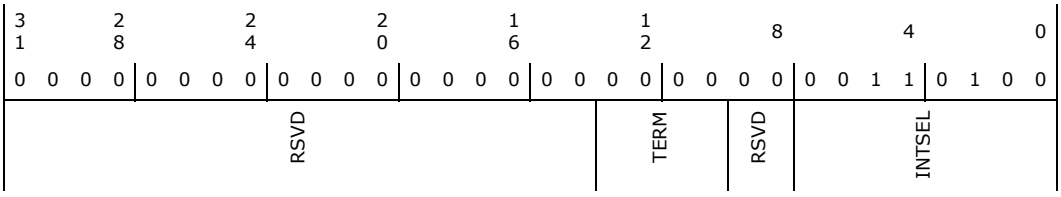
18.11.72 Pad Configuration DW1 (PAD_CFG_DW1_GPP_G_19)—Offset 49Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 34h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved.
7:0	34h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved

Bit Range	Default & Access	Field Name (ID): Description
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved.
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved.
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved.
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved

Bit Range	Default & Access	Field Name (ID): Description
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved.
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved.
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved.
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	Reserved.
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

18.11.80 Pad Configuration DW1 (PAD_CFG_DW1_GPP_G_23)—Offset 4BCh

Access Method

The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved.
7:0	3Eh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

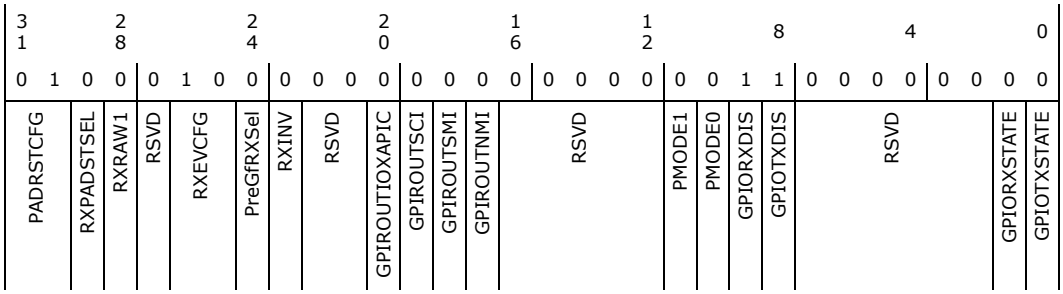
18.11.93 Pad Configuration DW0 (PAD_CFG_DW0_GPP_H_6)—Offset 4F0h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000300h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved.
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved.
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	Reserved.
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

7:0	45h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

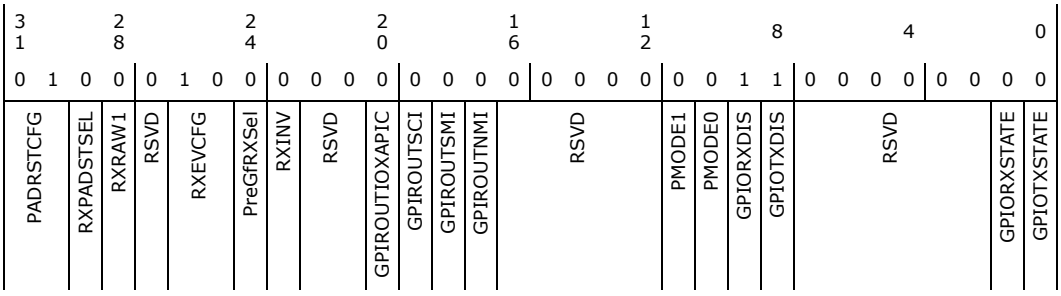
18.11.107 Pad Configuration DW0 (PAD_CFG_DW0_GPP_H_13)—Offset 528h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000300h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved

Bit Range	Default & Access	Field Name (ID): Description
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved.
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved.
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved.
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	Reserved.
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved.
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved.
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	Reserved.
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved.
7:0	4Ch RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

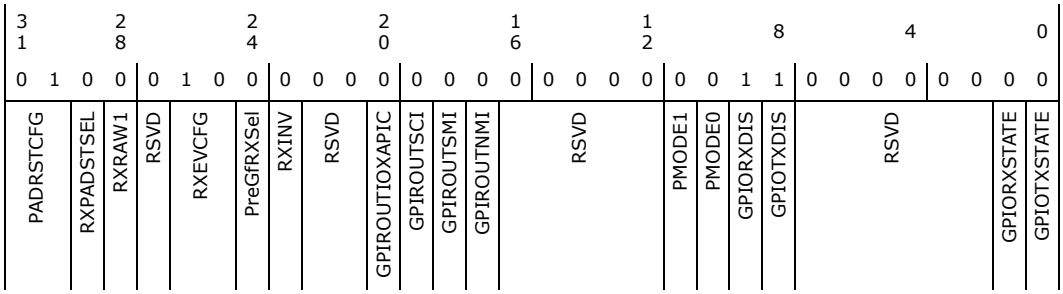
18.11.121 Pad Configuration DW0 (PAD_CFG_DW0_GPP_H_20)—Offset 560h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000300h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved.
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved.
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	0h RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	Reserved.
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

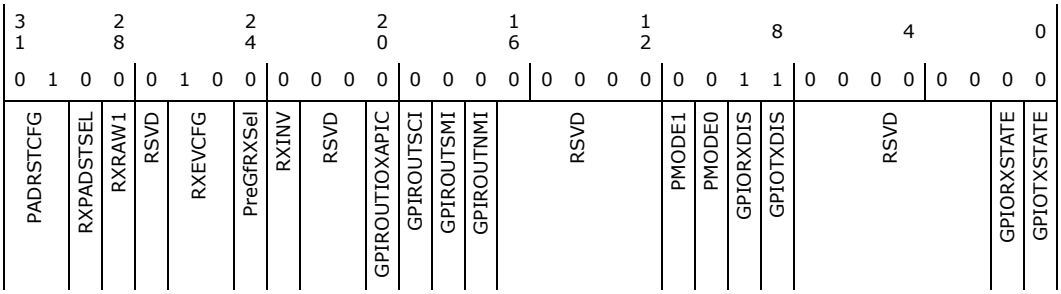
Default: 44000300h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved.
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved.
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.

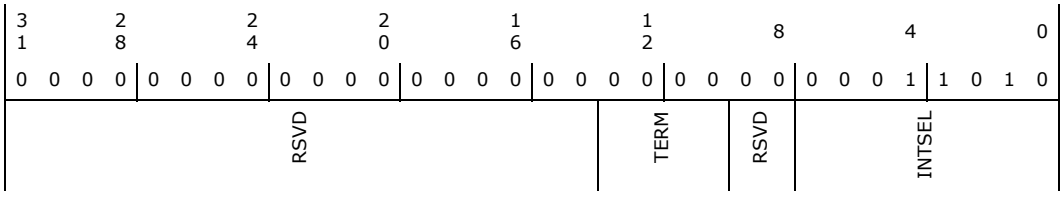
18.11.134 Pad Configuration DW1 (PAD_CFG_DW1_GPP_L_2)—Offset 594h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 1Ah



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved.
7:0	1Ah RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

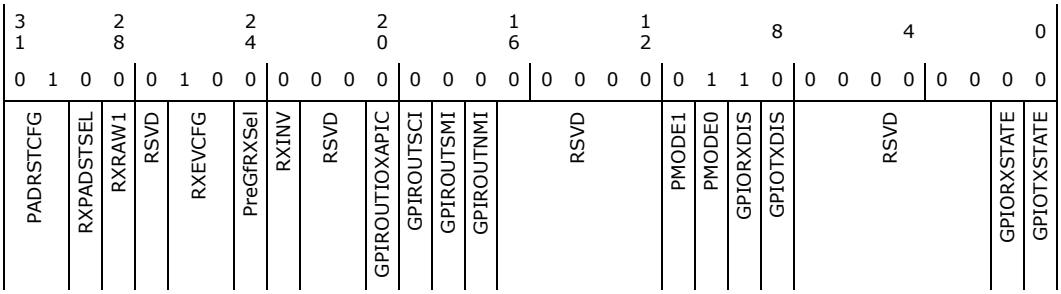
18.11.135Pad Configuration DW0 (PAD_CFG_DW0_GPP_L_3)—Offset 598h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000600h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved

Bit Range	Default & Access	Field Name (ID): Description
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved.
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved.
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved.
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	0b RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	Reserved.
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved

Bit Range	Default & Access	Field Name (ID): Description
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved.
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved.
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved.
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	0b RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	Reserved.
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved.
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	0b RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	Reserved.
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

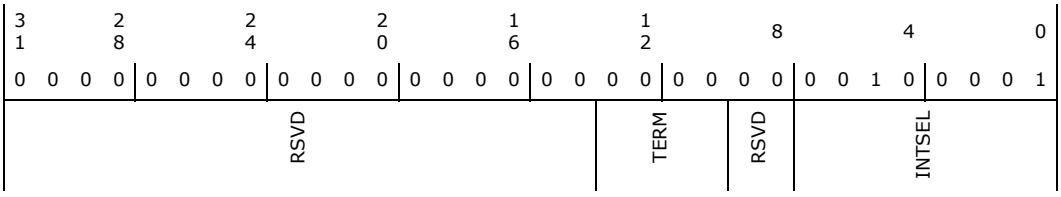
18.11.148Pad Configuration DW1 (PAD_CFG_DW1_GPP_L_9)—Offset 5CCh

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 21h



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved.
7:0	21h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved

Bit Range	Default & Access	Field Name (ID): Description
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved.
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved.
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.

13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved.
7:0	24h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

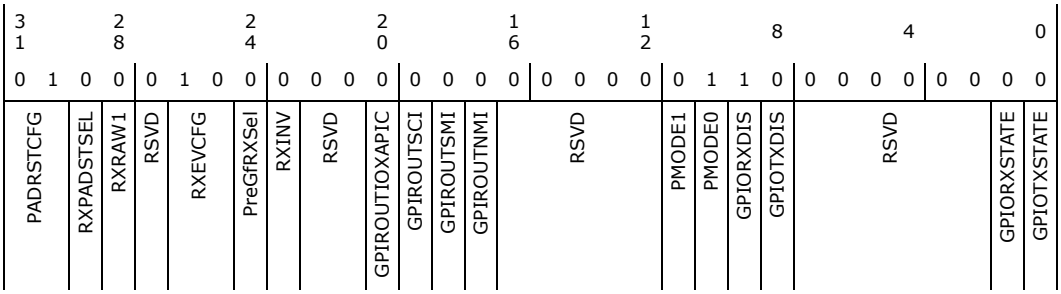
18.11.155Pad Configuration DW0 (PAD_CFG_DW0_GPP_L_13)—Offset 5E8h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 44000600h



Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset GPIO pad register fields in PAD_CFG_DW0 and PAD_CFG_DW1 registers. This register can be used for Sx isolation of the associated signal if needed. 00 = RSMRST# 01 = Host deep reset. This reset occurs when a host reset (with or without power cycle) is initiated or a global reset is initiated, except that the reset does not assert when in S3/S4/S5. 10 = PLTRST# 11 = Reserved

Bit Range	Default & Access	Field Name (ID): Description
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from RX buffer 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	Reserved.
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved.
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved.
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	0b RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	Reserved.
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

27	0h RO	Reserved.
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PreGfRXSel):** Non-filtered only.
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field is only applicable when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	Reserved.
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI. 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s).
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). This bit only applies to a GPIO that has SMI capability. Otherwise, the bit is RO.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. This bit only applies to a GPIO that has NMI capability. Otherwise, the bit is RO.
16:12	0h RO	Reserved.
11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit 1. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	0b RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	Reserved.
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

11	0h RW	**Pad Mode bit 1 (PMODE1):** See Pad Mode Bit 0 description.
10	1b RW	**Pad Mode bit 0 (PMODE0):** This bit is used in conjunction with Pad Mode bit r. These two-bit field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad. 1h = native function 1, if applicable, controls the Pad 2h = native function 2, if applicable, controls the Pad 3h = native function 3, if applicable, controls the Pad Dedicated (unmuxed) GPIO shall report RO of all 0's in this register field If GPIO vs. native mode is configured via soft strap, this bit has no effect.
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad. 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0'.
8	0b RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad. 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	Reserved.
1	0h RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad. 1 = Drive a level '1' to the TX output pad

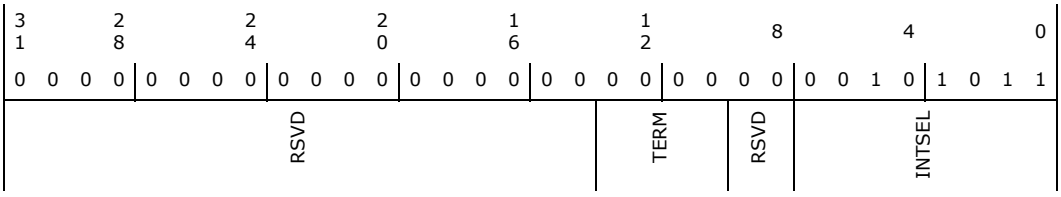
18.11.168 Pad Configuration DW1 (PAD_CFG_DW1_GPP_L_19)—Offset 61Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 2Bh



Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0010: 5k pd 0100: 20k pd 1000: none 1010: 5k pu 1100: 20k pu All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW/FW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, pu/pd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	Reserved.
7:0	2Bh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 .... Up to the max IOxAPIC IRQ supported

19.3 Overview

The Gigabit Ethernet controller(D31:F6) in conjunction with the Intel® i219 Gigabit Ethernet LAN Connect Device provide a complete LAN solution. This chapter describes the behavior of the Gigabit Ethernet Controller. For details on the Intel® i219 Gigabit Ethernet LAN Connect Device, refer to document 544486 on the Resource and Design Center (RDC). The Gigabit Ethernet Controller can operate at multiple speeds (10/100/1000 Mbps) and in either full duplex or half duplex mode.

19.4 Signal Description

Table 19-1. GbE LAN Signals (Sheet 1 of 2)

Name	Type	Description
USB3_10_PCIE3_GBe_TXP **USB3_10_PCIE3_GBE_TXN** **PCIE4_GBE_TXP** **PCIE4_GBE_TXN** **PCIE5_GBE_TXP** **PCIE5_GBE_TXN** **PCIE8_SSATA2_GBE_TXP** **PCIE8_SSATA2_GBE_TXN** **PCIE11_SSATA5_GBE_TXP** **PCIE11_SSATA5_GBE_TXN**	O	***Note:*** Refer to Chapter 22 for details on the PCI Express transmit signals.The Intel® i219 Gigabit Ethernet LAN Connect Device can be connected to one of the following PCI Express ports 3, 4, 5, 8 and 11.

Table 19-1. GbE LAN Signals (Sheet 2 of 2)

Name	Type	Description
USB3_10_PCIE3_GBe_RXP **USB3_10_PCIE3_GBE_RXN** **PCIE4_GBE_RXP** **PCIE4_GBE_RXN** **PCIE5_GBE_RXP** **PCIE5_GBE_RXN** **PCIE8_SSATA2_GBE_RXP** **PCIE8_SSATA2_GBE_RXN** **PCIE11_SSATA5_GBE_RXP** **PCIE11_SSATA5_GBE_RXN**	I	***Note:*** Refer to Chapter 22 for details on the PCI Express receive signals.The Intel® i219 Gigabit Ethernet LAN Connect Device can be connected to one of the following PCI Express ports 3, 4, 5, 8 and 11. on PCH-H.
GPP_C4_SML0DATA_IE	I/OD	Refer to Chapter 25 for details on the SML0DATA signal. ***Note:*** The Intel® i219 Gigabit Ethernet LAN Connect Device connects to SML0DATA signal.
GPP_C3_SML0CLK_IE	I/OD	Refer to Chapter 25 for details on the SML0CLK signal. ***Note:*** The Intel® i219 Gigabit Ethernet LAN Connect Device connects to SML0CLK signal.
GPD11_GBEPHY	O	**GBE PHY Power Control:** GBD11_GBEPHY should be connected to LAN_DISABLE_N on the PHY. PCH will drive this signal low to put the PHY into a low power state when functionality is not needed. ***Note:*** GPD11_GBEPHY can only be driven low if SLP_GBE# is deasserted. ***Note:*** Signal can instead be used as GPD11.
SLP_GBE#	O	**LAN Sub-System Sleep Control:** When SLP_GBE# is de-asserted it indicates that the PHY device must be powered. When SLP_GBE# is asserted, power can be shut off to the PHY device. SLP_GBE# will always be deasserted in S0 and anytime SLP_A# is de-asserted.
GPD2_GBE_WAKE#	I	**GBE WAKE:** GbE Wake Indicator from the GbE PHY. ***Note:*** Signal can instead be used as GPD2.

19.5 Integrated Pull-Ups and Pull-Downs

Table 19-2. Integrated Pull-Ups and Pull-Downs

Signal	Resistor Type	Value Ω	Notes
GPD2_GBE_WAKE#	External pull-up required.	15k-40k	

19.6 I/O Signal Planes and States

Table 19-3. Power Plane and States for Output Signals

GPD11_GBEPHY	DSW	Driven Low	Driven Low	Driven Low	Driven Low
SLP_GBE#	DSW	Driven Low	Driven Low	0/1[1]	0/1[1]

Note:
1. Based on wake events and Intel ME state

Table 19-4. Power Plane and States for Input Signals

Signal Name	Power Plane	During Reset	Immediately After Reset	S3/S4/S5	Deep Sx
GPD2_G-BE_WAKE#	DSW	Undriven	Undriven	Undriven	Undriven/ Internal Pull-Down[2]

Notes:
1. Configurable
2. Configurable based on PMC configuration bit.
   '1' (pin will be driven by platform in DeepSx) -> Undriven;
   '0' (pin will NOT be driven by platform in DeepSx) -> Internal pull-down (15k-40k) enabled

19.7 Functional Description

The PCH integrates a Gigabit Ethernet controller. The integrated GbE controller is compatible with the Intel® i219 Gigabit Ethernet LAN Connect Device. The integrated GbE controller provides two interfaces for 10/100/1000 Mbps and manageability operation:

- Data link based on PCI Express – A high-speed interface that uses PCIe electrical signaling at half speed and custom logical protocol for active state operation mode.
- System Management Link (SMLink0) – A low speed connection for low power state mode for manageability communication only. The frequency of this connection can be configured to one of three different speeds (100 kHz, 400 kHz or 1 MHz).

The Intel® i219 Gigabit Ethernet LAN Connect Device only runs at a speed of 1250 Mbps, which is 1/2 of the 2.5 GB/s PCI Express frequency. Each of the PCI Express root ports in the PCH have the ability to run at the 1250 Mbps rate. There is no need to implement a mechanism to detect that the platform LAN device is connected. The port configuration (if any), attached to the platform LAN device, is pre-loaded from the NVM. The selected port adjusts the transmitter to run at the 1250 Mbps rate and does not need to be PCI Express compliant.

Note: PCIe validation tools cannot be used for electrical validation of this interface; however, PCIe layout rules apply for on-board routing.

The integrated GbE controller operates at full-duplex at all supported speeds or half-duplex at 10/100 Mbps. It also adheres to the *IEEE 802.3x Flow Control Specification.*

Note: GbE operation (1000 Mbps) is only supported in S0 mode. In Sx modes, SMBus is the only active bus and is used to support manageability/remote wake-up functionality.

Note: It is not possible to disable the device via the PSF registers. With the C620 series you must use the soft strap 119 to disable the device.

The integrated GbE controller provides a system interface using a PCI Express function. A full memory-mapped or I/O-mapped interface is provided to the software, along with DMA mechanisms for high performance data transfer.

The integrated GbE controller features are:

- Network Features
  - — Compliant with the 1 GB/s Ethernet 802.3, 802.3u, 802.3ab specifications
  - — Multi-speed operation: 10/100/1000 Mbps
  - — Full-duplex operation at 10/100/1000 Mbps: Half-duplex at 10/100 Mbps
  - — Flow control support compliant with the 802.3X specification

  - — VLAN support compliant with the 802.3q specification
  - — MAC address filters: perfect match unicast filters; multicast hash filtering, broadcast filter and promiscuous mode
  - — PCI Express/SMLink interface to GbE PHYs
- Host Interface Features
  - — 64-bit address master support for systems using more than 4 GB of physical memory
  - — Programmable host memory receive buffers (256 bytes to 16 KB)
  - — Intelligent interrupt generation features to enhance driver performance
  - — Descriptor ring management hardware for transmit and receive
  - — Software controlled reset (resets everything except the configuration space)
  - — Message Signaled Interrupts
- Performance Features
  - — Configurable receive and transmit data FIFO, programmable in 1 KB increments
  - — TCP segmentation off loading features
  - — Fragmented UDP checksum off load for packet reassembly
  - — IPv4 and IPv6 checksum off load support (receive, transmit, and large send)
  - — Split header support to eliminate payload copy from user space to host space
  - — Receive Side Scaling (RSS) with two hardware receive queues
  - — Supports 9018 bytes of jumbo packets
  - — Packet buffer size 32 KB
  - — TimeSync off load compliant with 802.1as specification
  - — Platform time synchronization
- Power Management Features
  - — Magic Packet* wake-up enable with unique MAC address
  - — ACPI register set and power down functionality supporting D0 and D3 states
  - — Full wake up support (APM, ACPI)
  - — MAC power down at Sx, DM-Off with and without WoL
  - — Auto connect battery saver at S0 no link and Sx no link
  - — Energy Efficient Ethernet (EEE) support
  - — Latency Tolerance Reporting (LTR)
  - — ARP and ND proxy support through LAN Connected Device proxy
  - — Wake on LAN (WoL) from Deep Sx
  - — Windows* InstantGo* Support

19.7.1 GbE PCI Express Bus Interface

The GbE controller has a PCI Express interface to the host processor and host memory. The following sections detail the bus transactions.

19.7.1.1 Transaction Layer

The upper layer of the host architecture is the transaction layer. The transaction layer connects to the device GbE controller using an implementation specific protocol. Through this GbE controller-to-transaction-layer protocol, the application-specific parts of the device interact with the subsystem and transmit and receive requests to or from the remote agent, respectively.

19.7.1.2 Data Alignment

19.7.1.2.1 4-KB Boundary

PCI requests must never specify an address/length combination that causes a memory space access to cross a 4-KB boundary. It is hardware's responsibility to break requests into 4 KB-aligned requests (if needed). This does not pose any requirement on software. However, if software allocates a buffer across a 4-KB boundary, hardware issues multiple requests for the buffer. Software should consider aligning buffers to a 4-KB boundary in cases where it improves performance. The alignment to the 4-KB boundaries is done by the GbE controller. The transaction layer does not do any alignment according to these boundaries.

19.7.1.2.2 PCI Request Size

PCI requests are 128 bytes or less and are aligned to make better use of memory controller resources. Writes, however, can be on any boundary and can cross a 64-byte alignment boundary.

19.7.1.3 Configuration Request Retry Status

The integrated GbE controller might have a delay in initialization due to an NVM read. If the NVM configuration read operation is not completed and the device receives a configuration request, the device responds with a configuration request retry completion status to terminate the request, and thus effectively stalls the configuration request until such time that the sub-system has completed local initialization and is ready to communicate with the host.

19.7.2 Error Events and Error Reporting

19.7.2.1 Completer Abort Error Handling

A received request that violates the LAN Controller programing model will be discarded, for non posted transactions an unsuccessful completion with CA completion status will be returned. For posted transactions if both SERR# enable and URRE# enable are enabled, the LAN Controller will assert SERR#.

19.7.2.2 Unsupported Request Error Handling

A received unsupported request to the LAN Controller will be discarded, for non posted transactions an unsuccessful completion with UR completion status will be returned. The URD bit will be set in ECTL register, If both SERR# enable and URRE# enable are enabled, the LAN Controller will assert SERR#. For posted transactions if both SERR# enable and URRE# enable are enabled, the LAN Controller will assert SERR#.

19.7.3 Ethernet Interface

The integrated GbE controller provides a complete CSMA/CD function supporting IEEE 802.3 (10 Mbps), 802.3u (100 Mbps) implementations. It also supports the IEEE 802.3z and 802.3ab (1000 Mbps) implementations. The device performs all of the functions required for transmission, reception, and collision handling called out in the standards.

The mode used to communicate between the PCH and the Intel® i219 Gigabit Ethernet LAN Connect Device supports 10/100/1000 Mbps operation, with both half- and full-duplex operation at 10/100 Mbps, and full-duplex operation at 1000 Mbps.

19.7.3.1 Intel® i219 Gigabit Ethernet LAN Connect Device

The integrated GbE controller and the Intel® i219 Gigabit Ethernet LAN Connect Device communicate through the PCIe* and SMLink0 interfaces. All integrated GbE controller configuration is performed using device control registers mapped into system memory or I/O space. The Platform LAN PHY is configured using the PCI Express or SMLink0 interface.

The integrated GbE controller supports various modes as listed in the following table.

Table 19-5. LAN Mode Support

Mode	System State	Interface Active	Connections
Normal 10/100/1000 Mbps	S0	PCI Express or SMLink0[1]	Intel® i219 Gigabit Ethernet LAN Connect Device
Manageability and Remote Wake-up	Sx	SMLink0	Intel® i219 Gigabit Ethernet LAN Connect Device
Note: [1]GbE operation is not supported in Sx state.			

19.7.4 PCI Power Management

The integrated GbE controller supports the Advanced Configuration and Power Interface specification as well as Advanced Power Management. This enables the network-related activity (using an internal host wake signal) to wake up the host. For example, from Sx (S3–S5) and Deep Sx to S0.

Note: The Intel® i219 Gigabit Ethernet LAN Connect Device must be powered during the Deep Sx state in order to support host wake up from Deep Sx. GPD_2_LAN_WAKE# on the PCH must be configured to support wake from Deep Sx and must be connected to LANWAKE_N on the Platform LAN Connect Device. The SLP_GBE# signal must be driven high (de-asserted) in the Deep Sx state to maintain power to the Platform LAN Connect Device.

The integrated GbE controller contains power management registers for PCI and supports D0 and D3 states. PCIe* transactions are only allowed in the D0 state, except for host accesses to the integrated GbE controller's PCI configuration registers.

19.8 GbE Configuration Registers Summary

Table 19-6. Summary of GbE Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	GbE Vendor and Device Identification Register (GBE_VID_DID)—Offset 0h	156F8086h
4h	7h	PCI Command and Status Register (PCICMD_STS)—Offset 4h	100000h
8h	Bh	Revision Identification and Class Code Register (RID_CC)—Offset 8h	2000000h
Ch	Fh	Cache Line Size Primary Latency Timer and Header Type Register (CLS_PLT_HEADTYP)—Offset Ch	0h
10h	13h	Memory Base Address Register A (MBARA)—Offset 10h	0h
2Ch	2Fh	Subsystem Vendor and Subsystem ID (DMI_CONFIG11)—Offset 2Ch	8086h
30h	33h	Expansion ROM Base Address Register (ERBA)—Offset 30h	0h
34h	37h	Capabilities List Pointer Register (CAPP)—Offset 34h	C8h
3Ch	3Fh	Interrupt Information and Maximum Latency/Minimum Grant Register (INTR_MLMG)—Offset 3Ch	100h
A0h	A3h	LAN Disable Control (LANDISCTRL)—Offset A0h	0h
A4h	A7h	Lock LAN Disable (LOCKLANDIS)—Offset A4h	0h
A8h	ABh	System Time Control High Register (LTRCAP)—Offset A8h	0h
C8h	CBh	Capabilities List and Power Management Capabilities Register (CLIST1_PMC)—Offset C8h	23D001h
CCh	CFh	PCI Power Management Control Status and Data Register (PMCS_DR)—Offset CCh	0h
D0h	D3h	Capabilities List 2 and Message Control Register (CLIST2_MCTL)—Offset D0h	80E005h
D4h	D7h	Message Address Low Register (MADDL)—Offset D4h	0h
D8h	DBh	Message Address High Register (MADDH)—Offset D8h	0h
DCh	DFh	Message Data Register (MDAT)—Offset DCh	0h

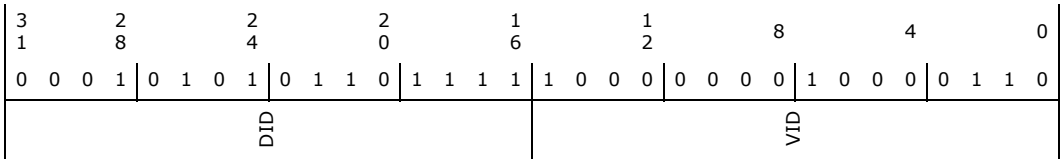
19.8.1 GbE Vendor and Device Identification Register (GBE_VID_DID)—Offset 0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 156F8086h



Bit Range	Default and Access	Field Name (ID): Description
31:16	156Fh RW/V	**Device ID (DID):** This is a 16-bit value assigned to the PCH Gigabit LAN controller. The field may be auto-loaded from the NVM word 0Dh during initialization time depending on the "Load Vendor/ Device ID" bit field in NVM word 0Ah.
15:0	8086h RW/V	**Vendor ID (VID):** This is a 16-bit value assigned to Intel. The field may be auto-loaded from the NVM at address 0Dh during INIT time depending on the "Load Vendor/Device ID" bit field in NVM word 0Ah with a default value of 8086h.

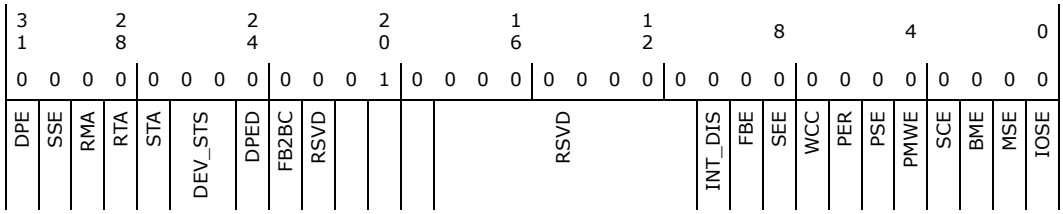
19.8.2 PCI Command and Status Register (PCICMD_STS)—Offset 4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 100000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/V	**Detected Parity Error (DPE):** 0 = No parity error detected. 1 = Set when the Gb LAN controller receives a command or data from the backbone with a parity error. This is set even if PCIMD.PER (D25:F0, bit 6) is not set.
30	0h RW/V	**Signaled System Error (SSE):** 0 = No system error signaled. 1 = Set when the Gb LAN controller signals a system error to the internal SERR# logic.
29	0h RW/V	**Received Master Abort (RMA):** 0 = Root port has not received a completion with unsupported request status from the backbone. 1 = Set when the GbE LAN controller receives a completion with unsupported request status from the backbone.
28	0h RW/V	**Received Target Abort (RTA):** 0 = Root port has not received a completion with completer abort from the backbone. 1 = Set when the Gb LAN controller receives a completion with completer abort from the backbone.
27	0h RW/V	**Signaled Target Abort (STA):** 0 = No target abort received. 1 = Set whenever the Gb LAN controller forwards a target abort received from the downstream device onto the backbone.
26:25	0h RW/V	**DEVSEL# Timing Status (DEV_STS):** Hardwired to 0.
24	0h RW/V	**Master Data Parity Error Detected (DPED):** 0 = No data parity error received. 1 = Set when the Gb LAN Controller receives a completion with a data parity error on the backbone and PCIMD.PER (D25:F0, bit 6) is set.
23	0h RW/V	**Fast Back to Back Capable (FB2BC):** Hardwired to 0.
22	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
21	0h RW/V	**66 MHz Capable:** Hardwired to 0.
20	1h RW/V	**Capabilities List:** Hardwired to 1. Indicates the presence of a capabilities list.
19	0h RW/V	**Interrupt Status:** Indicates status of hot-plug and power management interrupts on the root port that result in INTx# message generation. 0 = Interrupt is de-asserted. 1 = Interrupt is asserted. This bit is not set if MSI is enabled. If MSI is not enabled, this bit is set regardless of the state of PCICMD.Interrupt Disable bit (D25:F0:04h:bit 10).
18:11	0h RO	Reserved.
10	0h RW	**Interrupt Disable (INT_DIS):** This disables pin-based INTx# interrupts on enabled hot-plug and power management events. This bit has no effect on MSI operation. 0 = Internal INTx# messages are generated if there is an interrupt for hot-plug or power management and MSI is not enabled. 1 = Internal INTx# messages will not be generated. This bit does not affect interrupt forwarding from devices connected to the root port. Assert_INTx and de-assert_INTx messages will still be forwarded to the internal interrupt controllers if this bit is set.
9	0h RW/V	**Fast Back to Back Enable (FBE):** Hardwired to 0.
8	0h RW	**SERR# Enable (SEE):** 0 = Disable 1 = Enables the Gb LAN controller to generate an SERR# message when PSTS.SSE is set.
7	0h RW/V	**Wait Cycle Control (WCC):** Hardwired to 0.
6	0h RW	**Parity Error Response (PER):** 0 = Disable. 1 = Indicates that the device is capable of reporting parity errors as a master on the backbone.
5	0h RW/V	**Palette Snoop Enable (PSE):** Hardwired to 0.
4	0h RW/V	**Postable Memory Write Enable (PMWE):** Hardwired to 0.
3	0h RW/V	**Special Cycle Enable (SCE):** Hardwired to 0.
2	0h RW	**Bus Master Enable (BME):** 0 = Disable. All cycles from the device are master aborted 1 = Enable. Allows the root port to forward cycles onto the backbone from a Gigabit LAN device.
1	0h RW	**Memory Space Enable (MSE):** 0 = Disable. Memory cycles within the range specified by the memory base and limit registers are master aborted on the backbone. 1 = Enable. Allows memory cycles within the range specified by the memory base and limit registers can be forwarded to the Gigabit LAN device.
0	0h RW/V	**I/O Space Enable (IOSE):** This bit controls access to the I/O space registers. 0 = Disable. I/O cycles within the range specified by the I/O base and limit registers are master aborted on the backbone. 1 = Enable. Allows I/O cycles within the range specified by the I/O base and limit registers can be forwarded to the Gigabit LAN device.

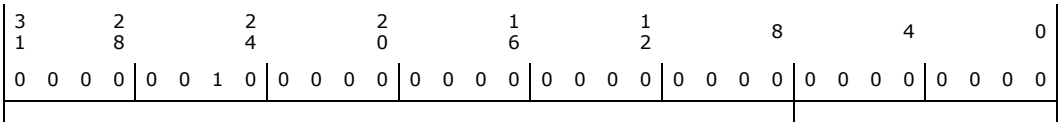
19.8.3 Revision Identification and Class Code Register (RID_CC)—Offset 8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 2000000h



Bit Range	Default and Access	Field Name (ID): Description
31:8	20000h RW/V	**Class Code:** Identifies the device as an Ethernet Adapter. 020000h = Ethernet Adapter.
7:0	0h RW/V	**Revision ID:** See Table 2-1, "Intel® C620 Series ChipsetDevice and Revision ID Table" on page 38 for the value of the RID Register.

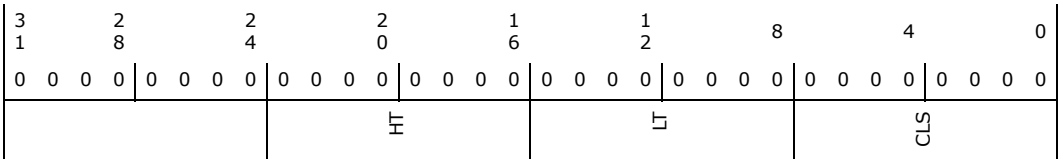
19.8.4 Cache Line Size Primary Latency Timer and Header Type Register (CLS_PLT_HEADTYP)—Offset Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RW/V	**Reserved**
23:16	0h RW/V	**Header Type (HT):** 00h = Indicates this is a single function device.
15:8	0h RW/V	**Latency Timer (LT):** Hardwired to 0.
7:0	0h RW/V	**Cache Line Size (CLS):** This field is implemented by PCI devices as a read/write field for legacy compatibility purposes but has no impact on any device functionality.

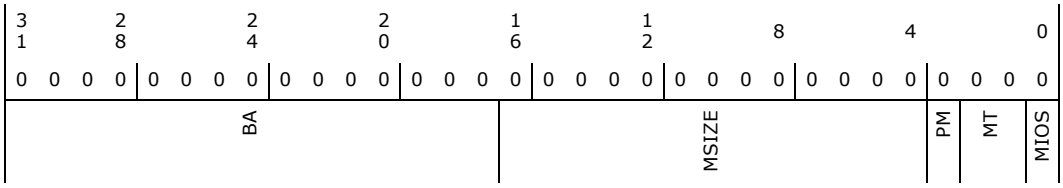
19.8.5 Memory Base Address Register A (MBARA)—Offset 10h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:17	0h RW	**Base Address (BA):** Software programs this field with the base address of this region.
16:4	0h RW/V	**Memory Size (MSIZE):** Memory size is 128KB.
3	0h RW/V	**Prefetchable Memory (PM):** The GbE LAN controller does not implement prefetchable memory.
2:1	0h RW/V	**Memory Type (MT):** Set to 00b indicating a 32-bit BAR.
0	0h RW/V	**Memory/I/O Space (MIOS):** Set to 0 indicating a Memory Space BAR.

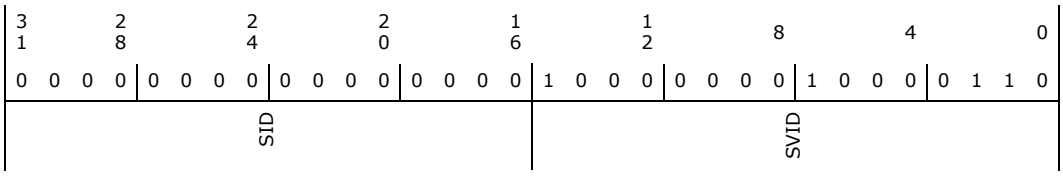
19.8.6 Subsystem Vendor and Subsystem ID (DMI_CONFIG11)—Offset 2Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 8086h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW/V	**Subsystem ID (SID):** This value may be loaded automatically from the NVM Word 0Bh upon power up or reset depending on the "Load Subsystem ID" bit field in NVM word 0Ah with a default value of 0000h. This value is loadable from NVM word location 0Ah.
15:0	8086h RW/V	**Subsystem Vendor ID (SVID):** This value may be loaded automatically from the NVM Word 0Ch upon power up or reset depending on the "Load Subsystem ID" bit field in NVM word 0Ah. A value of 8086h is default for this field upon power up if the NVM does not respond or is not programmed. All functions are initialized to the same value.

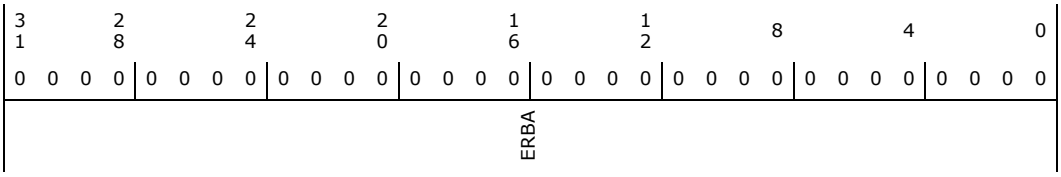
19.8.7 Expansion ROM Base Address Register (ERBA)—Offset 30h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Expansion ROM Base Address (ERBA):** This register is used to define the address and size information for boot-time access to the optional FLASH memory. If no Flash memory exists, this register reports 00000000h.

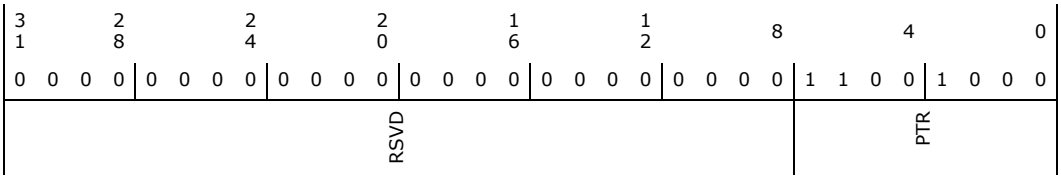
19.8.8 Capabilities List Pointer Register (CAPP)—Offset 34h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 6

Default: C8h



Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	C8h RW/V	**Capabilities Pointer (PTR):** Indicates that the pointer for the first entry in the capabilities list is at C8h in configuration space.

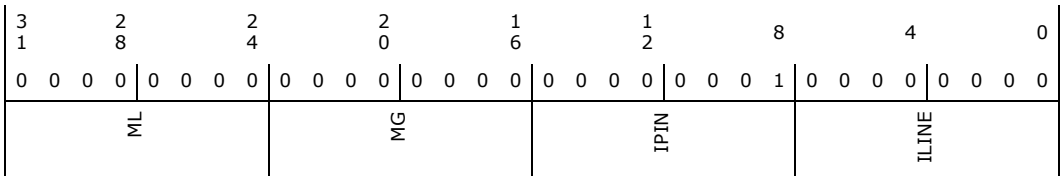
19.8.9 Interrupt Information and Maximum Latency/Minimum Grant Register (INTR_MLMG)—Offset 3Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 100h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RW/V	**Maximum Latency (ML):** Not used. Hardwired to 00h.
23:16	0h RW/V	**Minimum Grant (MG):** Not used. Hardwired to 00h.
15:8	1h RW/V	**Interrupt Pin (IPIN):** Indicates the interrupt pin driven by the GbE LAN controller. 01h = The GbE LAN controller implements legacy interrupts on INTA.
7:0	0h RW	**Interrupt Line (ILINE):** Default = 00h. Software written value indicates which interrupt line (vector) the interrupt is connected. No hardware action is taken on this register.

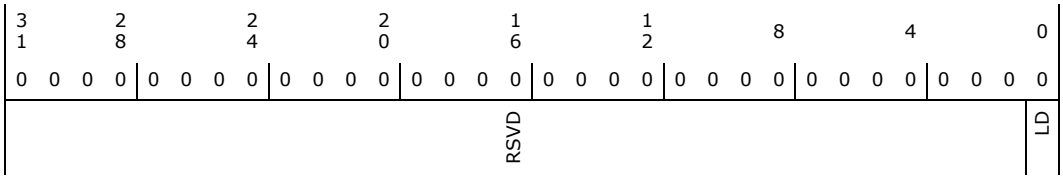
19.8.10 LAN Disable Control (LANDISCTRL)—Offset A0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RW	**LAN Disable (LD):** Setting this bit to 1 will disable the LAN Controller functionality.

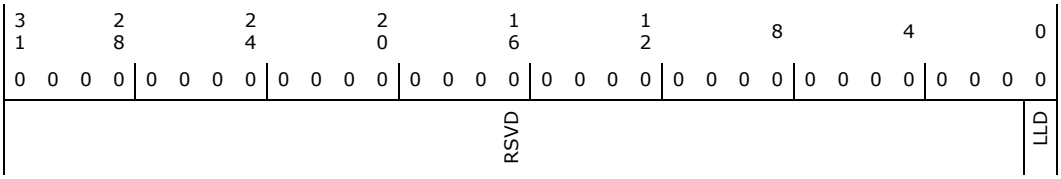
19.8.11 Lock LAN Disable (LOCKLANDIS)—Offset A4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RW	**Lock LAN Disable (LLD):** When set this bit blocks writes to the LANDISCTRL register. ***Note:*** Once set this bit will only be cleared on host reset.

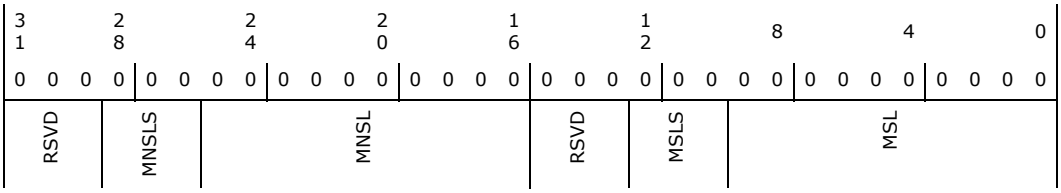
19.8.12 System Time Control High Register (LTRCAP)—Offset A8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:29	0h RO	Reserved.
28:26	0h RW	**Maximum Non-Snoop Latency Scale (MNSLS):** Provides a scale for the value contained within the Maximum Non-Snoop Latency Value field. 000b = Value times 1 ns 001b = Value times 32 ns 010b = Value times 1,024 ns 011b = Value times 32,768 ns 100b = Value times 1,048,576 ns 101b = Value times 33,554,432 ns 110b–111b = Reserved
25:16	0h RW	**Maximum Non-Snoop Latency (MNSL):** Specifies the maximum non-snoop latency that a device is permitted to request. Software should set this to the platform's maximum supported latency or less. This field is also an indicator of the platforms maximum latency, should an endpoint send up LTR Latency Values with the Requirement bit not set.
15:13	0h RO	Reserved.
12:10	0h RW	**Maximum Snoop Latency Scale (MSLS):** Provides a scale for the value contained within the Maximum Snoop Latency Value field. 000b = Value times 1 ns 001b = Value times 32 ns 010b = Value times 1,024 ns 011b = Value times 32,768 ns 100b = Value times 1,048,576 ns 101b = Value times 33,554,432 ns 110b–111b = Reserved
9:0	0h RW	**Maximum Snoop Latency (MSL):** Specifies the maximum snoop latency that a device is permitted to request. Software should set this to the platform's maximum supported latency or less. This field is also an indicator of the platforms maximum latency, should an endpoint send up LTR Latency Values with the Requirement bit not set.

19.8.13 Capabilities List and Power Management Capabilities Register (CLIST1_PMC)—Offset C8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 23D001h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1	1	1	0	1	0	0	0	0	0	0	0	0	0	0	0	1
PMES					D2S	D1S	AC				DSI	RSVD	PMEC	VER					NEXT					CID								

Bit Range	Default and Access	Field Name (ID): Description
31:27	0h RW/V	**PME_SUPPORT (PMES):** This five-bit field indicates the power states in which the function may assert PME#. It depend on PM Ena and AUX-PWR bits in word 0Ah in the NVM: Condition Functionality Value PM Ena=0 No PME at all states 0000b PM Ena and AUX-PWR=0 PME at D0 and $D3_{HOT}$ 01001b PM Ena and AUX-PWR=1 PME at D0, $D3_{HOT}$ and $D3_{COLD}$ 11001b These bits are not reset by Function Level Reset.
26	0h RW/V	**D2_SUPPORT (D2S):** The D2 state is not supported.
25	0h RW/V	**D1_SUPPORT (D1S):** The D1 state is not supported.
24:22	0h RW/V	**AUX_CURRENT (AC):** Required current defined in the Data register.
21	1h RW/V	**Device Specific Initialization (DSI):** Set to 1. The GbE LAN Controller requires its device driver to be executed following transition to the D0 un-initialized state.
20	0h RO	Reserved.
19	0h RW/V	**PME Clock (PMEC):** Hardwired to 0.
18:16	3h RW/V	**Version (VER):** Hardwired to 011b to indicate support for Revision 1.2 of the *PCI Power Management Specification*.
15:8	D0h RW/V	**Next Capability (NEXT):** Value of D0h indicates the location of the next pointer.
7:0	1h RW/V	**Capability ID (CID):** Indicates the linked list item is a PCI Power Management Register.

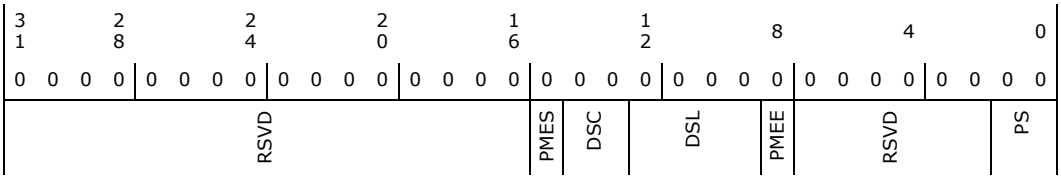
19.8.14 PCI Power Management Control Status and Data Register (PMCS_DR)—Offset CCh

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW/V	**PME STATUS (PMES):** This bit is set to 1 when the function detects a wake-up event independent of the state of the PMEE bit. Writing a 1 will clear this bit.
14:13	0h RW/V	**DATA SCALE (DSC):** This field indicates the scaling factor to be used when interpreting the value of the Data register. For the GbE LAN and common functions this field equals 01b (indicating 0.1 watt units) if the PM is enabled in the NVM, and the Data_Select field is set to 0, 3, 4, 7, (or 8 for Function 0). Otherwise, it equals 00b. For the manageability functions, this field equals 10b (indicating 0.01 watt units) if the PM is enabled in the NVM, and the Data_Select field is set to 0, 3, 4, 7. Otherwise, it equals 00b.
12:9	0h RW	**Data Select (DSL):** This four-bit field is used to select which data is to be reported through the Data register (offset CFh) and Data_Scale field. These bits are writable only when Power Management is enabled using NVM. 0h = D0 Power Consumption 3h = D3 Power Consumption 4h = D0 Power Dissipation 7h = D3 Power Dissipation 8h = Common Power All other values are reserved.
8	0h RW	**PME Enable (PMEE):** If Power Management is enabled in the NVM, writing a 1 to this bit will enable Wakeup. If Power Management is disabled in the NVM, writing a 1 to this bit has no affect, and will not set the bit to 1. This bit is not reset by Function Level Reset.
7:2	0h RO	Reserved.
1:0	0h RW/V	**Power State (PS):** This field is used both to determine the current power state of the GbE LAN Controller and to set a new power state. The values are: 00 = D0 state (default) 01 = Ignored 10 = Ignored 11 = D3 state (Power Management must be enabled in the NVM or this cycle will be ignored).

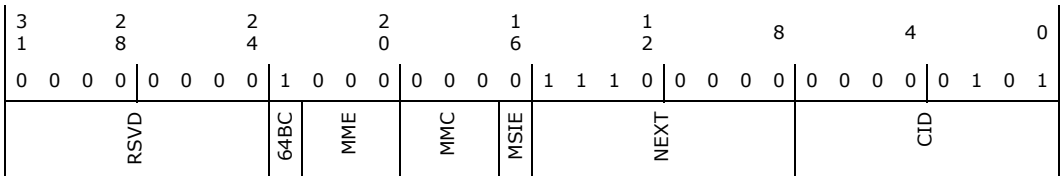
19.8.15 Capabilities List 2 and Message Control Register (CLIST2_MCTL)—Offset D0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 80E005h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23	1h RW/V	**64-bit Capable (64BC):** Set to 1 to indicate that the GbE LAN Controller is capable of generating 64-bit message addresses.
22:20	0h RW/V	**Multiple Message Enable (MME):** Returns 000b to indicate that the GbE LAN controller only supports a single message.
19:17	0h RW/V	**Multiple Message Capable (MMC):** The GbE LAN controller does not support multiple messages.
16	0h RW	**Message Signal Interrupt Enable (MSIE):** 0 = MSI generation is disabled. 1 = The Gb LAN controller will generate MSI for interrupt assertion instead of INTx signaling.
15:8	E0h RW/V	**Next Capability (NEXT):** Value of E0h points to the Function Level Reset capability structure. These bits are not reset by Function Level Reset.
7:0	5h RW/V	**Capability ID (CID):** Indicates the linked list item is a Message Signaled Interrupt Register.

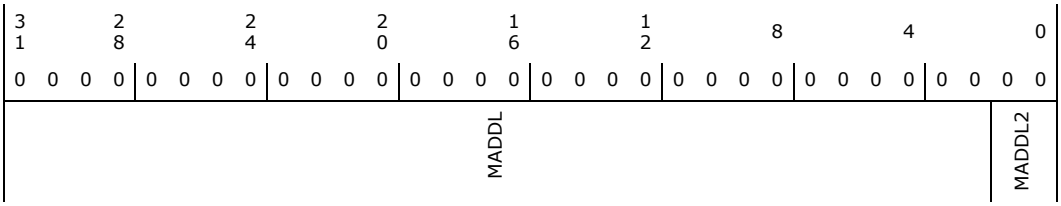
19.8.16 Message Address Low Register (MADDL)—Offset D4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW/V	**Message Address Low (MADDL):** These bits combine with MADDL2 to create one 32 bit field which is written by the system to indicate the lower 32 bits of the address to use for the MSI memory write transaction.
1:0	0h RW/V	**Message Address Low 2 (MADDL2):** These bits combine with MADDL to create one 32 bit field which is written by the system to indicate the lower 32 bits of the address to use for the MSI memory write transaction. These lower two bits will always return 0.

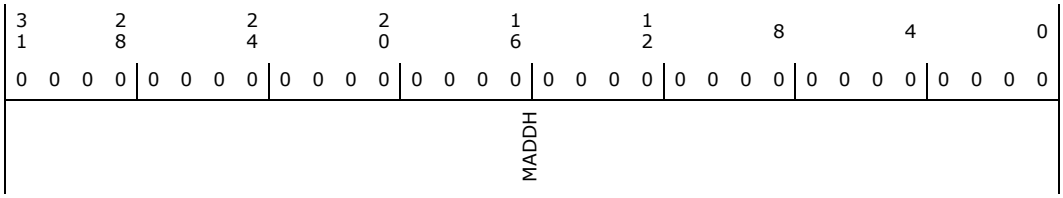
19.8.17 Message Address High Register (MADDH)—Offset D8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Message Address High (MADDH):** Written by the system to indicate the upper 32 bits of the address to use for the MSI memory write transaction.

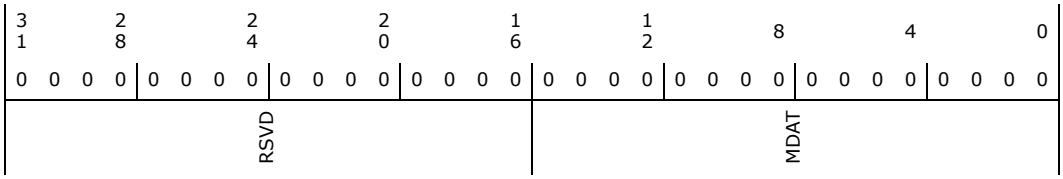
19.8.18 Message Data Register (MDAT)—Offset DCh

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW	**Message Data (MDAT):** Written by the system to indicate the lower 16 bits of the data written in the MSI memory write DWord transaction. The upper 16 bits of the transaction are written as 0000h.

19.9 GbE Memory Mapped I/O Registers Summary

Table 19-7. Summary of GbE Memory Mapped I/O Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Gigabit Ethernet Capabilities and Status (GBECSR_00)—Offset 0h	0h
18h	1Bh	Gigabit Ethernet Capabilities and Status (GBECSR_18)—Offset 18h	0h
20h	23h	Gigabit Ethernet Capabilities and Status (GBECSR_20)—Offset 20h	10000000h
2Ch	2Fh	Gigabit Ethernet Capabilities and Status (GBECSR_2C)—Offset 2Ch	0h
F00h	F03h	Gigabit Ethernet Capabilities and Status (GBECSR_F00)—Offset F00h	0h
F10h	F13h	Gigabit Ethernet Capabilities and Status F10 (GBECSR_F10)—Offset F10h	Ch
5400h	5403h	Gigabit Ethernet Capabilities and Status (GBECSR_5400)—Offset 5400h	0h
5404h	5407h	Gigabit Ethernet Capabilities and Status (GBECSR_5404)—Offset 5404h	0h
5800h	5803h	Gigabit Ethernet Capabilities and Status (GBECSR_5800)—Offset 5800h	0h
5B54h	5B57h	Gigabit Ethernet Capabilities and Status (GBECSR_5B54)—Offset 5B54h	0h

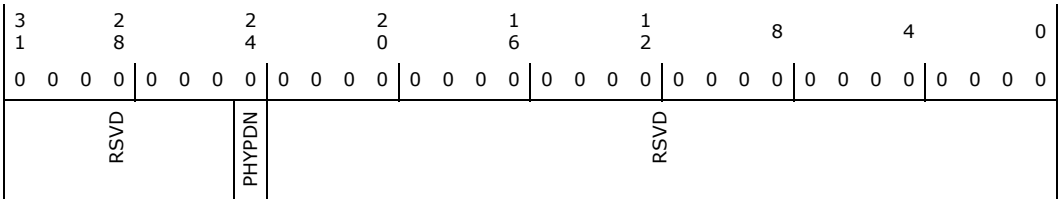
19.9.1 Gigabit Ethernet Capabilities and Status (GBECSR_00)—Offset 0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:25	0h RO	Reserved.
24	0h RW	**PHY Power Down (PHYPDN):** When cleared (0b), the PHY power down setting is controlled by the internal logic of PCH.
23:0	0h RO	Reserved.

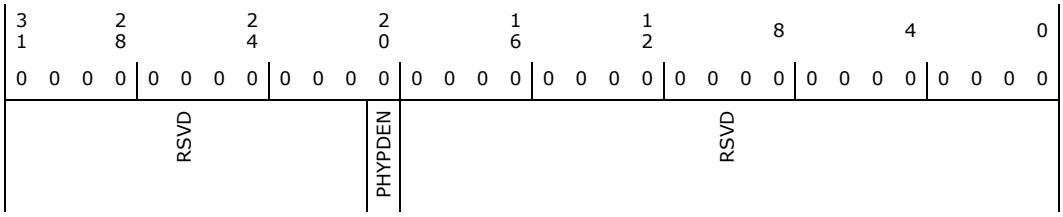
19.9.2 Gigabit Ethernet Capabilities and Status (GBECSR_18)—Offset 18h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:21	0h RO	Reserved.
20	0h RW	**PHY Power Down Enable (PHYPDEN):** When set, this bit enables the PHY to enter a low-power state when the LAN controller is at the DMOff/ D3 or with no WOL.
19:0	0h RO	Reserved.

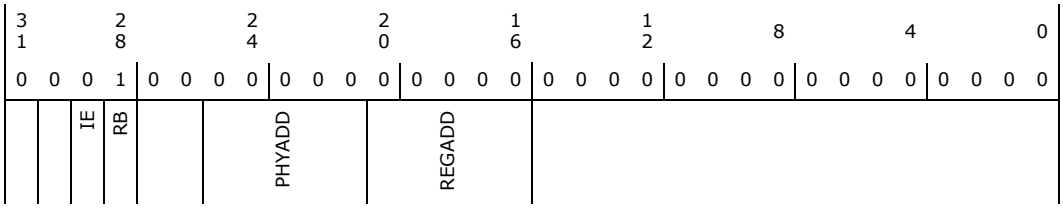
19.9.3 Gigabit Ethernet Capabilities and Status (GBECSR_20)—Offset 20h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 10000000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/V	**Wait:** Set to 1 by the Gigabit Ethernet Controller to indicate that a PCI Express* to SMBus transition is taking place. The Intel ME/Host should not issue new MDIC transactions while this bit is set to 1. This bit is auto cleared by hardware after the transition has occurred.
30	0h RW/V	**Error:** Set to 1 by the Gigabit Ethernet Controller when it fails to complete an MDI read. Software should make sure this bit is clear before making an MDI read or write command.
29	0h RW/V	**Interrupt Enable (IE):** When set to 1 by software, it will cause an Interrupt to be asserted to indicate the end of an MDI cycle.
28	1h RW/V	**Ready Bit (RB):** Set to 1 by the Gigabit Ethernet Controller at the end of the MDI transaction. This bit should be reset to 0 by software at the same time the command is written.
27:26	0h RW/V	**MDI Type:** 01 = MDI Write 10 = MDI Read All other values are reserved.
25:21	0h RW/V	**LAN Connected Device Address (PHYADD)**
20:16	0h RW/V	**LAN Connected Device Register Address (REGADD)**
15:0	0h RW/V	**DATA:** In a Write command, software places the data bits and the MAC shifts them out to the LAN Connected Device. In a Read command, the MAC reads these bits serially from the LAN Connected Device and software can read them from this location.

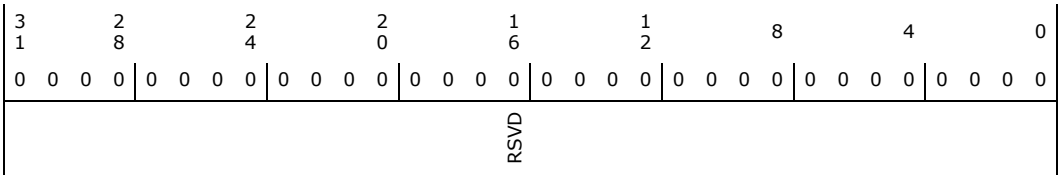
19.9.4 Gigabit Ethernet Capabilities and Status (GBECSR_2C)—Offset 2Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO	**Reserved**

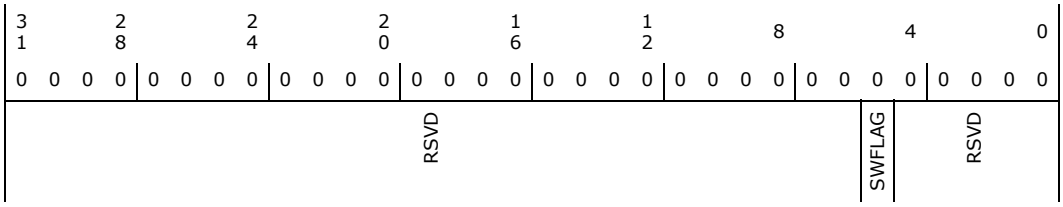
19.9.5 Gigabit Ethernet Capabilities and Status (GBECSR_F00)—Offset F00h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:6	0h RO	Reserved.
5	0h RW/V	**Software Semaphore FLAG (SWFLAG):** This bit is set by the device driver to gain access permission to shared CSR registers with the firmware and hardware.
4:0	0h RO	Reserved.

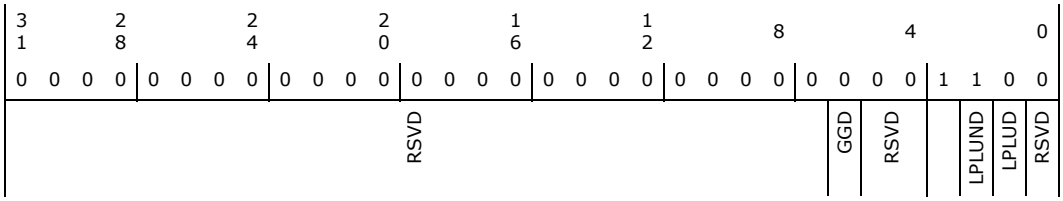
19.9.6 Gigabit Ethernet Capabilities and Status F10 (GBECSR_F10)—Offset F10h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 6

Default: Ch



Bit Range	Default and Access	Field Name (ID): Description
31:7	0h RO	Reserved.
6	0h RW	**Global GbE Disable (GGD):** Prevents the PHY from auto-negotiating 1000Mb/s link in all power states.
5:4	0h RO	Reserved.
3	1h RW	**GbE Disable at non D0a—:** Prevents the PHY from auto-negotiating 1000Mb/s link in all power states except D0a. This bit must be set since GbE is not supported in Sx states.
2	1h RW	**LPLU in non D0a (LPLUND):** Enables the PHY to negotiate for the slowest possible link in all power states except D0a.
1	0h RW	**LPLU in D0a (LPLUD):** Enables the PHY to negotiate for the slowest possible link in all power states. This bit overrides bit 2.
0	0h RO	Reserved.

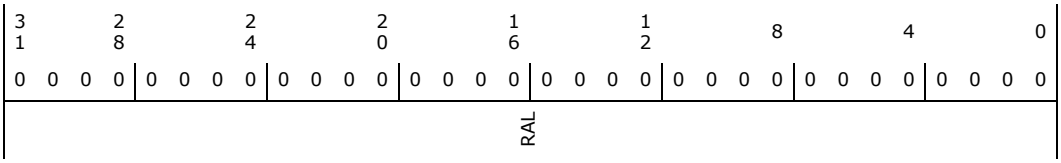
19.9.7 Gigabit Ethernet Capabilities and Status (GBECSR_5400)—Offset 5400h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Receive Address Low (RAL):** The lower 32 bits of the 48-bit Ethernet Address.

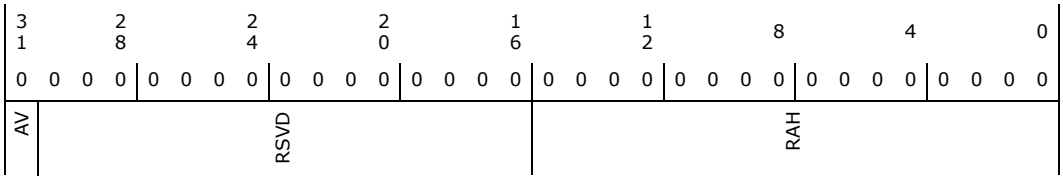
19.9.8 Gigabit Ethernet Capabilities and Status (GBECSR_5404)—Offset 5404h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW	**Address Valid (AV)**
30:16	0h RO	Reserved.
15:0	0h RW	**Receive Address High (RAH):** The lower 16 bits of the 48-bit Ethernet Address.

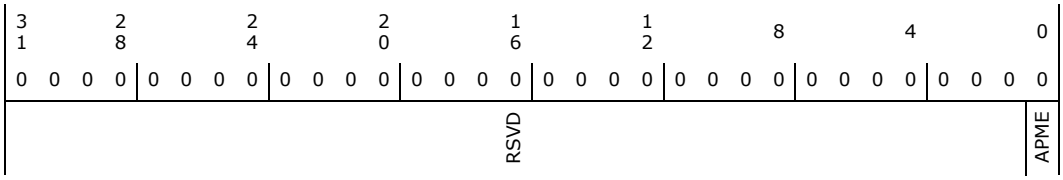
19.9.9 Gigabit Ethernet Capabilities and Status (GBECSR_5800)—Offset 5800h

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 31
Function: 6

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RW	**Advanced Power Management Enable (APME):** 1 = APM Wakeup is enabled 0 = APM Wakeup is disabled

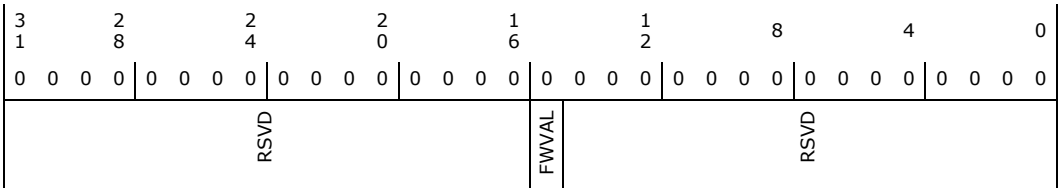
19.9.10 Gigabit Ethernet Capabilities and Status (GBECSR_5B54)—Offset 5B54h

Access Method

Type: MEM Register (Size: 32 bits)

Device: 31
Function: 6

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW	**Firmware Valid Bit (FWVAL):** 1 = Firmware is ready 0 = Firmware is not ready
14:0	0h RO	Reserved.

§

20 Interrupt Interface

20.1 Acronyms

Acronyms	Description
AEOI	Automatic End Of Interrupt
APIC	Advanced Programmable Interrupt Controller
HPET	High Precision Event Timer
EOI	End of Interrupt
PIC	Programmable Interrupt Controller
PIRQ	Peripheral Interrupt Request

20.2 References

Specification	Location
None	

20.3 Overview

The interrupt controllers are used by the OS to dynamically route PCI interrupts to interrupt requests. Refer to the BIOS Writer's Guide for the additional information.

20.4 Signal Description

Name	Type	Description
GPP_A6_SERIRQ_ESPI_CS1#	I/O	Serial Interrupt Request ***Note:*** An external pull-up is required
GPP_A7_PIRQA#_ESPI_ALERT0#	I/OD	PCI Interrupt Request A ***Note:*** An external pull-up is required
GPP_G18_NMI#	OD	Active low signal driven by the PCH when it is generating an NMI#. This can be used by external components to determine that the PCH is generating an NMI#.
GPP_G19_SMI#	OD	Active low signal driven by the PCH when it is generating an SMI#. This can be used by external components to determine that the PCH is generating an SMI#.

20.5 Integrated Pull-Ups and Pull-Downs

None.

20.6 I/O Signal Planes and States

Signal Name	Power Plane	During Reset	Immediately after Reset	S3/S4/S5	Deep Sx
GPP_A6_SERIRQ_ESPI_CS1#	Primary	Undriven	Undriven	Undriven	OFF
GPP_A7_PIRQA#_ESPI_ALERT0#	Primary	Undriven	Undriven	Undriven	OFF
GPP_G18_NMI#	Primary	Undriven	Undriven	Undriven	OFF
GPP_G19_SMI#	Primary	Undriven	Undriven	Undriven	OFF

20.7 Functional Description

The PCH supports both APIC and PIC modes.

Interrupt sharing from the perspective of the interrupt controller that receives the interrupts is limited to IRQ 0-23.

- Shareable interrupts require the interrupt controller to track the Assert/De-assert Sideband message from each interrupt source. The interrupt controller achieves this through Source ID decode of the message.
- Maintains backwards compatibility with the prior generations where only the lower 24 IRQs are available to support interrupt sharing.
- Interrupts are dedicated and not shareable from the perspective of the interrupt controller for IRQ 24-119. In other words, not more than one interrupt initiator is allowed to be assigned to the same IRQ# for IRQ 24-119. For example, GPIO (multi-cause Interrupt Initiator) and LPSS (multi-function Interrupt Initiator) should not each generate Assert/De-assert IRQn that maps to IRQ24.
- Possible multi-cause interrupt initiators that map to IRQ24-119 are GPIO, eSPI, etc.

Interrupt Sharing Compliance Requirement for the interrupt initiator are as follows:

1. For multi-cause Initiators (Multiple Interrupt Cause from Single Source and Single SB Port ID, i.e., GPIO, eSPI): If more than 1interrupt cause has to use the same IRQ#, it has to be aggregated or guaranteed through BIOS/SW to assign a unique IRQ per interrupt cause.
2. For multi-function devices (one interrupt cause per source but many sources have behind single SB Port ID, i.e., LPSS): Again if sharing is needed, the interrupts have to be aggregated or guaranteed through SW to ensure a unique IRQ is assigned per interrupt cause.
3. IPs that have 1:1 mapping to the IRQ# such as eSPI and LPC is not impacted by this requirement. For eSPI, it is expected that the EC devices aggregate the interrupts before it is communicated to eSPI.
4. Single-cause or Single-function device behind a unique SB Port ID is not subjected to this requirement.

Only level-triggered interrupts can be shared. PCI interrupts are inherently shared on the board; these should, therefore, be programmed as level-triggered.

The following tables show the mapping of the various interrupts in Non-APIC and APIC modes.

Table 20-1. Interrupt Options - 8259 Mode

IRQ#	Pin	SERIRQ	PCI Message	Internal Modules
0	No	No	No	8254 Counter 0, HPET#0
1	No	Yes	No	Option for configurable sources including GPIO, eSPI and internal PCI/ACPI devices
2	No	No	No	8259 #2 cascade only
3:7	PIRQA	Yes	Yes	Option for configurable sources including PIRQx, GPIO, eSPI and internal PCI/ACPI devices
8	No	No	No	RTC, HPET#1
9:10	PIRQA	Yes	Yes	Option for configurable sources including PIRQx, GPIO, eSPI, internal PCI/ACPI devices, SCI and TCO.
11	PIRQA	Yes	Yes	Option for configurable sources including PIRQx, GPIO, eSPI, internal ACPI devices, SCI, TCO, HPET #2
12	PIRQA	Yes	Yes	Option for configurable sources including PIRQx, GPIO, eSPI, internal ACPI devices, HPET#3
13	No	No	Yes	Option for configurable sources including GPIO, eSPI, internal ACPI devices
14:15	PIRQA	Yes	Yes	Option for configurable sources including PIRQx, GPIO, eSPI and internal ACPI devices

Notes:
1. 8259 Interrupt Request Lines 0, 2 and 8 are non-shareable and dedicated. Only one interrupt source is allowed to use the Interrupt Request Line at any one time.
2. If an interrupt is used for PCI IRQ [A:H], SCI, or TCO, it should not be used for ISA-style interrupts (via SERIRQ).
3. In 8259 mode, PCI interrupts are mapped to IRQ3, 4, 5, 6, 7, 9, 10, 11, 12, 14, or 15. It can be programmed via 10.1.4 Interrupt Control Offset 60h-63h, 68h-6Bh.

Table 20-2. Interrupt Options - APIC Mode (Sheet 1 of 2)

IRQ#	Pin	SERIRQ	PCI Message	IRQ Sharable?	Internal Modules
0	No	No	No	No	Cascade from 8259 #1
1	No	Yes	No	Yes	Option for configurable sources including GPIO, eSPI, internal ACPI/ PCI devices
2	No	No	No	No	8254 Counter 0, HPET #0 (legacy mode)
3:7	No	Yes	No	Yes	Option for configurable sources including GPIO, eSPI, internal ACPI/ PCI devices
8	No	No	No	No	RTC, HPET #1 (legacy mode)
9:10	No	Yes	No	Yes	Option for configurable sources including GPIO, eSPI, internal ACPI/ PCI devices, SCI and TCO
11	No	Yes	No	Yes	Option for configurable sources including GPIO, eSPI, internal ACPI/ PCI devices, SCI, TCO, HPET #2
12	No	Yes	No	Yes	Option for configurable sources including GPIO, eSPI, internal ACPI/ PCI devices, HPET#3
13	No	No	No	Yes	Option for configurable sources including GPIO, eSPI and internal ACPI/PCI devices

Table 20-2. Interrupt Options - APIC Mode (Sheet 2 of 2)

IRQ#	Pin	SERIRQ	PCI Message	IRQ Sharable?	Internal Modules
14:15	No	Yes	No	Yes	Option for configurable sources including GPIO, eSPI and internal ACPI/PCI devices
16	PIRQA	PIRQA	Yes	Yes	Option for configurable sources including internal PIRQA, GPIO, eSPI and internal ACPI/PCI devices
17:19	No	PIRQ[B-D]	Yes	Yes	Option for configurable sources including internal PIRQ[B-D], GPIO, eSPI and internal ACPI/PCI devices
20:23	No	No	No	Yes	Option for configurable sources including internal PIRQ[E-H], GPIO, eSPI, SCI, TCO, internal ACPI/PCI devices and HPET
24:119	No	No	No	No	Option for configurable sources including GPIO, eSPI and internal ACPI/PCI devices

Notes:
1. Interrupts 24 through 119 are dedicated and not shareable from the perspective of the Interrupt Controller. Not more than one interrupt source is allowed to be assigned to the same IRQ#. For example, GPIO and LPSS should not generate Assert/Deassert_IRQn that maps to IRQ24. Although dedicated, Interrupts 24 through 119 can be configured to be level or edge-triggered.
2. If an interrupt is used for PCI IRQ [A:H], SCI, or TCO, it should not be used for ISA-style interrupts (via SERIRQ).
3. In APIC mode, the PCI interrupts [A:H] are directly mapped to IRQ[16:23].
4. When programming the polarity of internal interrupt sources on the APIC, interrupts 0 through 15, and 24 through 119 receive active-high internal interrupt sources; interrupts 16 through 23 receive active-low internal interrupt sources.
5. PIRQA is muxed with GPIO pins for assertion by external devices. Interrupt PIRQA will not be exposed if they are configured as GPIOs. When configured as GPIO pin, the internal PIRQA# is delivered internally to internal interrupt controller.
6. The internal ACPI/PCI devices refer to PCI/PCIe devices configured to the ACPI or PCI function mode. If in ACPI function mode, the device interrupt is map directly to one of the available IRQ. If in PCI function mode, the device interrupt is map to INT[A-D] and then to the IRQ before these devices issue the Interrupt Message using Assert/Deassert_IRQn.
7. PCI Message refers to the downstream Assert/Deassert_INT[A-D] messages forwarded from the CPU complex.

The following signals are associated with the interrupt logic.

Table 20-3. Interrupt Logic Signals

Signal Name	C3	S1-D	S1-M	S3	S5
SERIRQ	Can be running	Tri-State (high)	Tri-State (high)	Off	Off
PIRQA#	Can go active	Tri-State (high)	Tri-State (high)	Off	Off

20.7.1 8259 Interrupt Controllers

The ISA-compatible interrupt controller incorporates the functionality of two 8259 interrupt controllers. The following table shows how the cores are connected.

Table 20-4. Interrupt Controllers PIC

8259	8259 Input	Typical Interrupt Source	Connected Pin / Function
Master	0	Internal	Internal Timer / Counter 0 output or Multimedia Timer #0
	1	Keyboard	IRQ1 via SERIRQ. Option for configurable sources including eSPI, GPIO, internal ACPI devices.
	2	Internal	Slave Controller INTR output
	3	Serial Port A	IRQ3 from configurable sources including PIRQx, SERIRQ, eSPI, GPIO, internal ACPI devices.
	4	Serial Port B	IRQ4 from configurable sources including PIRQx, SERIRQ, eSPI, GPIO, internal ACPI devices.
	5	Parallel Port / Generic	IRQ5 from configurable sources including PIRQx, SERIRQ, eSPI, GPIO, internal ACPI devices.
	6	Floppy Disk	IRQ6 from configurable sources including PIRQx, SERIRQ, eSPI, GPIO, internal ACPI devices.
	7	Parallel Port / Generic	IRQ7 from configurable sources including PIRQx, SERIRQ, eSPI, GPIO, internal ACPI devices.
Slave	0	Real Time Clock	Inverted IRQ8# from internal RTC or Multimedia Timer #1
	1	Generic	IRQ9 from configurable sources including PIRQx, SERIRQ, eSPI, GPIO, internal ACPI devices, SCI, TCO.
	2	Generic	IRQ10 from configurable sources including PIRQx, SERIRQ, eSPI, GPIO, internal ACPI devices, SCI, TCO.
	3	Generic	IRQ11 from configurable sources including PIRQx, SERIRQ, eSPI, GPIO, internal ACPI devices, SCI, TCO or HPET #2.
	4	PS/2 Mouse	IRQ12 from configurable sources including PIRQx, SERIRQ, eSPI, GPIO, internal ACPI devices, SCI, TCO or HPET #3.
	5	Internal	IRQ13 from configurable sources including PIRQx, eSPI, GPIO, internal ACPI devices.
	6	Internal	IRQ14 from configurable sources including PIRQx, SERIRQ, eSPI, GPIO, internal ACPI devices.
	7	Internal	IRQ15 from configurable sources including PIRQx, SERIRQ, eSPI, GPIO, internal ACPI devices.

The slave controller is cascaded onto the master controller through master controller interrupt input 2. This means there are only 15 possible interrupts for PCH PIC.

Interrupts can individually be programmed to be edge or level triggered, except for IRQ0, IRQ1, IRQ2 and IRQ8# which always default to edge.

Active-low interrupt sources, such as the PIRQ#'s, are internally inverted before being sent to the PIC. In the following descriptions of the 8259's, the interrupt levels are in reference to the signals at the internal interface of the 8259's, after the required inversions have occurred. Therefore, the term "high" indicates "active", which means "low" on an originating PIRQ#.

20.7.2 Interrupt Handling

20.7.2.1 Generating Interrupts

The PIC interrupt sequence involves three bits, from the IRR, ISR, and IMR, for each interrupt level. These bits are used to determine the interrupt vector returned, and status of any other pending interrupts. Table 20-5 defines the IRR, ISR, and IMR.

Table 20-5. Interrupt Status Registers

Bit	Description
IRR	**Interrupt Request Register.** This bit is set on a low to high transition of the interrupt line in edge mode, and by an active high level in level mode. This bit is set whether or not the interrupt is masked. However, a masked interrupt will not generate INTR.
ISR	**Interrupt Service Register.** This bit is set, and the corresponding IRR bit cleared, when an interrupt acknowledge cycle is seen, and the vector returned is for that interrupt.
IMR	**Interrupt Mask Register.** This bit determines whether an interrupt is masked. Masked interrupts will not generate INTR.

20.7.2.2 Acknowledging Interrupts

The processor generates an interrupt acknowledge cycle that is translated by the host bridge into a PCI Interrupt Acknowledge Cycle to the PCH. The PIC translates this command into two internal INTA# pulses expected by the 8259 cores. The PIC uses the first internal INTA# pulse to freeze the state of the interrupts for priority resolution. On the second INTA# pulse, the master or slave sends the interrupt vector to the processor with the acknowledged interrupt code. This code is based upon bits [7:3] of the corresponding ICW2 register, combined with three bits representing the interrupt within that controller.

Table 20-6. Content of Interrupt Vector Byte

Master, Slave Interrupt	Bits [7:3]	Bits [2:0]
IRQ7,15	ICW2[7:3]	111
IRQ6,14		110
IRQ5,13		101
IRQ4,12		100
IRQ3,11		011
IRQ2,10		010
IRQ1,9		001
IRQ0,8		000

20.7.2.3 Hardware/Software Interrupt Sequence

1. One or more of the interrupt request lines are raised high in edge mode, or seen high in level mode, setting the corresponding IRR bit.
2. The PIC sends INTR active to the processor if an asserted interrupt is not masked.
3. The processor acknowledges the INTR and responds with an interrupt acknowledge cycle. The cycle is translated into a PCI interrupt acknowledge cycle by the host bridge. This command is broadcast over PCI by the PCH.
4. Upon observing its own interrupt acknowledge cycle on PCI, the PCH converts it into the two cycles that the internal 8259 pair can respond to. Each cycle appears as an interrupt acknowledge pulse on the internal INTA# pin of the cascaded interrupt controllers.

5. Upon receiving the first internally generated INTA# pulse, the highest priority ISR bit is set and the corresponding IRR bit is reset. On the trailing edge of the first pulse, a slave identification code is broadcast by the master to the slave on a private, internal three bit wide bus. The slave controller uses these bits to determine if it must respond with an interrupt vector during the second INTA# pulse.
6. Upon receiving the second internally generated INTA# pulse, the PIC returns the interrupt vector. If no interrupt request is present because the request was too short in duration, the PIC returns vector 7 from the master controller.
7. This completes the interrupt cycle. In AEOI mode the ISR bit is reset at the end of the second INTA# pulse. Otherwise, the ISR bit remains set until an appropriate EOI command is issued at the end of the interrupt subroutine.

20.7.3 Initialization Command Words

Before operation can begin, each 8259 must be initialized. In the PCH, this is a four byte sequence. The four initialization command words are referred to by their acronyms: ICW1, ICW2, ICW3, and ICW4.

The base address for each 8259 initialization command word is a fixed location in the I/O memory space: 20h for the master controller, and A0h for the slave controller.

20.7.3.1 ICW1

An I/O write to the master or slave controller base address with data bit 4 equal to 1 is interpreted as a write to ICW1. Upon sensing this write, the PCH's PIC expects three more byte writes to 21h for the master controller, or A1h for the slave controller, to complete the ICW sequence.

A write to ICW1 starts the initialization sequence during which the following automatically occur:

1. Following initialization, an interrupt request input must make a low-to-high transition to generate an interrupt.
2. The Interrupt Mask Register is cleared.
3. IRQ7 input is assigned priority 7.
4. The slave mode address is set to 7.
5. Special mask mode is cleared and Status Read is set to IRR.

20.7.3.2 ICW2

The second write in the sequence (ICW2) is programmed to provide bits [7:3] of the interrupt vector that will be released during an interrupt acknowledge. A different base is selected for each interrupt controller.

20.7.3.3 ICW3

The third write in the sequence (ICW3) has a different meaning for each controller.

- For the master controller, ICW3 is used to indicate which IRQ input line is used to cascade the slave controller. Within the PCH, IRQ2 is used. Therefore, Bit 2 of ICW3 on the master controller is set to a 1, and the other bits are set to 0s.

- For the slave controller, ICW3 is the slave identification code used during an interrupt acknowledge cycle. On interrupt acknowledge cycles, the master controller broadcasts a code to the slave controller if the cascaded interrupt won arbitration on the master controller. The slave controller compares this identification code to the value stored in its ICW3, and if it matches, the slave controller assumes responsibility for broadcasting the interrupt vector.

20.7.3.4 ICW4

The final write in the sequence (ICW4) must be programmed for both controllers. At the very least, Bit 0 must be set to a 1 to indicate that the controllers are operating in an Intel Architecture-based system.

20.7.4 Operation Command Words

These command words reprogram the Interrupt controller to operate in various interrupt modes.

- OCW1 masks and unmasks interrupt lines.
- OCW2 controls the rotation of interrupt priorities when in rotating priority mode, and controls the EOI function.
- OCW3 sets up ISR/IRR reads, enables/disables the Special Mask Mode (SMM), and enables/disables polled interrupt mode.

20.7.5 Modes of Operation

20.7.5.1 Fully-Nested Mode

In this mode, interrupt requests are ordered in priority from 0 through 7, with 0 being the highest. When an interrupt is acknowledged, the highest priority request is determined and its vector placed on the bus. Additionally, the ISR for the interrupt is set. This ISR bit remains set until: the processor issues an EOI command immediately before returning from the service routine; or if in AEOI mode, on the trailing edge of the second INTA#. While the ISR bit is set, all further interrupts of the same or lower priority are inhibited, while higher levels generate another interrupt. Interrupt priorities can be changed in the rotating priority mode.

20.7.5.2 Special Fully-Nested Mode

This mode is used in the case of a system where cascading is used, and the priority has to be conserved within each slave. In this case, the special fully-nested mode is programmed to the master controller. This mode is similar to the fully-nested mode with the following exceptions:

- When an interrupt request from a certain slave is in service, this slave is not locked out from the master's priority logic and further interrupt requests from higher priority interrupts within the slave are recognized by the master and initiate interrupts to the processor. In the normal-nested mode, a slave is masked out when its request is in service.
- When exiting the Interrupt Service Routine, software has to check whether the interrupt serviced was the only one from that slave. This is done by sending a Non-Specific EOI command to the slave and then reading its ISR. If it is 0, a Non-Specific EOI can also be sent to the master.

20.7.5.3 Automatic Rotation Mode (Equal Priority Devices)

In some applications, there are a number of interrupting devices of equal priority. Automatic rotation mode provides for a sequential 8-way rotation. In this mode, a device receives the lowest priority after being serviced. In the worst case, a device requesting an interrupt has to wait until each of seven other devices are serviced at most once.

There are two ways to accomplish automatic rotation using OCW2; the Rotation on Non-Specific EOI Command (R=1, SL=0, EOI=1) and the rotate in automatic EOI mode which is set by (R=1, SL=0, EOI=0).

20.7.5.4 Specific Rotation Mode (Specific Priority)

Software can change interrupt priorities by programming the bottom priority. For example, if IRQ5 is programmed as the bottom priority device, then IRQ6 is the highest priority device. The Set Priority Command is issued in OCW2 to accomplish this, where: R=1, SL=1, and LO–L2 is the binary priority level code of the bottom priority device.

In this mode, internal status is updated by software control during OCW2. However, it is independent of the EOI command. Priority changes can be executed during an EOI command by using the Rotate on Specific EOI Command in OCW2 (R=1, SL=1, EOI=1 and LO–L2=IRQ level to receive bottom priority.

20.7.5.5 Poll Mode

Poll mode can be used to conserve space in the interrupt vector table. Multiple interrupts that can be serviced by one Interrupt Service Routine do not need separate vectors if the service routine uses the poll command. Poll mode can also be used to expand the number of interrupts. The polling Interrupt Service Routine can call the appropriate service routine, instead of providing the interrupt vectors in the vector table. In this mode, the INTR output is not used and the microprocessor internal Interrupt Enable flip-flop is reset, disabling its interrupt input. Service to devices is achieved by software using a Poll command.

The Poll command is issued by setting P=1 in OCW3. The PIC treats its next I/O read as an interrupt acknowledge, sets the appropriate ISR bit if there is a request, and reads the priority level. Interrupts are frozen from the OCW3 write to the I/O read. The byte returned during the I/O read contains a 1 in Bit 7 if there is an interrupt, and the binary code of the highest priority level in bits [2:0].

20.7.5.6 Edge and Level Triggered Mode

In ISA systems this mode is programmed using Bit 3 in ICW1, which sets level or edge for the entire controller. In the PCH, this bit is disabled and a register for edge and level triggered mode selection, per interrupt input, is included. This is the Edge/Level control Registers ELCR1 and ELCR2.

If an ELCR bit is 0, an interrupt request will be recognized by a low-to-high transition on the corresponding IRQ input. The IRQ input can remain high without generating another interrupt. If an ELCR bit is 1, an interrupt request will be recognized by a high level on the corresponding IRQ input and there is no need for an edge detection. The interrupt request must be removed before the EOI command is issued to prevent a second interrupt from occurring.

In both the edge and level triggered modes, the IRQ inputs must remain active until after the falling edge of the first internal INTA#. If the IRQ input goes inactive before this time, a default IRQ7 vector is returned.

20.7.5.7 End Of Interrupt Operations

An EOI can occur in one of two fashions: by a command word write issued to the PIC before returning from a service routine, the EOI command; or automatically when AEOI bit in ICW4 is set to 1.

20.7.5.8 Normal End of Interrupt

In normal EOI, software writes an EOI command before leaving the Interrupt Service Routine to mark the interrupt as completed. There are two forms of EOI commands: Specific and Non-Specific. When a Non-Specific EOI command is issued, the PIC clears the highest ISR bit of those that are set to 1. Non-Specific EOI is the normal mode of operation of the PIC within the PCH, as the interrupt being serviced currently is the interrupt entered with the interrupt acknowledge. When the PIC is operated in modes that preserve the fully nested structure, software can determine which ISR bit to clear by issuing a Specific EOI. An ISR bit that is masked is not cleared by a Non-Specific EOI if the PIC is in the special mask mode. An EOI command must be issued for both the master and slave controller.

20.7.5.9 Automatic End of Interrupt Mode

In this mode, the PIC automatically performs a Non-Specific EOI operation at the trailing edge of the last interrupt acknowledge pulse. From a system standpoint, this mode should be used only when a nested multi-level interrupt structure is not required within a single PIC. The AEOI mode can only be used in the master controller and not the slave controller.

20.7.6 Masking Interrupts

20.7.6.1 Masking on an Individual Interrupt Request

Each interrupt request can be masked individually by the Interrupt Mask Register (IMR). This register is programmed through OCW1. Each bit in the IMR masks one interrupt channel. Masking IRQ2 on the master controller masks all requests for service from the slave controller.

20.7.6.2 Special Mask Mode

Some applications may require an Interrupt Service Routine to dynamically alter the system priority structure during its execution under software control. For example, the routine may wish to inhibit lower priority requests for a portion of its execution but enable some of them for another portion.

The special mask mode enables all interrupts not masked by a bit set in the Mask Register. Normally, when an Interrupt Service Routine acknowledges an interrupt without issuing an EOI to clear the ISR bit, the interrupt controller inhibits all lower priority requests. In the special mask mode, any interrupts may be selectively enabled by loading the Mask Register with the appropriate pattern. The special Mask Mode is set by OCW3.SSMM and OCW3.SMM being set, and cleared when OCW3.SSMM and OCW3.SMM are cleared.

20.7.7 Steering PCI Interrupts

PCH can be programmed to allow PIRQ[A:D]# to be internally routed to interrupts 3-7, 9-12, 14 or 15, through the PARC, PBRC, PCRC, PDRC, PERC, PFRC, PGRC, and PHRC registers in the chipset configuration section. One or more PIRQx# lines can be routed to the same IRQx input.

The PIRQx# lines are defined as active low, level sensitive. When PIRQx# is routed to specified IRQ line, software must change the corresponding ELCR1 or ELCR2 register to level sensitive mode. PCH will internally invert the PIRQx# line to send an active high level to the PIC. When a PCI interrupt is routed onto the PIC, the selected IRQ can no longer be used by an ISA device.

20.8 Advanced Programmable Interrupt Controller (APIC) (D31:F0)

In addition to the standard ISA-compatible PIC described in the previous section, the PCH incorporates the APIC. While the standard interrupt controller is intended for use in a uni-processor system, APIC can be used in either a uni-processor or multi-processor system.

20.8.1 Interrupt Handling

The I/O APIC handles interrupts very differently than the 8259. Briefly, these differences are:

- **Method of Interrupt Transmission.** The I/O APIC transmits interrupts through memory writes on the normal data path to the processor, and interrupts are handled without the need for the processor to run an interrupt acknowledge cycle.
- **Interrupt Priority.** The priority of interrupts in the I/O APIC is independent of the interrupt number. For example, interrupt 10 can be given a higher priority than interrupt 3.
- **More Interrupts.** The I/O APIC in the PCH supports a total of 24 interrupts.
- **Multiple Interrupt Controllers.** The I/O APIC architecture allows for multiple I/O APIC devices in the system with their own interrupt vectors.

20.8.2 Interrupt Mapping

The I/O APIC within the PCH supports 40 APIC interrupts. Each interrupt has its own unique vector assigned by software. The interrupt vectors are mapped as follows.

Table 20-7. APIC Interrupt Mapping[1] (Sheet 1 of 2)

IRQ #	Using SERIRQ	Direct from Pin	Using PCI Message	Internal Modules
0	No	No	No	Cascade from 8259 #1
1	Yes	No	Yes	
2	No	No	No	8254 Counter 0, HPET #0 (legacy mode)
3	Yes	No	Yes	
4	Yes	No	Yes	
5	Yes	No	Yes	GSPI, UART, I^2C, SDIO
6	Yes	No	Yes	GSPI, UART, I^2C, SDIO
7	Yes	No	Yes	GSPI, UART, I^2C, SDIO

Table 20-7. APIC Interrupt Mapping[1] (Sheet 2 of 2)

IRQ #	Using SERIRQ	Direct from Pin	Using PCI Message	Internal Modules
8	No	No	No	RTC, HPET #1 (legacy mode)
9	Yes	No	Yes	Option for SCI, TCO
10	Yes	No	Yes	Option for SCI, TCO
11	Yes	No	Yes	HPET #2, Option for SCI, TCO (Note 2)
12	Yes	No	Yes	HPET #3 (Note 3)
13	No	No	No	GSPI, UART, I^2C, SDIO
14	Yes	No	Yes	GPIO
15	Yes	No	Yes	GPIO
16	PIRQA#	PIRQA#[5]	Yes	Internal devices are routable.
17	PIRQB#	PIRQB#[5]		
18	PIRQC#	PIRQC#[5]		
19	PIRQD#	PIRQD#[5]		
20	N/A	PIRQE#[4]	Yes	Option for SCI, TCO, HPET #0, 1, 2, 3. Other internal devices are routable.
21	N/A	PIRQF#[4]		
22	N/A	PIRQG#[4]		
23	N/A	PIRQH#[4]		
24	No	PIRQI	No	
25	No	PIRQJ	No	
26	No	PIRQK	No	
27	No	PIRQL	No	
28	No	PIRQM	No	
29	No	PIRQN	No	
30	No	PIRQO	No	
31	No	PIRQP	No	
32	No	PIRQQ	No	
33	No	PIRQR	No	
34	No	PIRQS	No	
35	No	PIRQT	No	
36	No	PIRQU	No	
37	No	PIRQV	No	
38	No	PIRQW	No	
39	No	PIRQX	No	

Notes:

1. When programming the polarity of internal interrupt sources on the APIC, interrupts 0 through 15 receive active-high internal interrupt sources, while interrupts 16 through 23 receive active-low internal interrupt sources.
2. If IRQ 11 is used for HPET #2, software should ensure IRQ 11 is not shared with any other devices to ensure the proper operation of HPET #2. The PCH hardware does not prevent sharing of IRQ 11.
3. If IRQ 12 is used for HPET #3, software should ensure IRQ 12 is not shared with any other devices to ensure the proper operation of HPET #3. The PCH hardware does not prevent sharing of IRQ 12.
4. PIRQ[E:H] physical pins are not supported. The internal PIRQ[E:H]# are delivered internally to internal interrupt controller.
5. PIRQ[A:D] are Multiplexed with GPIO pins. Interrupts PIRQ[A:D] will not be exposed if they are configured as GPIOs. When configured as GPIO pins, the internal PIRQ[A:D]# are delivered internally to internal interrupt controller.

20.8.3 PCI/PCI Express Message-Based Interrupts

When external devices through PCI/PCI Express wish to generate an interrupt, they will send the message defined in the *PCI Express* Base Specification,* Revision 2.0 for generating INTA# – INTD#. These will be translated internal assertions/de-assertions of INTA# – INTD#.

20.8.4 IOxAPIC Address Remapping

To support Intel Virtualization Technology, interrupt messages are required to go through similar address remapping as any other memory request. Address remapping allows for domain isolation for interrupts, so a device assigned in one domain is not allowed to generate an interrupt to another domain.

The address remapping is based on the Bus: Device: Function field associated with the requests. The internal APIC is required to initiate the interrupt message using a unique Bus: Device: Function.

The PCH allows BIOS to program the unique Bus: Device: Function address for the internal APIC. This address field does not change the APIC functionality and the APIC is not promoted as a stand-alone PCI device. See Device 31: Function 0 Offset 6Ch for additional information.

20.8.5 External Interrupt Controller Support

The PCH supports external APICs off of PCI Express ports but does not support APICs on the PCI bus. The EOI special cycle is only forwarded to PCI Express ports.

20.9 Serial Interrupt

The PCH supports a serial IRQ scheme. This allows a single signal to be used to report interrupt requests. The signal used to transmit this information is shared between the PCH and all participating peripherals. The signal line, SERIRQ, is synchronous to 24 MHz CLKOUT_LPC, and follows the sustained tri-state protocol that is used by all PCI signals. This means that if a device has driven SERIRQ low, it will first drive it high synchronous to PCI clock and release it the following PCI clock. The serial IRQ protocol defines this sustained tri-state signaling in the following fashion:

- **S – Sample Phase,** Signal driven low
- **R** – **Recovery Phase,** Signal driven high
- **T** – **Turn-around Phase,** Signal released

The PCH supports a message for 21 serial interrupts. These represent the 15 ISA interrupts (IRQ0–1, 3–15), the four PCI interrupts, and the control signals SMI# and IOCHK#. The serial IRQ protocol does not support the additional APIC interrupts (20–23).

Note: IRQ14 and IRQ15 are special interrupts and maybe used by the GPIO controller when it is running GPIO driver mode. When the GPIO controller operates in GPIO driver mode, IRQ14 and IRQ15 shall not be utilized by the SERIRQ stream nor mapped to other interrupt sources, and instead come from the GPIO controller. If the GPIO controller is entirely in ACPI mode, these interrupts can be mapped to other devices accordingly.

20.9.1 Start Frame

The serial IRQ protocol has two modes of operation which affect the start frame. These two modes are: Continuous, where the PCH is solely responsible for generating the start frame; and Quiet, where a serial IRQ peripheral is responsible for beginning the start frame.

The mode that must first be entered when enabling the serial IRQ protocol is continuous mode. In this mode, the PCH asserts the start frame. This start frame is four, six or eight PCI clocks wide based upon the Serial IRQ Control Register, bits 1:0 at 64h in D31:F0 configuration space. This is a polling mode.

When the serial IRQ stream enters quiet mode (signaled in the Stop Frame), the SERIRQ line remains inactive and pulled up between the Stop and Start Frame until a peripheral drives the SERIRQ signal low. The PCH senses the line low and continues to drive it low for the remainder of the Start Frame. Since the first PCI clock of the start frame was driven by the peripheral in this mode, the PCH drives the SERIRQ line low for one PCI clock less than in continuous mode. This mode of operation allows for a quiet, and therefore lower power, operation.Data Frames

Once the Start frame has been initiated, all of the SERIRQ peripherals must start counting frames based on the rising edge of SERIRQ. Each of the IRQ/DATA frames has exactly three phases of one clock each:

- **Sample Phase—**During this phase, the SERIRQ device drives SERIRQ low if the corresponding interrupt signal is low. If the corresponding interrupt is high, then the SERIRQ devices tri-state the SERIRQ signal. The SERIRQ line remains high due to pull-up resistors (there is no internal pull-up resistor on this signal, an external pull-up resistor is required). A low level during the IRQ0–1 and IRQ2–15 frames indicates that an active-high ISA interrupt is not being requested, but a low level during the PCI INT[A:D], SMI#, and IOCHK# frame indicates that an active-low interrupt is being requested.
- **Recovery Phase—**During this phase, the device drives the SERIRQ line high if in the Sample Phase it was driven low. If it was not driven in the sample phase, it is tri-stated in this phase.
- **Turn-around Phase—**The device tri-states the SERIRQ line

20.9.2 Stop Frame

After all data frames, a Stop Frame is driven by the PCH. The SERIRQ signal is driven low by the PCH for two or three PCI clocks. The number of clocks is determined by the SERIRQ configuration register. The number of clocks determines the next mode.

Table 20-8. Stop Frame Explanation

Stop Frame Width	Next Mode
2 PCI clocks	**Quiet Mode.** Any SERIRQ device may initiate a Start Frame
3 PCI clocks	**Continuous Mode.** Only the host (the PCH) may initiate a Start Frame

20.9.3 Specific Interrupts Not Supported Using SERIRQ

There are three interrupts seen through the serial stream that are not supported by the PCH. These interrupts are generated internally, and are not sharable with other devices within the system. These interrupts are:

- IRQ0. Heartbeat interrupt generated off of the internal 8254 counter 0.
- IRQ8#. RTC interrupt can only be generated internally.
- IRQ13. Reserved internally.

The PCH ignores the state of these interrupts in the serial stream, and does not adjust their level based on the level seen in the serial stream.Data Frame Format

Table 20-9 shows the format of the data frames. For the PCI interrupts (A–D), the output from the PCH is AND'd with the PCI input signal. This way, the interrupt can be signaled using both the PCI interrupt input signal and using the SERIRQ signal (they are shared).

Table 20-9. Data Frame Format

Data Frame #	Interrupt	Clocks Past Start Frame	Comment
1	IRQ0	2	Ignored. IRQ0 can only be generated using the internal 8524
2	IRQ1	5	Before port 60h latch
3	SMI#	8	Causes SMI# if low. Will set the SERIRQ_SMI_STS bit.
4	IRQ3	11	
5	IRQ4	14	
6	IRQ5	17	
7	IRQ6	20	
8	IRQ7	23	
9	IRQ8	26	Ignored. IRQ8# can only be generated internally.
10	IRQ9	29	
11	IRQ10	32	
12	IRQ11	35	
13	IRQ12	38	Before port 60h latch
14	IRQ13	41	Ignored.
15	IRQ14	44	Not attached to GPIO logic
16	IRQ15	47	Not attached to GPIO logic
17	IOCHCK#	50	Same as ISA IOCHCK# going active
18	PCI INTA#	53	Drive PIRQA#
19	PCI INTB#	56	Drive PIRQB#
20	PCI INTC#	59	Drive PIRQC#
21	PCI INTD#	62	Drive PIRQD#

20.10 Interrupt Registers Summary

Table 20-10. Summary of Interrupt Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
20h	20h	Master Initialization Command Word 1 (MICW1)—Offset 20h	11h
20h	20h	Master Operational Control Word 2 (MOCW2)—Offset 20h	0h
20h	20h	Master Operational Control Word 3 (MOCW3)—Offset 20h	8h
21h	21h	Master Initialization Command Word 2 (MICW2)—Offset 21h	0h
21h	21h	Master Initialization Command Word 3 (MICW3)—Offset 21h	7h
21h	21h	Master Initialization Command Word 4 (MICW4)—Offset 21h	0h
21h	21h	Master Operational Control Word 1 (MOCW1)—Offset 21h	0h
A0h	A0h	Slave Initialization Command Word 1 (SICW1)—Offset A0h	11h
A0h	A0h	Slave Operational Control Word 2 (SOCW2)—Offset A0h	0h
A0h	A0h	Slave Operational Control Word 3 (SOCW3)—Offset A0h	8h
A1h	A1h	Slave Initialization Command Word 2 (SICW2)—Offset A1h	0h
A1h	A1h	Slave Initialization Command Word 3 (SICW3)—Offset A1h	7h
A1h	A1h	Slave Initialization Command Word 4 (SICW4)—Offset A1h	0h
A1h	A1h	Slave Operational Control Word 1 (SOCW1)—Offset A1h	0h
4D0h	4D0h	Master Edge/Level Control (ELCR1)—Offset 4D0h	0h
4D1h	4D1h	Slave Edge/Level Control (ELCR2)—Offset 4D1h	0h

20.10.1 Master Initialization Command Word 1 (MICW1)—Offset 20h

A write to Initialization Command Word 1 starts the interrupt controller initialization sequence, during which the following occurs:

1. The Interrupt Mask register is cleared.
2. IRQ7 input is assigned priority 7.
3. The slave mode address is set to 7.
4. Special Mask Mode is cleared and Status Read is set to IRR.

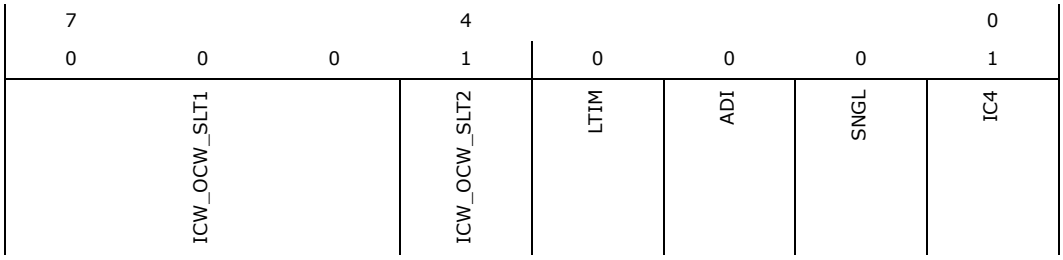
Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

Access Method

Type: I/O Register
(Size: 8 bits)

Device:
Function:

Default: 11h



Bit Range	Default and Access	Field Name (ID): Description
7:5	0h WO	**ICW/OCW select (ICW_OCW_SLT1):** These bits are MCS-85 specific, and not needed. Should be programmed to 000
4	1h WO	**ICW/OCW select (ICW_OCW_SLT2):** This bit must be a 1 to select ICW1 and enable the ICW2, ICW3, and ICW4 sequence.
3	0h WO	**Edge/Level Bank Select (LTIM):** Disabled. Replaced by the edge/level triggered control registers (ELCR).
2	0h WO	**ADI (ADI):** Ignored for PCH. Should be programmed to 0.
1	0h WO	**Single or Cascade (SNGL):** Must be programmed to a 0 to indicate two controllers operating in cascade mode.
0	1h WO	**ICW4 Write Required (IC4):** This bit must be programmed to a 1 to indicate that ICW4 needs to be programmed.

20.10.2 Master Operational Control Word 2 (MOCW2)—Offset 20h

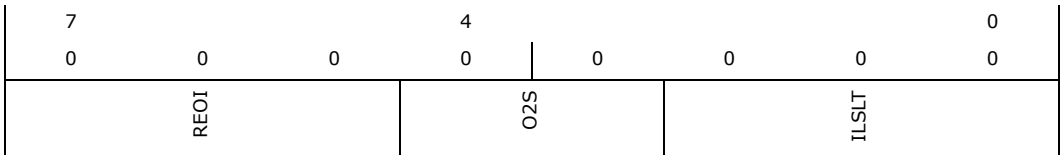
*address should be 20h
Following a part reset or ICW initialization, the controller enters the fully nested mode of operation. Non-specific EOI without rotation is the default. Both rotation mode and specific EOI mode are disabled following initialization.

Access Method

Type: I/O Register
(Size: 8 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:5	0h WO	**Rotate and EOI Codes (REOI):** R, SL, EOI - These three bits control the Rotate and End of Interrupt modes and combinations of the two. A chart of these combinations is listed above under the bit definition. 000 Rotate in Auto EOI Mode (Clear) 001 Non-specific EOI command 010 No Operation 011 *Specific EOI Command 100 Rotate in Auto EOI Mode (Set) 101 Rotate on Non-Specific EOI Command 110 *Set Priority Command 111 *Rotate on Specific EOI Command *L0 - L2 Are Used
4:3	0h WO	**OCW2 Select (O2S):** When selecting OCW2, bits 4:3 = 00
2:0	0h WO	**Interrupt Level Select (L2, L1, L0) (ILSLT):** L2, L1, and L0 determine the interrupt level acted upon when the SL bit is active. A simple binary code, outlined above, selects the channel for the command to act upon. When the SL bit is inactive, these bits do not have a defined function, programming L2, L1 and L0 to 0 is sufficient in this case.

20.10.3 Master Operational Control Word 3 (MOCW3)—Offset 20h

Note: Address should be 20h.

Bit Range	Default and Access	Field Name (ID): Description
7	0h RO	Reserved.
6	0h WO	**Enable Special Mask Mode (ESMM):**
5	0h WO	**Special Mask Mode (SMM):** If this bit is set, the Special Mask Mode can be used by an interrupt service routine to dynamically alter the system priority structure while the routine is executing, through selective enabling/ disabling of the other channel's mask bits. Bit 6, the ESMM bit, must be set for this bit to have any meaning.
4:3	1h WO	**OCW3 Select (O3S):** When selecting OCW3, bits 4:3 = 01
2	0h WO	**Poll Mode Command (PMC):** When cleared, poll command is not issued. When set, the next I/O read to the interrupt controller is treated as an interrupt acknowledge cycle. An encoded byte is driven onto the data bus, representing the highest priority level requesting service.

Bit Range	Default and Access	Field Name (ID): Description
1:0	0h WO	**Register Read Command (RRC):** To retain the current selection (read ISR or read IRR), always write a 0 to bit 1 when programming this register. The selected register can be read repeatedly without reprogramming OCW3. To select a new status register, OCW3 must be reprogrammed prior to attempting the read. Value Command 00 No Action 01 No Action 10 Read IRQ Register 11 Read IS Register

20.10.4 Master Initialization Command Word 2 (MICW2)—Offset 21h

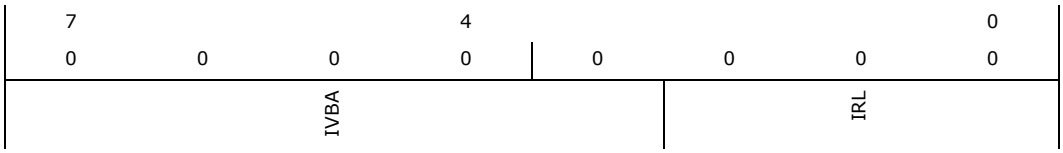
ICW2 is used to initialize the interrupt controller with the five most significant bits of the interrupt vector address. The value programmed for bits [7:3] is used by the CPU to define the base address in the interrupt vector table for the interrupt routines associated with each IRQ on the controller. Typical ISA ICW2 values are 08h for the master controller and 70h for the slave controller.

Access Method

Type: I/O Register
(Size: 8 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:3	0h WO	**Interrupt Vector Base Address (IVBA):** Bits [7:3] define the base address in the interrupt vector table for the interrupt routines associated with each interrupt request level input.
2:0	0h WO	**Interrupt Request Level (IRL):** When writing ICW2, these bits should all be 0. During an interrupt acknowledge cycle, these bits are programmed by the interrupt controller with the interrupt to be serviced. This is combined with bits [7:3] to form the interrupt vector driven onto the data bus during the second INTA# cycle. The code is a three bit binary code: Code Master Interrupt Slave Interrupt 000 IRQ0 IRQ8 001 IRQ1 IRQ9 010 IRQ2 IRQ10 011 IRQ3 IRQ11 100 IRQ4 IRQ12 101 IRQ5 IRQ13 110 IRQ6 IRQ14 111 IRQ7 IRQ15

Bit Range	Default and Access	Field Name (ID): Description
7:5	0h RO	Reserved.
4	0h WO	**Special Fully Nested Mode (SFNM):** Should normally be disabled by writing a 0 to this bit. If SFNM=1, the special fully nested mode is programmed.
3	0h WO	**Buffered Mode (BUF):** Must be cleared for non-buffered mode. Writing 1 will result in undefined behavior.
2	0h WO	**Master/Slave in Buffered Mode (MSBM):** Not used. Should always be programmed to 0.
1	0h WO	**Automatic End of Interrupt (AEOI):** This bit should normally be programmed to 0. This is the normal end of interrupt. If this bit is 1, the automatic end of interrupt mode is programmed.
0	0h WO	**Microprocessor Mode (MM):** This bit must be written to 1 to indicate that the controller is operating in an Intel Architecture-based system. Writing 0 will result in undefined behavior.1

20.10.7 Master Operational Control Word 1 (MOCW1)—Offset 21h

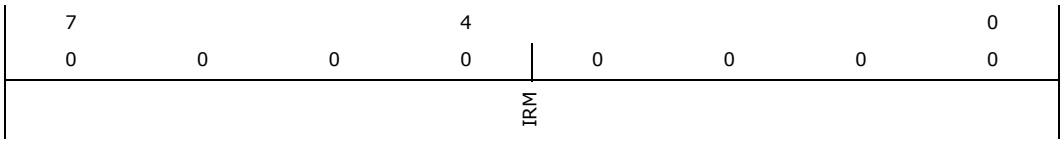
Note: Address should be 21h.

Access Method

Type: I/O Register
(Size: 8 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Request Mask (IRM):** When a 1 is written to any bit in this register, the corresponding IRQ line is masked. When a 0 is written to any bit in this register, the corresponding IRQ mask bit is cleared, and interrupt requests will again be accepted by the controller. Masking IRQ2 on the master controller will also mask the interrupt requests from the slave controller.

20.10.8 Slave Initialization Command Word 1 (SICW1)—Offset A0h

A write to Initialization Command Word 1 starts the interrupt controller initialization sequence, during which the following occurs:

1. The Interrupt Mask register is cleared.
2. IRQ7 input is assigned priority 7.
3. The slave mode address is set to 7.
4. Special Mask Mode is cleared and Status Read is set to IRR.

Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

Access Method

11	0h RO	Reserved.
10:8	2h RW	**Interrupt C Pin Route (ICR):** See the IDR description. This field applies to INTC#
7	0h RO	Reserved.
6:4	1h RW	**Interrupt B Pin Route (IBR):** See the IDR description. This field applies to INTB#.
3	0h RO	Reserved.
2:0	0h RW	**Interrupt A Pin Route (IAR):** See the IDR description. This field applies to INTA#.

20.11.10 PCI Interrupt Route 1 (PIR1)—Offset 3142h

Same definition as PIR0.

20.11.11 PCI Interrupt Route 2 (PIR2)—Offset 3144h

Same definition as PIR0, except this register applies to Device 29 functions.

20.11.12 PCI Interrupt Route 3 (PIR3)—Offset 3146h

Same definition as PIR0, except this register applies to Device 28 functions.

20.11.13 PCI Interrupt Route 4 (PIR4)—Offset 3148h

Same definition as PIR0, except this register applies to Device 27 functions.

20.11.14 General Interrupt Control (GIC)—Offset 31FCh

Note: FEC10000h - FEC3FFFFh is allocated to PCIe when Port I/OxApic Enable (PAE) bit is set.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD												INITVTMDIS	RSVD	AME	SDPS	MAXIRQSIZE							SERM	RSVD							CPUSDSTS

Bit Range	Default and Access	Field Name (ID): Description
31:20	0h RO	Reserved.
19	0b RW	**INIT# VLW Message Disable INITVMDIS**: When set, if other type VLW message is to be sent, the VLWValueBIt[5] under the VLW Vendor Defined Message should always be 0 - no active edge on INIT#. When cleared, the INIT# information will be conveyed as normal.
18	0b RW	Reserved
17	0h RW	**Alternate Access Mode Enable (AME):** When set, read only registers can be written, and write only registers can be read.
16	0h RW	**Shutdown Policy Select (SDPS):** When cleared (default) the PCH will update INIT# in response to the shutdown Vendor Defined Message (VDM). When set to 1, PCH will treat the shutdown VDM similar to receiving a CF9h I/O write, and will drive PLTRST# active.
15:9	0h RW	**MAX_IRQ_ENTRY_SIZE (MAXIRQSIZE):** This field indicates the size of the IOAPIC entry. The default size is 120 entries. 0000000: 120 entry size 0000001: 24 entry size (Legacy mode) 0000010 - 1111111: Reserved
8	0b RW	**Server Error Reporting Mode (SERM):** When set, the CPU Complex is the final target of all host space errors. In this mode, if the PCH detects a fatal, non-fatal, or correctable error on DMI or downstream functions from DMI, it sends one of the ERR_FATAL, ERR_NONFATAL, or ERR_CORR to CPU complex. When cleared, the PCH is the final target of all host space errors.
7:1	0h RO	Reserved.
0	0h RO/P	**CPU Shutdown Status (CPUSDSTS):** This bit is set to 1 if the CPU sends the Shutdown Special cycle message. The Shutdown Message is recognized as an INIT# event if the Shutdown Policy Select = 0, else PCH shall treat the Shutdown Special cycle as a request for CF9 Hard Reset. This is a sticky Read Only bit that is only reset by a loss of core power.

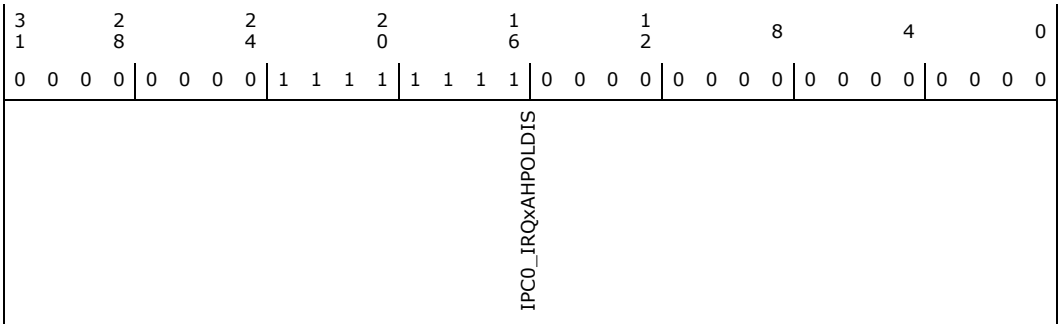
20.11.15 Interrupt Polarity Control 0 (IPC0)—Offset 3200h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: FF0000h



Bit Range	Default and Access	Field Name (ID): Description
31:0	FF0000h RW	**IRQ 31-0 Active High Polarity Disable (IPC0_IRQxAHPOLDIS):** When set to 1, the interrupt polarity associated with IRQ31 down to IRQ0 is inverted to appear as Active Low to IOAPIC. When set to 0, the interrupt is appears as Active High to IOAPIC.

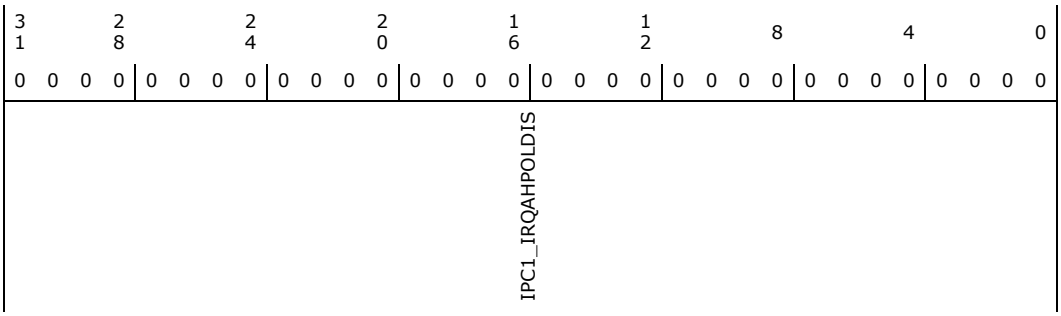
20.11.16 Interrupt Polarity Control 1 (IPC1)—Offset 3204h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**IRQ 63-32 Active High Polarity Disable (IPC1_IRQAHPOLDIS):** When set to 1, the interrupt polarity associated with IRQ63 down to IRQ32 is inverted to appear as Active Low to IOAPIC. When set to 0, the interrupt is appears as Active High to IOAPIC.

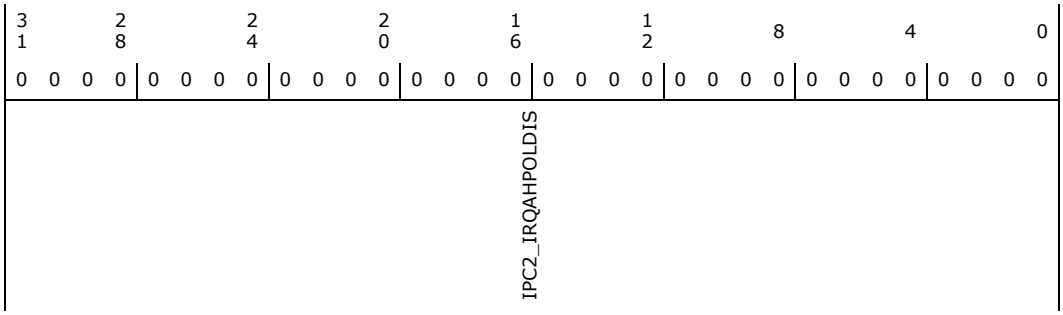
20.11.17 Interrupt Polarity Control 2 (IPC2)—Offset 3208h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**IRQ 95-64 Active High Polarity Disable (IPC2_IRQAHPOLDIS):** When set to 1, the interrupt polarity associated with IRQ95 down to IRQ64 is inverted to appear as Active Low to IOAPIC. When set to 0, the interrupt is appears as Active High to IOAPIC.

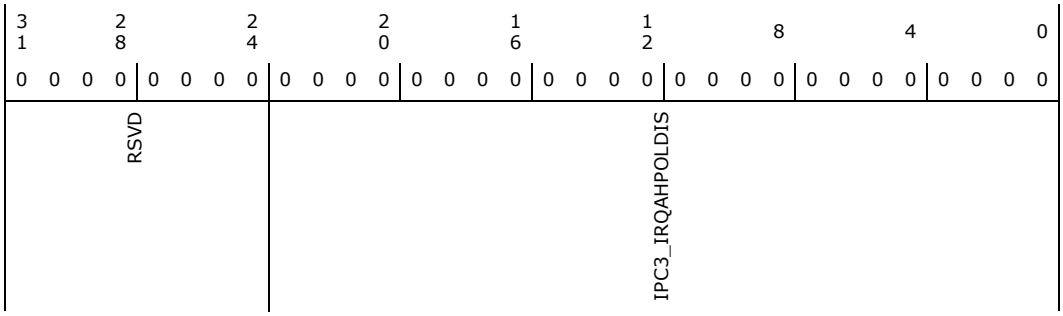
20.11.18 Interrupt Polarity Control 3 (IPC3)—Offset 320Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:0	0h RW	**IRQ 119-96 Active High Polarity Disable (IPC3_IRQAHPOLDIS):** When set to 1, the interrupt polarity associated with IRQ119 down to IRQ96 is inverted to appear as Active Low to IOAPIC. When set to 0, the interrupt is appears as Active High to IOAPIC.

20.11.19 ITSS Power Reduction Control (ITSSPRC)—Offset 3300h

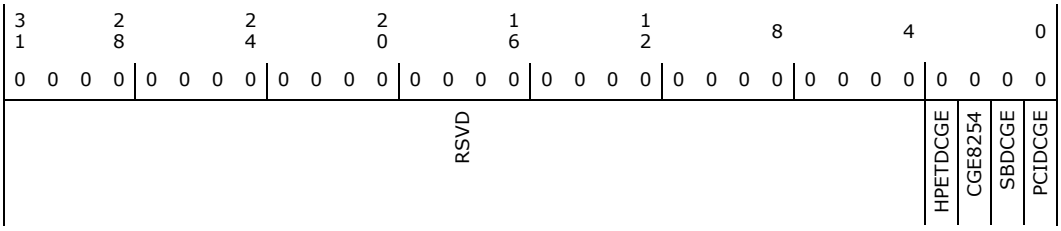
Power controls for the entire interrupt and timer subsystem.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3	0h RW	**HPET Dynamic Clock Gating Enable (HPETDCGE):** When set, the HPET enables dynamic clock gating.
2	0h RW	**8254 Static Clock Gating Enable (CGE8254):** When set, the 8254 timer is disabled statically. This bit shall be set by BIOS if the 8254 feature is not needed in the system or before BIOS hands off the system that supports C11. Normal operation of 8254 requires this bit to 0.
1	0h RW	**Sideband Dynamic Clock Gating Enable (SBDCGE):** Setting this bit will enable all dynamic clock gating of the Sideband Clock domain.
0	0h RW	**PCI Dynamic Clock Gating Enable (PCIDCGE):** Setting this bit will enable dynamic clock gating for the Interrupt and Timer Sub System Core Logic.

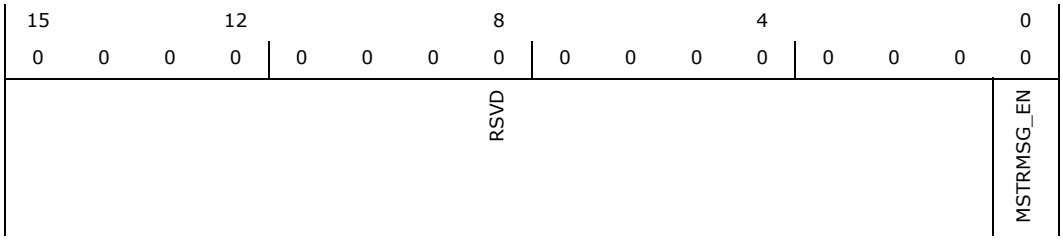
20.11.20 Master Message Control (MMC)—Offset 3334h

Access Method

Type: MSG Register
(Size: 16 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:1	0h RO	Reserved.
0	0h RW/V	**Master Message Enable (MSTRMSG_EN):** When set, allows Interrupt and Timer Subsystem (ITSS) to release any pending/in progress IOAPIC memory write, HPET memory write, virtual wire event or error messages to the I/O fabric. When cleared, ITSS prevents these messages from being issued to the I/O fabric.

20.12 APIC Indirect Registers Summary

APIC Indirect Registers lists the registers that can be accessed within the APIC using the Index Register. When accessing these registers, accesses must be done one DWord at a time. For example, software should never access byte 2 from the Data register before accessing bytes 0 and 1. The hardware will not attempt to recover from a bad programming model in this case.

Index	Mnemonic	Register Name
10-11h	RTE0	Redirection Table Entry 0
12-13h	RTE1	Redirection Table Entry 1
14-15h	RTE2	Redirection Table Entry 2
...	...	...
3E-3Fh	RTE23	Redirection Table Entry 23
40-41h	RTE24	Redirection Table Entry 24
...	...	...
FE-FFh	RTE119	Redirection Table Entry 119

20.12.1 Identification Register (ID)—Offset 0h

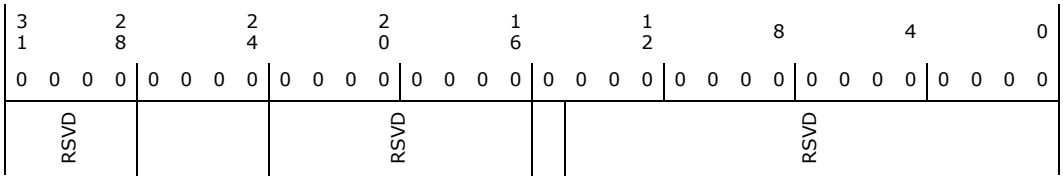
This APIC ID serves as a physical name of the APIC. The APIC bus arbitration ID for the APIC is derived from its I/O APIC ID. This register is reset to 0 on power-up reset.

Access Method

Type: APIC_IDX Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:24	0h RW	**APIC ID:** Software must program this value before using the APIC.
23:16	0h RO	Reserved.
15	0h RW	**Scratchpad**
14:0	0h RO	Reserved.

20.12.2 Version Register (VER)—Offset 1h

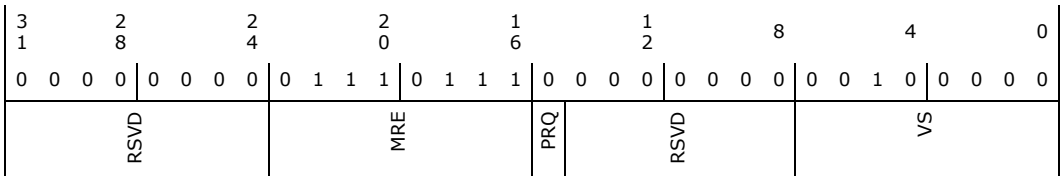
Each I/O APIC contains a hardwired Version Register that identifies different implementation of APIC and their versions. The maximum redirection entry information is also in this register to let software know how many interrupt are supported by this APIC.

Access Method

Type: APIC_IDX Register
(Size: 32 bits)

Device:
Function:

Default: 770020h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:16	77h RW/O	**Maximum Redirection Entries (MRE):** This is the entry number (0 being the lowest entry) of the highest entry in the redirection table. It is equal to the number of interrupt input pins minus one and is in the range of 0 through 239. In PCH this field is defaulted to 17h to indicate 24 interrupts. This field is Read-Write-Once. BIOS must write to this field after PLTRST# to lock down the value. This allows BIOS to utilize some of the entries for its own purpose and thus advertising fewer IOxAPIC Redirection Entries to OS. BIOS may to program this field up to 78h (maximum 120 entries).
15	0h RO	**Pin Assertion Register Supported (PRQ):** Indicate that the IOxAPIC does not implement the Pin Assertion Register.
14:8	0h RO	Reserved.
7:0	20h RO	**Version (VS):** Identifies the implementation version as IOxAPIC.

20.12.3 Redirection Table Entry 0 (RTE0)—Offset 10h

The Redirection Table has a dedicated entry for each interrupt input pin. The information in the Redirection Table is used to translate the interrupt manifestation on the corresponding interrupt pin into an APIC message.

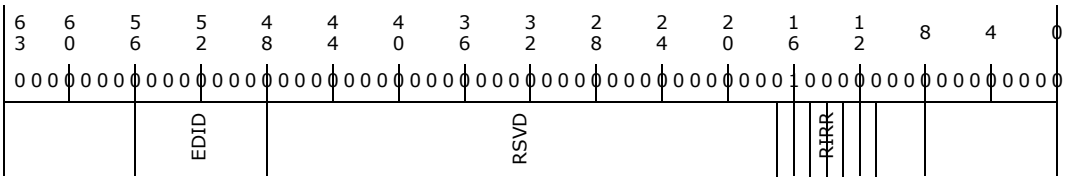
The APIC will respond to an edge triggered interrupt as long as the interrupt is held until after the acknowledge cycle has begun. Once the interrupt is detected, a delivery status bit internally to the I/O APIC is set. The state machine will step ahead and wait for an acknowledgment from the APIC unit that the interrupt message was sent. Only then will the I/O APIC be able to recognize a new edge on that interrupt pin. That new edge will only result in a new invocation of the handler if its acceptance by the destination APIC causes the Interrupt Request register bit to go from 0 to 1. (In other words, if the interrupt was not already pending a the destination.)

Access Method

Type: APIC_IDX Register
(Size: 64 bits)

Device:
Function:

Default: 10000h



Bit Range	Default and Access	Field Name (ID): Description
63:56	0h RW	**Destination:** If bit 11 of this entry is 0 (Physical), then bits 59:56 specifies an APIC ID. In this case, bits 63:59 should be programmed by software to 0. If bit 11 of this entry is 1 (Logical), then bits 63:56 specify the logical destination address of a set of processors.
55:48	0h RW	**Extended Destination ID (EDID):** These bits are sent to a local APIC only when in Processor System Bus mode. They become bits 11:4 of the address.
47:17	0h RO	Reserved.
16	1h RW	**Mask:** 0 = Not masked. An edge or level on this interrupt pin results in the delivery of the interrupt to the destination. 1 = Masked. Interrupts are not delivered nor held pending. Setting this bit after the interrupt is accepted by a local APIC has no effect on that interrupt. This behavior is identical to the device withdrawing the interrupt before it is posted to the processor. It is software's responsibility to deal with the case where the mask bit is set after the interrupt message has been accepted by a local APIC unit but before the interrupt is dispensed to the processor.
15	0h RW	**Trigger Mode:** This field indicates the type of signal on the interrupt pin that triggers an interrupt. 0 = The interrupt is edge sensitive. 1 = The interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts; its meaning is undefined for edge triggered interrupts. 0 = Reset when an EOI message is received that matches the VCT field. 1 = Set when IOxAPIC sends the level interrupt message to the CPU. Note, this bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Interrupt Input Pin Polarity:** This bit specifies the polarity of each interrupt signal connected to the interrupt pins. 0 = Signal is active high. 1 = Signal is active low.
12	0h RO/V	**Delivery Status:** This field contains the current status of the delivery of this interrupt. 0 = Idle. There is no activity for this interrupt. 1 = Pending. An interrupt has been injected, but delivery is not complete. Note, writes to this bit have no effect.
11	0h RW	**Destination Mode:** This field is used by the local Apic to determine whether it is the destination of the message. 0 = Physical. Destination APIC ID is identified by bits 59:56. 1 = Logical. Destinations are identified by matching bit 63:56 with Logical Destination in the Destination Format register and Logical Destination register in each Local APIC.
10:8	0h RW	**Delivery Mode:** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported 011 Reserved 100 NMI Not supported 101 INIT Not supported 110 Reserved 111 ExtINT
7:0	0h RW	**Vector:** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

20.12.4 Redirection Table Entry 1 (RTE1)—Offset 12h

This register has the same bit definition as RTE0.

20.12.5 Redirection Table Entry 2 (RTE2)—Offset 14h

This register has the same bit definition as RTE0.

20.12.6 Redirection Table Entry 3 (RTE3)—Offset 16h

This register has the same bit definition as RTE0.

20.12.7 Redirection Table Entry 4 (RTE4)—Offset 18h

This register has the same bit definition as RTE0.

20.12.8 Redirection Table Entry 5 (RTE5)—Offset 1Ah

This register has the same bit definition as RTE0.

20.12.9 Redirection Table Entry 6 (RTE6)—Offset 1Ch

This register has the same bit definition as RTE0.

20.12.10 Redirection Table Entry 7 (RTE7)—Offset 1Eh

This register has the same bit definition as RTE0.

20.12.11 Redirection Table Entry 8 (RTE8)—Offset 20h

This register has the same bit definition as RTE0.

20.12.12 Redirection Table Entry 9 (RTE9)—Offset 22h

This register has the same bit definition as RTE0.

20.12.13 Redirection Table Entry 10 (RTE10)—Offset 24h

This register has the same bit definition as RTE0.

20.12.14 Redirection Table Entry 11 (RTE11)—Offset 26h

This register has the same bit definition as RTE0.

20.12.15 Redirection Table Entry 12 (RTE12)—Offset 28h

This register has the same bit definition as RTE0.

20.12.16 Redirection Table Entry 13 (RTE13)—Offset 2Ah

This register has the same bit definition as RTE0.

20.12.17 Redirection Table Entry 14 (RTE14)—Offset 2Ch

This register has the same bit definition as RTE0.

20.12.18 Redirection Table Entry 15 (RTE15)—Offset 2Eh

This register has the same bit definition as RTE0.

20.12.19 Redirection Table Entry 16 (RTE16)—Offset 30h

This register has the same bit definition as RTE0.

20.12.20 Redirection Table Entry 17 (RTE17)—Offset 32h

This register has the same bit definition as RTE0.

20.12.21 Redirection Table Entry 18 (RTE18)—Offset 34h

This register has the same bit definition as RTE0.

20.12.22 Redirection Table Entry 19 (RTE19)—Offset 36h

This register has the same bit definition as RTE0.

20.12.23 Redirection Table Entry 20 (RTE20)—Offset 38h

This register has the same bit definition as RTE0.

20.12.24 Redirection Table Entry 21 (RTE21)—Offset 3Ah

This register has the same bit definition as RTE0.

20.12.25 Redirection Table Entry 22 (RTE22)—Offset 3Ch

This register has the same bit definition as RTE0.

20.12.26 Redirection Table Entry 23 (RTE23)—Offset 3Eh

This register has the same bit definition as RTE0.

20.12.27 Redirection Table Entry 24 (RTE24)—Offset 40h

This register has the same bit definition as RTE0.

20.12.28 Redirection Table Entry 25 (RTE25)—Offset 42h

This register has the same bit definition as RTE0.

20.12.29 Redirection Table Entry 26 (RTE26)—Offset 44h

This register has the same bit definition as RTE0.

20.12.30 Redirection Table Entry 27 (RTE27)—Offset 46h

This register has the same bit definition as RTE0.

20.12.31 Redirection Table Entry 28 (RTE28)—Offset 48h

This register has the same bit definition as RTE0.

20.12.32 Redirection Table Entry 29 (RTE29)—Offset 4Ah

This register has the same bit definition as RTE0.

20.12.33 Redirection Table Entry 30 (RTE30)—Offset 4Ch

This register has the same bit definition as RTE0.

20.12.34 Redirection Table Entry 31 (RTE31)—Offset 4Eh

This register has the same bit definition as RTE0.

20.12.35 Redirection Table Entry 32 (RTE32)—Offset 50h

This register has the same bit definition as RTE0.

20.12.36 Redirection Table Entry 33 (RTE33)—Offset 52h

This register has the same bit definition as RTE0.

20.12.37 Redirection Table Entry 34 (RTE34)—Offset 54h

This register has the same bit definition as RTE0.

20.12.38 Redirection Table Entry 35 (RTE35)—Offset 56h

This register has the same bit definition as RTE0.

20.12.39 Redirection Table Entry 36 (RTE36)—Offset 58h

This register has the same bit definition as RTE0.

20.12.40 Redirection Table Entry 37 (RTE37)—Offset 5Ah

This register has the same bit definition as RTE0.

20.12.41 Redirection Table Entry 38 (RTE38)—Offset 5Ch

This register has the same bit definition as RTE0.

20.12.42 Redirection Table Entry 39 (RTE39)—Offset 5Eh

This register has the same bit definition as RTE0.

20.12.43 Redirection Table Entry 40 (RTE40)—Offset 60h

This register has the same bit definition as RTE0.

20.12.44 Redirection Table Entry 41 (RTE41)—Offset 62h

This register has the same bit definition as RTE0.

20.12.45 Redirection Table Entry 42 (RTE42)—Offset 64h

This register has the same bit definition as RTE0.

20.12.46 Redirection Table Entry 43 (RTE43)—Offset 66h

This register has the same bit definition as RTE0.

20.12.47 Redirection Table Entry 44 (RTE44)—Offset 68h

This register has the same bit definition as RTE0.

20.12.48 Redirection Table Entry 45 (RTE45)—Offset 6Ah

This register has the same bit definition as RTE0.

20.12.49 Redirection Table Entry 46 (RTE46)—Offset 6Ch

This register has the same bit definition as RTE0.

20.12.50 Redirection Table Entry 47 (RTE47)—Offset 6Eh

This register has the same bit definition as RTE0.

20.12.51 Redirection Table Entry 48 (RTE48)—Offset 70h

This register has the same bit definition as RTE0.

20.12.52 Redirection Table Entry 49 (RTE49)—Offset 72h

This register has the same bit definition as RTE0.

20.12.53 Redirection Table Entry 50 (RTE50)—Offset 74h

This register has the same bit definition as RTE0.

20.12.54 Redirection Table Entry 51 (RTE51)—Offset 76h

This register has the same bit definition as RTE0.

20.12.55 Redirection Table Entry 52 (RTE52)—Offset 78h

This register has the same bit definition as RTE0.

20.12.56 Redirection Table Entry 53 (RTE53)—Offset 7Ah

This register has the same bit definition as RTE0.

20.12.57 Redirection Table Entry 54 (RTE54)—Offset 7Ch

This register has the same bit definition as RTE0.

20.12.58 Redirection Table Entry 55 (RTE55)—Offset 7Eh

This register has the same bit definition as RTE0.

20.12.59 Redirection Table Entry 56 (RTE56)—Offset 80h

This register has the same bit definition as RTE0.

20.12.60 Redirection Table Entry 57 (RTE57)—Offset 82h

This register has the same bit definition as RTE0.

20.12.61 Redirection Table Entry 58 (RTE58)—Offset 84h

This register has the same bit definition as RTE0.

20.12.62 Redirection Table Entry 59 (RTE59)—Offset 86h

This register has the same bit definition as RTE0.

20.12.63 Redirection Table Entry 60 (RTE60)—Offset 88h

This register has the same bit definition as RTE0.

20.12.64 Redirection Table Entry 61 (RTE61)—Offset 8Ah

This register has the same bit definition as RTE0.

20.12.65 Redirection Table Entry 62 (RTE62)—Offset 8Ch

This register has the same bit definition as RTE0.

20.12.66 Redirection Table Entry 63 (RTE63)—Offset 8Eh

This register has the same bit definition as RTE0.

20.12.67 Redirection Table Entry 64 (RTE64)—Offset 90h

This register has the same bit definition as RTE0.

20.12.68 Redirection Table Entry 65 (RTE65)—Offset 92h

This register has the same bit definition as RTE0.

20.12.69 Redirection Table Entry 66 (RTE66)—Offset 94h

This register has the same bit definition as RTE0.

20.12.70 Redirection Table Entry 67 (RTE67)—Offset 96h

This register has the same bit definition as RTE0.

20.12.71 Redirection Table Entry 68 (RTE68)—Offset 98h

This register has the same bit definition as RTE0.

20.12.72 Redirection Table Entry 69 (RTE69)—Offset 9Ah

This register has the same bit definition as RTE0.

20.12.73 Redirection Table Entry 70 (RTE70)—Offset 9Ch

This register has the same bit definition as RTE0.

20.12.74 Redirection Table Entry 71 (RTE71)—Offset 9Eh

This register has the same bit definition as RTE0.

20.12.75 Redirection Table Entry 72 (RTE72)—Offset A0h

This register has the same bit definition as RTE0.

20.12.76 Redirection Table Entry 73 (RTE73)—Offset A2h

This register has the same bit definition as RTE0.

20.12.77 Redirection Table Entry 74 (RTE74)—Offset A4h

This register has the same bit definition as RTE0.

20.12.78 Redirection Table Entry 75 (RTE75)—Offset A6h

This register has the same bit definition as RTE0.

20.12.79 Redirection Table Entry 76 (RTE76)—Offset A8h

This register has the same bit definition as RTE0.

20.12.80 Redirection Table Entry 77 (RTE77)—Offset AAh

This register has the same bit definition as RTE0.

20.12.81 Redirection Table Entry 78 (RTE78)—Offset ACh

This register has the same bit definition as RTE0.

20.12.82 Redirection Table Entry 79 (RTE79)—Offset AEh

This register has the same bit definition as RTE0.

20.12.83 Redirection Table Entry 80 (RTE80)—Offset B0h

This register has the same bit definition as RTE0.

20.12.84 Redirection Table Entry 81 (RTE81)—Offset B2h

This register has the same bit definition as RTE0.

20.12.85 Redirection Table Entry 82 (RTE82)—Offset B4h

This register has the same bit definition as RTE0.

20.12.86 Redirection Table Entry 83 (RTE83)—Offset B6h

This register has the same bit definition as RTE0.

20.12.87 Redirection Table Entry 84 (RTE84)—Offset B8h

This register has the same bit definition as RTE0.

20.12.88 Redirection Table Entry 85 (RTE85)—Offset BAh

This register has the same bit definition as RTE0.

20.12.89 Redirection Table Entry 86 (RTE86)—Offset BCh

This register has the same bit definition as RTE0.

20.12.90 Redirection Table Entry 87 (RTE87)—Offset BEh

This register has the same bit definition as RTE0.

20.12.91 Redirection Table Entry 88 (RTE88)—Offset C0h

This register has the same bit definition as RTE0.

20.12.92 Redirection Table Entry 89 (RTE89)—Offset C2h

This register has the same bit definition as RTE0.

20.12.93 Redirection Table Entry 90 (RTE90)—Offset C4h

This register has the same bit definition as RTE0.

20.12.94 Redirection Table Entry 91 (RTE91)—Offset C6h

This register has the same bit definition as RTE0.

20.12.95 Redirection Table Entry 92 (RTE92)—Offset C8h

This register has the same bit definition as RTE0.

20.12.96 Redirection Table Entry 93 (RTE93)—Offset CAh

This register has the same bit definition as RTE0.

20.12.97 Redirection Table Entry 94 (RTE94)—Offset CCh

This register has the same bit definition as RTE0.

20.12.98 Redirection Table Entry 95 (RTE95)—Offset CEh

This register has the same bit definition as RTE0.

20.12.99 Redirection Table Entry 96 (RTE96)—Offset D0h

This register has the same bit definition as RTE0.

20.12.100 Redirection Table Entry 97 (RTE97)—Offset D2h

This register has the same bit definition as RTE0.

20.12.101 Redirection Table Entry 98 (RTE98)—Offset D4h

This register has the same bit definition as RTE0.

20.12.102 Redirection Table Entry 99 (RTE99)—Offset D6h

This register has the same bit definition as RTE0.

20.12.103 Redirection Table Entry 100 (RTE100)—Offset D8h

This register has the same bit definition as RTE0.

20.12.104 Redirection Table Entry 101 (RTE101)—Offset DAh

This register has the same bit definition as RTE0.

20.12.105 Redirection Table Entry 102 (RTE102)—Offset DCh

This register has the same bit definition as RTE0.

20.12.106 Redirection Table Entry 103 (RTE103)—Offset DEh

This register has the same bit definition as RTE0.

20.12.107 Redirection Table Entry 104 (RTE104)—Offset E0h

This register has the same bit definition as RTE0.

20.12.108 Redirection Table Entry 105 (RTE105)—Offset E2h

This register has the same bit definition as RTE0.

20.12.109 Redirection Table Entry 106 (RTE106)—Offset E4h

This register has the same bit definition as RTE0.

20.12.110 Redirection Table Entry 107 (RTE107)—Offset E6h

This register has the same bit definition as RTE0.

20.12.111 Redirection Table Entry 108 (RTE108)—Offset E8h

This register has the same bit definition as RTE0.

20.12.112 Redirection Table Entry 109 (RTE109)—Offset EAh

This register has the same bit definition as RTE0.

20.12.113 Redirection Table Entry 110 (RTE110)—Offset ECh

This register has the same bit definition as RTE0.

20.12.114 Redirection Table Entry 111 (RTE111)—Offset EEh

This register has the same bit definition as RTE0.

20.12.115 Redirection Table Entry 112 (RTE112)—Offset F0h

This register has the same bit definition as RTE0.

20.12.116 Redirection Table Entry 113 (RTE113)—Offset F2h

This register has the same bit definition as RTE0.

20.12.117 Redirection Table Entry 114 (RTE114)—Offset F4h

This register has the same bit definition as RTE0.

20.12.118 Redirection Table Entry 115 (RTE115)—Offset F6h

This register has the same bit definition as RTE0.

20.12.119 Redirection Table Entry 116 (RTE116)—Offset F8h

This register has the same bit definition as RTE0.

20.12.120 Redirection Table Entry 117 (RTE117)—Offset FAh

This register has the same bit definition as RTE0.

20.12.121 Redirection Table Entry 118 (RTE118)—Offset FCh

This register has the same bit definition as RTE0.

20.12.122 Redirection Table Entry 119 (RTE119)—Offset FEh

This register has the same bit definition as RTE0.

20.13 Advanced Programmable Interrupt Controller (APIC) Registers Summary

The APIC is accessed using an indirect addressing scheme. Two registers are visible by software for manipulation of most of the APIC registers. These registers are mapped into memory space. The address bits [19:12] of the address range are programmable through bits [7:0] of OIC register (Chipset Configuration Register: Offset 31FEh). The registers are shown below.

Table 20-13. Summary of Advanced Programmable Interrupt Controller (APIC) Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Index Register (IDX)—Offset 0h	0h
10h	13h	Data Register (DAT)—Offset 10h	0h
40h	43h	EOI Register (EOIR)—Offset 40h	0h

20.13.1 Index Register (IDX)—Offset 0h

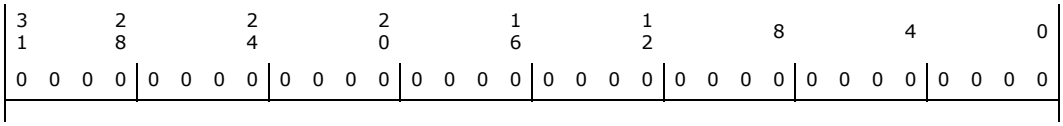
The Index Register will select which APIC indirect register to be manipulated by software. Software will program this register to select the desired APIC internal register.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**APIC Index:** This is an 8 bit pointer into the I/O APIC register table.

20.13.2 Data Register (DAT)—Offset 10h

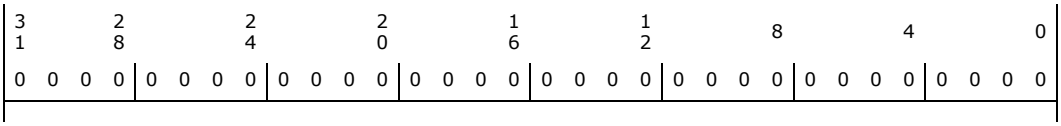
This 32-bit register specifies the data to be read or written to the register pointed to by the Index register. This register can be accessed only in DW quantities.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**APIC Data:** This is a 32-bit register for the data to be read or written to the APIC indirect register pointed to by the Index register (Memory Address FEC0_0000h).

20.13.3 EOI Register (EOIR)—Offset 40h

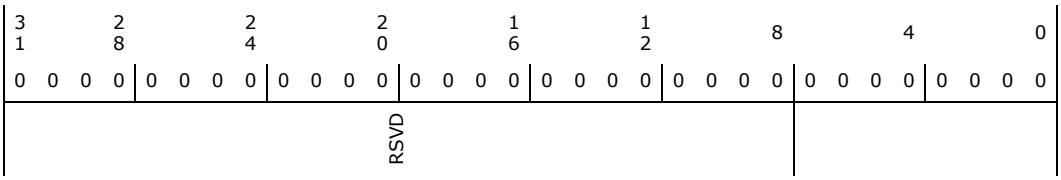
When a write is issued to this register, the IOxAPIC will check the lower 8 bits written to this register, and compare it with the vector field for each entry in the I/O Redirection Table. When a match is found, RTE.RIRR for that entry will be cleared. If multiple entries have the same vector, each of those entries will have RTE.RIRR cleared. Only bits [7:0] are used. Bits [31:8] are ignored.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h WO	**Redirection Entry Clear:** When a write is issued to this register, the I/O APIC will check this field and compare it with the vector field for each entry in the I/O Redirection Table. When a match is found, the Remote_IRR bit for that I/O Redirection Entry will be cleared.

§

21 Low Pin Count

21.1 Acronyms

Acronyms	Description
LPC	Low Pin Count

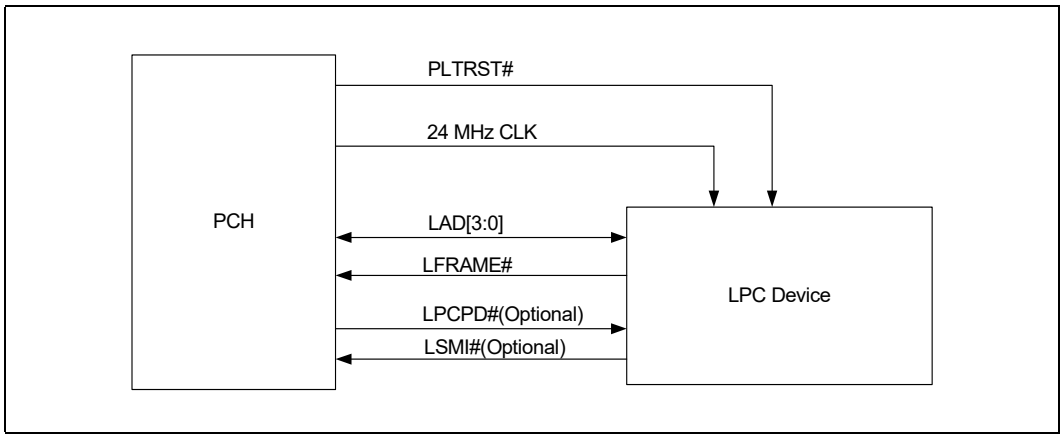
21.2 References

Specification	Location
Intel® Low Pin Count Interface Specification Revision 1.1	http://developer.intel.com/design/chipsets/industry/lpc.htm

21.3 Overview

The PCH implements an LPC interface as described in the *Low Pin Count Interface Specification,* Revision 1.1. The LPC interface to the PCH is shown in the following figure.

Table 21-1. LPC Interface Diagram



The PCH supports all of the signals that are shown as optional, but peripherals are not required to do so.

LSMI# can be connected to any of the PCH's SMI capable GPIO signals.

Note: The LPC bridge cannot be configured as a subtractive decode agent.

21.4 Signal Description

Name	Type	Description
GPP_A1_LAD0_ESPI_IO0	I/O	**LPC Multiplexed Command, Address, Data.** For LAD0, internal pull-up is provided.
GPP_A2_LAD1_ESPI_IO1	I/O	**LPC Multiplexed Command, Address, Data.** For LAD1, internal pull-up is provided.
GPP_A3_LAD2_ESPI_IO2	I/O	**LPC Multiplexed Command, Address, Data.** For LAD2, internal pull-up is provided.
GPP_A4_LAD3_ESPI_IO3	I/O	**LPC Multiplexed Command, Address, Data.** For LAD3, internal pull-up is provided.
GPP_A5_LFRAME_N_ESPI_CS1_N	O	**LPC Frame:** LFRAME# indicates the start of an LPC cycle, or an abort.

21.5 Integrated Pull-ups and Pull-downs

Signal	Resistor Type	Value	Notes
LAD[3:0]	Pull-up	15 - 40 kΩ	
Note: Integrated pull-ups and pull-downs will not be valid until all the voltages have reached a valid level.			

21.6 I/O Signal Planes and States

Signal Name	Power Plane	During Reset	Immediately after Reset	S3/S4/S5	Deep Sx
LAD[3:0]	Primary	Internal Pull-up	Internal Pull-up	Undriven	Off
LFRAME_N	Primary	Driven High	Driven High	Driven Low	Off

21.7 Functional Description

The PCH LPC interface supports the *Low Pin Count Interface Specification,* Revision 1.1. The bus is operating at 24 MHz clock frequency.

One change in the C620 series chipset from previous chipsets is the removal of the LDRQ_N signals. This results in LPC DMA/bus mastering not being supported.

21.7.1 LPC Cycle Types

The PCH implements the cycle types shown in Table 21-2.

Table 21-2. LPC Cycle Types Supported (Sheet 1 of 2)

Cycle Type	Comment
Memory Read	One byte only—(See Note 1 below)
Memory Write	One byte only—(See Note 1 below)
I/O Read	One byte only—The PCH breaks up 16-bit and 32-bit processor cycles into multiple 8-bit transfers.
I/O Write	One byte only—The PCH breaks up 16-bit and 32-bit processor cycles into multiple 8-bit transfers.
Bus Master Read	Can be one, two or four bytes—(See Note 2 below)
Bus Master Write	Can be 1, 2 or 4 bytes—(See Note 2 below)

Table 21-2. LPC Cycle Types Supported (Sheet 2 of 2)

Cycle Type	Comment
Notes: 1. The PCH provides a single generic memory range (LGMR) for decoding memory cycles and forwarding them as LPC Memory cycles on the LPC bus. The LGMR memory decode range is 64 KB in size and can be defined as being anywhere in the 4-GB memory space. This range needs to be configured by BIOS during POST to provide the necessary memory resources. BIOS should advertise the LPC Generic Memory Range as Reserved to the OS in order to avoid resource conflict. For larger transfers, the PCH performs multiple 8-bit transfers. If the cycle is not claimed by any peripheral, it is subsequently aborted, and the PCH returns a value of all 1s to the processor. This is done to maintain compatibility with ISA memory cycles where pull-up resistors would keep the bus high if no device responds. 2. Bus Master Read or Write cycles must be naturally aligned. For example, a 1-byte transfer can be to any address. However, the 2-byte transfer must be word-aligned (that is, with an address where A0=0). A DWord transfer must be DWord-aligned (that is, with an address where A1 and A0 are both 0)	

21.7.2 Start Field Definition

Table 21-3. Start Field Bit Definitions

Bits[3:0] Encoding	Definition
0000	Start of cycle for a generic target
1111	Stop/Abort: End of a cycle for a target.
Note: All other encodings are RESERVED.	

21.7.3 Cycle Type/Direction

The PCH always drives Bit 0 of this field to 0. Table 21-4 shows the valid bit encodings.

Table 21-4. Cycle Type Bit Definitions

Bits[3:2]	Bit1	Definition
00	0	I/O Read
00	1	I/O Write
01	0	Memory Read
01	1	Memory Read
11	x	Reserved. If a peripheral performing a bus master cycle generates this value, the PCH aborts the cycle.
Note: All other encodings are RESERVED.		

21.7.4 Size

Bits [3:2] are reserved. The PCH always drives them to 00. Bits [1:0] are encoded as listed in Table 21-5.

Table 21-5. Transfer Size Bit Definition

Bits[1:0]	Size
00	8-bit transfer (one byte)
01	16-bit transfer (two bytes)
10	Reserved—The PCH never drives this combination.
11	32-bit transfer (four bytes)
Note: All other combination are RESERVED.	

21.7.4.1 SYNC

Valid values for the SYNC field are shown in Table 21-6.

21.7.5 SYNC Timeout

Table 21-6. SYNC Bit Definition

Bits[3:0]	Indication
0000	**Ready:** SYNC achieved with no error.
0101	**Short Wait:** Part indicating wait-states. For bus master cycles, the PCH does not use this encoding. Instead, the PCH uses the Long Wait encoding (see next encoding below).
0110	**Long Wait:** Part indicating wait-states, and many wait-states will be added. This encoding driven by the PCH for bus master cycles, rather than the Short Wait (0101).
1010	**Error:** Sync achieved with error. This is generally used to replace the SERR# or IOCHK# signal on the PCI/ISA bus. It indicates that the data is to be transferred, but there is a serious error in this transfer.
Notes: 1. All other combinations are RESERVED. 2. If the LPC controller receives any SYNC returned from the device other than short (0101), long wait (0110), or ready (0000) when running a FWH cycle, indeterminate results may occur. A FWH device is not allowed to assert an Error SYNC.	

There are several error cases that can occur on the LPC interface. The PCH responds as defined in Section 4.2.1.9 of the *Low Pin Count Interface Specification*, Revision 1.1 (http://www.intel.com/design/chipsets/industry/lpc.htm) to the stimuli described therein. There may be other peripheral failure conditions; however, these are not handled by the PCH.

21.7.6 SYNC Error Indication

The PCH responds as defined in Section 4.2.1.10 of the *Low Pin Count Interface Specification,* Revision 1.1.

Upon recognizing the SYNC field indicating an error, the PCH treats this as a SERR by reporting this into the Device 31 Error Reporting Logic.

21.7.7 LFRAME# Usage

The PCH follows the usage of LFRAME# as defined in the *Low Pin Count Interface Specification,* Revision 1.1.

The PCH performs an abort for the following cases (possible failure cases):

- The PCH starts a Memory or I/O cycle, but no device drives a valid SYNC after four consecutive clocks.
- The PCH starts a Memory or I/O and the peripheral drives an invalid SYNC pattern.
- A peripheral drives an invalid value.

21.7.8 I/O Cycles

For I/O cycles targeting registers specified in the PCH's decode ranges, the PCH performs I/O cycles as defined in the *Low Pin Count Interface Specification,* Revision 1.1. These are 8-bit transfers. If the processor attempts a 16-bit or 32-bit transfer, the PCH breaks the cycle up into multiple 8-bit transfers to consecutive I/O addresses.

Note: If the cycle is not claimed by any peripheral (and subsequently aborted), the PCH returns a value of all 1s (FFh) to the processor. This is to maintain compatibility with ISA I/O cycles where pull-up resistors would keep the bus high if no device responds.

21.7.9 Configuration and PCH Implications

21.7.9.1 LPC I/F Decoders

To allow the I/O cycles and memory mapped cycles to go to the LPC interface, the PCH includes several decoders. During configuration, the PCH must be programmed with the same decode ranges as the peripheral. The decoders are programmed using the D 31:F0 configuration space.

Note: The PCH cannot accept PCI write cycles from PCI-to-PCI bridges or devices with similar characteristics (specifically those with a "Retry Read" feature which is enabled) to an LPC device if there is an outstanding LPC read cycle towards the same PCI device or bridge. These cycles are not part of normal system operation, but may be encountered as part of platform validation testing using custom test fixtures.

21.8 LPC Configuration Registers Summary

Table 21-7. Summary of LPC Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Identifiers (ID)—Offset 0h	8086h
4h	5h	Device Command (CMD)—Offset 4h	7h
6h	7h	Status (STS)—Offset 6h	210h
8h	8h	Revision ID (RID)—Offset 8h	0h
9h	Ch	Class Code (CC)—Offset 9h	60100h
Eh	Eh	Header Type (HTYPE)—Offset Eh	80h
2Ch	2Fh	Sub System Identifiers (SS)—Offset 2Ch	0h
34h	34h	Capability List Pointer (CAPP)—Offset 34h	E0h
64h	64h	Serial IRQ Control (SCNT)—Offset 64h	10h
80h	81h	I/O Decode Ranges (IOD)—Offset 80h	0h
82h	83h	I/O Enables (IOE)—Offset 82h	0h
84h	87h	LPC Generic I/O Range #1 (LGIR1)—Offset 84h	0h
88h	8Bh	LPC Generic I/O Range #2 (LGIR2)—Offset 88h	0h
8Ch	8Fh	LPC Generic I/O Range #3 (LGIR3)—Offset 8Ch	0h
90h	93h	LPC Generic I/O Range #4 (LGIR4)—Offset 90h	0h
94h	97h	USB Legacy Keyboard/Mouse Control (ULKMC)—Offset 94h	0h
98h	9Bh	LPC Generic Memory Range (LGMR)—Offset 98h	0h
D0h	D3h	FWH ID Select #1 (FS1)—Offset D0h	112233h
D4h	D5h	FWH ID Select #2 (FS2)—Offset D4h	4567h
D8h	D9h	BIOS Decode Enable (BDE)—Offset D8h	FFCFh
DCh	DCh	BIOS Control (BC)—Offset DCh	20h
E0h	E3h	PCI Clock Control (PCCTL)—Offset E0h	0h

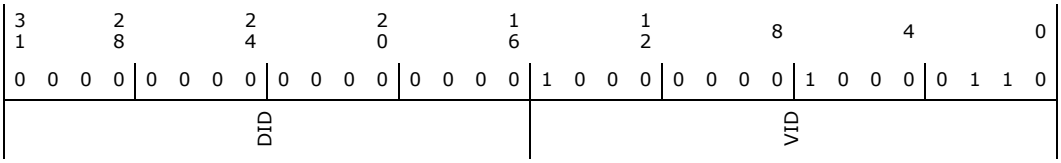
21.8.1 Identifiers (ID)—Offset 0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 8086h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	**Device Identification (DID):** This is a 16-bit value assigned to the PCH LPC bridge.
15:0	8086h RO	**Vendor Identification (VID):** Indicates Intel.

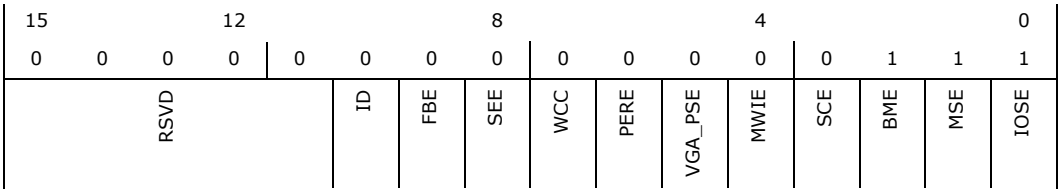
21.8.2 Device Command (CMD)—Offset 4h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 0

Default: 7h



Bit Range	Default and Access	Field Name (ID): Description
15:11	0h RO	Reserved.
10	0h RO	**Interrupt Disable (ID):** The LPC bridge has no interrupts to disable.
9	0h RO	**Fast Back to Back Enable (FBE):** Reserved as 0 per PCI Express Specification.
8	0h RW	**SERR# Enable (SEE):** The LPC bridge generates SERR# if this bit is set.
7	0h RO	**Wait Cycle Control (WCC):** Reserved as 0 per PCI Express Specification.

Bit Range	Default and Access	Field Name (ID): Description
6	0h RW	**Parity Error Response Enable (PERE):** When this bit is set to 1, it enables the LPC bridge to response to parity errors detected on backbone interface.
5	0h RO	**VGA Palette Snoop (VGA_PSE):** Reserved as 0 per *PCI Express Specification*.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Reserved as 0 per *PCI Express Specification*.
3	0h RO	**Special Cycle Enable (SCE):** Reserved as 0 per *PCI Express Specification*.
2	1h RO	**Bus Master Enable (BME):** Bus Masters cannot be disabled.
1	1h RO	**Memory Space Enable (MSE):** Memory space cannot be disabled on LPC.
0	1h RO	**I/O Space Enable (IOSE):** I/O space cannot be disabled on LPC.

21.8.3 Status (STS)—Offset 6h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 0

Default: 210h

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	1	0	0	0	0	1	0	0	0	0
DPE	SSE	RMA	RTA	STA	DTS		DPD	FBC	RSVD	C66	CLIST	IS	RSVD		

Bit Range	Default and Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE):** Set when the bridge detects a parity error on the internal backbone. This bit gets set even if CMD.PERE is not set.
14	0h RW/1C	**Signaled System Error (SSE):** Set when the LPC bridge signals a system error to the internal SERR# logic.
13	0h RO	**Received Master Abort (RMA):** Set when the bridge receives a completion with unsupported request status from the backbone. LPC is a target only controller.
12	0h RO	**Received Target Abort (RTA):** Set when the bridge receives a completion with completer abort status from the backbone. LPC is a target only controller.
11	0h RW/1C	**Signaled Target Abort (STA):** Set when the bridge generates a completion packet with target abort status on the backbone.
10:9	1h RO	**DEVSEL# Timing Status (DTS):** Indicates medium timing, although this has no meaning on the backbone.
8	0h RW/1C	**Data Parity Error Detected (DPD):** Set when the bridge receives a completion packet from the backbone from a previous request, and detects a parity error, and CMD.PERE is set.
7	0h RO	**Fast Back to Back Capable (FBC):** Reserved - bit has no meaning on internal backbone.

Bit Range	Default and Access	Field Name (ID): Description
6	0h RO	Reserved.
5	0h RO	**66 MHz Capable (C66):** Reserved - bit has no meaning on internal backbone.
4	1h RO	**Capabilities List (CLIST):** There is a capabilities list in the LPC bridge.
3	0h RO	**Interrupt Status (IS):** The LPC bridge does not generate interrupts.
2:0	0h RO	Reserved.

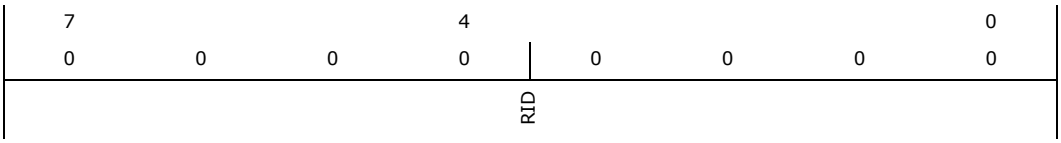
21.8.4 Revision ID (RID)—Offset 8h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Revision ID (RID):** Indicates the PCH revision.

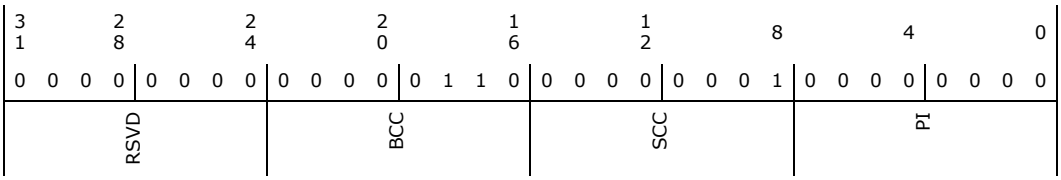
21.8.5 Class Code (CC)—Offset 9h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 60100h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:16	6h RO	**Base Class Code (BCC):** Indicates the device is a bridge device.
15:8	1h RO	**Sub-Class Code (SCC):** Indicates the device a PCI to ISA bridge.
7:0	0h RO	**Programming Interface (PI):** The LPC bridge has no programming interface.

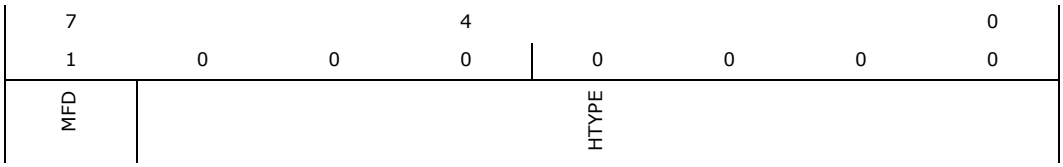
21.8.6 Header Type (HTYPE)—Offset Eh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 0

Default: 80h



Bit Range	Default and Access	Field Name (ID): Description
7	1h RO	**Multi-function Device (MFD):** This bit is 1 to indicate a multifunction device.
6:0	0h RO	**Header Type (HTYPE):** Identifies the header layout of the configuration space, which is a generic device.

21.8.7 Sub System Identifiers (SS)—Offset 2Ch

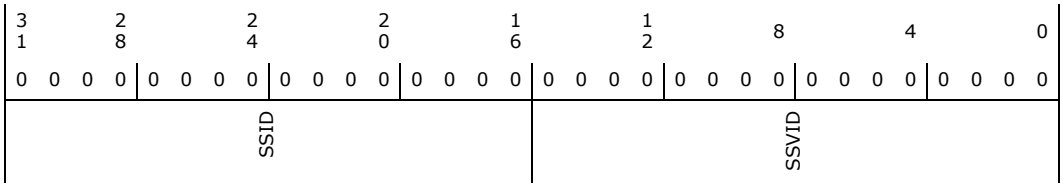
This register is initialized to logic 0 by the assertion of PLTRST#. This register can be written only once after PLTRST# de-assertion.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** This is written by BIOS. No hardware action taken on this value.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** This is written by BIOS. No hardware action taken on this value.

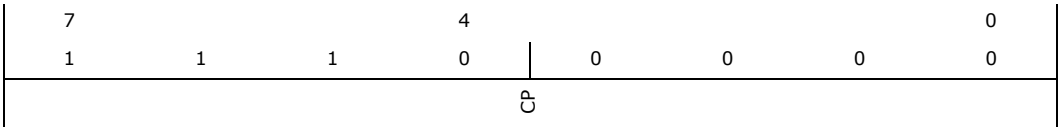
21.8.8 Capability List Pointer (CAPP)—Offset 34h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 0

Default: E0h



Bit Range	Default and Access	Field Name (ID): Description
7:0	E0h RO	**Capability Pointer (CP):** Indicates the offset of the first Capability Item.

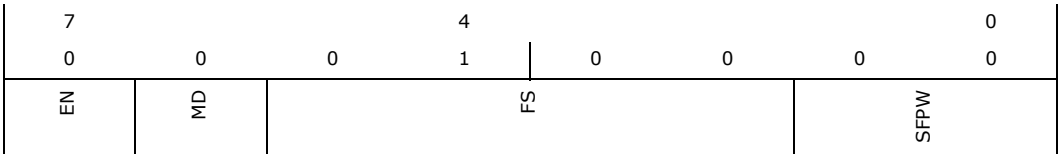
21.8.9 Serial IRQ Control (SCNT)—Offset 64h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 0

Default: 10h



Bit Range	Default and Access	Field Name (ID): Description
7	0h RW	**Enable (EN):** When set, serial IRQs will be recognized.

Bit Range	Default and Access	Field Name (ID): Description
6	0h RW	**Mode (MD):** When set, the serial IRQ machine will be in continuous mode. When cleared, the serial IRQ machine will be in quiet mode. When setting the EN bit, this bit must also be written as a one to guarantee that the first action of the serial IRQ machine will be a start frame.
5:2	4h RO	**Frame Size (FS):** Fixed field that indicates the size of the SERIRQ frame as 21 frames.
1:0	0h RW	**Start Frame Pulse Width (SFPW):** This is the number of 33 MHz clocks that the SERIRQ pin will be driven low by the Serial IRQ controller to signal a start frame. In continuous mode, the controller will drive the start frame for the number of clocks specified. In quiet mode, the controller will drive the start frame for the number of clocks specified minus one, as the first clock was driven by the peripheral. Bits Clocks 00 4 01 6 10 8 11 Reserved

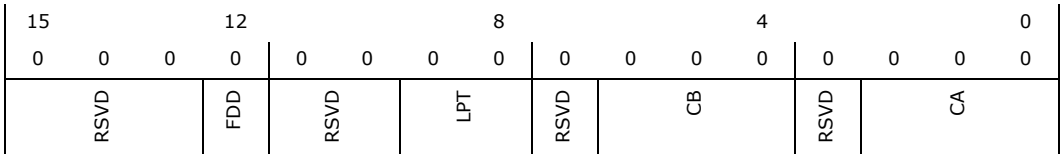
21.8.10 I/O Decode Ranges (IOD)—Offset 80h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
15:13	0h RO	Reserved.
12	0h RW	**FDD Range (FDD):** The following table describes which range to decode for the FDD Port Bits Decode Range 0 3F0h - 3F5h, 3F7h (Primary) 1 370h - 375h, 377h (Secondary)
11:10	0h RO	Reserved.
9:8	0h RW	**LPT Range (LPT):** The following table describes which range to decode for the LPT Port: Bits Decode Range 00 378h - 37Fh and 778h - 77Fh 01 278h - 27Fh (port 279h is read only) and 678h - 67Fh 10 3BCh - 3BEh and 7BCh - 7BEh 11 Reserved
7	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
6:4	0h RW	**ComB Range (CB):** The following table describes which range to decode for the COMB Port Bits Decode Range 000 3F8h - 3FFh (COM 1) 001 2F8h - 2FFh (COM 2) 010 220h - 227h 011 228h - 22Fh 100 238h - 23Fh 101 2E8h - 2EFh (COM 4) 110 338h - 33Fh 111 3E8h - 3EFh (COM 3)
3	0h RO	Reserved.
2:0	0h RW	**ComA Range (CA):** The following table describes which range to decode for the COMA Port Bits Decode Range 000 3F8h - 3FFh (COM 1) 001 2F8h - 2FFh (COM 2) 010 220h - 227h 011 228h - 22Fh 100 238h - 23Fh 101 2E8h - 2EFh (COM 4) 110 338h - 33Fh 111 3E8h - 3EFh (COM 3)

21.8.11 I/O Enables (IOE)—Offset 82h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 0

Default: 0h

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD		ME2	SE	ME1	KE	HGE	LGE	RSVD				FDE	PPE	CBE	CAE

Bit Range	Default and Access	Field Name (ID): Description
15:14	0h RO	Reserved.
13	0h RW	**Microcontroller Enable #2 (ME2):** Enables decoding of I/O locations 4Eh and 4Fh to LPC.
12	0h RW	**SuperI/O Enable (SE):** Enables decoding of I/O locations 2Eh and 2Fh to LPC.
11	0h RW	**Microcontroller Enable #1 (ME1):** Enables decoding of I/O locations 62h and 66h to LPC.
10	0h RW	**Keyboard Enable (KE):** Enables decoding of the keyboard I/O locations 60h and 64h to LPC.
9	0h RW	**High Gameport Enable (HGE):** Enables decoding of the I/O locations 208h to 20Fh to LPC.
8	0h RW	**Low Gameport Enable (LGE):** Enables decoding of the I/O locations 200h to 207h to LPC.

Bit Range	Default and Access	Field Name (ID): Description
7:4	0h RO	Reserved.
3	0h RW	**Floppy Drive Enable (FDE):** Enables decoding of the FDD range to LPC. Range is selected by LIOD.FDE
2	0h RW	**Parallel Port Enable (PPE):** Enables decoding of the LPT range to LPC. Range is selected by LIOD.LPT.
1	0h RW	**Com Port B Enable (CBE):** Enables decoding of the COMB range to LPC. Range is selected LIOD.CB.
0	0h RW	**Com Port A Enable (CAE):** Enables decoding of the COMA range to LPC. Range is selected LIOD.CA.

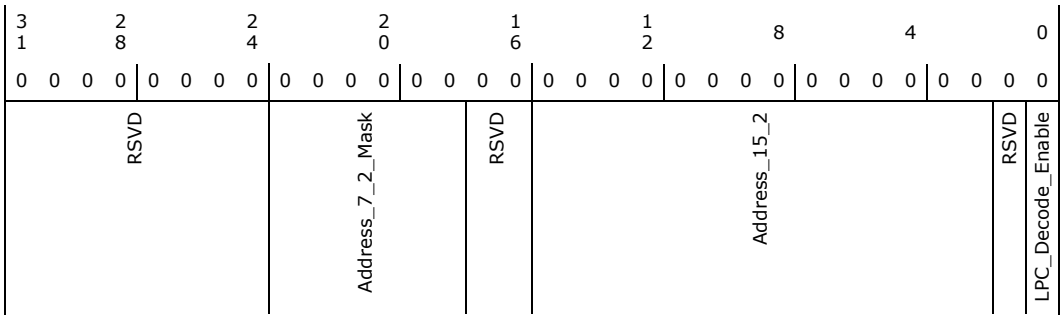
21.8.12 LPC Generic I/O Range #1 (LGIR1)—Offset 84h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:18	0h RW	**Address[7:2] Mask (Address_7_2_Mask):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	Reserved.
15:2	0h RW	**Address[15:2] (Address_15_2):** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level.
1	0h RO	Reserved.
0	0h RW	**LPC Decode Enable (LPC_Decode_Enable):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

21.8.13 LPC Generic I/O Range #2 (LGIR2)—Offset 88h

Same bit definition as Generic I/O Range #1 (LGIR1).

21.8.14 LPC Generic I/O Range #3 (LGIR3)—Offset 8Ch

Same bit definition as Generic I/O Range #1 (LGIR1).

21.8.15 LPC Generic I/O Range #4 (LGIR4)—Offset 90h

Same bit definition as Generic I/O Range #1 (LGIR1).

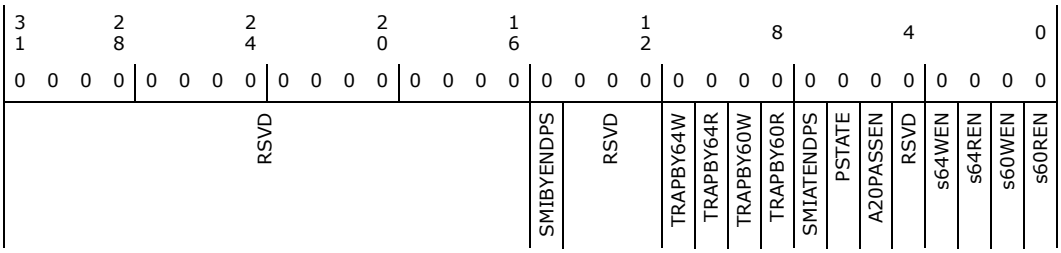
21.8.16 USB Legacy Keyboard/Mouse Control (ULKMC)—Offset 94h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW/1C	**SMI Caused by End of Pass-through (SMIBYENDPS):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 7, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
14:12	0h RO	Reserved.
11	0h RW/1C	**SMI Caused by Port 64 Write (TRAPBY64W):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 3, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch. Note that the A20Gate Pass-Through Logic allows specific port 64h Writes to complete without setting this bit.
10	0h RW/1C	**SMI Caused by Port 64 Read (TRAPBY64R):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 2, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
9	0h RW/1C	**SMI Caused by Port 60 Write (TRAPBY60W):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 1, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch. Note that the A20Gate Pass-Through Logic allows specific port 60h Writes to complete without setting this bit.

Bit Range	Default and Access	Field Name (ID): Description
8	0h RW/1C	**SMI Caused by Port 60 Read (TRAPBY60R):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the bit 0, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
7	0h RW	**SMI at End of Pass-through Enable (SMIATENDPS):** May need to cause SMI at the end of a pass-through. Can occur if an SMI is generated in the middle of a pass through, and needs to be serviced later.
6	0h RO	**Pass Through State (PSTATE):** This read-only bit indicates that the state machine is in the middle of an A20GATE pass-through sequence. If software needs to reset this bit, it should set Bit 5 0.
5	0h RW	**A20Gate Pass-Through Enable (A20PASSEN):** When enabled, allows A20GATE sequence Pass-Through function. When enabled, a specific cycle sequence involving writes to port 60h and port 64h does not result in the setting of the SMI status bits.SMI# will not be generated, even if the various enable bits are set.
4	0h RO	Reserved.
3	0h RW	**SMI on Port 64 Writes Enable (s64WEN):** When set, a 1 in bit 11 will cause an SMI event.
2	0h RW	**SMI on Port 64 Reads Enable (s64REN):** When set, a 1 in bit 10 will cause an SMI event.
1	0h RW	**SMI on Port 60 Writes Enable (s60WEN):** When set, a 1 in bit 9 will cause an SMI event.
0	0h RW	**SMI on Port 60 Reads Enable (s60REN):** When set, a 1 in bit 8 will cause an SMI event.

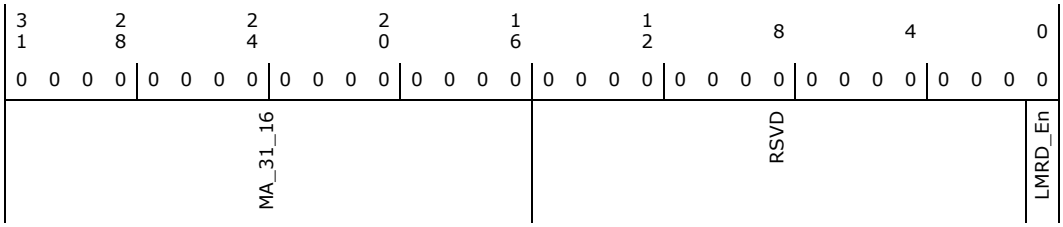
21.8.17 LPC Generic Memory Range (LGMR)—Offset 98h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW	**Memory Address[31:16] (MA_31_16):** This field specifies a 64 KB memory block anywhere in the 4GB memory space that will be decoded to LPC as standard LPC Memory Cycle if enabled.
15:1	0h RO	Reserved.
0	0h RW	**LPC Memory Range Decode Enable (LMRD_En):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

21.8.18 FWH ID Select #1 (FS1)—Offset D0h

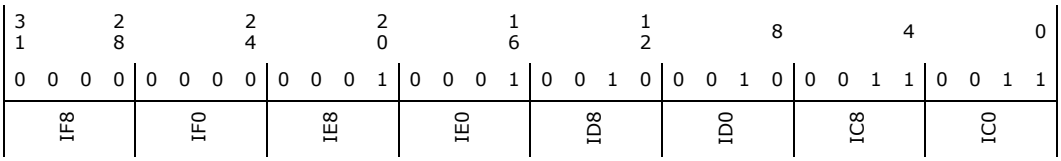
This register contains the IDSEL fields the LPC Bridge uses for memory cycles going to the FWH.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 112233h



Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RO	**F8-FF IDSEL (IF8):** IDSEL to use in FWH cycle for range enabled by BDE.EF8.
27:24	0h RW	**F0-F7 IDSEL (IF0):** IDSEL to use in FWH cycle for range enabled by BDE.EF0.
23:20	1h RW	**E8-EF IDSEL (IE8):** IDSEL to use in FWH cycle for range enabled by BDE.EE8.
19:16	1h RW	**E0-E7 IDSEL (IE0):** IDSEL to use in FWH cycle for range enabled by BDE.EE0.
15:12	2h RW	**D8-DF IDSEL (ID8):** IDSEL to use in FWH cycle for range enabled by BDE.ED8.
11:8	2h RW	**D0-D7 IDSEL (ID0):** IDSEL to use in FWH cycle for range enabled by BDE.ED0.
7:4	3h RW	**C8-CF IDSEL (IC8):** IDSEL to use in FWH cycle for range enabled by BDE.EC8.
3:0	3h RW	**C0-C7 IDSEL (IC0):** IDSEL to use in FWH cycle for range enabled by BDE.EC0.

21.8.19 FWH ID Select #2 (FS2)—Offset D4h

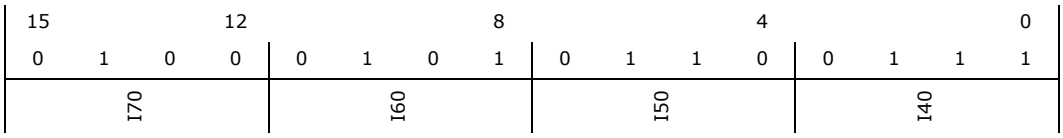
This register contains the additional IDSEL fields the LPC Bridge uses for memory cycles going to the FWH.

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 0

Default: 4567h



Bit Range	Default and Access	Field Name (ID): Description
15:12	4h RW	**70-7F IDSEL (I70):** IDSEL to use in FWH cycle for range enabled by BDE.E70.
11:8	5h RW	**60-6F IDSEL (I60):** IDSEL to use in FWH cycle for range enabled by BDE.E60.
7:4	6h RW	**50-5F IDSEL (I50):** IDSEL to use in FWH cycle for range enabled by BDE.E50.
3:0	7h RW	**40-4F IDSEL (I40):** IDSEL to use in FWH cycle for range enabled by BDE.E40.

21.8.20 BIOS Decode Enable (BDE)—Offset D8h

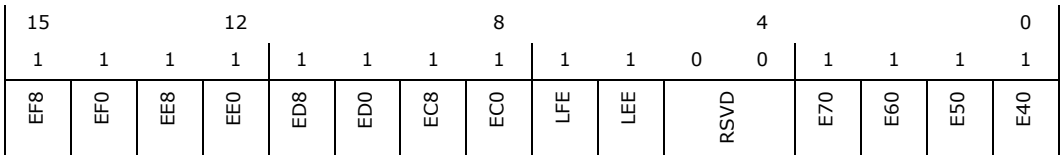
Note that this register effects the BIOS decode regardless of whether the BIOS is resident on LPC or SPI. The concept of Feature Space does not apply to SPI-based flash. PCH simply decodes these ranges as memory accesses when enabled for the SPI flash interface.

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 0

Default: FFCFh



Bit Range	Default and Access	Field Name (ID): Description
15	1h RO	**F8-FF Enable (EF8):** Enables decoding of 512K of the following BIOS range: Data space: FFF80000h - FFFFFFFFh Feature space: FFB80000h - FFBFFFFFh
14	1h RW	**F0-F8 Enable (EF0):** Enables decoding of 512K of the following BIOS range: Data space: FFF00000h - FFF7FFFFh Feature space: FFB00000h - FFB7FFFFh
13	1h RW	**E8-EF Enable (EE8):** Enables decoding of 512K of the following BIOS range: Data space: FFE80000h - FFEFFFFFh Feature space: FFA80000h - FFAFFFFFh
12	1h RW	**E0-E8 Enable (EE0):** Enables decoding of 512K of the following BIOS range: Data space: FFE00000h - FFE7FFFFh Feature Space: FFA00000h - FFA7FFFFh
11	1h RW	**D8-DF Enable (ED8):** Enables decoding of 512K of the following BIOS range: Data space: FFD80000h - FFDFFFFFh Feature space: FF980000h - FF9FFFFFh
10	1h RW	**D0-D7 Enable (ED0):** Enables decoding of 512K of the following BIOS range: Data space: FFD00000h - FFD7FFFFh Feature space: FF900000h - FF97FFFFh
9	1h RW	**C8-CF Enable (EC8):** Enables decoding of 512K of the following BIOS range: Data space: FFC80000h - FFCFFFFFh Feature space: FF880000h - FF8FFFFFh
8	1h RW	**C0-C7 Enable (EC0):** Enables decoding of 512K of the following BIOS range: Data space: FFC00000h - FFC7FFFFh Feature space: FF800000h - FF87FFFFh
7	1h RW	**Legacy F Segment Enable (LFE):** This enables the decoding of the legacy 64KB range at F0000h - FFFFFh Note that decode for the BIOS legacy F segment is enabled by the LFE bit only, it is not affected by the GEN_PMCON_1.iA64_EN bit.
6	1h RW	**Legacy E Segment Enable (LEE):** This enables the decoding of the legacy 64KB range at E0000h - EFFFFh Note that decode for the BIOS legacy E segment is enabled by the LEE bit only, it is not affected by the GEN_PMCON_1.iA64_EN bit.
5:4	0h RO	Reserved.
3	1h RW	**70-7F Enable (E70):** Enables decoding of 1MB of the following BIOS range: Data space: FF700000h - FF7FFFFFh Feature space: FF300000h - FF3FFFFFh
2	1h RW	**60-6F Enable (E60):** Enables decoding of 1MB of the following BIOS range: Data space: FF600000h - FF6FFFFFh Feature Space: FF200000h - FF2FFFFFh
1	1h RW	**50-5F Enable (E50):** Enables decoding of 1MB of the following BIOS range: Data space: FF500000h - FF5FFFFFh Feature space: FF100000h - FF1FFFFFh
0	1h RW	**40-4F Enable (E40):** Enables decoding of 1MB of the following BIOS range: Data space: FF400000h - FF4FFFFFh Feature space: FF000000h - FF0FFFFFh

21.8.21 BIOS Control (BC)—Offset DCh

Access Method

BILD	BBS	EISS	TS	SRC		LE	WPD

Bit Range	Default and Access	Field Name (ID): Description
7	0h RW/1L	**BIOS Interface Lock-Down (BILD):** When set, prevents BC.TS and BC.BBS from being changed. This bit can only be written from 0 to 1 once. **BIOS Note:** This bit is not backed up in the RTC well. This bit should also be set in the BUC register in the RTC device to record the last state of this value following a cold reset.
6	0h RW/L	**Boot BIOS Strap (BBS):** This field determines the destination of accesses to the BIOS memory range. For the default, Functional Strap section of Signal Description chapter for details. Bits Description 0 SPI 1 LPC When SPI or LPC is selected, the range that is decoded is further qualified by other configuration bits described in the respective sections. The value in this field can be overwritten by software as long as the BIOS Interface Lock-Down is not set.
5	1h RW/L	**Enable InSMM.STS (EISS):** When this bit is set, the BIOS region is not writable until SMM sets the InSMM.STS bit. Today BIOS Flash is writable if WPD is a 1. If this bit [5] is set, then WPD must be a 1 and InSMM.STS (0xFED3_0880[0]) must be 1 also. If this bit [5] is clear, then BIOS is writable based only on WPD = 1 and the InSMM.STS is a don't care.
4	0h RO	**Top Swap (TS):** When set, PCH will invert either A16, A17, or A18 for cycles going to the BIOS space (but not the feature space) in the FWH. When cleared, PCH will not invert A16. If booting from LPC (FWH), then the Boot Blook size is 64 KB and A16 is inverted if Top Swap is enabled. If booting from SPI, then the BOOT_BLOCK_SIZE soft strap determines if A16, A17, or A18 should be inverted if Top Swap is enabled. *If PCH is strapped for Top-Swap (GNT[3]# is low at rising edge of PWROK), then this bit cannot be cleared by software. The strap jumper should be removed and the system rebooted. **BIOS Note:** 1. This bit provides a read-only path to view the state of the Top Swap strap. It is backed up and driven from the RTC well. BIOS will need to program the corresponding register in the RTC Controller (in RTC well), which will be reflected in this register. 2. The Register portion of the Top Swap is lockable by the BIOS Interface Lockdown Bit (BC.BILD) but unlockable by SPI Flash Protected Range and Top Swap Override (uCode.PRR_TS_OVR).
3:2	0h RW	LPC or eSPI Strap (LPC_eSPI). Bit 3 is reserved. Bit 2 is read only and reflects whether eSPI or LPC is enabled. If 0, then D31:F0 is LPC. If 1, then D31:F0 is eSPI.
1	0h RW/1L	**Lock Enable (LE):** When set, setting the WP bit will cause SMI. When cleared, setting the WP bit will not cause SMI. Once set, this bit can only be cleared by a PLTRST#. When this bit is set, EISS - bit [5] of this register is locked down.
0	0h RW	**Write Protect Disable (WPD):** When set, access to the BIOS space is enabled for both read and write cycles to BIOS. When cleared, only read cycles are permitted to the FWH or SPI flash. When this bit is written from a 0 to a 1 and the LE bit is also set, an SMI# is generated. This ensures that only SMM code can update BIOS.

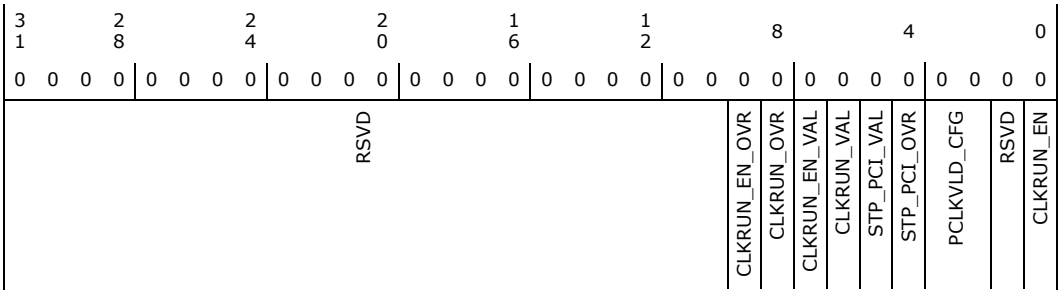
21.8.22 PCI Clock Control (PCCTL)—Offset E0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9	0h RO	**CLKRUN# Buffer Enable Override (CLKRUN_EN_OVR):** When set to '1', SW is in control of the CLKRUN# buffer enable and the value in CLKRUN_EN_VAL will be propagated to the output buffer enable. When this bit is '0', HW will determine the value of the buffer enable.
8	0h RO	**CLKRUN# Override (CLKRUN_OVR):** When set to '1', SW is in control of the CLKRUN# pin and the value in CLKRUN_VAL will be propagated to the output pin. When this bit is '0', HW will determine the value of the pin.
7	0h RO	**CLKRUN# Buffer Enable Value (CLKRUN_EN_VAL):** Either HW or SW may own control of the CLKRUN# pin. This bit provides the value to drive on the active low CLKRUN# buffer enable if CLKRUN_EN_OVR is set to '1'.
6	0h RO	**CLKRUN# Pin Output Value (CLKRUN_VAL):** Either HW or SW may own control of the CLKRUN# pin. This bit provides the value to drive on the pin if CLKRUN_OVR is set to '1'.
5	0h RO	**Stop PCI# Value (STP_PCI_VAL):** Either Hardware or Software may own control of the internal STP_PCI#. This bit provides the value to drive on the STP_PCI# if STP_PCI_OVR is set to 1. ***Note:*** SW cannot control the STP_PCI# pin while PLTRST# is asserted (the pin will be at its reset default value).
4	0h RO	**Stop PCI# Override (STP_PCI_OVR):** This field determines the relationship between the internally broadcast indication of the external PCI clock being valid vs. the STP_PCI# pin. Encodings: 00: 1 flop stage of delay from STP_PCI# (default). Expected setting for Full Integration Mode 01: No delay (edges match STP_PCI#). For CK505 legacy mode 10: 2 flop stages of delay from STP_PCI# 11: Tie high (indicate that PCI clock is always valid)

Bit Range	Default and Access	Field Name (ID): Description
3:2	0h RW	**PCI Clock Valid Configuration (PCLKVLD_CFG):** This field determines the relationship between the internally broadcast indication of the external PCI clock being valid vs. the STP_PCI# pin. Encodings: 00: 1 flop stage of delay from STP_PCI# (default) 01: No delay (edges match STP_PCI# 10: 2 flop stages of delay from STP_PCI# 11: Tie high (indicate that PCI clock is always valid)
1	0h RO	Reserved.
0	0h RW	**Clock Run Enable (CLKRUN_EN):** Enables the CLKRUN# logic to stop the PCI clocks. If the SLP_EN bit is set, then the Intel PCH will drive CLKRUN# low. This will keep the PCI and LPC clocks running on the way to the sleeping state. This is required to meet an LPC specification. This does not necessarily mean that the CLKRUN_EN bit is forced low when SLP_EN is set. Even though the CLKRUN# signal will be low when SLP_EN is set, the state of the CLKRUN_EN bit is ignored when SLP_EN bit is set. This gives flexibility in the implementation.

21.9 LPC PCR Registers Summary

These registers are within the PCH Private Configuration Space which is accessible through the PCH Sideband Interface. They can be accessed via (SBREG_BAR + PortID + Register Offset).

Table 21-8. Summary of LPC PCR Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
3418h	341Bh	General Control and Function Disable (GCFD)—Offset 3418h	0h

21.9.1 General Control and Function Disable (GCFD)—Offset 3418h

Access Method

Type: MSG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD																														eSPI	LPC_BD

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1	0h RO	**eSPI Enable Pin Strap (eSPI):** This field determines the destination of accesses to the D31:F0 and related Fixed and Variable I/O and Memory decode ranges, including BIOS memory range. 0: LPC is the D31:F0 target. 1: eSPI is the D31:F0 target. ***Note:*** This field, along with BC.BBS strap setting determines the final BIOS Boot Location.
0	0h RW	**LPC Bridge Disable (LPC_BD):** When set, the LPC bridge is disabled. When disabled the following spaces will no longer be decoded by the LPC bridge: 1) D31:F0 PCI Configuration space 2) Memory cycles below 16MB (1000000h) 3) I/O cycles below 64kB (10000h)

22 PCI Express*

22.1 Acronyms and Register Attributes/Modifiers

Acronyms	Description
LTR	Latency tolerance Reporting
SSC	Spread Spectrum Clocking
SRIS	Separate Reference Clocking with Independent SSC
PCIe*	PCI Express
Intel® RSTe	Intel® Rapid Storage Technology Enterprise

Attribute	Description
RO	**Read Only:** These bits can be read by Software, but writes have no effect. The value of the bit is determined by hardware only.
RW	**Read/Write:** These register bits can be read by software and modified by software
RW1C	**Read/Write 1Clear**. These bits can be read from and written to by software. Writing a "0" to these bits has no effect. Writing a "1" clears the bit.
RV	**Reserved**: These bits are reserved. Their value must be maintained by software. When writing these bits, software must preserve the value read.
Modifier	**Description**
S	**Sticky**: These bits are only reinitialized to their default state by a PWRGD reset.
-K	**Key:** This bit is used to lock other bits
-L	**Lock:** This bit can will become read only once locked by another bit or logic
-O	**Once:** After reset, these bits can only be written to once. After that they are read only.
-V	**Variant:** The value of the bit can be updated by hardware.

22.3 Overview

The PCIe ports on the Intel® C620 Series Chipset are arranged in three groups with separate functions:

- One group of PCIe ports are root ports, that are used to connect the Intel® C620 Series Chipset to downstream PCIe devices outside the chip (down devices, slots, etc.) These PCIe ports are always available and are selected by strapping options. Data from these PCIe ports is transferred to the CPU over the DMI bus.
- The second set of PCIe functions are endpoints. Their job is to provide a connection to the 10/1 GbE Ethernet controller and Intel® QuickAssist Technology engines. These downstream ports come in two blocks. One block is a x16 port. All 10 GbE traffic is sent to the CPU over this port. Data from the Intel QuickAssist Technology

engines is also sent over this port to the CPU. In addition to this x16 uplink, 8 of the HSIO pins have a PCIe endpoint function multiplexed on them, too. When enabled, this permits the PCH to have x24 PCIe Gen3 lanes connecting the PCH to the CPU. These extra x8 PCIe uplinks are solely for the use of the Intel QuickAssist Technology engines.

- The third set of PCIe functions are Virtual Switch Ports (VSP). Their job is to provide connection between the PCIe Upstream Ports and the 10/1 GbE Ethernet controller and Intel QuickAssist Technology endpoints.

22.4 PCIe Root Port

22.4.1 PCIe Root Port overview

- Up to 16 PCIe Ports and 20 PCIe Lanes, with transfer rates up to 8 GT/s (Gen3)
- ExpressCard 1.0 module-based hot-plug supported
- Dynamic Link Throttling
- Port 8xh Decode
- Separate Reference Clock with Independent Spread Spectrum Clocking (SSC)
- Latency Tolerance Reporting
- x4 static end-to-end Lane Reversal
- Access Control Services
- Alternative Routing ID
- Autonomous Link Width Negotiation as a target
- Advanced Error Reporting
- Polarity Inversion
- Configurable 128B or 256B Maximum Data Payload
- Subtractive Decode is not Supported
- Intel® Rapid Storage Technology enterprise (Intel® RSTe) for PCIe Gen3 Storage Support

22.4.2 Signal Description

Name	Type	Description
USB3_7_PCIE0_TXN/P	O	PCI Express Differential Transmit Pair 0 PCI Express transmit pair 0, muxed with USB3 port 7
USB3_8_PCIE1_TXN/P	O	PCI Express Differential Transmit Pair 1 PCI Express transmit pair 1, muxed with USB3 port 8
USB3_9_PCIE2_TXN/P	O	PCI Express Differential Transmit Pair 2 PCI Express transmit pair 2, muxed with USB3 port 9
USB3_10_PCIE3_TXN/P	O	PCI Express Differential Transmit Pair 3 PCI Express transmit pair 3, muxed with USB3 port 10
PCIE4_GBE_TXN/P	O	PCI Express Differential Transmit Pair 4 PCI Express transmit pair 4, muxed with the output of the 1 GbE MAC
PCIE5_GBE_TXN/P	O	PCI Express Differential Transmit Pair 5 PCI Express transmit pair 5, muxed with the output of the 1 GbE MAC

Name	Type	Description
PCIE6_SSATA0_TXN/P	O	PCI Express Differential Transmit Pair 6 PCI Express transmit pair 6, muxed with SSATA port 0
PCIE7_SSATA1_TXN/P	O	PCI Express Differential Transmit Pair 7 PCI Express transmit pair 7, muxed with SSATA port 1
PCIE8_SSATA2_GBE_TXN/P	O	PCI Express Differential Transmit Pair 8 PCI Express Transmit pair 7, muxed with SSATA port 2 and the output of the 1 GbE MAC
PCIE9_SSATA3_TXN/P	O	PCI Express Differential Transmit Pair 9 PCI Express transmit pair 9, muxed with SSATA port 3
PCIE10_SSATA4_TXN/P	O	PCI Express Differential Transmit Pair 10 PCI Express transmit pair 10, muxed with SSATA port 4
PCIE11_SSATA5_GBE_TXN/P	O	PCI Express Differential Transmit Pair 11 PCI Express Transmit pair 11, muxed with SSATA port 5and the output of the 1GbE MAC
PCIE12_UP0_SATA0_TXN/P	O	PCI Express Differential Transmit Pair 12 PCI Express Transmit pair 12, muxed with PCI Express Uplink Port 0 and SATA port 0
PCIE13_UP1_SATA1_TXN/P	O	PCI Express Differential Transmit Pair 13 PCI Express Transmit pair 13, muxed with PCI Express Uplink Port 1 and SATA port 1
PCIE14_UP2_SATA2_TXN/P	O	PCI Express Differential Transmit Pair 14 PCI Express Transmit pair 14, muxed with PCI Express Uplink Port 2 and SATA port 2
PCIE15_UP3_SATA3_TXN/P	O	PCI Express Differential Transmit Pair 15 PCI Express Transmit pair 15, muxed with PCI Express Uplink Port 3 and SATA port 3
PCIE16_UP4_SATA4_TXN/P	O	PCI Express Differential Transmit Pair 16 PCI Express Transmit pair 16, muxed with PCI Express Uplink Port 4 and SATA port 4
PCIE17_UP5_SATA5_TXN/P	O	PCI Express Differential Transmit Pair 17 PCI Express Transmit pair 17, muxed with PCI Express Uplink Port 5 and SATA port 5
PCIE18_UP6_SATA6_TXN/P	O	PCI Express Differential Transmit Pair 18 PCI Express Transmit pair 18, muxed with PCI Express Uplink Port 6 and SATA port 6
PCIE19_UP7_SATA7_TXN/P	O	PCI Express Differential Transmit Pair 19 PCI Express Transmit pair 19, muxed with PCI Express Uplink Port 7 and SATA port 7
USB3_7_PCIE0_RXN/P	I	PCI Express Differential Receive Pair 0 PCI Express Receive pair 0, muxed with USB3 port 7
USB3_8_PCIE1_RXN/P	I	PCI Express Differential Receive Pair 1 PCI Express Receive pair 1, muxed with USB3 port 8
USB3_9_PCIE2_RXN/P	I	PCI Express Differential Receive Pair 2 PCI Express Receive pair 2, muxed with USB3 port 9
USB3_10_PCIE3_RXN/P	I	PCI Express Differential Receive Pair 3 PCI Express Receive pair 3, muxed with USB3 port 10
PCIE4_GBE_RXN/P	I	PCI Express Differential Receive Pair 4 PCI Express Receive pair 4, muxed with the output of the 1 GbE MAC
PCIE5_GBE_RXN/P	I	PCI Express Differential Receive Pair 5 PCI Express Receive pair 5, muxed with the output of the 1 GbE MAC
PCIE6_SSATA0_RXN/P	I	PCI Express Differential Receive Pair 6 PCI Express Receive pair 6, muxed with SSATA port 0

Name	Type	Description
PCIE7_SSATA1_RXN/P	I	PCI Express Differential Receive Pair 7 PCI Express Receive pair 7, muxed with SSATA port 1
PCIE8_SSATA2_GBE_RXN/P	I	PCI Express Differential Receive Pair 8 PCI Express Receive pair 7, muxed with SSATA port 2 and the output of the 1GbE MAC
PCIE9_SSATA3_RXN/P	I	PCI Express Differential Receive Pair 9 PCI Express Receive pair 9, muxed with SSATA port 3
PCIE10_SSATA4_RXN/P	I	PCI Express Differential Receive Pair 10 PCI Express Receive pair 10, muxed with SSATA port 4
PCIE11_SSATA5_GBE_RXN/P	I	PCI Express Differential Receive Pair 11 PCI Express Receive pair 11, muxed with SSATA port 5and the output of the 1 GbE MAC
PCIE12_UP0_SATA0_RXN/P	I	PCI Express Differential Receive Pair 12 PCI Express Receive pair 12, muxed with PCI Express Uplink Port 0 and SATA port 0
PCIE13_UP1_SATA1_RXN/P	I	PCI Express Differential Receive Pair 13 PCI Express Receive pair 13, muxed with PCI Express Uplink Port 1 and SATA port 1
PCIE14_UP2_SATA2_RXN/P	O	PCI Express Differential Receive Pair 14 PCI Express Receive pair 14, muxed with PCI Express Uplink Port 2 and SATA port 2
PCIE15_UP3_SATA3_RXN/P	O	PCI Express Differential Receive Pair 15 PCI Express Receive pair 15, muxed with PCI Express Uplink Port 3 and SATA port 3
PCIE16_UP4_SATA4_RXN/P	O	PCI Express Differential Receive Pair 16 PCI Express Receive pair 16, muxed with PCI Express Uplink Port 4 and SATA port 4
PCIE17_UP5_SATA5_RXN/P	O	PCI Express Differential Receive Pair 17 PCI Express Receive pair 17, muxed with PCI Express Uplink Port 5 and SATA port 5
PCIE18_UP6_SATA6_RXN/P	O	PCI Express Differential Receive Pair 18 PCI Express Receive pair 18, muxed with PCI Express Uplink Port 6 and SATA port 6
PCIE19_UP7_SATA7_RXN/P	O	PCI Express Differential Receive Pair 19 PCI Express Receive pair 19, muxed with PCI Express Uplink Port 7 and SATA port 7

22.4.3 I/O Signal Planes and States

Table 22-1. Power Plane and States for PCI Express* Signals

Signal Name	Type	Power Plane	During Reset	Immediately After Reset	S3/S4/S5	Deep Sx
PCIE[20:1]_TXP/N	O	Primary	Internal Pull-down	Internal Pull-down	Internal Pull-down	Off
PCIE[20:1]_RXP/N	I	Primary	Internal Pull-down	Internal Pull-down	Internal Pull-down	Off
PCIE_RCOMPP PCIE_RCOMPN	I	Primary	Un-driven	Un-driven	Un-driven	Off

Note: For brevity, the PCIe root port names have been shortened.

PCIE1_RXP\N pins transition from un-driven to internal pull-down during reset.

22.4.4 PCI Express Port Support Feature Details

Table 22-2. PCI Express Port Feature Details

Max Device (Ports)	Max Lanes	PCIe Gen Type	Encoding	Transfer Rate (MT/s)	Theoretical Max Bandwidth (GB/s)		
					x1	x2	x4
16	20	1	8b/10b	2500	0.25	0.50	1.00
		2	8b/10b	5000	0.50	1.00	2.00
		3	128b/130b	8000	1.00	2.00	3.94

Notes:
1. Theoretical Maximum Bandwidth (GB/s) = ((Transfer Rate * Encoding * # PCIe Lanes) /8) / 1000
   — Gen3 Example: = ((8000 * 128/130* 4) / 8) / 1000 = 3.94 GB/s
2. When GbE is enabled on a PCIe Root Port, the Max Device (Ports) value listed is reduced by a factor of 1

Table 22-3. PCI Express Link Configurations Supported

PCIe Link Config	PCI Express Lanes																			
	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
1x4	P1				P5				P9				P13				P17			
2x2	P1		P3		P5		P7		P9		P11		P13		P15		P17		P19	
1x2 + 2x1	P1		P3	P4	P5		P7	P8	P9		P11	P12	P13		P15	P16	P17		P19	P20
4x1	P1	P2	P3	P4	P5	P6	P7	P8	P9	P10	P11	P12	P13	P14	P15	P16	P17	P18	P19	P20

Notes:
1. P# refers to a specific PCH PCI Express Root Port #; for example P3 = PCH PCI Express Root Port 3
2. A PCIe Lane is composed of a single pair of Transmit (TX) and Receive (RX) differential pairs, for a total of four data wires per PCIe Lane (such as, PCIE[3]_TXP/ PCIE[3]_TXN and PCIE[3]_RXP/ PCIE[3]_RXN make up PCIe Lane 3). A connection between two PCIe devices is known as a PCIe Link, and is built up from a collection of one or more PCIe Lanes which make up the width of the link (such as bundling 2 PCIe Lanes together would make a x2 PCIe Link). A PCIe Link is addressed by the lowest number PCIe Port it connects to in the PCH (such as a x2 PCIe Link connected to PCIe Ports 3 and 4 would be called x2 PCIe Port 3). This lowest number PCIe Port in the PCIe Link is known as the PCIe Root Port.
3. The PCIe Ports can be configured independently from one another but the max number of configured Devices (Ports) must not be exceeded.
4. Unidentified Ports within a PCIe Link Configuration are disabled but their physical lanes are used for the identified Port.
5. GbE can be mapped to PCIe Root Ports 4, 5, 9, 12, or 13 within their respective PCIe Link configurations. When GbE is enabled on a PCIe Root Port, there can be at most up to a max of 15 Device (Ports) enabled
6. The PCH PCIe Root Ports can be configured to map to any of the SRCCLKRQ# PCIe clock request signals and the CLKOUT_SRC_P/N PCIe differential signal pairs covered in the “PCH and System Clocks” Chapter
7. Reference and understand the PCIe High Speed I/O Muxing details covered in the “Flexible I/O” Chapter

22.4.5 Interrupt Generation

The root port generates interrupts on behalf of hot plug, power management, link bandwidth management, Link Equalization Request and link error events, when enabled. These interrupts can either be pin-based, or can be MSI, when enabled.

When an interrupt is generated via the legacy pin, the pin is internally routed to the PCH interrupt controllers. The pin that is driven is based upon the setting of the STRPFUSECFG.PXIP configuration registers.

Table 22-4 summarizes interrupt behavior for MSI and wire-modes. In the table “bits” refers to the hot-plug and PME interrupt bits.

Table 22-4. MSI Versus PCI IRQ Actions

Interrupt Register	Wire-Mode Action	MSI Action
All bits 0	Wire inactive	No action
One or more bits set to 1	Wire active	Send message
One or more bits set to 1, new bit gets set to 1	Wire active	Send message
One or more bits set to 1, software clears some (but not all) bits	Wire active	Send message
One or more bits set to 1, software clears all bits	Wire inactive	No action
Software clears one or more bits, and one or more bits are set on the same clock	Wire active	Send message

22.4.6 Power Management

22.4.6.1 S3/S4/S5 Support

Software initiates the transition to S3/S4/S5 by performing an I/O write to the Power Management Control register in the PCH. After the I/O write completion has been returned to the CPU the Power Management Controller will signal each root port to send a PME_Turn_Off message on the downstream link. The device attached to the link will eventually respond with a PME_TO_Ack followed by sending a PM_Enter_L23 DLLP (Data Link Layer Packet) request to enter L23. The Express ports and Power Management Controller take no action upon receiving a PME_TO_Ack. When all the Express port links are in state L23, the Power Management Controller will proceed with the entry into S3/S3/S5.

Prior to entering S3, software is required to put each device into $D3_{HOT.}$ When a device is put into $D3_{HOT,}$ it will initiate entry into a L1 link state by sending a PM_Enter_L1 DLLP. Under normal operating conditions when the root ports sends the PME_Turn_Off message, the link will be in state L1. However, when the root port is instructed to send the PME_Turn_Off message, it will send it whether or not the link was in L1. Endpoints attached to the PCH can make no assumptions about the state of the link prior to receiving a PME_Turn_Off message.

22.4.6.2 Resuming from Suspended State

The root port contains enough circuitry in the suspend well to detect a wake event through the WAKE# signal and to wake the system. When WAKE# is detected asserted, an internal signal is sent to the power management controller of the PCH to cause the system to wake up. This internal message is not logged in any register, nor is an interrupt/GPE generated due to it.

22.4.6.3 Device Initiated PM_PME Message

When the system has returned to a working state from a previous low power state, a device requesting service will send a PM_PME message continuously, until acknowledged by the root port. The root port will take different actions depending upon whether this is the first PM_PME that has been received, or whether a previous message has been received but not yet serviced by the operating system.

If this is the first message received (RSTS.PS), the root port will set RSTS.PS, and log the PME Requester ID into RSTS.RID. If an interrupt is enabled using RCTL.PIE, an interrupt will be generated. This interrupt can be either a pin or an MSI if MSI is enabled using MC.MSIE. See Section 22.4.6.4 for SMI/SCI generation.

If this is a subsequent message received (RSTS.PS is already set), the root port will set RSTS.PP. No other action will be taken.

When the first PME event is cleared by software clearing RSTS.PS, the root port will set RSTS.PS, clear RSTS.PP, and move the requester ID into RSTS.RID.

If RCTL.PIE is set, an interrupt will be generated. If RCTL.PIE is not set, a message will be sent to the power management controller so that a GPE can be set. If messages have been logged (RSTS.PS is set), and RCTL.PIE is later written from a 0b to a 1b, an interrupt will be generated. This last condition handles the case where the message was received prior to the operating system re-enabling interrupts after resuming from a low power state.

22.4.6.4 SMI/SCI Generation

Interrupts for power management events are not supported on legacy operating systems. To support power management on non-PCI Express aware operating systems, PM events can be routed to generate SCI. To generate SCI, MPC.PMCE must be set. When set, a power management event will cause SMSCS.PMCS to be set.

Additionally, BIOS workarounds for power management can be supported by setting MPC.PMME. When this bit is set, power management events will set SMSCS.PMMS, and SMI# will be generated. This bit will be set regardless of whether interrupts or SCI is enabled. The SMI# may occur concurrently with an interrupt or SCI.

When operating at PCIe 8 Gb/s, Link Equalization Request can also be routed to generate SCI or SMI. The intention8 for the SCI/SMI is to invoke the proprietary software to diagnose the reason behind the Link Equalization Request interrupt and take the proper link recovery path, which may include software re-performing link equalization. Root Ports do not support the hardware mechanism to service the Link Equalization Request from the device.

22.4.6.5 Latency Tolerance Reporting

The root port supports the extended Latency Tolerance Reporting capability. LTR provides a means for device endpoints to dynamically report their service latency requirements for memory access to the root port. Endpoint devices should transmit a new LTR message to the root port each time its latency tolerance changes (and initially during boot). The PCH uses the information to make better power management decisions. The processor uses the worst case tolerance value communicated by the PCH to optimize C-state transitions. This results in better platform power management without impacting endpoint functionality.

Note: Endpoint devices that support LTR must implement the reporting and enable mechanism detailed in the PCIe Latency Tolerance Reporting Engineering Change Notice.

22.4.7 Dynamic Link Throttling

Root Port supports dynamic link throttling as a mechanism to help lower the overall component power, ensuring that the component never operates beyond the thermal limit of the package. Dynamic link throttling is also used as a mechanism for ensuring that the ICC_{max} current rating of the voltage regulator is never exceeded. The target response time for this particular usage model is < 100 us.

If dynamic link throttling is enabled, the link will be induced by the Root Port to enter TxL0s and RxL0s based on the throttle severity indication received. To induce the link into TxL0s, new TLP requests and opportunistic flow control update will be blocked. Eventually, in the absence of TLP and DLLP requests, the transmitter side of the link will enter TxL0s.

The periodic flow control update, as required by the PCI Express Base Specification is not blocked. However, the flow control credit values advertised to the component on the other side of the link will not be incremented, even if the periodic flow control update packet is sent. Once the other component runs out of credits, it will eventually enter TxL0s, resulting in the local receiver entering RxL0s.

Each of the Root Ports receives four throttle severity indications; T0, T1, T2 and T3. The throttling response for each of the four throttle severity levels can be independently configured in the Root Port TNPT.TSLxM register fields. This allows the duty cycle of the Throttling Window to be varied based on the severity levels, when dynamic link throttling is enabled.

A Throttling Window is defined as a period of time where the duty cycle of throttling can be specified. A Throttling Window is sub-divided into a Throttling Zone and a Non-Throttling Zone. The period of the Throttling Zone is configurable through the TNPT.TT field. Depending on the throttle severity levels, the throttling duration specified by the TNPT.TT field will be multiplied by the multipliers configurable through TNPT.TSLxM.

The period of the Throttling Window is configurable through the TNPT.TP field. The Throttling Window is always referenced from the time a new Throttle State change indication is received by the Root Port or from the time the throttling is enabled by the configuration register. The Throttling Window and Throttling Zone timers continue to behave the same as in L0 or L0s even if the link transitions to other LTSSM states, except for L1, L23_Rdy and link down. For L1 case, the timer is allowed to be stopped and hardware is allowed to re-start the Throttling Window and the corresponding Throttling Zone timers on exit from L1.

22.4.8 Port 8xh Decode

The PCIe root ports will explicitly decode and claim I/O cycles within the 80h – 8Fh range when MPC.P8XDE is set. The claiming of these cycles are not subjected to standard PCI I/O Base/Limit and I/O Space Enable fields. This allows a POST-card to be connected to the Root Port either directly as a PCI Express device or through a PCI Express to PCI bridge as a PCI card.

Any I/O reads or writes will be forwarded to the link as it is. The device will need to be able to return the previously written value, on I/O read to these ranges. BIOS must ensure that at any one time, no more than one Root Port is enabled to claim Port 8xh cycles.

22.4.9 Separate Reference Clock with Independent SSC

The current PCI-SIG PCIe External Cabling form factor specification defines the reference clock as part of the signals delivered through the cable. Inclusion of the reference clock in the cable requires an expensive shielding solution to meet EMI requirements.

The need for an inexpensive PCIe cabling solution for PCIe SSDs requires a new cabling form factor that supports non-common clock mode with spread spectrum enabled, such that the reference clock does not need to be part of the signals delivered through the

cable. This new clock mode requires the components on both sides of a link to tolerate a much higher ppm tolerance of ~5600 ppm compared to the PCIe Base Specification defined as 600 ppm.

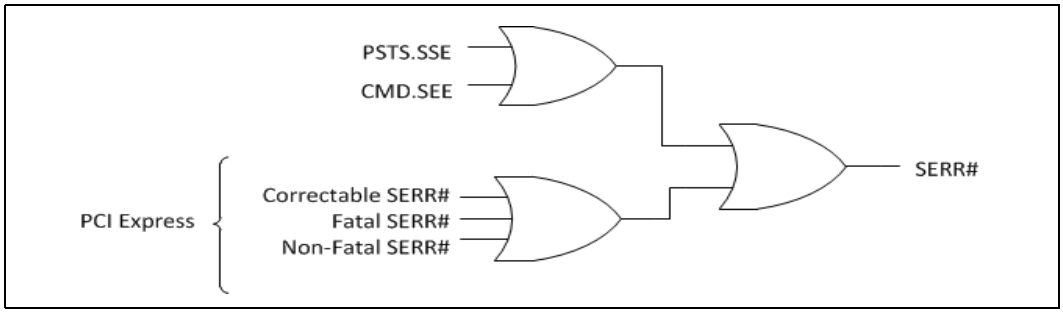
Soft straps are needed as a method to configure the port statically to operate in the new mode. This new mode is only enabled if the SSD connector is present on the motherboard, where the SSD connector does not include the reference clock. No change is being made to PCIe add-in card form factors and solutions.

ASPM L0s is not supported in this new form factor. The L1 exit latency advertised to software would be increased to 10 us. The root port does not support Lower SKP Ordered Set generation and reception feature defined in SRIS ECN.

22.4.10 SERR# Generation

SERR# may be generated using two paths—through PCI mechanisms involving bits in the PCI header, or through PCI Express* mechanisms involving bits in the PCI Express capability structure.

Figure 22-1. Generation of SERR# to Platform



22.4.11 Hot-Plug

All PCIe Root Ports support Express Card 1.0 based hot-plug that performs the following:

- Presence Detect and Link Active Changed Support
- Interrupt Generation Support

22.4.11.1 Presence Detection

When a module is plugged in and power is supplied, the physical layer will detect the presence of the device, and the root port sets SLSTS.PDS and SLSTS.PDC. If SLCTL.PDE and SLCTL.HPE are both set, the root port will also generate an interrupt.

When a module is removed (using the physical layer detection), the root port clears SLSTS.PDS and sets SLSTS.PDC. If SLCTL.PDE and SLCTL.HPE are both set, the root port will also generate an interrupt.

22.4.11.2 SMI/SCI Generation

Interrupts for power-management events are not supported on legacy operating systems. To support power-management on non-PCI Express aware operating systems, power management events can be routed to generate SCI. To generate SCI, MPC.HPCE must be set. When set, enabled hot-plug events will cause SMSCS.HPCS to be set.

Additionally, BIOS workarounds for hot-plug can be supported by setting MPC.HPME. When this bit is set, hot-plug events can cause SMI status bits in SMSCS to be set. Supported hot-plug events and their corresponding SMSCS bit are:

- Presence Detect Changed – SMSCS.HPPDM
- Link Active State Changed – SMSCS.HPLAS

When any of these bits are set, SMI# will be generated. These bits are set regardless of whether interrupts or SCI is enabled for hot-plug events. The SMI# may occur concurrently with an interrupt or SCI.

22.5 PCIe Upstream Port

22.5.1 Features

22.5.1.1 Supported Features

- PCI Express 3.0 specification Compliant
- Support for PCIe Gen3, Gen2 and Gen1 speeds
- VC0 support only
- 512B maximum payload
- 2048 maximum read request
- Malformed packet checks
- ARI support
- Advanced Error Reporting
- Role Based Error Reporting
- ASPM L1
- L1, L3
- D0, $D3_{HOT,}$ and $D3_{COLD}$
- Polarity Inversion
- Lane reversal
- Support of legacy INTx Interrupt messaging over PCIe
- Support for MSI, MSI-X interrupt messaging over PCIe
- NPx16 supports 1x16, 1x8, 1x4 and 1x1 widths
- NPx8 supports 1x8, 1x4 and 1x1 widths.

22.5.1.2 Features Not Supported

- 1x2 link width
- L0s
- Isochronous services
- P2P support
- Atomic ops
- Lock cycles
- Multicast

22.5.2 Signal List

Table 22-5. NPx16 Port

Name	Type	Description

22.5.3 PCIe Upstream Ports - Configuration

The PCIe Upstream ports consist of two groups, a x16 port that will refer to as NPX16, and an x8 port, referred to as NPx8. The availability and configuration of these ports is based on a mixture of fusing and soft straps. NPx16 port is always enabled by default. Fusing will enabled this as x16, x8 or x1 PCIe uplink depending on SKU. This sets the maximum width, but with soft straps it's possible to either 1) make the uplink smaller or 2) completely disable the uplink. The impact of #2 is that there is no Intel QuickAssist Technology or 10/1GbE functionality.

The PCH has two PCIe Uplink Configurations, Configuration 1 and Configuration 2, associated with how the Intel QuickAssist Technology engines route to the NPx8 and NPx16. Two of the three engines are routed to the NPx16 port, while the 3rd engine can either be routed to NPx8 or NPx16. Selection of which uplink configuration is used is done via softstrap. Refer to Section 22.5.3.1, "PCIe Uplink Configuration 1" and Section 22.5.3.2, "PCIe Uplink Configuration 2" for additional details. Refer to Section 22.6.1.3, "Virtual Switch Ports Overview" for additional details on the related VSP.

It must be noted that for maximum bandwidth of data transfer, if routing up NPx8 is an option, then you must route the PCIe traffic from the Intel QuickAssist Technology engine up that uplink.

Note: Not all PCH SKUs support the secondary PCIe x8 Uplink. On those SKUs, the Uplink has been fused to Configuration 2.

Note: For SKUs that do not have Intel QuickAssist Technology, there is only the NPx16 uplink.

Table 22-7. PCI Express Link Configurations Supported

PCIe NBX16 Link Config	PCI Express Lanes															
	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
1x16	P1															
1x8	P1								NA	NA	NA	NA	NA	NA	NA	NA
1x4	P1				NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA
1x1	P1	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA

Notes:
1. The up link has only one controller, and there is only one Port. Unused lanes are not available.

PCIe* NBX8 Link Config	PCI Express* Lanes							
	0	1	2	3	4	5	6	7
1x8	P1							
1x4	P1				NA	NA	NA	NA
1x1	P1	NA	NA	NA	NA	NA	NA	NA

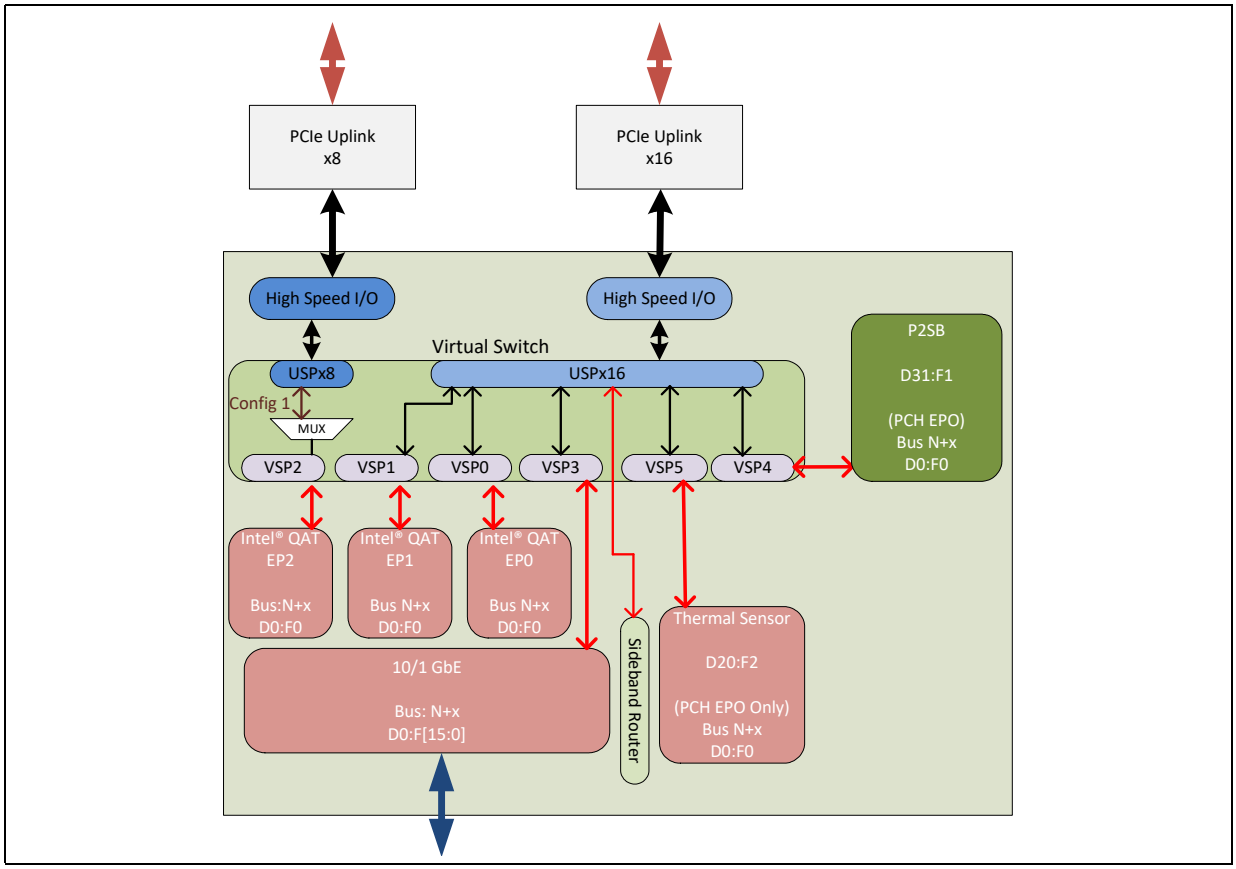
Notes:
1. The up link has only one controller, and there is only one Port. Unused lanes are not available.

22.5.3.1 PCIe Uplink Configuration 1

In PCIe Uplink Configuration 1, the primary PCIe x16 Uplink is used for transactions to the 10 GbE controller, Intel QAT Endpoints [1:0], P2SB, and the PCH thermal sensor (PCH EPO mode only) via the Virtual Switch Ports [5:3,1:0]. The secondary PCIe x8 Uplink is connected and dedicated to Intel QAT Endpoint 2 via Virtual Switch Port 2.

The following is a block diagram of PCIe Uplink configuration #1.

Figure 22-2. PCIe Uplink Configuration 1

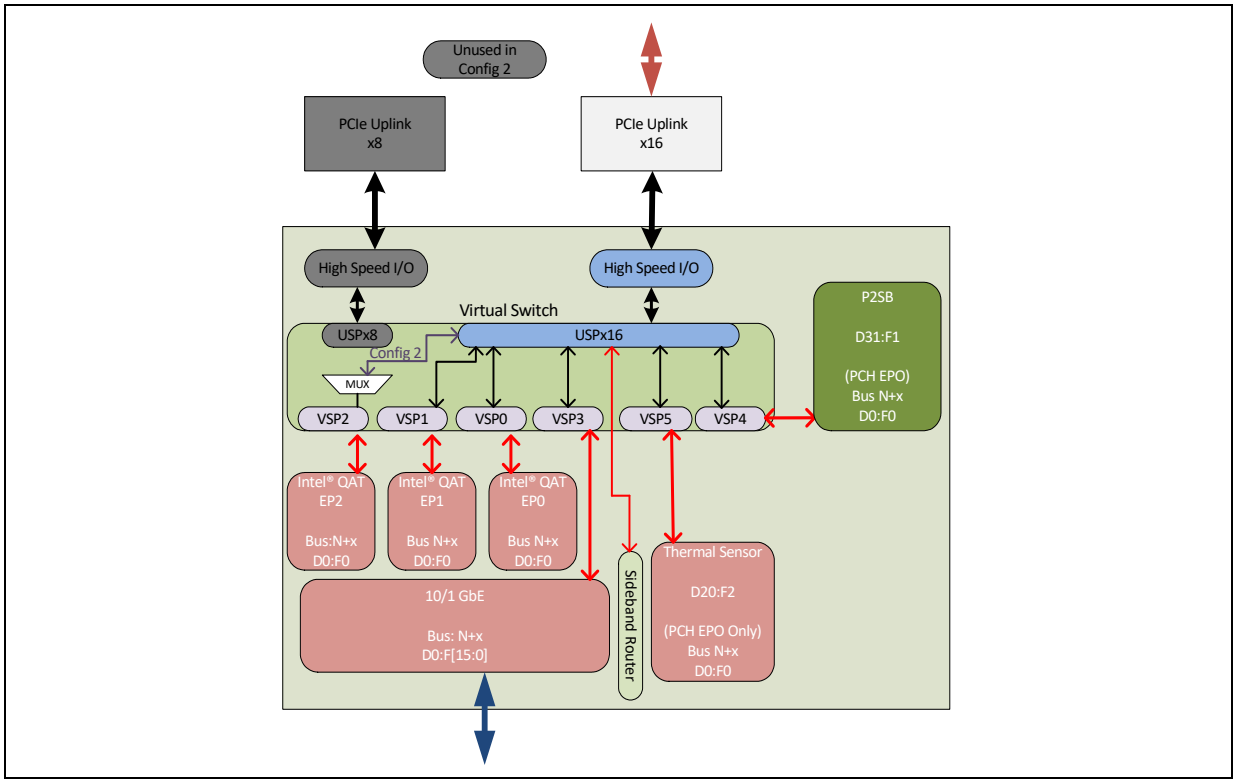


22.5.3.2 PCIe Uplink Configuration 2

In PCIe Uplink Configuration 2, the primary PCIe x16 Uplink is used for transactions to the 10 GbE controller, Intel QAT Endpoints [2:0], P2SB, and the PCH thermal sensor (PCH EPO Only) via the Virtual Switch Ports [5:0]. The secondary PCIe x8 Uplink is unused and is power gated.

The following is a block diagram of PCIe Uplink configuration #2.

Figure 22-3. NP8 PCIe Uplink Configuration 2



22.6 PCIe Virtual Switch Ports

22.6.1 Features

22.6.1.1 Supported Features

- PCI Express 3.0 specification Compliant
- VC0 support only
- 512B maximum payload
- 2048 maximum read request
- Malformed packet checks
- Allows passing of SR-IOV transactions through the PCIe Switch
- ARI support
- Advanced Error Reporting
- Role Based Error Reporting
- L1, L3
- D0, $D3_{HOT,}$ and $D3_{COLD}$
- Support of legacy INTx Interrupt messaging over PCIe
- Support for MSI, MSI-X interrupt messaging over PCIe

22.6.1.2 Features Not Supported

- 1x2 link width
- L0s
- Isochronous services
- P2P support
- Atomic ops
- Lock cycles
- Multicast

22.6.1.3 Virtual Switch Ports Overview

The PCH PCIe Upstream Ports and the Virtual Switch Ports together provide the capabilities of an integrated PCIe Switch. The VSP does not implement the data and link layer functionality relative to a typical PCIe downstream port.

The PCH supports independent VSPs with Type 1 headers for each PCIe endpoint device. Each of the endpoints have a separate VSP that allows the endpoint to show up as a Type 0 device.

The six VSPs are:

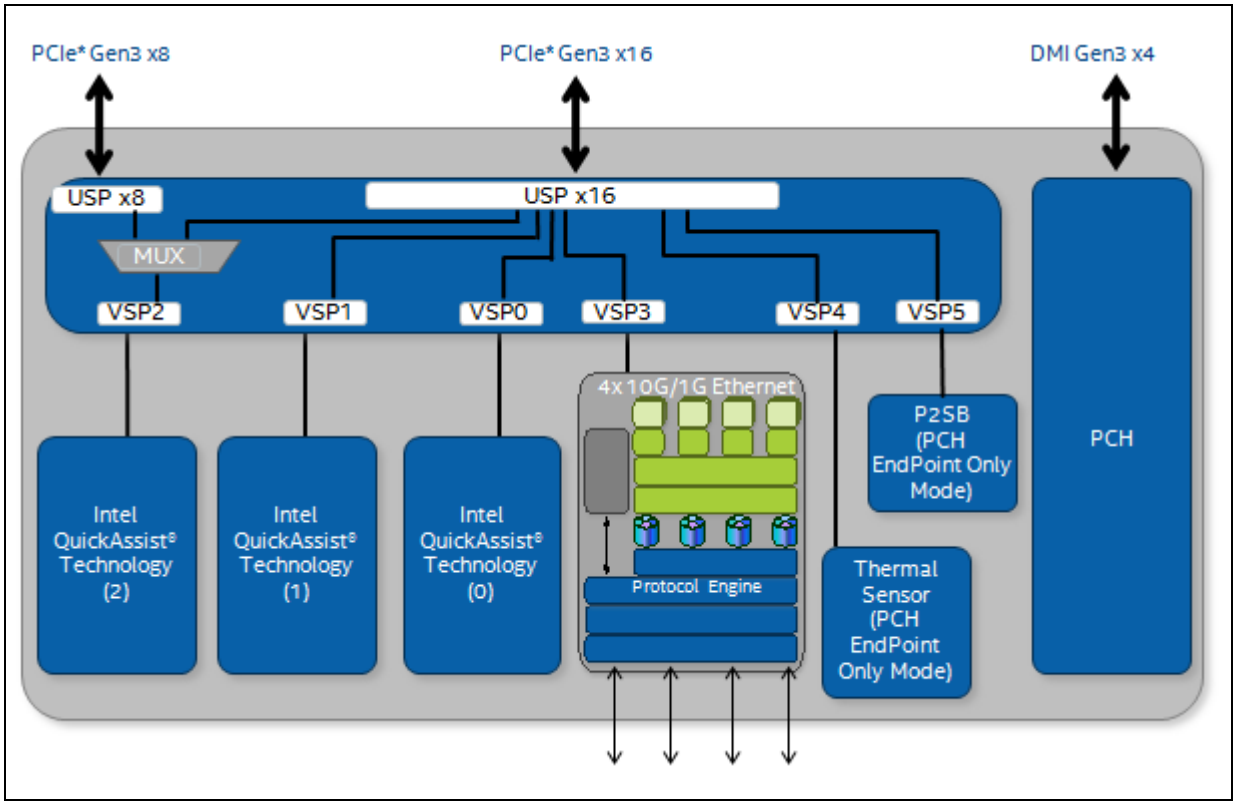
- VSP0 - associated with Intel QuickAssist Endpoint 0
- VSP1- associated with Intel QuickAssist Endpoint 1
- VSP2 - associated with Intel QuickAssist Endpoint 2
- VSP3 - associated with integrated 10/1 GbE
- VSP4 - associated with the PCH Thermal Sensor in Endpoint Only (EPO) mode

- VSP5 - associated with PCH P2SB in Endpoint Only (EPO) mode

Note: VSP[2:0] are only available on PCH SKUs that support Intel QuickAssist Technology.

Note: VSP[5:4] are only available when the PCH is configured for EndPoint Only (EPO) mode.

Figure 22-4. Virtual Switch Ports Block Diagram



22.7 PCI Express Root Port Configuration Registers Register Summary

There are twenty sets of the following configuration registers used for PCH PCI Express Port Configuration. Each PCH PCI Express* Configuration Register set covers a single PCI Express* Port and maps out as the following Device/Function: D28/F0 = Port1, D28/F1 = Port2, D28/F2 = Port3, D28/F3 = Port4 D28/F4 = Port5, D28/F5 = Port6, D28/F6 = Port7, D28/F7 = Port8 D29/F0 = Port9, D29/F1 = Port10, D29/F2 = Port11, D29/F3 = Port12 D29/F4 = Port13, D29/F5 = Port14, D29/F6 = Port15, D29/F7 = Port16 D27/F0 = Port17, D27/F1 = Port18, D27/F2 = Port19, D27/F3 = Port20

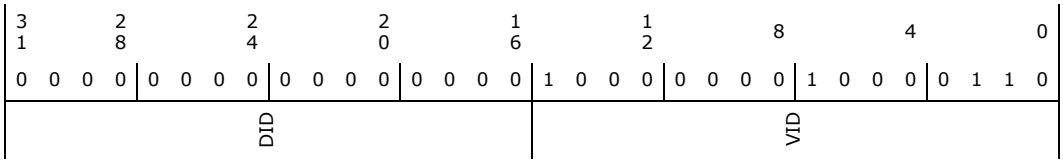
22.7.1 Identifiers (ID)—Offset 0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 8086h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO/V	**Device Identification (DID):** The value of this ID is product specific.
15:0	8086h RO	**Vendor Identification (VID):** Indicates Intel

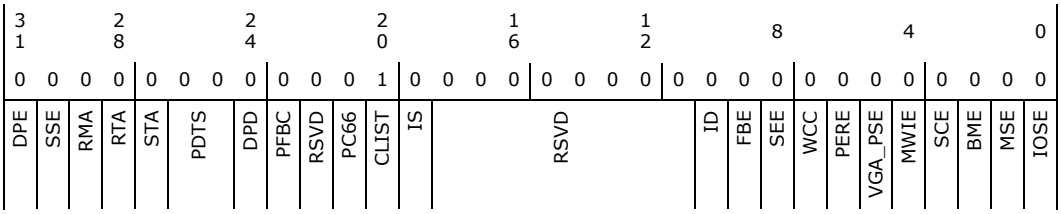
22.7.2 Device Command; Primary Status (CMD_PSTS)—Offset 4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 100000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/1C/V	**DPE - Detected Parity Error (DPE):** Set when the root port receives a command or data from the backbone with a parity error. This is set even if CMD.PERE is not set.
30	0h RW/1C/V	**Signaled System Error (SSE):** Set when the root port signals a system error to the internal SERR# logic.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the root port receives a completion with unsupported request status from the backbone.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the root port receives a completion with completer abort from the backbone.
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set whenever the root port forwards a target abort received from the downstream device onto the backbone.
26:25	0h RO	**Primary DEVSEL# Timing Status (PDTS):** Reserved per *PCI Express Specification*.
24	0h RW/1C/V	**Master Data Parity Error Detected (DPD):** Set when the root port receives a completion with a data parity error on the backbone and CMD.PERE is set.
23	0h RO	**Primary Fast Back to Back Capable (PFBC):** Reserved per *PCI Express Specification*.
22	0h RO	Reserved.
21	0h RO	**Primary 66 MHz Capable (PC66):** Reserved per *PCI Express Specification*.
20	1h RO	**Capabilities List (CLIST):** Indicates the presence of a capabilities list.
19	0h RO/V	**Interrupt Status (IS):** Indicates status of hot plug and power management interrupts on the root port that result in INTx# message generation. This bit is not set if MSI is enabled. If MSI is not enabled, this bit is set regardless of the state of CMD.ID.
18:11	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
10	0h RW/V2	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts on enabled hot plug and power management events. This bit has no effect on MSI operation. When set, internal INTx# messages will not be generated. When cleared, internal INTx# messages are generated if there is an interrupt for hot plug or power management and MSI is not enabled. This bit does not affect interrupt forwarding from devices connected to the root port. Assert_INTx and Deassert_INTx messages will still be forwarded to the internal interrupt controllers if this bit is set. For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register is RO and returns a value of 0 when read, else it is RW with the functionality described above.
9	0h RO	**Fast Back to Back Enable (FBE):** Reserved per *PCI Express Specification*.
8	0h RW	**SERR# Enable (SEE):** When set, enables the root port to generate an SERR# message when PSTS.SSE is set.
7	0h RO	**Wait Cycle Control (WCC):** Reserved per *PCI Express Specification*.
6	0h RW	**Parity Error Response Enable (PERE):** Indicates that the device is capable of reporting parity errors as a master on the backbone.
5	0h RO	**VGA Palette Snoop (VGA_PSE):** Reserved per *PCI Express Specification*.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Reserved per *PCI Express Specification*.
3	0h RO	**Special Cycle Enable (SCE):** Reserved per *PCI Express Specification* and *PCI Bridge Specification*.
2	0h RW	**Bus Master Enable (BME):** When set, allows the root port to forward Memory and I/O Read/Write cycles onto the backbone from a PCI-Express device. When this bit is 0b, Memory and I/O requests received at a Root Port must be handled as Unsupported Requests (UR). This bit does not affect forwarding of Completions in either the Upstream or Downstream direction. The forwarding of Requests other than Memory or I/O requests is not controlled by this bit.
1	0h RW	**Memory Space Enable (MSE):** When set, memory cycles within the range specified by the memory base and limit registers can be forwarded to the PCI-Express device. When cleared, these memory cycles are master aborted on the backbone.
0	0h RW	**I/O Space Enable (IOSE):** When set, I/O cycles within the range specified by the I/O base and limit registers can be forwarded to the PCI-Express device. When cleared, these cycles are master aborted on the backbone.

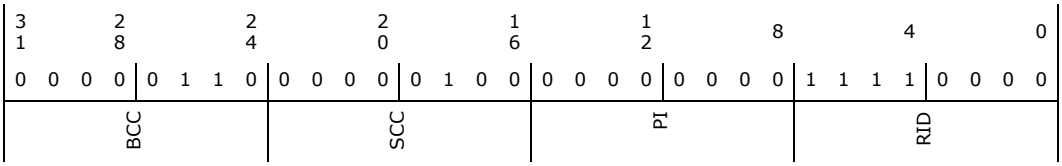
22.7.3 Revision ID;Class Code (RID_CC)—Offset 8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 60400F0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	6h RO	**Base Class Code (BCC):** Indicates the device is a bridge device.
23:16	4h RO/V	**Sub-Class Code (SCC):** The default indicates the device is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:8	0h RO/V	**Programming Interface (PI):** The value reported in this register is a function of the Decode Control.Subtractive Decode Enable (SDE) register. SDE Value reported in this register 0: 00h 1: 01h
7:0	F0h RO/V	**Revision ID (RID):** Indicates the revision of the bridge.

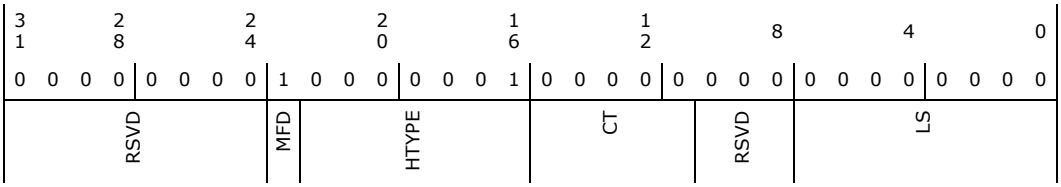
22.7.4 Cache Line Size; Primary Latency Timer; Header Type (CLS_PLT_HTYPE)—Offset Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 810000h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23	1h RO	**Multi-function Device (MFD):** This bit is '1' to indicate a multi-function device.
22:16	1h RO/V	**Header Type (HTYPE):** The default mode identifies the header layout of the configuration space, which is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:11	0h RO	**Latency Count (CT):** Reserved per *PCI Express Specification*.
10:8	0h RO	Reserved.
7:0	0h RW	**Line Size (LS):** This is read/write but contains no functionality, per *PCI Express Specification*.

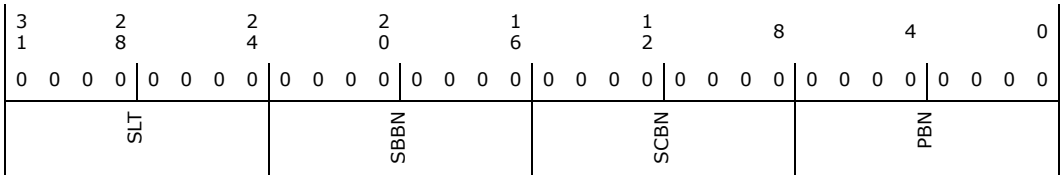
22.7.5 Bus Numbers; Secondary Latency Timer (BNUM_SLT)—Offset 18h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RW/V2	**Secondary Latency Timer (SLT):** For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is a RW register; else this register is RO and returns 0. This register does not affect the behavior of any HW logic.
23:16	0h RW	**Subordinate Bus Number (SBBN):** Indicates the highest PCI bus number below the bridge.
15:8	0h RW	**Secondary Bus Number (SCBN):** Indicates the bus number the port.
7:0	0h RW	**Primary Bus Number (PBN):** Indicates the bus number of the backbone.

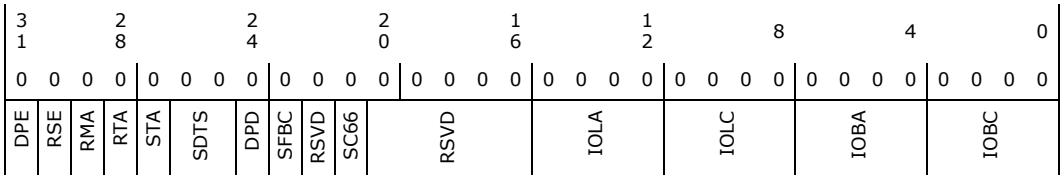
22.7.6 I/O Base and Limit; Secondary Status (IOBL_SSTS)—Offset 1Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/1C/V	**Detected Parity Error (DPE):** Set when the port receives a poisoned TLP.
30	0h RW/1C/V	**Received System Error (RSE):** Set when the port receives an ERR_FATAL or ERR_NONFATAL message from the device.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the port receives a completion with 'Unsupported Request' status from the device.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the port receives a completion with 'Completion Abort' status from the device.
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set when the port generates a completion with 'Completion Abort' status to the device.
26:25	0h RO/V	**Secondary DEVSEL# Timing Status (SDTS):** Reserved per *PCI Express Specification*. For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register returns a value of 01b when read, else this register returns a value of 00b.
24	0h RW/1C/V	**Data Parity Error Detected (DPD):** Set when the BCTRL.PERE, and either of the following two conditions occurs: Port receives completion marked poisoned. Port poisons a write request to the secondary side.
23	0h RO/V	**Secondary Fast Back to Back Capable (SFBC):** Reserved per *PCI Express Specification*. For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register returns a value of 1b when read, else this register returns a value of 0b.
22	0h RO	Reserved.
21	0h RO	**Secondary 66 MHz Capable (SC66):** Reserved per *PCI Express Specification*.
20:16	0h RO	Reserved.
15:12	0h RW	**I/O Address Limit (IOLA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to FFFh.
11:8	0h RO	**I/O Limit Address Capability (IOLC):** Indicates that the bridge does not support 32-bit I/O addressing.
7:4	0h RW	**I/O Base Address (IOBA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to 000h.
3:0	0h RO	**I/O Base Address Capability (IOBC):** Indicates that the bridge does not support 32-bit I/O addressing.

22.7.7 Memory Base and Limit (MBL)—Offset 20h

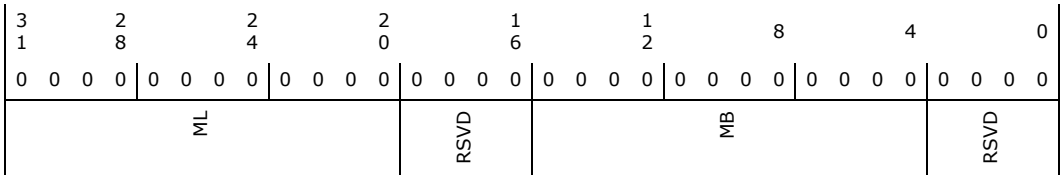
Accesses that are within the ranges specified in this register will be sent to the attached device if CMD.MSE is set. Accesses from the attached device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is MB [gt]= AD[lb]31:20[rb] [lt]= ML.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:20	0h RW	**Memory Limit (ML):** These bits are compared with bits [31:20] of the incoming address to determine the upper 1MB aligned value of the range.
19:16	0h RO	Reserved.
15:4	0h RW	**Memory Base (MB):** These bits are compared with bits [31:20] of the incoming address to determine the lower 1MB aligned value of the range.
3:0	0h RO	Reserved.

22.7.8 Prefetchable Memory Base and Limit (PMBL)—Offset 24h

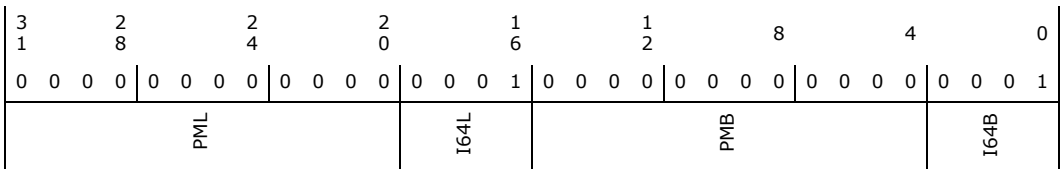
Accesses that are within the ranges specified in this register will be sent to the device if CMD.MSE is set. Accesses from the device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is PMBU32:PMB [gt]= AD[lb]63:32[rb]:AD[lb]31:20[rb] [lt]= PMLU32:PML.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 10001h



Bit Range	Default and Access	Field Name (ID): Description
31:20	0h RW	**Prefetchable Memory Limit (PML):** These bits are compared with bits [31:20] of the incoming address to determine the upper 1MB aligned value of the range.
19:16	1h RO	**64-bit Indicator (I64L):** Indicates support for 64-bit addressing.
15:4	0h RW	**Prefetchable Memory Base (PMB):** These bits are compared with bits [31:20] of the incoming address to determine the lower 1MB aligned value of the range.
3:0	1h RO	**64-bit Indicator (I64B):** Indicates support for 64-bit addressing.

22.7.9 Prefetchable Memory Base Upper 32 Bits (PMBU32)—Offset 28h

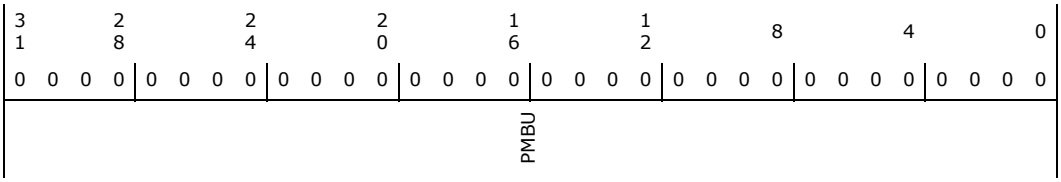
Size:32 bits

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Prefetchable Memory Base Upper Portion (PMBU):** Upper 32-bits of the prefetchable address base.

22.7.10 Prefetchable Memory Limit Upper 32 Bits (PMLU32)—Offset 2Ch

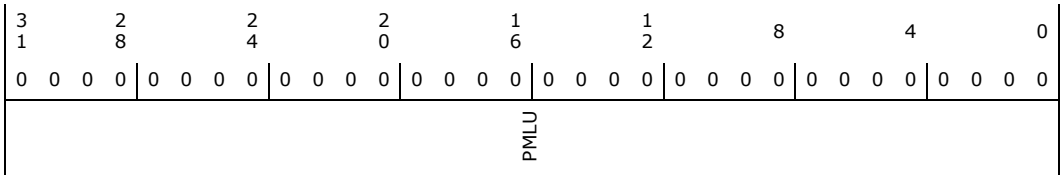
Size:32 bits

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Prefetchable Memory Limit Upper Portion (PMLU):** Upper 32-bits of the prefetchable address limit.

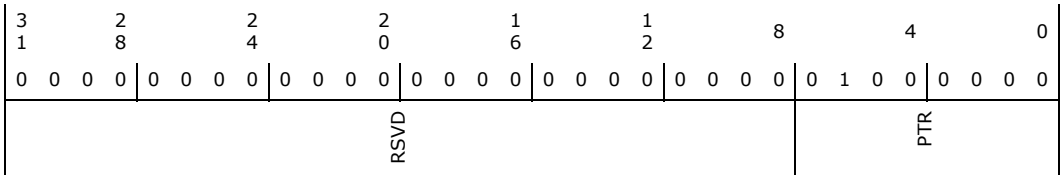
22.7.11 Capabilities List Pointer (CAPP)—Offset 34h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 40h



Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	40h RW/O	**Capabilities Pointer (PTR):** Indicates that the pointer for the first entry in the capabilities list. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value. Capability Linked List (Default Settings) OffsetCapability Next Pointer 40h PCI Express 80h 80h Message Signaled Interrupt (MSI) 90h 90h Subsystem Vendor A0h A0h PCI Power Management 00h Extended PCIe Capability Linked List OffsetCapability Next Pointer 100h Advanced Error Reporting 000h

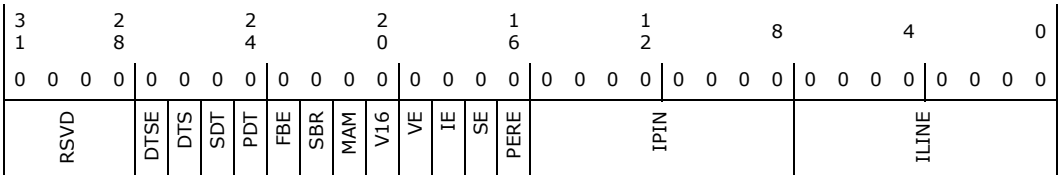
22.7.12 Interrupt Information; Bridge Control (INTR_BCTRL)—Offset 3Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27	0h RW/V2	**Discard Timer SERR# Enable (DTSE):** Reserved per *PCI Express Specification*. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
26	0h RO	**Discard Timer Status (DTS):** Reserved per *PCI Express Specification*. For PCI Bus Emulation Mode compatibility, this register can remain RO as no secondary discard timer exists that will ever cause it to be set.
25	0h RW/V2	**Secondary Discard Timer (SDT):** Reserved per *PCI Express Specification*. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
24	0h RW/V2	**Primary Discard Timer (PDT):** Reserved per *PCI Express Specification*. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
23	0h RO	**Fast Back to Back Enable (FBE):** Reserved per *PCI Express Specification*.

Bit Range	Default and Access	Field Name (ID): Description
22	0h RW	**Secondary Bus Reset (SBR):** Triggers a hot reset on the PCI-Express port.
21	0h RW/V2	**Master Abort Mode (MAM):** Reserved per *PCI Express Specification*.For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
20	0h RW	**VGA 16-Bit Decode (V16):** When set, indicates that the I/O aliases of the VGA range (see BCTRL:VE definition below), are not enabled. 0: Execute 10-bit address decode on VGA I/O accesses. 1: Execute 16-bit address decode on VGA I/O accesses.
19	0h RW	**VGA Enable (VE):** When set, the following ranges will be claimed off the backbone by the root port: Memory ranges A0000h-BFFFFh I/O ranges 3B0h 3BBh and 3C0h 3DFh, and all aliases of bits 15:10 in any combination of 1's
18	0h RW	**ISA Enable (IE):** This bit only applies to I/O addresses that are enabled by the I/O Base and I/O Limit registers and are in the first 64KB of PCI I/O space. If this bit is set, the root port will block any forwarding from the backbone to the device of I/O transactions addressing the last 768 bytes in each 1KB block (offsets 100h to 3FFh).
17	0h RW	**SERR# Enable (SE):** When set, ERR_COR, ERR_NONFATAL, and ERR_FATAL messages received are forwarded to the backbone. When cleared, they are not.
16	0h RW	**Parity Error Response Enable (PERE):** When set, poisoned write TLPs and completions indicating poisoned TLPs will set the SSTS.DPD.
15:8	0h RO/V	**Interrupt Pin (IPIN):** Indicates the interrupt pin driven by the root port. At reset, this register takes on the following values, which reflect the reset state of the STRPFUSECFG register in chipset config space: Port Bits[lb]15:12[rb] Bits[lb]11:08[rb] 1 0h STRPFUSECFG.P1IP 2 0h STRPFUSECFG.P2IP 3 0h STRPFUSECFG.P3IP 4 0h STRPFUSECFG.P4IP 5 0h STRPFUSECFG.P5IP 6 0h STRPFUSECFG.P6IP 7 0h STRPFUSECFG.P7IP 8 0h STRPFUSECFG.P8IP The value that is programmed into STRPFUSECFG.PxIP is always reflected in this register. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register returns a value of 00h when read, else this register returns the value from the table above.
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register.

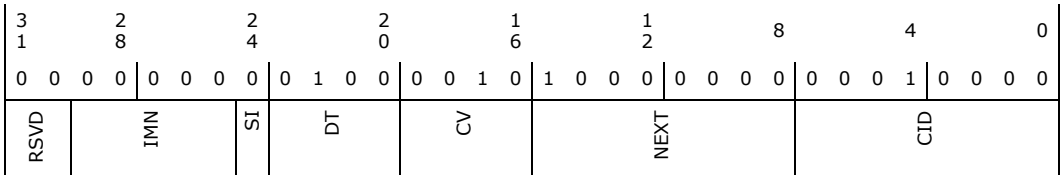
22.7.13 Capabilities List; PCI Express Capabilities (CLIST_XCAP)—Offset 40h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 428010h



Bit Range	Default and Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:25	0h RO	**Interrupt Message Number (IMN):** The root port does not have multiple MSI interrupt numbers.
24	0h RW/O	**Slot Implemented (SI):** Indicates whether the root port is connected to a slot. Slot support is platform specific. BIOS programs this field, and it is maintained until a platform reset.
23:20	4h RO	**Device / Port Type (DT):** Indicates this is a PCI-Express root port
19:16	2h RO	**Capability Version (CV):** Version 2.0 indicates devices compliant to the PCI Express 2.0 specification which incorporates the Register Expansion ECN.
15:8	80h RW/O	**Next Capability (NEXT):** Indicates the location of the next capability. The default value of this register is 80h which points to the MSI Capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	10h RO	**Capability ID (CID):** Indicates this is a PCI Express capability

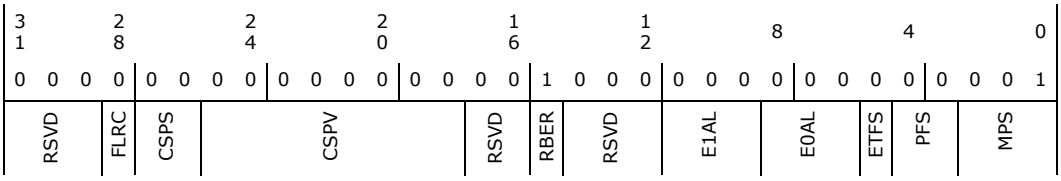
22.7.14 Device Capabilities (DCAP)—Offset 44h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 8001h



Bit Range	Default and Access	Field Name (ID): Description
31:29	0h RO	Reserved.
28	0h RO	**Function Level Reset Capable (FLRC):** Not supported in Root Ports
27:26	0h RO	**Captured Slot Power Limit Scale (CSPS):** Not supported
25:18	0h RO	**Captured Slot Power Limit Value (CSPV):** Not supported
17:16	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
15	1h RO	**Role Based Error Reporting (RBER):** When Set, this bit indicates that the Function implements the functionality originally defined in the Error Reporting ECN for *PCI Express Base Specification*, Revision 1.0a, and later incorporated into PCI Express Base Specification, Revision 1.1. This bit must be Set by all Functions conforming to the ECN, *PCI Express Base Specification*, Revision 1.1, or subsequent PCI Express Base Specification revisions.
14:12	0h RO	Reserved.
11:9	0h RO	**Endpoint L1 Acceptable Latency (E1AL):** Reserved for root ports.
8:6	0h RO	**Endpoint L0 Acceptable Latency (E0AL):** Reserved for Root port.
5	0h RO	**Extended Tag Field Supported (ETFS):** The root port never needs to initiate a transaction as a Requester with the Extended Tag bits being set. This bit does not affect the root port's ability to forward requests as a bridge as the root port always supports forwarding requests with extended tags.
4:3	0h RO	**Phantom Functions Supported (PFS):** No phantom functions supported
2:0	1h RW/O	**Max Payload Size Supported (MPS):** BIOS should write to this field during system initialization. Only Max Payload Size of up to 256B is supported. Programming this field to any values other than 128B max payload size will result in aliasing to 128B max payload size. 000b: 128 bytes max payload size. 001b: 256 bytes max payload size. 010b: 512 bytes max payload size. 011b: 1024 bytes max payload size. 100b: 2048 bytes max payload size. 101b: 4096 bytes max payload size. 110b: Reserved. 111b: Reserved. This field applies only to the PCIe link interface.

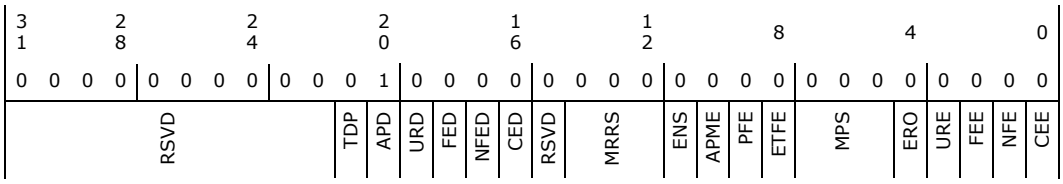
22.7.15 Device Control; Device Status (DCTL_DSTS)—Offset 48h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 100000h



Bit Range	Default and Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21	0h RO	**Transactions Pending (TDP):** This bit has no meaning for the root port since it never initiates a non-posted request with its own Requester ID.
20	1h RO	**AUX Power Detected (APD):** The root port contains AUX power for wakeup

Bit Range	Default and Access	Field Name (ID): Description
19	0h RW/1C/V	**Unsupported Request Detected (URD):** Indicates an unsupported request was detected.
18	0h RW/1C/V	**Fatal Error Detected (FED):** Indicates a fatal error was detected. Set when a fatal error occurred on from a data link protocol error, buffer overflow, or malformed tlp
17	0h RW/1C/V	**Non-Fatal Error Detected (NFED):** Indicates a non-fatal error was detected. Set when an received a non-fatal error occurred from a poisoned tlp, unexpected completions, unsupported requests, completer abort, or completer timeout
16	0h RW/1C/V	**Correctable Error Detected (CED):** Indicates a correctable error was detected. Set when received an internal correctable error from receiver errors / framing errors, tlp crc error, dllp crc error, replay num rollover, replay timeout.
15	0h RO	Reserved.
14:12	0h RO	**Max Read Request Size (MRRS):** Hardwired to 0. This field applies only to the PCIe link interface.
11	0h RO	**Enable No Snoop (ENS):** Not supported. The root port will never issue non-snoop requests.
10	0h RW/P	**Aux Power PM Enable (APME):** The OS will set this bit to '1' if the device connected has detected aux power.
9	0h RO	**Phantom Functions Enable (PFE):** Not supported
8	0h RO	**Extended Tag Field Enable (ETFE):** Not supported
7:5	0h RW	**Max Payload Size (MPS):** The root port only supports up to 256B max payload. Programming this field to any values other than 128B or 256B max payload size will result in aliasing to 128B max payload size. If the DCAP.MPS indicates 128B max payload size support, programming this field to any values other than 128B will result in aliasing to 128B max payload size. Programming this field to any values greater than DCAP.MPS will result in aliasing to 128B max payload size. 000b: 128 bytes max payload size. 001b: 256 bytes max payload size. 010b: 512 bytes max payload size. 011b: 1024 bytes max payload size. 100b: 2048 bytes max payload size. 101b: 4096 bytes max payload size. 110b: Reserved. 111b: Reserved. This field applies only to the PCIe link interface. ***Note:*** Software should ensure that the system is quiescent and no TLP is in progress prior to changing this field. BIOS should program this field prior to enabling BME.
4	0h RO	**Enable Relaxed Ordering (ERO):** Not supported
3	0h RW	**Unsupported Request Reporting Enable (URE):** When set, allows signaling ERR_NONFATAL, ERR_FATAL, or ERR_COR to the Root Control register when detecting an unmasked Unsupported Request (UR). An ERR_COR is signaled when a unmasked Advisory Non-Fatal UR is received. An ERR_FATAL, ERR_or NONFATAL, is sent to the Root Control Register when an uncorrectable non-Advisory UR is received with the severity set by the Uncorrectable Error Severity register.
2	0h RW	**Fatal Error Reporting Enable (FEE):** enables signaling of ERR_FATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
1	0h RW	**Non-Fatal Error Reporting Enable (NFE):** When set, enables signaling of ERR_NONFATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
0	0h RW	**Correctable Error Reporting Enable (CEE):** When set, enables signaling of ERR_CORR to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.

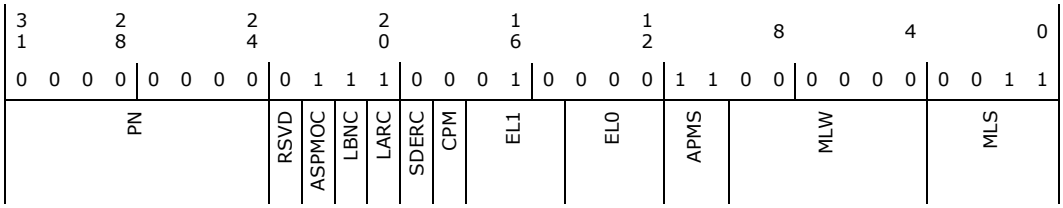
22.7.16 Link Capabilities (LCAP)—Offset 4Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 710C00h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO/V	**Port Number (PN):** Indicates the port number for the root port. This value is different for each implemented port: Port # Value of PN field 1 01h 2 02h 3 03h 4 04h
23	0h RO	Reserved.
22	1h RW/O	**ASPM Optionality Compliance (ASPMOC):** ASPM Optionality Compliance(ASPMOC): This bit must be set to 1b for PCIe 3.0 compliant port. Components implemented against certain earlier versions of this specification will have this bit set to 0b. Software is permitted to use the value of this bit to help determine whether to enable ASPM or whether to run ASPM compliance tests.
21	1h RO	**Link Bandwidth Notification Capability (LBNC):** This port supports Link Bandwidth Notification status and interrupt mechanisms.
20	1h RO	**Link Active Reporting Capable (LARC):** This port supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine.
19	0h RO	**Surprise Down Error Reporting Capable (SDERC):** Set to '0' to indicate the root port does not support Surprise Down Error Reporting
18	0h RO	**Clock Power Management (CPM):** '0' Indicates that root ports do not support the CLKREQ# mechanism.
17:15	2h RW/O	**L1 Exit Latency (EL1):** Indicates an exit latency of 2us to 4us. 000b Less than 1 us 001b 1 us to less than 2 us 010b 2 us to less than 4 us 011b 4 us to less than 8 us 100b 8 us to less than 16 us 101b 16 us to less than 32 us 110b 32 us to 64 us 111b More than 64 us ***Note:*** If PXP PLL shutdown is enabled, BIOS should program this latency to comprehend PLL lock latency.
14:12	0h RO/V	**L0s Exit Latency (EL0):** Indicates an exit latency based upon common-clock configuration: LCTL.CCC Value 0 MPC.UCEL 1 MPC.CCEL

Bit Range	Default and Access	Field Name (ID): Description
11:10	3h RW/O	**Active State Link PM Support (APMS):** Indicates the level of active state power management on this link Bits Definition 00 No ASPM Supported 01 L0s Supported 10 L1 Supported 11 L0s and L1 supported ***Note:*** If STRPFUSECFG.ASPMDIS is 1, the default of this field is '01'. Otherwise, the default of this field is '11'. If STRPFUSECFG.ASPMDIS is 1, BIOS writing '11' to this field will have the same effect as writing '01'. '01' will be reflected on this register when read and the register will turn to Read-Only once written once.
9:4	0h RO/V	**Maximum Link Width (MLW):** For the root ports, several values can be taken, based upon the value of the chipset configuration register field RPC.PC1 for ports 1-4: Port # Value of PN field RPC.PC1 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h
3:0	3h RO/V	**Max Link Speeds (MLS):** Indicates the supported link speeds of the Uplink Port. This field indicates the supported link speed(s) of the associated port. 0001b: 2.5 Gb/s link speed is supported 0010b: 5.0 Gb/s and 2.5 Gb/s link speed supported 0011b: 8.0 Gb/s and 5.0 and 2.5 Gb/s link speed supported Others: Reserved. ***Note:*** The encoding is the binary value of the bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the maximum Link speed.

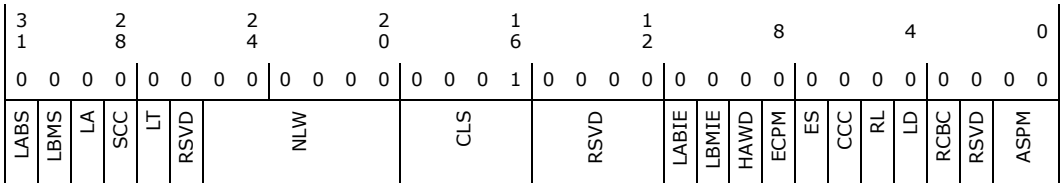
22.7.17 Link Control; Link Status (LCTL_LSTS)—Offset 50h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 10000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/1C/V	**Link Autonomous Bandwidth Status (LABS):** This bit is Set by hardware to indicate that hardware has autonomously changed Link speed or width, without the Port transitioning through DL_Down status, for reasons other than to attempt to correct unreliable Link operation. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was indicated as an autonomous change. The default value of this bit is 0b.
30	0h RW/1C/V	**Link Bandwidth Management Status (LBMS):** This bit is Set by hardware to indicate that either of the following has occurred without the Port transitioning through DL_Down status: - A Link retraining has completed following a write of 1b to the Retrain Link bit. ***Notes:*** This bit is Set following any write of 1b to the Retrain Link bit, including when the Link is in the process of retraining for some other reason. - Hardware has changed Link speed or width to attempt to correct unreliable Link operation, either through an LTSSM timeout or a higher level process This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was not indicated as an autonomous change. The default value of this bit is 0b.
29	0h RO/V	**Link Active (LA):** Set to 1b when the Data Link Control and Management State Machine is in the DL_Active state, 0b otherwise.
28	0h RO/V	**Slot Clock Configuration (SCC):** In normal mode, root port uses the same reference clock as on the platform and does not generate its own clock. ***Note:*** 1The default of this register bit is dependent on the 'PCIe Non-Common Clock With SSC Mode Enable Strap'. If the strap enables non-common clock with SSC support, this bit shall default to '0'. Otherwise, this bit shall default to '1'.
27	0h RO/V	**Link Training (LT):** The root port sets this bit whenever link training is occurring, or that 1b was written to the Retrain Link bit but Link training has not yet begun. It clears the bit upon completion of link training.
26	0h RO	Reserved.
25:20	0h RO/V	**Negotiated Link Width (NLW):** For the root ports, this register could take on several values: Port # Value of PN field RPC.PC1 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h The value of this register is undefined if the link has not successfully trained.

Bit Range	Default and Access	Field Name (ID): Description
19:16	1h RO/V	**Current Link Speed (CLS):** 0001b Link is 2.5Gb/s Link 0010b 5.0 GT/s Link This field indicates the negotiated Link speed of the given link. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. The value of this field is undefined if the link is not up.
15:12	0h RO	Reserved.
11	0h RW	**Link Autonomous Bandwidth Interrupt Enable (LABIE):** Link Autonomous Bandwidth Interrupt Enable - When Set, this bit enables the generation of an interrupt to indicate that the Link Autonomous Bandwidth Status bit has been Set.
10	0h RW	**Link Bandwidth Management Interrupt Enable (LBMIE):** When Set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been Set. This bit is not applicable and is reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. Functions that do not implement the Link Bandwidth Notification Capability must hardwire this bit to 0b. Default value of this bit is 0b.
9	0h RW	**Hardware Autonomous Width Disable (HAWD):** When Set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width. Default value of this bit is 0b. ***Note:*** When operating as PCI Express, this bit defines the value of the Link Upconfigure Capability in TS2 Ordered Sets.
8	0h RO	**Enable Clock Power Management (ECPM):** Reserved. Not supported on Root Ports.
7	0h RW	**Extended Synch (ES):** When set, forces extended transmission of FTS ordered sets in FTS and extra TS2 at exit from L1 prior to entering L0. ***Note:*** This functionality is not applicable for Mobile Express.
6	0h RW	**Common Clock Configuration (CCC):** When set, indicates that the root port and device are operating with a distributed common reference clock.
5	0h WO	**Retrain Link (RL):** When set, the root port will train its downstream link. This bit always returns '0' when read. Software uses LSTS.LT to check the status of training. It is permitted to write 1b to this bit while simultaneously writing modified values to other fields in this register. If the LTSSM is not already in Recovery or Configuration, the resulting Link training must use the modified values. If the LTSSM is already in Recovery or Configuration, the modified values are not required to affect the Link training that's already in progress.
4	0h RW	**Link Disable (LD):** When set, the root port will disable the link by directing the LTSSM to the Disabled state.
3	0h RW/O	**Read Completion Boundary Control (RCBC):** Indicates the read completion boundary is 64 bytes.
2	0h RO	Reserved.
1:0	0h RW	**Active State Link PM Control (ASPM):** Indicates whether the root port should enter L0s or L1 or both. Bits Definition 00 Disabled 01 L0s Entry Enabled 10 L1 Entry Enabled 11 L0s and L1 Entry Enabled The value of this register is used unless the Root Port ASPM Control Override Enable register is set, in which case the Root Port ASPM Control Override value is used. ***Note:*** If STRPFUSECFG.ASPMDIS is '1', hardware will always see '00' as an output from this register. BIOS reading this register should always return the correct value.

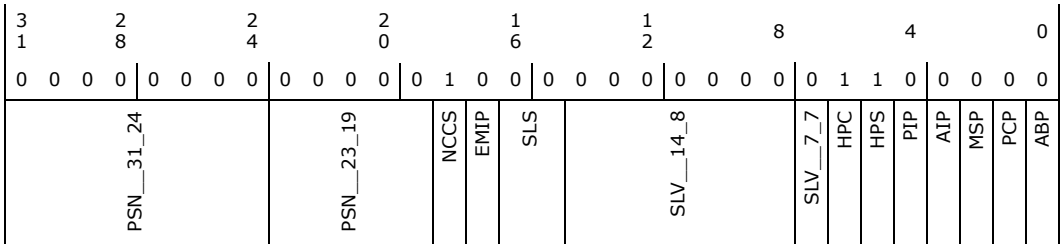
22.7.18 Slot Capabilities (SLCAP)—Offset 54h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 40060h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RW/O	**Physical Slot Number (PSN__31_24):** This is a value that is unique to the slot number. BIOS sets this field and it remains set until a platform reset.
23:19	0h RW/O	**Physical Slot Number (PSN__23_19):** This is a value that is unique to the slot number. BIOS sets this field and it remains set until a platform reset.
18	1h RO	**No Command Completed Support (NCCS):** Set to '1' as this port does not implement a Hot Plug controller and can handle back-2-back writes to all fields of the slot control register without delay between successive writes.
17	0h RO	**Electromechanical Interlock Present (EMIP):** Set to 0 to indicate that no electro-mechanical interlock is implemented.
16:15	0h RW/O	**Slot Power Limit Scale (SLS):** specifies the scale used for the slot power limit value. BIOS sets this field and it remains set until a platform reset.
14:8	0h RW/O	**Slot Power Limit Value (SLV__14_8):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
7	0h RW/O	**Slot Power Limit Value (SLV__7_7):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
6	1h RW/O	**Hot Plug Capable (HPC):** When set, Indicates that hot plug is supported.
5	1h RW/O	**Hot Plug Surprise (HPS):** When set, indicates the device may be removed from the slot without prior notification.
4	0h RO	**Power Indicator Present (PIP):** Indicates that a power indicator LED is not present for this slot.
3	0h RO	**Attention Indicator Present (AIP):** Indicates that an attention indicator LED is not present for this slot.
2	0h RO	**MRL Sensor Present (MSP):** Indicates that an MRL sensor is not present
1	0h RO	**Power Controller Present (PCP):** Indicates that a power controller is not implemented for this slot
0	0h RO	**Attention Button Present (ABP):** Indicates that an attention button is not implemented for this slot.

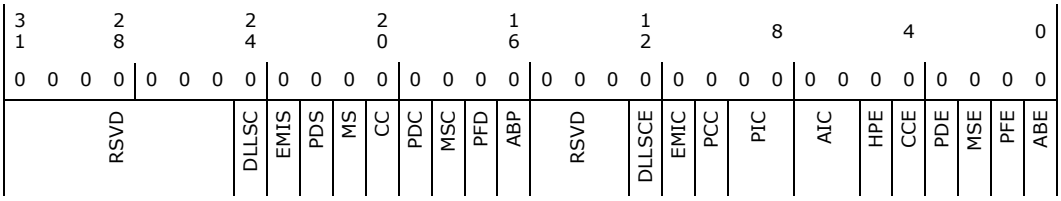
22.7.19 Slot Control; Slot Status (SLCTL_SLSTS)—Offset 58h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:25	0h RO	Reserved.
24	0h RW/1C/V	**Data Link Layer State Changed (DLLSC):** This bit is set when the value reported in Data Link Layer Link Active field of the Link Status register is changed. In response to a Data Link Layer State Changed event, software must read Data Link Layer Link Active field of the Link Status register to determine if the link is active before initiating configuration cycles to the hot plugged device.
23	0h RO	**Electromechanical Interlock Status (EMIS):** Reserved as this port does not support and electromechanical interlock.
22	0h RO/V	**Presence Detect State (PDS):** If XCAP.SI is set (indicating that this root port spawns a slot), then this bit indicates whether a device is connected ('1') or empty ('0'). If XCAP.SI is cleared, this bit is a '1'.
21	0h RO	**MRL Sensor State (MS):** Reserved as the MRL sensor is not implemented.
20	0h RO	**Command Completed (CC):** This register is RO as this port does not implement a Hot Plug Controller.
19	0h RW/1C/V	**Presence Detect Changed (PDC):** This bit is set by the root port when the SLSTS.PDS bit changes state.
18	0h RO	**MRL Sensor Changed (MSC):** Reserved as the MRL sensor is not implemented.
17	0h RO	**Power Fault Detected (PFD):** Reserved as a power controller is not implemented.
16	0h RO	**Attention Button Pressed (ABP):** This register is RO as this port does not implement an attention button
15:13	0h RO	Reserved.
12	0h RW	**Data Link Layer State Changed Enable (DLLSCE):** When set, this field enables generation of a hot plug interrupt when the Data Link Layer Link Active field is changed
11	0h RO	**Electromechanical Interlock Control (EMIC):** Reserved as this port does not support an Electromechanical Interlock.
10	0h RO	**Power Controller Control (PCC):** This bit has no meaning for module based hot plug.
9:8	0h RO	**Power Indicator Control (PIC):** This register is RO as this port does not implement a Hot Plug Controller.

Bit Range	Default and Access	Field Name (ID): Description
7:6	0h RO	**Attention Indicator Control (AIC):** This register is RO as this port does not implement a Hot Plug Controller.
5	0h RW	**Hot Plug Interrupt Enable (HPE):** When set, enables generation of a hot plug interrupt on enabled hot plug events.
4	0h RO	**Command Completed Interrupt Enable (CCE):** This register is RO as this port does not implement a Hot Plug Controller.
3	0h RW	**Presence Detect Changed Enable (PDE):** When set, enables the generation of a hot plug interrupt or wake message when the presence detect logic changes state.
2	0h RO	**MRL Sensor Changed Enable (MSE):** This register is RO as this port does not implement a Hot Plug Controller.
1	0h RO	**Power Fault Detected Enable (PFE):** This register is RO as this port does not implement a Hot Plug Controller...
0	0h RO	**Attention Button Pressed Enable (ABE):** This register is RO as this port does not implement a Hot Plug Controller.

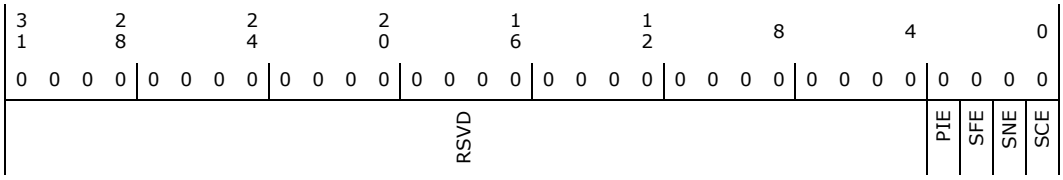
22.7.20 Root Control (RCTL)—Offset 5Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3	0h RW	**PME Interrupt Enable (PIE):** When set, enables interrupt generation when RSTS.PS is in a set state (either due to a '0' to '1' transition, or due to this bit being set with RSTS.PS already set).
2	0h RW	**System Error on Fatal Error Enable (SFE):** When set, an SERR# will be generated if a fatal error is reported by any of the devices in the hierarchy of this root port, including fatal errors in this root port. This register is not dependent on CMD.SEE being set.
1	0h RW	**System Error on Non-Fatal Error Enable (SNE):** When set, an SERR# will be generated if a non-fatal error is reported by any of the devices in the hierarchy of this root port, including non-fatal errors in this root port. This register is not dependent on CMD.SEE being set.
0	0h RW	**System Error on Correctable Error Enable (SCE):** When set, an SERR# will be generated if a correctable error is reported by any of the devices in the hierarchy of this root port, including correctable errors in this root port. This register is not dependent on CMD.SEE being set.

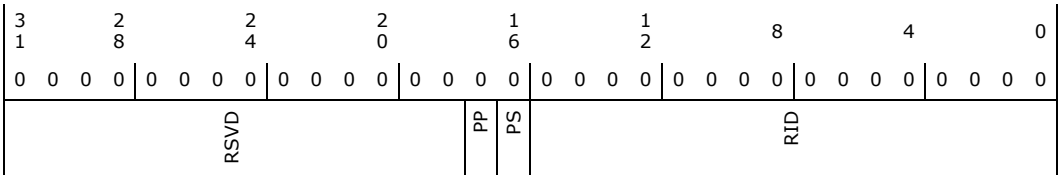
22.7.21 Root Status (RSTS)—Offset 60h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RO/V	**PME Pending (PP):** Indicates another PME is pending when the PME status bit is set. When the original PME is cleared by software, it will be set again, the requestor ID will be updated, and this bit will be cleared. Root ports have a one deep PME pending queue.
16	0h RW/1C/V	**PME Status (PS):** Indicates that PME was asserted by the requestor ID in RID. Subsequent PMEs are kept pending until this bit is cleared.
15:0	0h RO/V	**PME Requestor ID (RID):** Indicates the PCI requestor ID of the last PME requestor. Valid only when PS is set. Root ports are capable of storing the requester ID for two PM_PME messages, with one active (this register) and a one deep pending queue. Subsequent PM_PME messages will be dropped.

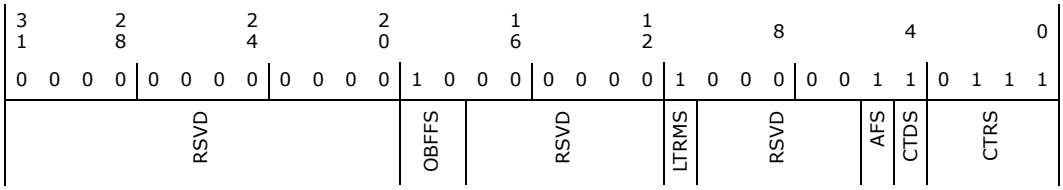
22.7.22 Device Capabilities 2 (DCAP2)—Offset 64h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 80837h



Bit Range	Default and Access	Field Name (ID): Description
31:20	0h RO	Reserved.
19:18	2h RW/O	**Optimized Buffer Flush/Fill Supported (OBFFS):** 00b - OBFF is not supported. 01b - OBFF is supported using Message signaling only. 10b - OBFF is supported using WAKE# signaling only. 11b - OBFF is supported using WAKE# and Message signaling. BIOS should program this field to 00b or 10b during system initialization to advertise the level of hardware OBFF support to software. BIOS should never program this field to 01b or 11b since OBFF messaging is not supported.
17:12	0h RO	Reserved.
11	1h RW/O	**LTR Mechanism Supported (LTRMS):** A value of 1b indicates support for the optional Latency Tolerance Reporting (LTR) mechanism capability. BIOS must write to this register with either a '1' or a '0' to enable/disable the root port from declaring support for the LTR capability.
10:6	0h RO	Reserved.
5	1h RO	**ARI Forwarding Supported (AFS):** ARI Forwarding Supported (AFS): Applicable only to Switch Downstream Ports and Root Ports; must be 0b for other Function types. This bit must be set to 1b if a Switch Downstream Port or Root Port supports this optional capability. ***Note:*** This bit is not made RWO to simplify implementation, since there is a requirement that the ARI Forwarding Enable bit must be hardwired to 0b if ARI Forwarding Supported bit is 0b. It is low risk to keep this risk 1b.
4	1h RO	**Completion Timeout Disable Supported (CTDS):** A value of 1b indicates support for the Completion Timeout Disable mechanism.

Bit Range	Default and Access	Field Name (ID): Description
3:0	7h RO	**Completion Timeout Ranges Supported (CTRS):** This field indicates device support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. Four time value ranges are defined: Range A: 50us to 10ms Range B: 10ms to 250ms Range C: 250ms to 4s Range D: 4s to 64s Bits are set according to the table below to show timeout value ranges supported. 0000b Completion Timeout programming not supported. 0001b Range A 0010b Range B 0011b Ranges A [amp] B 0110b Ranges B [amp] C 0111b Ranges A, B [amp] C [lt]-- This is what PCH supports 1110b Ranges B, C [amp] D 1111b Ranges A, B, C [amp] D All other values are reserved.

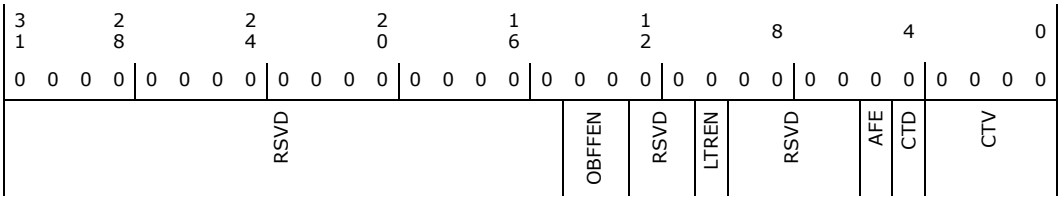
22.7.23 Device Control 2; Device Status 2 (DCTL2_DSTS2)—Offset 68h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:15	0h RO	Reserved.
14:13	0h RW	**Optimized Buffer Flush/Fill Enable (OBFFEN):** 00b Disable OBFF mechanism. 01b Enable OBFF mechanism using Message signaling (Variation A). 10b Enable OBFF mechanism using Message signaling (Variation B). 11b Enable OBFF using WAKE# signaling. ***Note:*** Only encoding 00b and 11b are supported. The encoding of 01b or 10b would be aliased to 00b. If DCAP2.OBFFS is clear, programming this field to any non-zero values will have no effect.
12:11	0h RO	Reserved.
10	0h RW	**LTR Mechanism Enable (LTREN):** When Set to 1b, this bit enables the Latency Tolerance Reporting (LTR) mechanism. For Downstream Ports, this bit must be reset to the default value if the Port goes to DL_Down status. If DCAP2.LTRMS is clear, programming this field to any non-zero values will have no effect.

Bit Range	Default and Access	Field Name (ID): Description
9:6	0h RO	Reserved.
5	0h RW	**ARI Forwarding Enable (AFE):** ARI Forwarding Enable (AFE): When set, the Downstream Port disables its traditional Device Number field being 0b enforcement when turning a Type 1 Configuration Request into a Type 0 Configuration Request, permitting access to Extended Functions in an ARI Device immediately below the Port.
4	0h RW	**Completion Timeout Disable (CTD):** When set to 1b, this bit disables the Completion Timeout mechanism. This field is required for all devices that support the Completion Timeout Disable Capability. Software is permitted to set or clear this bit at any time. When set, the Completion Timeout detection mechanism is disabled. If there are outstanding requests when the bit is cleared, it is permitted but not required for hardware to apply the completion timeout mechanism to the outstanding requests. If this is done, it is permitted to base the start time for each request on either the time this bit was cleared or the time each request was issued.
3:0	0h RW	**Completion Timeout Value (CTV):** In Devices that support Completion Timeout programmability, this field allows system software to modify the Completion Timeout value. This field is applicable to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. A Device that does not support this optional capability must hardwire this field to 0000b and is required to implement a timeout value in the range 50us to 50ms. Devices that support Completion Timeout programmability must support the values given below corresponding to the programmability ranges indicated in the Completion Timeout Values Supported field. The root port targeted configurable ranges are listed below, along with the range allowed by the PCI Express 2.0 specification. Defined encodings: 0000b Default range: 40-50ms (specification range 50us to 50ms) Values available if Range A (50 us to 10 ms) programmability range is supported: 0001b 90-100us (specification range is 50 us to 100 us) 0010b 9-10ms (specification range is 1 ms to 10 ms) Values available if Range B (10ms to 250ms) programmability range is supported: 0101b 40-50ms (specification range is 16 ms to 55 ms) 0110b 160-170ms (specification range is 65 ms to 210 ms) Values available if Range C (250ms to 4s) programmability range is supported: 1001b 400-500ms (specification range is 260 ms to 900 ms) 1010b 1.6-1.7s (specification range is 1s to 3.5s) Values not defined above are Reserved. Software is permitted to change the value in this field at any time. For requests already pending when the Completion Timeout Value is changed, hardware is permitted to use either the new or the old value for the outstanding requests, and is permitted to base the start time for each request either when this value was changed or when each request was issued.

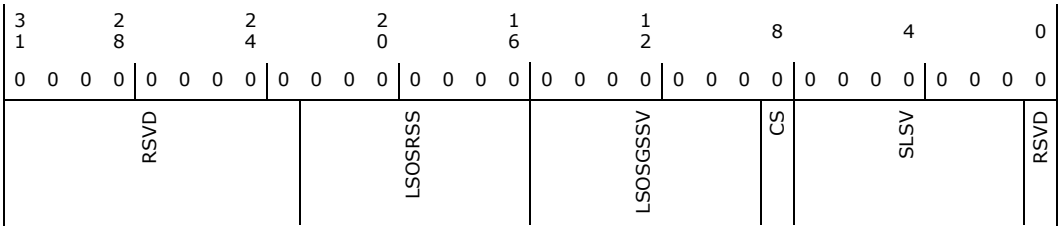
22.7.24 Link Capabilities 2 (LCAP2)—Offset 6Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:16	0h RO	**Lower SKP OS Reception Supported Speeds Vector (LSOSRSS):** Lower SKP OS Reception Supported Speeds Vector(LSOSRSS): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports receiving SKP OS at the rate defined for SRNS while running in SRIS. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
15:9	0h RO	**Lower SKP OS Generation Supported Speeds Vector (LSOSGSSV):** Lower SKP OS Generation Supported Speeds Vector(LSOSGSSV): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports software control of the SKP Ordered Set transmission scheduling rate. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
8	0h RO	**Crosslink Supported (CS):** Crosslink Supported (CS): No support for Crosslink.
7:1	0h RO/V	**Supported Link Speeds Vector (SLSV):** Supported Link Speeds Vector (SLSV): This field indicates the supported Link speed of the associated Port. For each bit, a value of 1b indicates that the corresponding Link speed is supported; otherwise, the Link speed is not supported. Bit definitions within this field are: Bit 0: 2.5 GT/s. Bit 1: 5.0 GT/s. Bit 2: 8.0 GT/s. Bits 6:3: Reserved. This register reports a value of 0001b if GEN1 data rate is supported but both GEN2 and GEN3 data rate support are disabled through Fuse or MPC.PCIESD register. This register reports a value of 0011b if both GEN1 and GEN2 data rate are supported but GEN3 data rate support is disabled through Fuse or MPC.PCIESD register.
0	0h RO	Reserved.

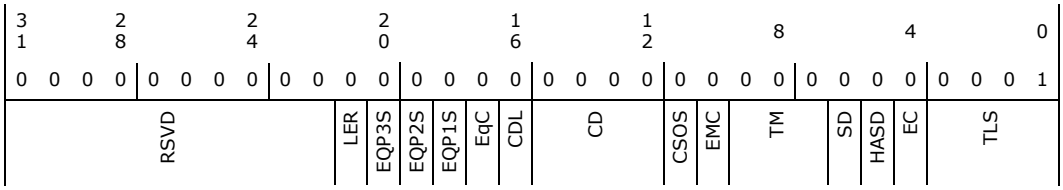
22.7.25 Link Control 2; Link Status 2 (LCTL2_LSTS2)—Offset 70h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 1h



Bit Range	Default and Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21	0h RW/1C/V/P	**Link Equalization Request (LER):** Link Equalization Request (LER): This bit is set by hardware to request the Link equalization process to be performed on the Link. Register Attribute: Dynamic.
20	0h RO/V/P	**Equalization Phase 3 Successful (EQP3S):** Equalization Phase 3 Successful (EQP3S): When set to 1, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed.
19	0h RO/V/P	**Equalization Phase 2 Successful (EQP2S):** Equalization Phase 2 Successful (EQP2S): When set to 1, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed.
18	0h RO/V/P	**Equalization Phase 1 Successful (EQP1S):** Equalization Phase 1 Successful (EQP1S): When set to 1, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed.
17	0h RO/V/P	**Equalization Complete (EqC):** Equalization Complete (EC): When set to 1, this bit indicates that the Transmitter Equalization procedure has completed
16	0h RO/V	**Current De-emphasis Level (CDL):** When the Link is operating at 5.0 GT/s speed, this bit reflects the level of de-emphasis. Encodings: 1b -3.5 dB 0b -6 dB The value in this bit is undefined when the Link is not operating at 5.0 GT/s speed.
15:12	0h RW/P	**Compliance Preset/De-emphasis (CD):** For 8.0 GT/s Data Rate: This field sets the Transmitter Preset in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Results are undefined if a reserved preset encoding is used when entering Polling.Compliance in this way. For 5.0 GT/s Data Rate: This bit sets the de-emphasis level in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Encodings: 0001b -3.5 dB 0000b -6 dB When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. The default value of this field is 0000b. This bit is intended for debug, compliance testing purposes. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this field is set to the default value.
11	0h RW/P	**Compliance SOS (CSOS):** When set to 1b, the LTSSM is required to send SKP Ordered Sets periodically in between the (modified) compliance patterns. The default value of this bit is 0b. This bit is applicable when the Link is operating at 2.5 GT/s or 5.0 GT/s data rates only.

Bit Range	Default and Access	Field Name (ID): Description
10	0h RW/P	**Enter Modified Compliance (EMC):** When this bit is set to 1b, the device transmits Modified Compliance Pattern if the LTSSM enters Polling.Compliance substate. Default value of this bit is 0b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
9:7	0h RW/P	**Transmit Margin (TM):** This field controls the value of the nondeemphasized voltage level at the Transmitter pins. This field is reset to 000b on entry to the LTSSM Polling.Configuration substate (see PCI Express Chapter 4 for details of how the Transmitter voltage level is determined in various states). Encodings: 000b Normal operating range 001b 800-1200 mV for full swing and 400-700 mV for half-swing 010b - (n-1) Values must be monotonic with a non-zero slope. The value of n must be greater than 3 and less than 7. At least two of these must be below the normal operating range of n : 200-400 mV for full-swing and 100-200 mV for half-swing n - 111b reserved For a Multi-Function device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. Default value of this field is 000b. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 000b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
6	0h RW/P	**Selectable De-emphasis (SD):** When the Link is operating at 5.0 GT/s speed, this bit selects the level of de-emphasis for an Upstream component. Encodings: 1b -3.5 dB 0b -6 dB When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. When the Link is operating at 2.5 GT/s speed, the setting of this bit has no effect.
5	0h RO	**Hardware Autonomous Speed Disable (HASD):** Reserved. This port cannot autonomously change speeds.
4	0h RW/P	**Enter Compliance (EC):** Software is permitted to force a Link to enter Compliance mode at the speed indicated in the Target Link Speed field by setting this bit to 1b in both components on a Link and then initiating a hot reset on the Link. Default value of this bit following Fundamental Reset is 0b. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value.
3:0	1h RW/V/P	**Target Link Speed (TLS):** Target Link Speed (TLS): This field sets an upper limit on Link operational speed by restricting the values advertised by the upstream component in its training sequences. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. If a value is written to this field that does not correspond to a supported speed, as indicated by the Supported Link Speeds Vector, the result is undefined. The default value of this field is GEN1. ***Note:*** This register field could be used by REUT software to limit the link speed to 2.5 GT/s or 5 GT/s data rate.

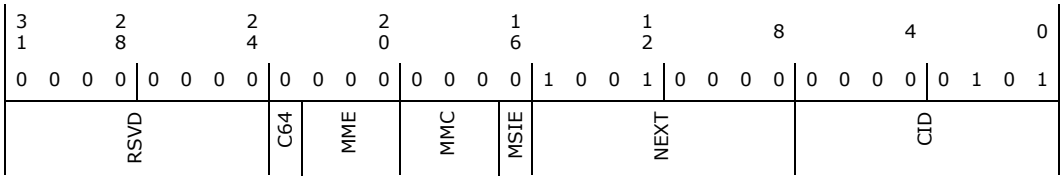
22.7.26 Message Signaled Interrupt Identifiers; Message Signaled Interrupt Message Control (MID_MC)—Offset 80h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 9005h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23	0h RO	**64-Bit Address Capable (C64):** Capable of generating a 32-bit message only.
22:20	0h RW	**Multiple Message Enable (MME):** These bits are RW for software compatibility, but only one message is ever sent by the root port.
19:17	0h RO	**Multiple Message Capable (MMC):** Only one message is required.
16	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. CMD.BME must be set for an MSI to be generated. If CMD.BME is cleared, and this bit is set, no interrupts (not even pin based) are generated.
15:8	90h RW/O	**Next Pointer (NEXT):** Indicates the location of the next capability in the list. The default value of this register is 90h which points to the Subsystem Vendor capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	5h RO	**Capability ID (CID):** Capabilities ID indicates MSI.

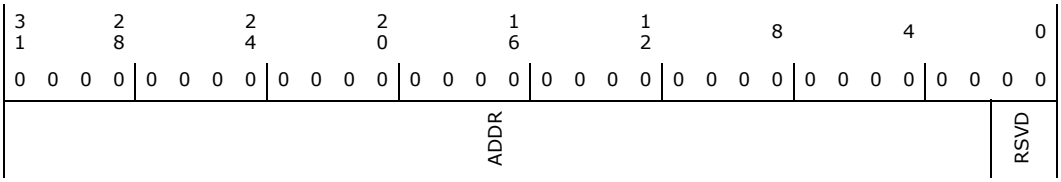
22.7.27 Message Signaled Interrupt Message Address (MA)—Offset 84h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**Address (ADDR):** Lower 32 bits of the system specified message address, always DW aligned.
1:0	0h RO	Reserved.

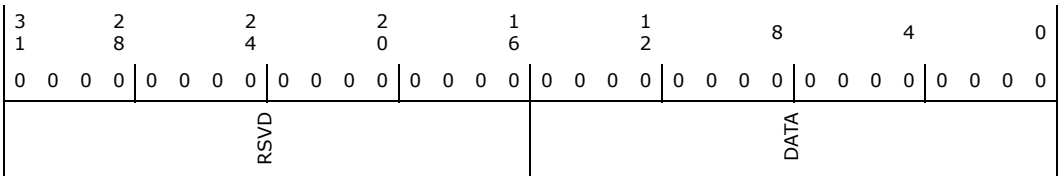
22.7.28 Message Signaled Interrupt Message Data (MD)—Offset 88h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD[lb]15:0[rb]) during the data phase of the MSI memory write transaction.

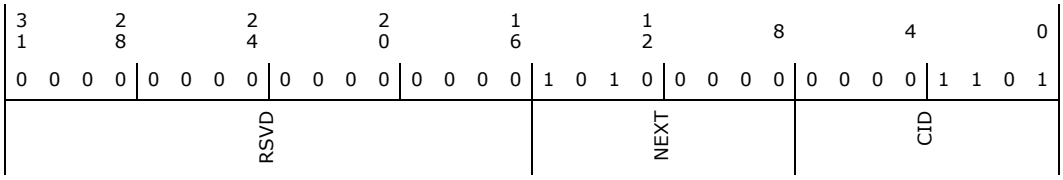
22.7.29 Subsystem Vendor Capability (SVCAP)—Offset 90h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: A00Dh



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:8	A0h RW/O	**Next Capability (NEXT):** Indicates the location of the next capability in the list. The default value of this register is A0h which points to the PCI Power Management capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	Dh RO	**Capability Identifier (CID):** Value of 0Dh indicates this is a PCI bridge subsystem vendor capability.

22.7.30 Subsystem Vendor IDs (SVID)—Offset 94h

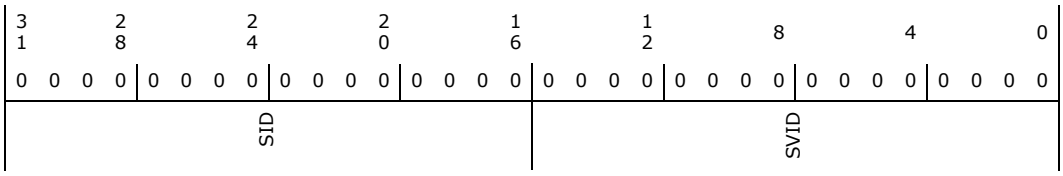
Size:32 bits

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem Identifier (SID):** Indicates the subsystem as identified by the vendor. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).
15:0	0h RW/O	**Subsystem Vendor Identifier (SVID):** Indicates the manufacturer of the subsystem. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).

22.7.31 Power Management Capability; PCI Power Management Capabilities (PMCAP_PMC)—Offset A0h

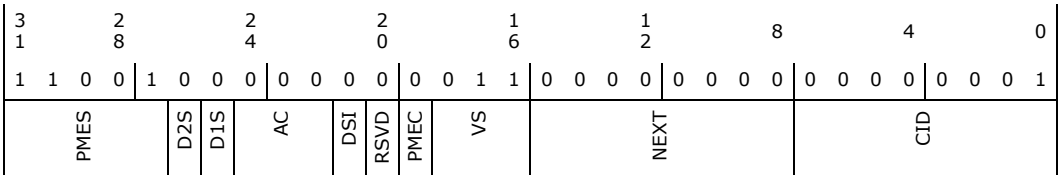
Size:32 bits

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: C8030001h



Bit Range	Default and Access	Field Name (ID): Description
31:27	19h RO	**PME Support (PMES):** Indicates PME# is supported for states D0, $D3_{HOT}$ and $D3_{COLD}$. The root port does not generate PME#, but reporting that it does is necessary for legacy Microsoft operating systems to enable PME# in devices connected behind this root port.
26	0h RO	**D2_Support (D2S):** The D2 state is not supported.
25	0h RO	**D1_Support (D1S):** The D1 state is not supported.
24:22	0h RO	**Aux_Current (AC):** Reports 0mA (self-powered), as use of this controller does not add to suspect well power consumption.
21	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
20	0h RO	Reserved.
19	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
18:16	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	0h RO	**Next Capability (NEXT):** Indicates this is the last item in the list.
7:0	1h RO	**Capability Identifier (CID):** Value of 01h indicates this is a PCI power management capability.

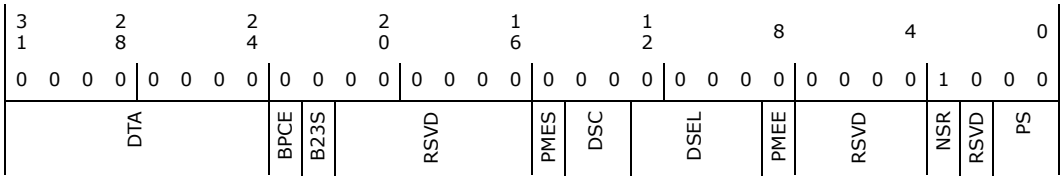
22.7.32 PCI Power Management Control and Status (PMCS)—Offset A4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 8h



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	**Data (DTA):** Reserved
23	0h RO	**Bus Power / Clock Control Enable (BPCE):** Reserved per PCI Express specification
22	0h RO	**B2/B3 Support (B23S):** Reserved per PCI Express specification.
21:16	0h RO	Reserved.
15	0h RO	**PME Status (PMES):** Indicates a PME was received on the downstream link.
14:13	0h RO	**Data Scale (DSC):** Reserved
12:9	0h RO	**Data Select (DSEL):** Reserved
8	0h RW/P	**PME Enable (PMEE):** Indicates PME is enabled. The root port takes no action on this bit, but it must be RW for legacy Microsoft operating systems to enable PME# on devices connected to this root port.
7:4	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
3	1h RW/O	**No Soft Reset (NSR):** When set to 1 this bit indicates that devices transitioning from $D3_{HOT}$ to D0 because of Power State commands do not perform an internal reset. Configuration context is preserved. Upon transition from $D3_{HOT}$ to D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the Power State bits. When clear, devices do perform an internal reset upon transitioning from $D3_{HOT}$ to D0 via software control of the Power State bits. Configuration Context is lost when performing the soft reset. Upon transition from $D3_{HOT}$ to D0 state, full reinitialization sequence is needed to return the device to D0 Initialized. Regardless of this bit, devices that transition from $D3_{HOT}$ to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	Reserved.
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the root port and to set a new power state. The values are: 00 D0 state 11 $D3_{HOT}$ state When in the $D3_{HOT}$ state, the controller's configuration space is available, but the I/O and memory spaces are not. Type 1 configuration cycles are also not accepted. Interrupts are not required to be blocked as software will disable interrupts prior to placing the port into $D3_{HOT}$. If software attempts to write a '10' or '01' to these bits, the write will be ignored.

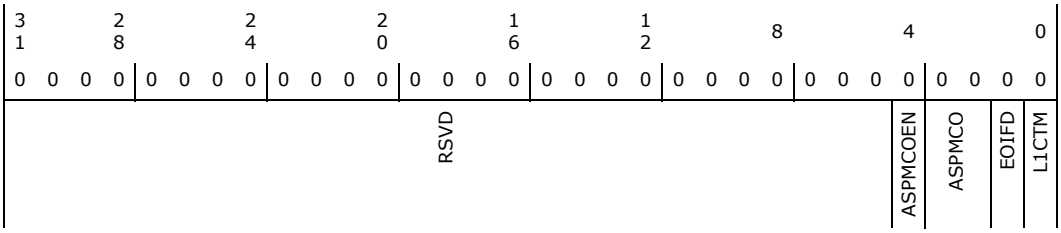
22.7.33 Miscellaneous Port Configuration 2 (MPC2)—Offset D4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:5	0h RO	Reserved.
4	0h RW	**ASPM Control Override Enable (ASPMCOEN):** When set to '1', the PCIe Root Port will use the values in the ASPM Control Override registers instead of ASPM Registers in the Link Control register. This register allows BIOS to control the DMI ASPM settings instead of the OS.
3:2	0h RW	**ASPM Control Override (ASPMCO):** Provides BIOS control of whether root port should enter L0s or L1 or both. 00 = Disabled 01 = L0s Entry Enabled 10 = L1 Entry Enabled 11 = L0s and L1 Entry Enabled.
1	0h RW	**EOI Forwarding Disable (EOIFD):** 0 = Broadcast EOI messages that are sent on the backbone are claimed by this port and forwarded across the PCIe* link.{br] 1 = Broadcast EOI messages are not claimed on the backbone by this port and will not be forwarded across the PCIe* Link.

Bit Range	Default and Access	Field Name (ID): Description
0	0h RW	**L1 Completion Timeout Mode (L1CTM):** 0 = PCI Express* Specification Compliant. Completion timeout is disabled during software initiated L1, and enabled during ASPM initiate L1. 1 = Completion timeout is enabled during L1, regardless of how L1 entry was initiated.

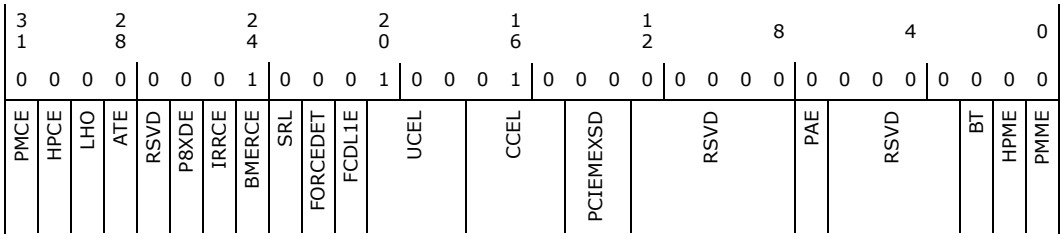
22.7.34 Miscellaneous Port Configuration (MPC)—Offset D8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 1110000h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW	**Power Management SCI Enable (PMCE):** 0 = SCI generation based on a power management event is disabled. 1 = Enables the root port to generate SCI whenever a power management event is detected.
30	0h RW	**Hot Plug SCI Enable (HPCE):** 0 = SCI generation based on a hot-plug event is disabled. 1 = Enables the root port to generate SCI whenever a hot-plug event is detected.
29	0h RW/L	**Link Hold Off (LHO):** When set, the port will not take any TLP. This is used during loopback mode to fill up the downstream queue.
28	0h RW/L	**Address Translater Enable (ATE):** Used to enable address translation via the AT bits in this register during loopback mode. 0: Disable 1: Enable
27	0h RO	Reserved.
26	0h RW/L	**Port8xh Decode Enable (P8XDE):** When set, allows PCIe Root Port to claim I/O cycles within the range from 80h - 8Fh inclusive and forwarding the cycle to the link. The claiming of these cycles are independent of I/O Base/Limit and I/O Space Enable bits. BIOS must ensure that at any one time, no more than one PCIe Root Port are enabled to claim Port 8xh cycles.
25	0h RW/L	**Invalid Receive Range Check Enable (IRRCE):** When set, the receive transaction layer will treat the TLP as an Unsupported Request error if the address range of a Memory request does not fall outside the range between prefetchable and non-prefetchable base and limit. Messages, I/O, Config, and Completions are never checked for valid address ranges This register bit is Read-Only when the MPC.SRL bit is set.
24	1h RW/L	**BME Receive Check Enable (BMERCE):** When set, the receive transaction layer will treat the TLP as an Unsupported Request error if a memory or I/O read or write request is received and the Bus Master Enable bit is not set. Messages, Config, and Completions are never checked for BME.

Bit Range	Default and Access	Field Name (ID): Description
23	0h RW/O	**Secured Register Lock (SRL):** When this bit is set, all the secured registers will be locked and will be Read-Only.
22	0h RW/L	**Detect Override (FORCEDET):** 0: Normal operation. Detect output from AFE is sampled for presence detection. 1: Override mode. Ignores AFE detect output and Link Training proceeds as if a device were detected.
21	0h RW	**Flow Control During L1 Entry (FCDL1E):** br] 0: No flow control update DLLPs sent during L1 Ack transmission 1: Flow control update DLLPs sent during L1 Ack transmission as required to meet the 30us periodic flow control update.
20:18	4h RW	**Unique Clock Exit Latency (UCEL):** This value represents the L0s Exit Latency for unique-clock configurations (LCTL.CCC = '0'). It defaults to 512ns to less than 1us, but may be overridden by BIOS.
17:15	2h RW	**Common Clock Exit Latency (CCEL):** This value represents the L0s Exit Latency for common-clock configurations (LCTL.CCC = '1'). It defaults to 128ns to less than 256ns, but may be overridden by BIOS.
14:13	0h RW	**PCIe MEx Speed Disable (PCIEMEXSD):** When operating as PCI Express: 00: PCIe supported data rate is as defined by the Supported Link Speed and Target Link Speed register. 01: PCIe supported data rate is limited to just 2.5 GT/s. Supported Link Speed field will reflect 0000001b. Max Link Speed field will reflect 0001b. 10: PCIe supported data rate is limited to 2.5 GT/s and 5.0 GT/s. Supported Link Speed register will reflect 0000011b. Max Link Speed field will reflect 0010b. 11: Reserved. When operating as Mobile Express: 00: MEx supported data rate is as defined by the Supported Link Speed and Target Link Speed register. 01: MEx supported data rate is limited to just HS-G1. Supported Link Speed field will reflect 0000001b. Max Link Speed field will reflect 0000b. 10: PCIe supported data rate is limited to HS-G1 and HS-G2. Supported Link Speed register will reflect 0000001b. Max Link Speed field will reflect 0000b. 11: Reserved. When this bit is changed, link retrain needs to be performed for the change to be effective.
12:8	0h RO	Reserved
7	0h RW	**Port I/OxApic Enable (PAE):** When set, a range is opened through the bridge for the following memory addresses: Port# Address 1 FEC1_0000h - FEC1_7FFFh 2 FEC1_8000h - FEC1_FFFFh 3 FEC2_0000h - FEC2_7FFFh 4 FEC2_8000h - FEC2_FFFFh 5 FEC3_0000h - FEC3_7FFFh 6 FEC3_8000h - FEC3_FFFFh 7 FEC4_0000h - FEC4_7FFFh 8 FEC4_8000h - FEC4_FFFFh When cleared, the hole is disabled.
6:3	0h RO	Reserved.
2	0h RW/O	**Bridge Type (BT):** This register can be used to modify the Base Class and Header Type fields from the default PCI-to-PCI bridge to a Host Bridge. Having the root port appear as a Host Bridge is useful in some server configurations. 0 = The root port bridge type is a PCI-to-PCI Bridge, Header Sub-Class = 04h, and Header Type = Type 1. 1 = The root port bridge type is a PCI-to-PCI Bridge, Header Sub-Class = 00h, and Header Type = Type 0.
1	0h RW	**Hot Plug SMI Enable (HPME):** 0 = SMI generation based on a hot-plug event is disabled. 1 = Enables the root port to generate SMI whenever a hot-plug event is detected.
0	0h RW	**Power Management SMI Enable (PMME):** 0 = SMI generation based on a power management event is disabled. 1 = Enables the root port to generate SMI whenever a power management event is detected.

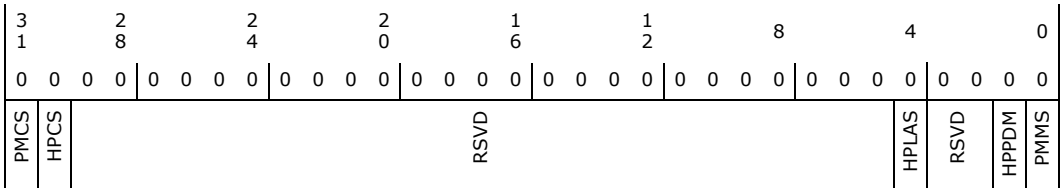
22.7.35 SMI / SCI Status (SMSCS)—Offset DCh

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/1C/V	**Power Management SCI Status (PMCS):** This bit is set if the root port PME control logic needs to generate an interrupt, and this interrupt has been routed to generate an SCI.
30	0h RW/1C/V	**Hot Plug SCI Status (HPCS):** This bit is set if the hot plug controller needs to generate an interrupt, and has this interrupt been routed to generate an SCI.
29:5	0h RO	Reserved.
4	0h RW/1C/V	**Hot Plug Link Active State Changed SMI Status (HPLAS):** This bit is set when SLSTS.DLLSC transitions from '0' to '1', and MPC.HPME is set. When this bit is set, an SMI# will be generated.
3:2	0h RO	Reserved.
1	0h RW/1C/V	**Hot Plug Presence Detect SMI Status (HPPDM):** This bit is set when SLSTS.PDC transitions from '0' to'1', and MPC.HPME is set. When this bit is set, an SMI# will be generated.
0	0h RW/1C/V	**Power Management SMI Status (PMMS):** This bit is set when RSTS.PS transitions from '0' to'1', and MPC.PMME is set.

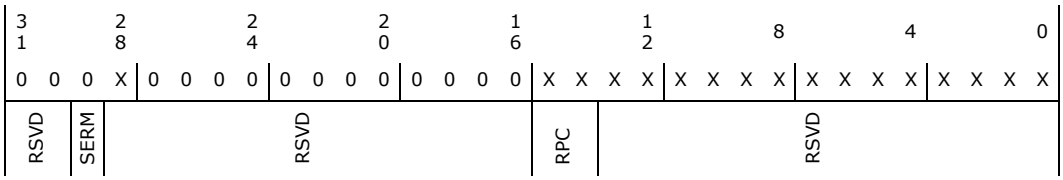
22.7.36 Strap and Fuse Configuration (STRPFUSECFG)—Offset FCh

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:30	00b RO	**Reserved**
29	0b RW	**Server Error Reporting Mode (SERM):** When set, if the PCIe port detects a fatal, non-fatal, or correctable error on the link, it sends one of ERR_FATAL, ERR_NONFATAL, or ERR_CORR message to the IOSF primary fabric. If the PCIe port receives an ERR_* message from the downstream device, it sends the message to the IOSF primary fabric. ***Note:*** For each x4 instance, only the value from Port 0 is used.
28:16	x00000000 0000b RO/W/S	**Reserved**
15:14	XX R0/s	**Root Port Configuration Strap (RPC):** The reflects that state of the soft straps. 11: 1x4 Port 0 (x4), Ports 1-3 (disabled 10: 2x2 Port 0 (x2), Port 2 (x2), Ports 1,3 (disabled) 01: 1x2, 2x1, Port 0 (x2), Port 1 (disabled), Ports 2,3 (x1) 00: 4x1 Ports 0-3 (x1)
13:0	xxh RO	**Reserved**

22.7.37 Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h

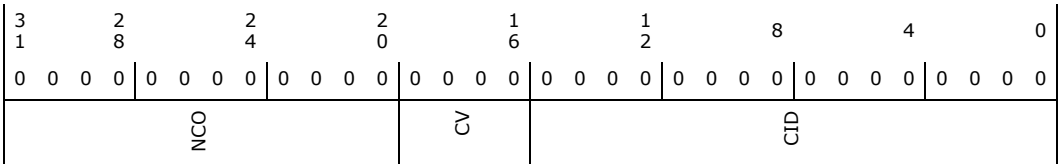
Size:32 bits
The AER capability can optionally be included or excluded from the capabilities list. The full AER is supported.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Set to 000h as this is the last capability in the list.
19:16	0h RW/O	**Capability Version (CV):** For systems that support AER, BIOS should write a 1h to this register else it should write 0.
15:0	0h RW/O	**Capability ID (CID):** For systems that support AER, BIOS should write a 0001h to this register else it should write 0.

22.7.38 Uncorrectable Error Status (UES)—Offset 104h

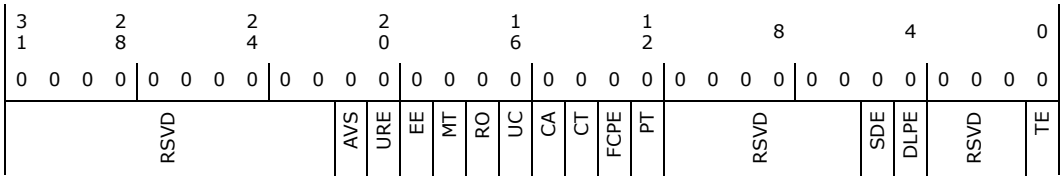
This register must maintain its state through a platform reset. It loses its state upon loss of core power.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21	0h RW/1C/V/P	**ACS Violation Status (AVS):** Reserved. Access Control Services are not supported
20	0h RW/1C/V/P	**Unsupported Request Error Status (URE):** Indicates an unsupported request was received.
19	0h RO	**ECRC Error Status (EE):** ECRC is not supported.
18	0h RW/1C/V/P	**Malformed TLP Status (MT):** Indicates a malformed TLP was received.
17	0h RW/1C/V/P	**Receiver Overflow Status (RO):** Indicates a receiver overflow occurred.
16	0h RW/1C/V/P	**Unexpected Completion Status (UC):** Indicates an unexpected completion was received.
15	0h RW/1C/V/P	**Completor Abort Status (CA):** Indicates a completer abort was received
14	0h RW/1C/V/P	**Completion Timeout Status (CT):** Indicates a completion timed out. This is signaled if Completion Timeout is enabled and a completion fails to return within the amount of time specified by the Completion Timeout Value
13	0h RO	**Flow Control Protocol Error Status (FCPE):** Not supported.
12	0h RW/1C/V/P	**Poisoned TLP Status (PT):** Indicates a poisoned TLP was received.
11:6	0h RO	Reserved.
5	0h RO	**Surprise Down Error Status (SDE):** Surprise Down is not supported.

Bit Range	Default and Access	Field Name (ID): Description
4	0h RW/1C/V/P	**Data Link Protocol Error Status (DLPE):** Indicates a data link protocol error occurred.
3:1	0h RO	Reserved.
0	0h RO	**Training Error Status (TE):** Not supported.

22.7.39 Uncorrectable Error Mask (UEM)—Offset 108h

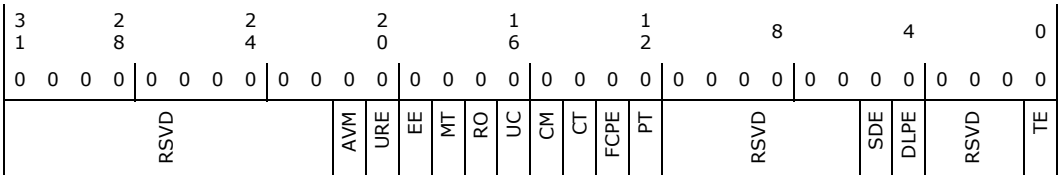
When set, the corresponding error in the UES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21	0h RW/P	**ACS Violation Mask (AVM):** Reserved. Access Control Services are not supported
20	0h RW/P	**Unsupported Request Error Mask (URE):** Mask for uncorrectable errors.
19	0h RO	**ECRC Error Mask (EE):** ECRC is not supported.
18	0h RW/P	**Malformed TLP Mask (MT):** Mask for malformed TLPs
17	0h RW/P	**Receiver Overflow Mask (RO):** Mask for receiver overflows.
16	0h RW/P	**Unexpected Completion Mask (UC):** Mask for unexpected completions.
15	0h RW/P	**Completor Abort Mask (CM):** Mask for completer abort.
14	0h RW/P	**Completion Timeout Mask (CT):** Mask for completion timeouts.

Bit Range	Default and Access	Field Name (ID): Description
13	0h RO	**Flow Control Protocol Error Mask (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Mask (PT):** Mask for poisoned TLPs.
11:6	0h RO	Reserved.
5	0h RO	**Surprise Down Error Mask (SDE):** Surprise Down is not supported.
4	0h RW/P	**Data Link Protocol Error Mask (DLPE):** Mask for data link protocol errors.
3:1	0h RO	Reserved.
0	0h RO	**Training Error Mask (TE):** Not supported.

22.7.40 Uncorrectable Error Severity (UEV)—Offset 10Ch

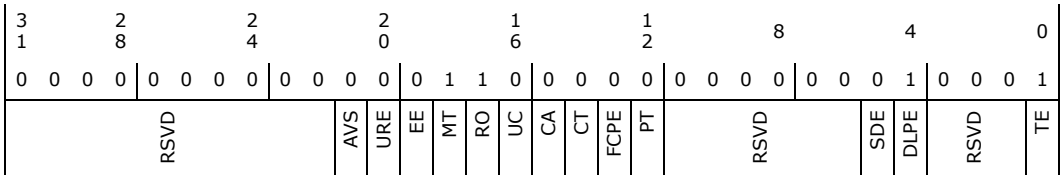
This register gives the option to make an uncorrectable error fatal or non-fatal. An error is fatal if the bit is set. An error is non-fatal if the bit is cleared. This register is only reset by a loss of core power.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 60011h



Bit Range	Default and Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21	0h RW/P	**ACS Violation Severity (AVS):** Severity for ACS violation.
20	0h RW/P	**Unsupported Request Error Severity (URE):** Severity for unsupported request reception.
19	0h RO	**ECRC Error Severity (EE):** ECRC is not supported.
18	1h RW/P	**Malformed TLP Severity (MT):** Severity for malformed TLP reception.
17	1h RW/P	**Receiver Overflow Severity (RO):** Severity for receiver overflow occurrences.

Bit Range	Default and Access	Field Name (ID): Description
16	0h RW/P	**Unexpected Completion Severity (UC):** Severity for unexpected completion reception.
15	0h RW/P	**Completor Abort Severity (CA):** Severity for completer abort.
14	0h RW/P	**Completion Timeout Severity (CT):** Severity for completion timeout.
13	0h RO	**Flow Control Protocol Error Severity (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Severity (PT):** Severity for poisoned TLP reception.
11:6	0h RO	Reserved.
5	0h RO	**Surprise Down Error Severity (SDE):** Surprise Down is not supported.
4	1h RW/P	**Data Link Protocol Error Severity (DLPE):** Severity for data link protocol errors.
3:1	0h RO	Reserved.
0	1h RO	**Training Error Severity (TE):** TE not supported. This bit is left as RO='1' for ease of implementation.

22.7.41 Correctable Error Status (CES)—Offset 110h

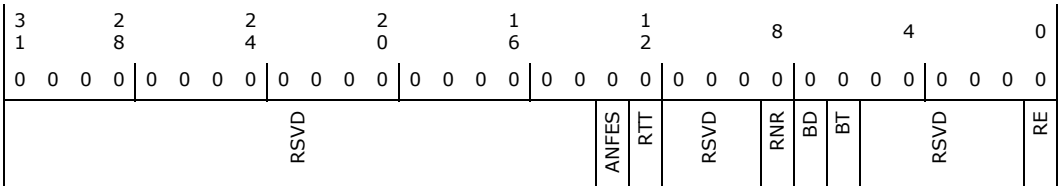
This register is only reset by a loss of core power.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13	0h RW/1C/V/P	**Advisory Non-Fatal Error Status (ANFES):** When set, indicates that an Advisory Non-Fatal Error occurred.
12	0h RW/1C/V/P	**Replay Timer Timeout Status (RTT):** Indicates the replay timer timed out.

Bit Range	Default and Access	Field Name (ID): Description
11:9	0h RO	Reserved.
8	0h RW/1C/V/P	**Replay Number Rollover Status (RNR):** Indicates the replay number rolled over.
7	0h RW/1C/V/P	**Bad DLLP Status (BD):** Indicates a bad DLLP was received.
6	0h RW/1C/V/P	**Bad TLP Status (BT):** Indicates a bad TLP was received.
5:1	0h RO	Reserved.
0	0h RW/1C/V/P	**Receiver Error Status (RE):** Indicates a receiver error occurred.

22.7.42 Correctable Error Mask (CEM)—Offset 114h

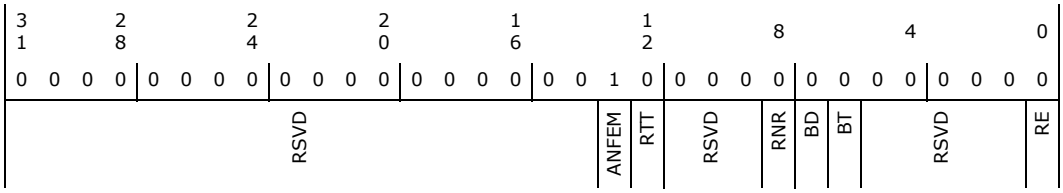
When set, the corresponding error in the CES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 2000h



Bit Range	Default and Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13	1h RW/P	**Advisory Non-Fatal Error Mask (ANFEM):** When set, masks Advisory Non-Fatal errors from (a) signaling ERR_COR to the device control register and (b) updating the Uncorrectable Error Status register. This register is set by default to enable compatibility with software that does not comprehend Role-Based Error Reporting.
12	0h RW/P	**Replay Timer Timeout Mask (RTT):** Mask for replay timer timeout.
11:9	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
8	0h RW/P	**Replay Number Rollover Mask (RNR):** Mask for replay number rollover.
7	0h RW/P	**Bad DLLP Mask (BD):** Mask for bad DLLP reception.
6	0h RW/P	**Bad TLP Mask (BT):** Mask for bad TLP reception.
5:1	0h RO	Reserved.
0	0h RW/P	**Receiver Error Mask (RE):** Mask for receiver errors.

22.7.43 Advanced Error Capabilities and Control (AECC)—Offset 118h

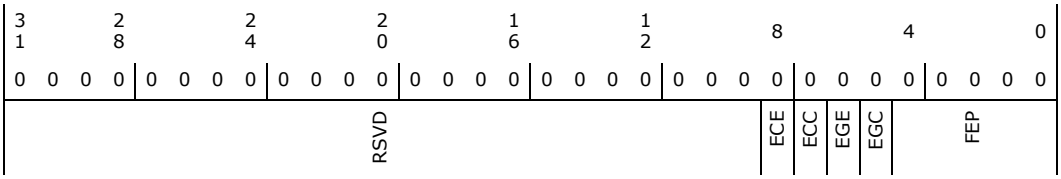
This register is only reset by a loss of core power.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8	0h RO	**ECRC Check Enable (ECE):** ECRC is not supported.
7	0h RO	**ECRC Check Capable (ECC):** ECRC is not supported.
6	0h RO	**ECRC Generation Enable (EGE):** ECRC is not supported.
5	0h RO	**ECRC Generation Capable (EGC):** ECRC is not supported.
4:0	0h RO/V/P	**First Error Pointer (FEP):** Identifies the bit position of the first error reported in the Uncorrectable Error Status Register.

22.7.44 Root Error Command (REC)—Offset 12Ch

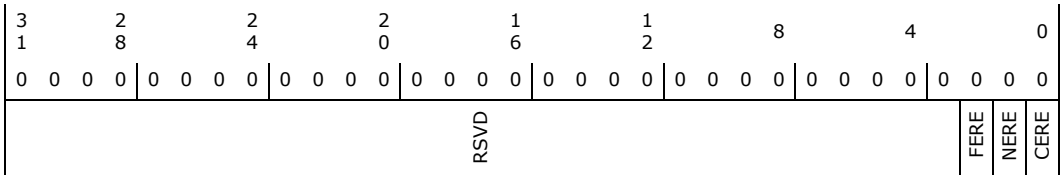
This register allows errors to generate interrupts.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:3	0h RO	Reserved.
2	0h RW	**Fatal Error Reporting Enable (FERE):** When set, the root port will generate an interrupt when a fatal error is reported by the attached device.
1	0h RW	**Non-fatal Error Reporting Enable (NERE):** When set, the root port will generate an interrupt when a non-fatal error is reported by the attached device.
0	0h RW	**Correctable Error Reporting Enable (CERE):** When set, the root port will generate an interrupt when a correctable error is reported by the attached device.

22.7.45 Root Error Status (RES)—Offset 130h

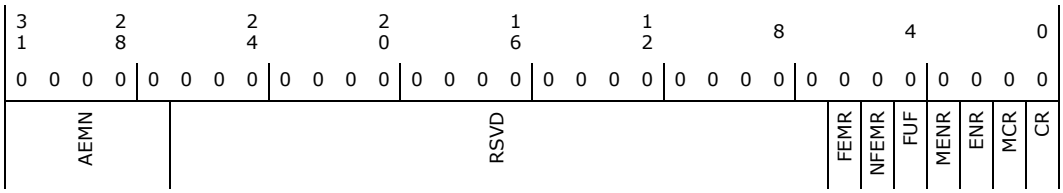
This register can track more than one error and set the 'multiple' bits if a second or subsequent error occurs and the first has not been serviced. This register is only reset by a loss of core power.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:27	0h RO	**Advanced Error Interrupt Message Number (AEMN):** Reserved. There is only one error interrupt allocated.
26:7	0h RO	Reserved.
6	0h RW/1C/V/P	**Fatal Error Message Received (FEMR):** Set when one or more Fatal Uncorrectable Error Messages have been received.
5	0h RW/1C/V/P	**Non-Fatal Error Messages Received (NFEMR):** Set when one or more Non-Fatal Uncorrectable error messages have been received
4	0h RW/1C/V/P	**First Uncorrectable Fatal (FUF):** Set when the first Uncorrectable Error message received is for a fatal error.
3	0h RW/1C/V/P	**Multiple ERR_FATAL/NONFATAL Received (MENR):** Set when either a fatal or a non-fatal error is received and the ENR bit is already set.
2	0h RW/1C/V/P	**ERR_FATAL/NONFATAL Received (ENR):** Set when either a fatal or a non-fatal error message is received.
1	0h RW/1C/V/P	**Multiple ERR_COR Received (MCR):** Set when a correctable error message is received and the CR bit is already set.
0	0h RW/1C/V/P	**ERR_COR Received (CR):** Set when a correctable error message is received.

22.7.46 Error Source Identification (ESID)—Offset 134h

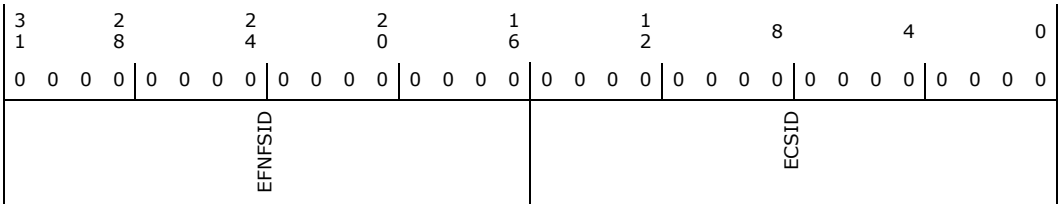
Size:32 bits
Identifies the source (Requester ID) of the first correctable and uncorrectable (Non-Fatal / Fatal) errors reported in the Root Error Status register. This register is only reset by a loss of core power.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO/V/P	**ERR_FATAL/NONFATAL Source Identification (EFNFSID):** Loaded with the Requester ID indicated in the received ERR_FATAL or ERR_NONFATAL Message with the ERR_FATAL/NONFATAL Received register is not already set.
15:0	0h RO/V/P	**ERR_COR Source Identification (ECSID):** Loaded with the Requester ID indicated in the received ERR_COR Message with the ERR_COR Received register is not already set.

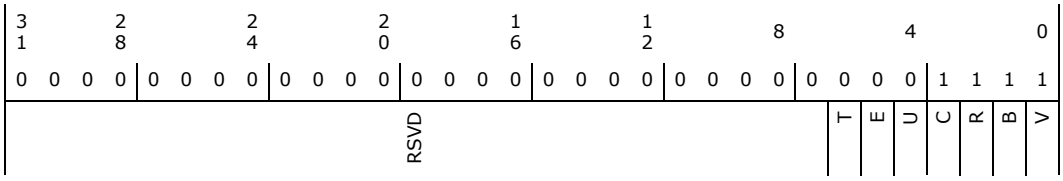
22.7.47 ACS Capability Register (ACSCAPR)—Offset 144h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: Fh



Bit Range	Default and Access	Field Name (ID): Description
31:7	0h RO	Reserved.
6	0h RO	**ACS Direct Translated P2P (T):** ACS Direct Translated P2P (T): ACS Direct Translated P2P is not supported.
5	0h RO	**ACS P2P Egress Control (E):** ACS P2P Egress Control (E): ACS P2P Egress Control is not supported.
4	0h RO	**ACS Upstream Forwarding (U):** ACS Upstream Forwarding (U): ACS Upstream Forwarding is not supported.
3	1h RW/O	**ACS P2P Completion Redirect (C):** ACS P2P Completion Redirect (C): Required for all Functions that support ACS P2P Request Redirect; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Completion Redirect.
2	1h RW/O	**ACS P2P Request Redirect (R):** ACS P2P Request Redirect (R): Required for Root Ports that support peer-to-peer traffic with other Root Ports; required for Switch Downstream Ports; required for multi-function device Functions that support peer-to-peer traffic with other Functions; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Request Redirect.
1	1h RW/O	**ACS Translation Blocking (B):** ACS Translation Blocking (B): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Translation Blocking.
0	1h RW/O	**ACS Source Validation (V):** ACS Source Validation (V): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Source Validation.

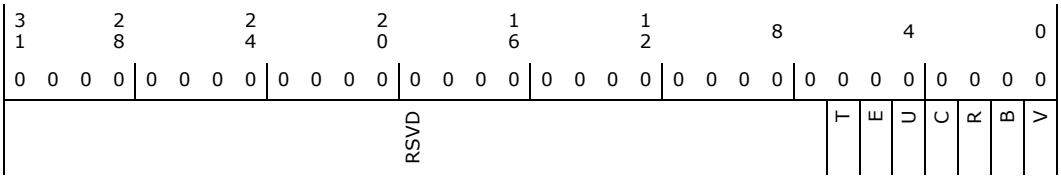
22.7.48 ACS Control Register (ACSCTLR)—Offset 148h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:7	0h RO	Reserved.
6	0h RO	**ACS Direct Translated P2P Enable (T):** ACS Direct Translated P2P Enable (T): ACS Direct Translated P2P is not supported.
5	0h RO	**ACS P2P Egress Control Enable (E):** ACS P2P Egress Control Enable (E): ACS P2P Egress Control is not supported.
4	0h RO	**ACS Upstream Forwarding Enable (U):** ACS Upstream Forwarding Enable (U): ACS Upstream Forwarding is not supported.
3	0h RW	**ACS P2P Completion Redirect (C):** ACS P2P Completion Redirect (C): Determines when the component redirects peer-to-peer Completions upstream; applicable only to Read Completions whose Relaxed Ordering Attribute is clear.
2	0h RW	**ACS P2P Request Redirect (R):** ACS P2P Request Redirect (R): Determines when the component redirects peer-to-peer memory Requests targeting another peer port upstream. I/O, Configuration, VDM Messages and Completions are never affected by ACS P2P Request Redirect.
1	0h RW	**ACS Translation Blocking (B):** ACS Translation Blocking (B): When set, the component blocks all upstream Memory Requests whose Address Translation (AT) field is not set to the default value. I/O, Configuration, Completions and Messages are never affected by ACS Translation Blocking.
0	0h RW	**ACS Source Validation (V):** ACS Source Validation (V): When set, the component validates the Bus Number from the Requester ID of upstream Requests against the secondary / subordinate Bus Numbers. I/O, Configuration and Completions are never affected by ACS Source Validation.

22.7.49 L1 Sub-States Extended Capability Header (L1SECH)—Offset 200h

Size:32 bits.

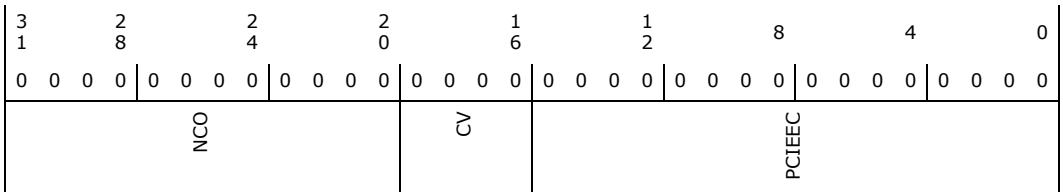
Note: When operating in Mobile Express mode, this capability should not be enabled.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b and software must mask them to allow for future uses of these bits.
19:16	0h RW/O	**Capability Version (CV):** This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. Must be 1h for this version of the specification. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 1h.
15:0	0h RW/O	**PCI Express Extended Capability ID (PCIEEC):** This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 001Eh.

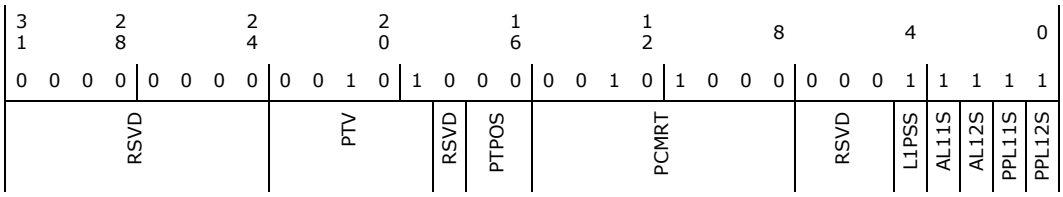
22.7.50 L1 Sub-States Capabilities (L1SCAP)—Offset 204h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 28281Fh



Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:19	5h RW/O	**Port Tpower_on Value (PTV):** Along with the Port T_POWER_ON Scale Field in the L1 Substates Capabilities register sets the Time (in us) that this Port requires the port on the opposite side of Link to wait in L1.OFF_EXIT after sampling CLKREQ# asserted before actively driving the interface. Port Tpower_on is calculated by multiplying the value in this field by the value in the Port Tpower_on scale field in the L1 Sub-States Capabilities 2 register. Required for all Ports that support L1.OFF.
18	0h RO	Reserved.
17:16	0h RW/O	**Port Tpower_on Scale (PTPOS):** Specifies the scale used for Tpower_on value field in the L1 Substates Capabilities register. '00b': 2 us '01b': 10 us '10b': 100 us '11b': Reserved Required for all Ports that support L1.OFF.
15:8	28h RW/O	**Port Common Mode Restore Time (PCMRT):** This is the time (in us) required for this Port to re-establish common mode. Required for all ports that support L1.OFF.
7:5	0h RO	Reserved.
4	1h RW/O	**L1 PM Substates Supported (L1PSS):** When Set this bit indicates that this Port supports L1 PM Substates. For compatibility with possible future extensions, software must not enable L1 PM Substates unless this bit is set. This RWO field must be programmed prior to enabling ASPM.
3	1h RW/O	**ASPM L1.1 Substates Supported (AL11S):** When set, this bit indicates that this port supports L1 substates for ASPM L1.SNOOZ. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
2	1h RW/O	**ASPM L1.2 Supported (AL12S):** When set, this bit indicates that ASPM_L1.OFF is supported. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
1	1h RW/O	**PCI-PM L1.1 Supported (PPL11S):** When set, this bit indicates that L1.SNOOZ sub-state is supported and this bit must be set by all ports implementing L1 Sub-States. A port that supports L1.OFF must support L1.SNOOZ. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
0	1h RW/O	**PCI-PM L1.2 Supported (PPL12S):** When set, this bit indicates that L1.OFF power management feature is supported. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static

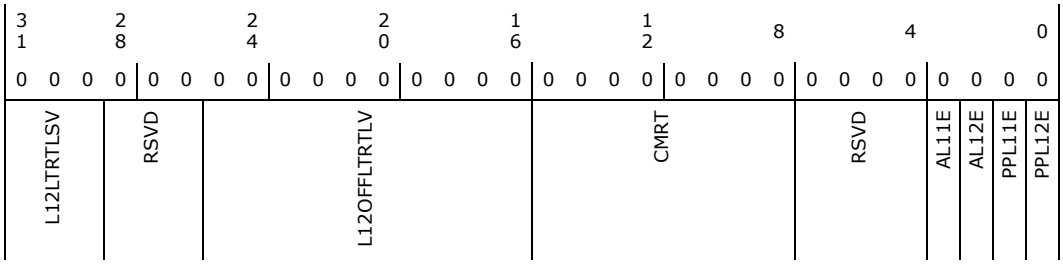
22.7.51 L1 Sub-States Control 1 (L1SCTL1)—Offset 208h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:29	0h RW	**L1.2 LTR Threshold Latency ScaleValue (L12LTRTLSV):** This field contains the L1.OFF LTR Threshold Latency Scale Value for this particular PCIe root port. The value in this field, together with L12LTRTLV is compared against both the snoop and non-snoop LTR values of the device. 000: L12LTRSTLV times 1 ns 001: L12LTRSTLV times 32 ns 010: L12LTRSTLV times 1024 ns 011: L12LTRSTLV times 32768 ns 100: L12LTRSTLV times 1048576 ns 101: L12LTRSTLV times 33554432 ns Others: Not Permitted. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
28:26	0h RO	Reserved.
25:16	0h RW	**L1.2 LTR Threshold Latency Value (L12OFFLTRTLV):** This field contains the L1.2 LTR Threshold Latency Value for this particular PCIe root port. The value in this field, together with L12LTRTLSV is compared against both the snoop and non-snoop LTR values of the device. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
15:8	0h RW	**Common Mode Restore Time (CMRT):** This is the Tcommon_mode time the PCIe root port needs to continue sending TS1 and refrain from sending TS2 in Recovery state to allow the TX common mode to be established prior to sending TS2. The timer starts from the time when the first TS1 has been sent and the receiver has detected un-squelch. The value in this field defines the time in micro-seconds. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
7:4	0h RO	Reserved.
3	0h RW	**ASPM L1.1 Enabled (AL11E):** When set, this bit indicates that ASPM L1.SNOOZ substates are enabled for ASPM. Required for both upstream and downstream ports. Register Attribute: Dynamic

Bit Range	Default and Access	Field Name (ID): Description
2	0h RW	**ASPM L1.2 Enable (AL12E):** When set, this bit indicates that ASPM L1.OFF substates are enabled for PCI-PM. Required for both upstream and downstream ports. Register Attribute: Dynamic
1	0h RW	**PCI-PM L1.SNOOZ Enable (PPL11E):** When set, this bit indicates that PCI-PM L1.SNOOZ power management feature is enabled. If L1.OFF is enabled, L1.SNOOZ must also be enabled. This field must be programmed prior to enabling ASPM L1. Register Attribute: Dynamic ***Note:*** If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
0	0h RW	**PCI-PM L1.2 Enabled (PPL12E):** When set, this bit indicates that PCI-PM L1.OFF power management feature is enabled. L1.OFF can only be enabled if the platform supports bi-directional CLKREQPLUS#. This field must be programmed prior to enabling ASPM L1. Ports that support L1.OFF shall support Latency Tolerance Reporting. Register Attribute: Dynamic ***Note:*** If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.

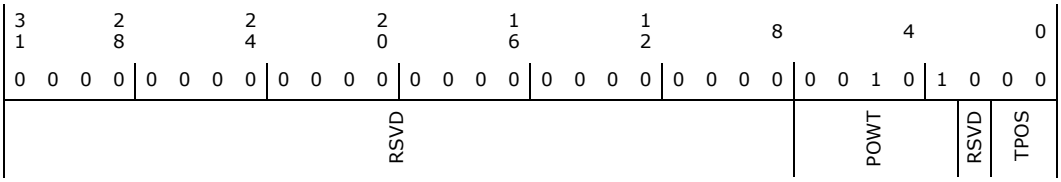
22.7.52 L1 Sub-States Control 2 (L1SCTL2)—Offset 20Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 28h



Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:3	5h RW	**Power On Wait Time (POWT):** Along with the Tpower_on Scale sets the minimum amount of time (in us) that the Port must wait in L1.OFF EXIT after sampling CLKREQPLUS# asserted before actively driving the interface. The timer starts counting when CLKREQPLUS# is sampled asserts in L1.OFF state. Tpower_on value is calculated by multiplying the value in this field by the value in the TPOS field. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
2	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
1:0	0h RW	**Tpower_on Scale (TPOS):** Specifies the scale used for Tpower_on value. '00b': 2 us '01b': 10 us '10b': 100us '11b': Reserved. Required for all Ports that support L1.OFF. Register Attribute: Static

22.7.53 Secondary PCI Express Extended Capability Header (SPEECH)—Offset 220h

Size:32 bits.

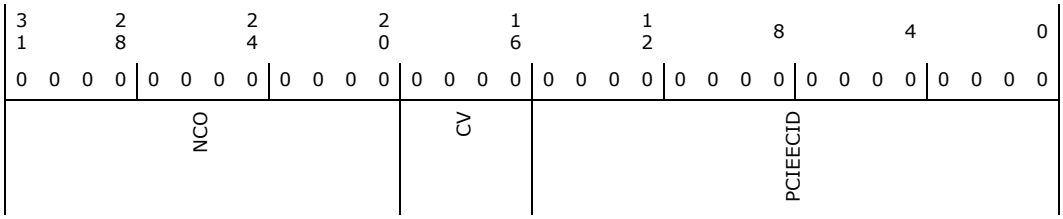
Note: When operating in Mobile Express mode, this capability should not be enabled.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b and software must mask them to allow for future uses of these bits.
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. For systems that support Secondary PCI Express Extended Capability, BIOS should write a 1h to this register else it should write 0
15:0	0h RW/O	**PCI Express Extended Capability ID (PCIEECID):** PCI Express Extended Capability ID (PCIEECID): This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. PCI Express Extended Capability ID for the Secondary PCI Express Extended Capability is 0019h. For systems that support Secondary PCI Express Extended Capability, BIOS should write a 0019h to this register else it should write 0.

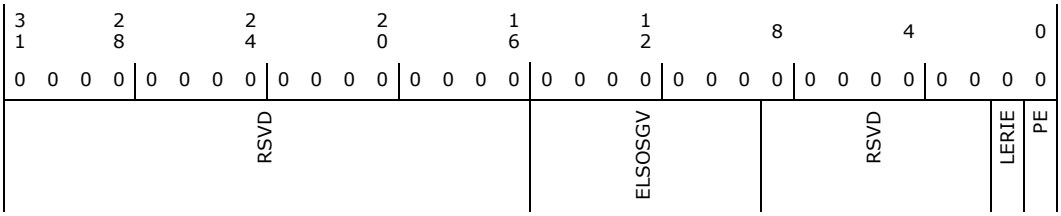
22.7.54 Link Control 3 (LCTL3)—Offset 224h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:9	0h RO	**Enable Lower SKP OS Generation Vector (ELSOSGV):** Enable Lower SKP OS Generation Vector(ELSOSGV): When the Link is in L0 and the bit in this field corresponding to the current Link speed is Set, SKP Ordered Sets are scheduled at the rate defined for SRNS, overriding the rate required based on the clock tolerance architecture. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is Set in this field and the corresponding bit in the Lower SKP OS Generation Supported Speeds Vector is not set.
8:2	0h RO	Reserved.
1	0h RW	**Link Equalization Request Interrupt Enable (LERIE):** Link Equalization Request Interrupt Enable (LERIE): When set, this bit enables the generation of an interrupt to indicate that the Link Equalization Request bit has been set.
0	0h RW	**Perform Equalization (PE):** Perform Equalization (PE): When this bit is 1b and Link Retrain bit is set with the Target Link Speed field set to 8 GT/s, the Downstream Port must perform Link Equalization. This bit is cleared by Root Port upon entry to Link Equalization

22.7.55 Lane 0 and Lane 1 Equalization Control (L01EC)—Offset 22Ch

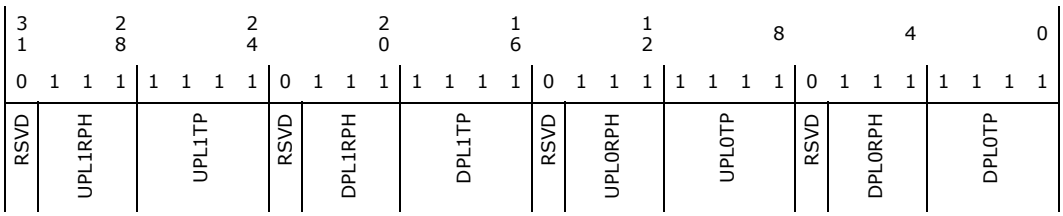
Each entry contains the values for the Lane with the corresponding default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during Link training.
Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 7F7F7F7Fh



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	Reserved.
30:28	7h RW	**Upstream Port Lane 1 Receiver Preset Hint (UPL1RPH):** Upstream Port Lane 1 Receiver Preset Hint (UPL1RPH): Field contains the Receiver Preset Hint value sent or received during Link Equalization.
27:24	Fh RW	**Upstream Port Lane 1 Transmitter Preset (UPL1TP):** Upstream Port Lane 1 Transmitter Preset (UPL1TP): Field contains the Transmit Preset value sent or received during Link Equalization.
23	0h RO	Reserved.
22:20	7h RW	**Downstream Port Lane 1 Receiver Preset Hint (DPL1RPH):** Downstream Port Lane 1 Receiver Preset Hint (DPL1RPH): Receiver Preset Hint may be used as a hint for receiver equalization by this Port when the Port is operating as a Downstream Port.
19:16	Fh RW	**Downstream Port Lane 1 Transmitter Preset (DPL1TP):** Downstream Port Lane 1 Transmitter Preset (DPL1TP): Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.
15	0h RO	Reserved.
14:12	7h RW	**Upstream Port Lane 0 Receiver Preset Hint (UPL0RPH):** Upstream Port Lane 0 Receiver Preset Hint (UPL0RPH): Field contains the Receiver Preset Hint value sent or received during Link Equalization.
11:8	Fh RW	**Upstream Port Lane 0 Transmitter Preset (UPL0TP):** Upstream Port Lane 0 Transmitter Preset (UPL0TP): Field contains the Transmit Preset value sent or received during Link Equalization.
7	0h RO	Reserved.
6:4	7h RW	**Downstream Port Lane 0 Receiver Preset Hint (DPL0RPH):** Downstream Port Lane 0 Receiver Preset Hint (DPL0RPH): Receiver Preset Hint may be used as a hint for receiver equalization by this Port when the Port is operating as a Downstream Port.
3:0	Fh RW	**Downstream Port Lane 0 Transmitter Preset (DPL0TP):** Downstream Port Lane 0 Transmitter Preset (DPL0TP): Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.

22.7.56 Lane 2 and Lane 3 Equalization Control (L23EC)—Offset 230h

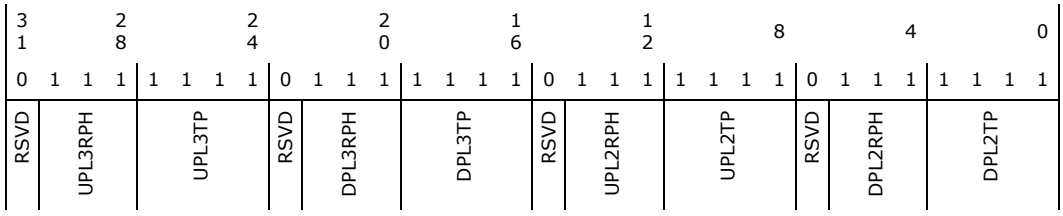
Each entry contains the values for the Lane with the corresponding default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during Link training.
Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 7F7F7F7Fh



Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	Reserved.
30:28	7h RW	**Upstream Port Lane 3 Receiver Preset Hint (UPL3RPH):** Upstream Port Lane 3 Receiver Preset Hint (UPL3RPH): Field contains the Receiver Preset Hint value sent or received during Link Equalization.
27:24	Fh RW	**Upstream Port Lane 3 Transmitter Preset (UPL3TP):** Upstream Port Lane 3 Transmitter Preset (UPL3TP): Field contains the Transmit Preset value sent or received during Link Equalization.
23	0h RO	Reserved.
22:20	7h RW	**Downstream Port Lane 3 Receiver Preset Hint (DPL3RPH):** Downstream Port Lane 3 Receiver Preset Hint (DPL3RPH): Receiver Preset Hint may be used as a hint for receiver equalization by this Port when the Port is operating as a Downstream Port.
19:16	Fh RW	**Downstream Port Lane 3 Transmitter Preset (DPL3TP):** Downstream Port Lane 3 Transmitter Preset (DPL3TP): Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.
15	0h RO	Reserved.
14:12	7h RW	**Upstream Port Lane 2 Receiver Preset Hint (UPL2RPH):** Upstream Port Lane 2 Receiver Preset Hint (UPL2RPH): Field contains the Receiver Preset Hint value sent or received during Link Equalization.
11:8	Fh RW	**Upstream Port Lane 2 Transmitter Preset (UPL2TP):** Upstream Port Lane 2 Transmitter Preset (UPL2TP): Field contains the Transmit Preset value sent or received during Link Equalization.
7	0h RO	Reserved.
6:4	7h RW	**Downstream Port Lane 2 Receiver Preset Hint (DPL2RPH):** Downstream Port Lane 2 Receiver Preset Hint (DPL2RPH): Receiver Preset Hint may be used as a hint for receiver equalization by this Port when the Port is operating as a Downstream Port.
3:0	Fh RW	**Downstream Port Lane 2 Transmitter Preset (DPL2TP):** Downstream Port Lane 2 Transmitter Preset (DPL2TP): Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.

22.8 PCI Express NP16 Uplink Port Configuration Registers Register Summary

The NP16 Uplink is a single endpoint PCIe controller. This controller is configurable into being x16, x8, x4 or x1. However, it is not capable of being configured into two endpoints (2x8 for example)

Table 22-9. Summary of PCI Express Port Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Identifiers (ID)—Offset 0h	37408086h
4h	7h	Device Command; Primary Status (CMD_PSTS)—Offset 4h	00100000h
8h	Bh	Revision ID;Class Code (RID_CC)—Offset 8h	06040000h
Ch	Fh	Cache Line Size; Primary Latency Timer; Header Type (CLS_PLT_HTYPE)—Offset Ch	0001000h
10h	17h	Express Port memory Base Address Register (EXPPTMBAR_UX16) - Offset 10h	000000000 0000004H
18h	1Bh	Bus Numbers; Secondary Latency Timer (BNUM_SLT)—Offset 18h	00000000h
1Ch	1Fh	I/O Base and Limit; Secondary Status (IOBL_SSTS)—Offset 1Ch	00000000h
20h	23h	Memory Base and Limit (MBL)—Offset 20h	00000000h
24h	27h	Prefetchable Memory Base and Limit (PMBL)—Offset 24h	00010001h
28h	2Bh	Prefetchable Memory Base Upper 32 Bits (PMBU32)—Offset 28h	00000000h
2Ch	2Fh	Prefetchable Memory Limit Upper 32 Bits (PMLU32)—Offset 2Ch	00000000h
34h	37h	Capabilities List Pointer (CAPP)—Offset 34h	00000040h
38h	3Bh	Expansion ROM Base Address Register (EXPROM) - Offset 38h	00000000
3Ch	3Fh	Interrupt Information; Bridge Control (INTR_BCTRL)—Offset 3Ch	00000100h
40h	43h	Capabilities List; PCI Express Capabilities (CLIST_XCAP)—Offset 40h	00528010h
44h	47h	Device Capabilities (DCAP)—Offset 44h	00008002h
48h	4Bh	Device Control; Device Status (DCTL_DSTS)—Offset 48h	00002000h
4Ch	4Fh	Link Capabilities (LCAP)—Offset 4Ch	0041C903h
50h	53h	Link Control; Link Status (LCTL_LSTS)—Offset 50h	00010000h
64h	67h	Device Capabilities 2 (DCAP2)—Offset 64h	00000000h
68h	6Bh	Device Control 2; Device Status 2 (DCTL2_DSTS2)—Offset 68h	00000000h
6Ch	6Fh	Link Capabilities 2 (LCAP2)—Offset 6Ch	0000000Eh
70h	73h	Link Control 2; Link Status 2 (LCTL2_LSTS2)—Offset 70h	00000003h
80h	83h	Power Management Capability, PCI Power Management Capabilities (PMCAP_PMC) - Offset 80h	C8038801h
84h	87h	PCI Power Management Control and Status (PMCS) - Offset 84h	00000008h
88h	8Bh	Subsystem Capability List Register (SVCAP) - Offset 88h	0000000D
8C	8F	Subsystem Vendor ID (SVID) - Offset 8C	00008086
EA	EF	Personality Lock Key Control Register (PLKCTL) - Offset EAh	00000000
100h	103h	Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h	20010001h
104h	107h	Uncorrectable Error Status (UES)—Offset 104h	00000000h
108h	10Bh	Uncorrectable Error Mask (UEM)—Offset 108h	00200000h
10Ch	10Fh	Uncorrectable Error Severity (UEV)—Offset 10Ch	00262010h
110h	113h	Correctable Error Status (CES)—Offset 110h	00000000h

Table 22-9. Summary of PCI Express Port Configuration Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
114h	117h	Correctable Error Mask (CEM)—Offset 114h	0000E000h
118h	11Bh	Advanced Error Capabilities and Control (AECC)—Offset 118h	00000000h
11Ch	128h	Header Log Register (AERHDRLOG[1-4]) - Offset 11c - 128h	00000000h
140h	143h	Uncorrectable Error Detect Mask Register (ERRUNCDETMSK) - Offset 140h	04000000
144h	147h	Correctable Error Detect Mask Register (ERRCORDETMSK) - Offset 144h	00000000
200h	203h	Secondary PCI Express Extended Capability Header (SPEECH)—Offset 200h	00010019h
204h	207h	Link Control 3 (LCTL3)—Offset 204h	00000000h
208h	20Bh	Lane Error Status Register (LANEERRSTS) - Offset 208	00000000
20Ch	22Ah	Lane Equalization Control Register (LANEEQCTL[0-15]) - Offset 20C - 22A by 2 (for up to 16 upstream lanes	7F00h

22.8.1 Identifiers (ID)—Offset 0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 37C08086h

31			28				24				20				16				12				8				4				0
0	0	1	1	0	1	1	1	1	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1	0	0	0	0	1	1	0
DID																VID															

Bit Range	Default and Access	Field Name (ID): Description
31:16	37C0 RO/V	**Device Identification (DID):** Identifies this particular function.
15:0	8086h RO	**Vendor Identification (VID):** Indicates Intel.

22.8.2 Device Command; Primary Status (CMD_PSTS)—Offset 4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00100000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DPE	SSE	RMA	RTA	STA	PDTS		DPD	PFBC	RSVD	PC66	CLIST	IS	RSVD								ID	FBE	SEE	WCC	PERE	VGA_PSE	MWIE	SCE	BME	MSE	IOSE

Bit Range	Default and Access	Field Name (ID): Description
31	0b RW1C/V	**DPE - Detected Parity Error (DPE):** Set when the port receives a poisoned tlp from the PCIe interface of the internal backboner. This is set even if CMD.PERE is not set.
30	0b RW1C/V	**Signaled System Error (SSE):** This bit is set when ERR_FATAL or ERR_NONFATAL messages are sent to the root complex and the SERR enable bit in the PCICMD Register is set
29	0b RW1C/V	**Received Master Abort (RMA):** Set when the requester receives a completion with unsupported request status.
28	0b RW1C/V	**Received Target Abort (RTA):** Set when the root port receives a completion with completer abort.
27	0b RW1C/V	**Signaled Target Abort (STA):** This bit is Set when the port completes a Posted or Non-Posted Request as a Completer Abort error. This applies to a Function with a Type 1 Configuration header when the Completer Abort was generated by its Primary Side.
26:25	0b RO	**Primary DEVSEL# Timing Status (PDTS):** Reserved per *PCI Express Specification*.
24	0b RW1C/V	**Master Data Parity Error Detected (DPD):** This bit is set by a requester (primary side for type1 configuration headerfunctions) if the parity error response enable bit (PERE) in the Command Register is set and either of the following two conditions occur: • Requester receives a completion marked poisoned. • Requester sends a poisoned request (includes writes and messages) If the parity error bit is 0b, this bit is never set.
23	0b RO	**Primary Fast Back to Back Capable (PFBC):** Reserved per *PCI Express Specification*.
22	0b RV	**Reserved**.
21	0b RO	**Primary 66 MHz Capable (PC66):** Reserved per *PCI Express Specification*.
20	1b RO	**Capabilities List (CLIST):** Indicates the presence of a capabilities list.
19	0b RO/V	**Interrupt Status (IS):** When set indicates that an INTx emulation interrupt is pending internally for this function.
18:11	0h RV	**Reserved**.

Bit Range	Default and Access	Field Name (ID): Description
10	0b RW	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts on enabled hot plug and power management events. This bit has no effect on MSI operation. When set, internal INTx# messages will not be generated. When cleared, internal INTx# messages are generated if there is an interrupt for hot plug or power management and MSI is not enabled. This bit does not affect interrupt forwarding from devices connected to the root port. Assert_INTx and Deassert_INTx messages will still be forwarded to the internal interrupt controllers if this bit is set. For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register is RO and returns a value of 0 when read, else it is RW with the functionality described above.
9	0b RO	**Fast Back to Back Enable (FBE):** Reserved per *PCI Express Specification*.
8	0b RW	**SERR# Enable (SEE):** When set, enables the root port to generate an SERR# message when PSTS.SSE is set.
7	0b RO	**Wait Cycle Control (WCC):** Reserved per *PCI Express Specification*.
6	0b RW	**Parity Error Response Enable (PERE):** Indicates that the device is capable of reporting parity errors as a master on the backbone.
5	0b RO	**VGA Palette Snoop (VGA_PSE):** Reserved per *PCI Express Specification*.
4	0b RO	**Memory Write and Invalidate Enable (MWIE):** Reserved per *PCI Express Specification*.
3	0b RO	**Special Cycle Enable (SCE):** Reserved per *PCI Express Specification* and *PCI Bridge Specification*.
2	0b RW	**Bus Master Enable (BME):.**This bit controls the ability of the Function to issue Memory and I/O read or write requests, and the ability of Root or Switch port to forward memory and I/O read or write requests in the upstream direction. When this bit is 0b, memory and I/O requests received at the root port or downstream side of a switch port (secondary side) must be handled as an Unsupported Request (UR). For Non-posted requests, a completion with UR completion status must be returned. For an endpoint, when this bit is Set, the PCI Express Function is allowed to issue Memory or I/O Requests. When this bit is Clear, the PCI Express Function is not allowed to issue any Memory or I/O Requests.
1	0b RW	**Memory Space Enable (MSE):** When set, memory cycles within the range specified by the memory base and limit registers can be forwarded to the PCI-Express device. When cleared, these memory cycles are responded to on the primary interface with an unsupported request completion.
0	0b RW	**I/O Space Enable (IOSE):** When set, I/O cycles within the range specified by the I/O base and limit registers can be forwarded to the PCI-Express device. When cleared, these cycles are responded to on the primary interface with an unsupported request completion.

22.8.3 Revision ID;Class Code (RID_CC)—Offset 8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 06040000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	1	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0
BCC								SCC								PI								RID								

Bit Range	Default and Access	Field Name (ID): Description
31:24	06h RW/L	**Base Class Code (BCC):** Indicates the device is a bridge device.
23:16	04h RW/L	**Sub-Class Code (SCC):** The default indicates the device is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:8	0h RW/L	**Programming Interface (PI):** This bit indicates that this device is standard (non-subtractive) PCI-to-PCI Bridge.
7:0	00h RO/V	**Revision ID (RID):** Indicates the revision of the function.

22.8.4 Cache Line Size; Primary Latency Timer; Header Type (CLS_PLT_HTYPE)—Offset Ch

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00010000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
BIST_TST								MFD	HTYPE							CT								LS								

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	**BIST tests (BIST_TST):** Not supported, hard wired to 00h
23	0b RW/L	**Multi-function Device (MFD):** This bit is '0' to indicate a single function device.

Bit Range	Default and Access	Field Name (ID): Description
22:16	01h RW/L	**Header Type (HTYPE):** The default mode identifies the header layout of the configuration space, which is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:8	00h RO	**Latency Count (CT):** Reserved per *PCI Express Specification*.
7:0	00h RW	**Line Size (LS):** This is read/write but contains no functionality, per *PCI Express Specification*.

22.8.5 Express Port Memory Base Address Register (EXPPTMBAR_UX16) — Offset 10h

Access Method

Type: CFG Register
(Size: 64 bits)

Device: 0
Function: 0

Default: 0000000000000004h

63			60				56				52				48				44				40				36				32
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DPE	RSE	RMA	RTA	STA	SDTS		MDPD	FBC	RSVD	SC66	RSVD				IOLA				IOLC				IOBA				IOBC				

Bit Range	Default and Access	Field Name (ID): Description
31	0b RW1C/V	**Detected Parity Error (DPE):** Set when the port receives a poisoned TLP.
30	0b RW1C/V	**Received System Error (RSE):** Set when the port receives an ERR_FATAL or ERR_NONFATAL message from the device.
29	0b RW1C/V	**Received Master Abort (RMA):** Set when the port receives a completion with 'Unsupported Request' status from the device.
28	0b RW1C/V	**Received Target Abort (RTA):** Set when the port receives a completion with 'Completion Abort' status from the device.
27	0b RW1C/V	**Signaled Target Abort (STA):** Set when the port generates a completion with 'Completion Abort' status to the device.

Bit Range	Default and Access	Field Name (ID): Description
26:25	0h RO	**DEVSEL# Timing Status (DVT):** Reserved per *PCI Express Specification*.
24	0b RW1C/V	**Master Data Parity Error Detected (MDPD):** Set when the BCTRL.PERE, and either of the following two conditions occurs: Port receives completion marked poisoned. Port poisons a write request to the secondary side.
23	0h RO	**Fast Back to Back Capable (FBC):** Reserved per *PCI Express Specification*.
22	0b RV	**Reserved**.
21	0b RO	**Secondary 66 MHz Capable (SC66):** Reserved per *PCI Express Specification*.
20:16	0h RV	Reserved.
15:12	0h RW	**I/O Address Limit (IOLA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to FFFh.
11:8	0h RO	**I/O Limit Address Capability (IOLC):** Indicates that the bridge does not support 32-bit I/O addressing.
7:4	0h RW	**I/O Base Address (IOBA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to 000h.
3:0	0h RO	**I/O Base Address Capability (IOBC):** Indicates that the bridge does not support 32-bit I/O addressing.

22.8.8 Memory Base and Limit (MBL)—Offset 20h

Accesses that are within the ranges specified in this register will be sent to the attached device if CMD.MSE is set. Accesses from the attached device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is MB [gt]= AD[lb]31:20[rb] [lt]= ML.

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 0h

31			28				24				20				16				12				8				4				0

0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
BADDR												RSVD																			EXPROMEN

Bit Range	Default and Access	Field Name (ID): Description
31:20	0h RW	**Base Address (BADDR)**: This marks the base address for the 1MB expansion ROM for the endpoint device. Firmware should initialize this region prior to PCIe enumeration.
19:1	0h RV	Reserved
0	0b RW/v	**Expansion ROM Enable (EXPROMEN):** This field enables the expansion ROM base address to be used by the device. 0: Disables access to Expansion ROM 1: Enables Access to Expansion ROM.

22.8.14 Interrupt Information; Bridge Control (INTR_BCTRL)—Offset 3Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00000100h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
RSVD				DTSE	DTS	SDT	PDT	FBE	SBR	MAM	V16	VE	IE	SE	PERE	IPIN								ILINE								

Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RV	**Reserved**.
27	0b RO	**Discard Timer SERR# Enable (DTSE):** Reserved per *PCI Express Specification*.
26	0b RO	**Discard Timer Status (DTS):** Reserved per *PCI Express Specification*.
25	0b RO	**Secondary Discard Timer (SDT):** Reserved per *PCI Express Specification*.
24	0b RO	**Primary Discard Timer (PDT):** Reserved per *PCI Express Specification*.
23	0b RO	**Fast Back to Back Enable (FBE):** Reserved per *PCI Express Specification*.
22	0b RW	**Secondary Bus Reset (SBR):** Triggers a hot reset on the PCI-Express port.
21	0b RO	**Master Abort Mode (MAM):** Reserved per *PCI Express Specification*.
20	0b RW	**VGA 16-Bit Decode (V16):** When set, indicates that the I/O aliases of the VGA range (see BCTRL:VE definition below), are not enabled. 0: Execute 10-bit address decode on VGA I/O accesses. 1: Execute 16-bit address decode on VGA I/O accesses.
19	0b RW	**VGA Enable (VE):** When set to 1b, the following ranges will be forwarded from the primary to the secondary side of the bridge regardless of the value of the I/O base and limit registers. Memory ranges A0000h-BFFFFh I/O ranges 3B0h 3BBh and 3C0h 3DFh, and all aliases of bits [15:10] in any combination of 1's
18	0b RW	**ISA Enable (IE):** This bit only applies to I/O addresses that are enabled by the I/O Base and I/O Limit registers and are in the first 64 KB of PCI I/O space. If this bit is set, the PCIe bridge will block any forwarding from the primary to the secondary sided I/O transactions addressing the last 768 bytes in each 1KB block (offsets 100h to 3FFh). In the opposite direction (secondary to primary) I/O transactions will be forwarded if they address the last 768B in each 1 KB block. 1: Forward upstream ISA I/O addresses in the address range defined by the I/O Base and I/O Limit registers that are in the firsts 64 KB of PCI I/O address space (Top 768B of each 1K block). 0: Forward downstream all I/O addresses in the address range defined by the I/O Base and I/O Limit registers.

Bit Range	Default and Access	Field Name (ID): Description
17	0b RW	SERR# Enable (SE): This bit controls the forwarding of ERR_COR, ERR_NONFATAL AND ERR_FATAL messages to the primary side of the PCIe port. 1: Enables forwarding of ERR_COR, ERR_NONFATA, ERR_FATAL messages. 0: Disables forwarding of ERR_COR, ERR_NONFATA, ERR_FATAL messages.
16	0b RW	Parity Error Response Enable (PERE): This bit controls the response to poisoned TLPs in the PCI Express port. 1: Enables reporting of poisoned TLP errors. 0: Disables reporting of poisoned TLP errors.
15:8	01h RW/L	**Interrupt Pin (IPIN):** This register tells which interrupt pin the function uses. 01h: Generate INTA 02h: Generate INTB 03h: Generate INTC 04h: Generate INTD Others: Reserved BIOS has the ability to write this register during boot to setup the correct interrupt for the function. Once the bits are locked they can not be updated until another PLTRST#
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register.

22.8.15 Capabilities List; PCI Express Capabilities (CLIST_XCAP)—Offset 40h

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00528010h

LABS	LBMS	LA	SCC	LT	RSVD	NLW								CLS				RSVD					LABIE	LBMIE	HAWD	ECPM	ES	CCC	RL	LD	RCBC	RSVD	ASPM		

Bit Range	Default and Access	Field Name (ID): Description
31	0b RO	**Link Autonomous Bandwidth Status (LABS):** This bit is not applicable and hardwired to 0b.
30	0b RO	**Link Bandwidth Management Status (LBMS):** This bit is not applicable and hardwired to 0b.
29	0h RO/V	**Link Active (LA):** Set to 1b when the Data Link Control and Management State Machine is in the DL_Active state, 0b otherwise.

Bit Range	Default and Access	Field Name (ID): Description
28	1b RW-L	**Slot Clock Configuration (SCC):** When to 1b, this bit indicates that the component uses the same physical reference clock that he platform provides on the connector. If the device uses an independent clock irrespective of the presence of a reference on the connector, this bit must be clear. 1: Indicates same reference clock. 0: Indicates independent reference clock
27	0b RO	**Link Training (LT):** This bit is not applicable for an upstream port and is hardwired to 0.
26	0b RV	**Reserved.**
25:20	0h RO/V	**Negotiated Link Width (NLW):** This field indicates the negotiated width of the PCI Express link. 00 0001b: x1 00 0010b: X2 00 0100b: x4 00 1000b: X8 00 1100b: X12—not supported 01 0000b: X16 10 0000b: X32—not supported All other values are reserved. ***Note:*** The value in this field is undefined when the link is not up.
19:16	1h RO/V	**Current Link Speed (CLS):** This field indicates the negotiated link speed of the given PCI Express link. 0001b: 2.5 Gb/s PCI Express Link 0010b: 5.0 Gb/s PCI Express Link 0011b: 8.0 Gb/s PCI Express Link Others: Reserved ***Notes:*** The encoding is the binary value of the bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. The value in this field is undefined when the link is not up.
15:12	0h RO	**Reserved**.
11	0b RO	**Link Autonomous Bandwidth Interrupt Enable (LABIE):** Link Autonomous Bandwidth Interrupt Enable - this is not applicable so hardwired to 0b.
10	0b RO	**Link Bandwidth Management Interrupt Enable (LBMIE):** The uplink does not implement the Link Bandwidth Notification Capability so this is hardwired to 0.
9	0b RW	**Hardware Autonomous Width Disable (HAWD):** When Set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width.
8	0b RO	**Enable Clock Power Management (ECPM):** Reserved. Not supported by the upstream port.
7	0h RW	**Extended Synch (ES):** When set, forces extended transmission of FTS ordered sets in FTS and extra TS2 at exit from L1 prior to entering L0.
6	0b RW	**Common Clock Configuration (CCC):** When set, indicates that the root port and device are operating with a distributed common reference clock. A value of 0b indicates that this component and the component at the opposite end of this link are operating with asynchronous reference clock. After changing the value in this bit in both components on a link, software must trigger the link to retrain by writing a 1b to the Retrain Link bit of the downstream port.
5	0b RO	**Retrain Link (RL):** Read only of 0b for an upstream port.
4	0b RO	**Link Disable (LD):** Read only of 0b for an upstream port.

Bit Range	Default and Access	Field Name (ID): Description
3	0b RO	**Read Completion Boundary Control (RCBC):** Indicates the read completion boundary is 64 bytes.
2	0b RV	**Reserved**.
1:0	00b RW	**Active State Link PM Control (ASPM):** Indicates whether the upstream port should enter L0s or L1 or both. Bits Definition 00 Disabled 01 L0s Entry Enabled 10 L1 Entry Enabled 11 L0s and L1 Entry Enabled

RSVD										LER	EQP3S	EQP2S	EQP1S	EqC	CDL	CD			CSOS	EMC	TM			SD	HASD	EC	TLS				

Bit Range	Default and Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21	0b RW1CS	**Link Equalization Request (LER):** This bit is set by hardware to request the Link equalization process to be performed on the Link.
20	0b ROS-V	**Equalization Phase 3 Successful (EQP3S):** When set to 1, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed.
19	0b ROS-V	**Equalization Phase 2 Successful (EQP2S):** When set to 1, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed.
18	0b ROS-V	**Equalization Phase 1 Successful (EQP1S):** When set to 1, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed.
17	0b ROS-V	**Equalization Complete (EqC):** When set to 1, this bit indicates that the Transmitter Equalization procedure has completed
16	0b RO V	**Current De-emphasis Level (CDL):** When the Link is operating at 5.0 GT/s speed, this bit reflects the level of de-emphasis. Encodings: 1b -3.5 dB 0b -6 dB The value in this bit is undefined when the Link is not operating at 5.0 GT/s speed.

Bit Range	Default and Access	Field Name (ID): Description
15:12	0h RWS	**Compliance Preset/De-emphasis (CD):** For 8 GT/s and 5 GT/s: This bit sets the transmitter preset level forPolling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. The Encoding are defined as follows: 8 GT/s Rate: 0000b: -6 dB for de-emphasis, 0 dB for preshoot 0001b: -3.5 dB for de-emphasis, 0 dB for preshoot 0010b: -4.5 dB for de-emphasis, 0 dB for preshoot 0011b: -2.5 dB for de-emphasis, 0 dB for preshoot 0100b: 0 dB for de-emphasis, 0 dB for preshoot 0101b: 0 dB for de-emphasis, 2 dB for preshoot 0110b: 0 dB for de-emphasis, 2.5 dB for preshoot 0111b: -6 dB for de-emphasis, 3.5 dB for preshoot 1000b: -3.5 dB for de-emphasis, 3.5 dB for preshoot 1001b: 0 dB for de-emphasis, 3.5 dB for preshoot 1010b: The Transmitter Preset encoding of 1010b corresponds to the maximum Vtx-boost that the Transmitter advertises with FS and LF in both full swing and reduced swing modes with C_{-1} = 0 and C_{+1} = FS – (2*LF). All other encodings are reserved. 5 GT/s Rate: 001b: -3.5dB 000b: -6 dB All other are reserved. When the link is operating at 2.5 Gb/s, the setting of this bit has no effect.
11	0h RWS	**Compliance SOS (CSOS):** When set to 1b, the LTSSM is required to send SKP Ordered Sets periodically in between the (modified) compliance patterns. The default value of this bit is 0b.
10	0b RWS	**Enter Modified Compliance (EMC):** When this bit is set to 1b, the device transmits Modified Compliance Pattern if the LTSSM enters Polling.Compliance substate. Default value of this bit is 0b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
9:7	0h RWS-V	**Transmit Margin (TM):** This field controls the value of the non-de-emphasized voltage level at the transmitter pins. This field is reset to 000b on entry to the LTSSM Polling.Configuration substate. 000b: Normal operating range 001b: 800-1200 mV for full swing and 400-700 mV for half-swing Others: Reserved This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
6	0b RO	**Selectable De-emphasis (SD):** not supported.
5	0b RWS	**Hardware Autonomous Speed Disable (HASD):** When set, this bit disables hardware from changing the link speed for device specific reasons other than attempting to correct unreliable link operation by reducing link speed for device-specific reasons other than attempting to correct unreliable link operations by reducing link speed. Initial transition to the highest supported common link speed is not blocked by this bit.

Bit Range	Default and Access	Field Name (ID): Description
4	0b RWS-V	**Enter Compliance (EC):** Software is permitted to force a Link to enter Compliance mode at the speed indicated in the Target Link Speed field by setting this bit to 1b in both components on a Link and then initiating a hot reset on the Link. Default value of this bit following Fundamental Reset is 0b. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value.
3:0	3h RWS-V	**Target Link Speed (TLS):** For downstream ports and root ports, this field sets an upper limit on link operational speed by restricting the values advertised by the Downstream Port in its training sequences. 0001b: 2.5 Gb/s Target Link Speed 0010b: 5.0 Gb/s Target Link Speed 0011b: 8.0 Gb/s Target Link Speed Others: Reserved ***Notes:*** The encoding is the binary value of the bit in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the desired target Link speed. All other encodings are reserved. If a value is written to this field that does not correspond to a speed included in the Supported Link Speeds field, the result is undefined. The default value of this field is the highest Link speed supported by the component (as reported in the Max Link Speed field of the Link Capabilities register) unless the corresponding platform/form factor requires a different default value. For both Upstream and Downstream Ports, this field is used to set the target compliance mode speed when software is using the Enter Compliance bit to force a Link into compliance mode.

20	0h RO	**Reserved**.
19	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
18:16	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	88h RO	**Next Capability (NEXT):** Contains the offset of the next item in the Capabilities List.
7:0	1h RO	**Capability Identifier (CID):** Value of 01h indicates this is a PCI power management capability.

22.8.25 PCI Power Management Control And Status (PMCS)—Offset 84h

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00000008h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
RSVD								BPCE	B23S	RSVD							PMES	DSC	DSEL				PMEE	RSVD				NSR	RSVD	PS		

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RV	**Reserved**
23	0b RO	**Bus Power / Clock Control Enable (BPCE):** Reserved per *PCI Express Specification*.
22	0b RO	**B2/B3 Support (B23S):** Reserved per *PCI Express Specification*.
21:16	0h RV	**Reserved.**
15	0b RW1CS	**PME Status (PMES):** Indicates a PME was received.
14:13	0h RO	**Data Scale (DSC):** Not supported
12:9	0h RO	**Data Select (DSEL):** Not supported
8	0b RWS	**PME Enable (PMEE):** Gates assertion of the PME message.
7:4	0h RV	**Reserved**.
3	1b RWL	**No Soft Reset (NSR):** When set to 1 this bit indicates that devices transitioning from $D3_{HOT}$ to D0 because of Power State commands do not perform an internal reset. Configuration context is preserved. Upon transition from $D3_{HOT}$ to D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the Power State bits. When clear, devices do perform an internal reset upon transitioning from $D3_{HOT}$ to D0 via software control of the Power State bits. Configuration Context is lost when performing the soft reset. Upon transition from $D3_{HOT}$ to D0 state, full reinitialization sequence is needed to return the device to D0 Initialized.
2	0b RV	**Reserved**.
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the upstream port and to set a new power state. The values are: 00 D0 state 11 $D3_{HOT}$ state If software attempts to write a '10' or '01' to these bits, the write will be ignored.

22.8.26 Subsystem Capability List Register (SVCAP)—Offset 88h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 000000Dh

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	0	0	1	1	0	1
RSVD																NEXT								CID							

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h Rv	Reserved.
15:8	0h RO	**Next Capability (NEXT):** For upstream ports there is no MSI structure so the capability is terminated
7:0	Dh RO	**Capability Identifier (CID):** Value of 0Dh indicates the function as subsystem identification capable.

22.8.27 Subsystem Vendor IDs (SVID)—Offset 8Ch

Size:32 bits.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00008086h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1	0	0	0	0	1	1	0
SID																SVID															

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW-L	**Subsystem Identifier (SID):** Indicates the subsystem as identified by the vendor. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).
15:0	8086h RW-L	**Subsystem Vendor Identifier (SVID):** Indicates the manufacturer of the subsystem. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).

22.8.28 Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h

Size:32 bits.

The AER capability can optionally be included or excluded from the capabilities list. The full AER is supported.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 20010001h

31			28				24				20				16				12				8				4				0
0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
NCO													CV				CID															

Bit Range	Default and Access	Field Name (ID): Description
31:20	200h RW-L	**Next Capability Offset (NCO):** Contains the offset of the next structure in the extended capabilities list.
19:16	1h RO	**Capability Version (CV):** Indicates the version of the capability structure present.
15:0	0001h RO	**Capability ID (CID):** Identifies the function as Advanced Error Reporting capable.

22.8.29 Uncorrectable Error Status (UES)—Offset 104h

This register must maintain its state through a platform reset. It loses its state upon loss of core power.

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD						PLTLPEBS	TPEBS	AEBE	MCE	UIE	AVS	URE	EE	MT	RO	UC	CA	CT	FCPE	PT	RSVD							SDE	DLPE	RSVD			

Bit Range	Default and Access	Field Name (ID): Description
31:27	000h RV	Reserved.
26	0b RO	**Poisoned TLP Egress Blocked Status (PLTLPEBS)**
25	0b RO	**TLP Prefix Blocked Error Status (TPBES)**
24	0b RW1CS	**Atomic Egress Blocked Status (AEBE):** This bit will never be set
23	0b RW1CS	**MC Blocked TLP Status (MCE):** This bit is set whenever a Multicast TLP is blocked
22	0b RW1CS	**Uncorrectable Internal Error Status (UIE):** This bit is set whenever an uncorrectable internal error is detected.
21	0b RO	**ACS Violation Status (AVS):** Reserved, not supported
20	0b RW1CS	**Unsupported Request Error Status (URE):** Indicates an unsupported request was received.
19	0b RW1CS	**ECRC Error Status (EE):** Set to 1b when an ECRC is detected
18	0b RW1CS	**Malformed TLP Status (MT):** Indicates a malformed TLP was received.
17	0b RW1CS	**Receiver Overflow Status (RO):** Indicates a receiver overflow occurred.
16	0b RW1CS	**Unexpected Completion Status (UC):** Indicates an unexpected completion was received.
15	0b RW1CS	**Completor Abort Status (CA):** Indicates a completer abort was received
14	0b RO	**Completion Timeout Status (CT):** not applicable as the upstream port will not issue non-posted requests on it's one behalf.
13	0b RW1CS	**Flow Control Protocol Error Status (FCPE):** This bit is set when a flow control error protocol is detected.
12	0b RW1CS	**Poisoned TLP Status (PT):** Indicates a poisoned TLP was received.
11:6	0h RV	**Reserved.** Software must write '0' to these bits
5	0b RO	**Surprise Down Error Status (SDE):** Surprise Down is not supported.
4	0b RW1CS	**Data Link Protocol Error Status (DLPE):** Indicates a data link protocol error occurred.
3:0	0h RV	**Reserved.**

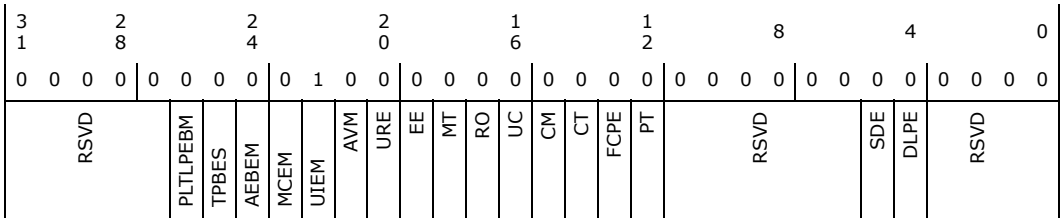
22.8.30 Uncorrectable Error Mask (UEM)—Offset 108h

When set, the corresponding error in the UES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00200000h



Bit Range	Default and Access	Field Name (ID): Description
31:27	0h RV	**Reserved.**
26	0b RO	**Poisoned TLP Egress Blocked Mask (PLTLPEBM)**: Not supported
25	0b RO	**TLP Prefix Blocked Error Mask (TPBES)**: not supported
24	0b RWS	**AtomicOP Egress Blocked Mask (AEBEM)**
23	0b RWS	**MC Blocked TLP Mask (MCEM):**
22	1b RWS	**Uncorrectable Internal Error Mask (UIEM)**
21	0b RO	**ACS Violation Mask (AVM):** Reserved. Access Control Services are not supported
20	0b RWS	**Unsupported Request Error Mask (URE):**
19	0b RWS	**ECRC Error Mask (EE):**
18	0b RWS	**Malformed TLP Mask (MT):**
17	0b RWS	**Receiver Overflow Mask (RO):**
16	0b RWS	**Unexpected Completion Mask (UC):**
15	0b RWS	**Completor Abort Mask (CM):**
14	0b RWS	**Completion Timeout Mask (CT):** Not supported.
13	0b RWS	**Flow Control Protocol Error Mask (FCPE):**

Bit Range	Default and Access	Field Name (ID): Description
12	0b RWS	**Poisoned TLP Mask (PT):**
11:6	0h RV	**Reserved.**
5	0h RO	**Surprise Down Error Mask (SDE):** not supported.
4	0b RWS	**Data Link Protocol Error Mask (DLPE):**
3:0	0h RV	**Reserved.**

22.8.31 Uncorrectable Error Severity (UEV)—Offset 10Ch

This register gives the option to make an uncorrectable error fatal or non-fatal. An error is fatal if the bit is set. An error is non-fatal if the bit is cleared. This register is only reset by a loss of core power.

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00262010h

31			28				24				20				16				12				8				4				0

31:27	000h RV	**Reserved.**
26	0b RO	**Poisoned TLP Egress Blocked Severity (PTLBEBS)**
25	0b RO	**TLP Prefix Blocked Error Severity (TPBES)**
24	0b RWS	**AtomicOP Egress Blocked Severity (AEBES)**
23	0b RWS	**MC Blocked TLP Severity (MCES)**
22	1b RWS	**Uncorrectable Internal Error Severity (UIES)**
21	0b RO	**ACS Violation Severity (AVS):** Not supported
20	0b RWS	**Unsupported Request Error Severity (URE):**

Bit Range	Default and Access	Field Name (ID): Description
19	0b RWS	**ECRC Error Severity (EE):**
18	1h RWS	**Malformed TLP Severity (MT):**
17	1b RWS	**Receiver Overflow Severity (RO):**
16	0b RWS	**Unexpected Completion Severity (UC):**
15	0b RWS	**Completor Abort Severity (CA):**
14	0b RO	**Completion Timeout Severity (CT):** Not Supported
13	1b RWS	**Flow Control Protocol Error Severity (FCPE):**
12	0b RWS	**Poisoned TLP Severity (PT):**
11:6	0h RV	Reserved.
5	0b RO	**Surprise Down Error Severity (SDE):** Not supported.
4	1b RWS	**Data Link Protocol Error Severity (DLPE):**
3:0	0h RV	Reserved.

22.8.32 Correctable Error Status (CES)—Offset 110h

This register is only reset by a loss of core power.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function: 0

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD																HLOE	CIE	ANFES	RTT	RSVD			RNR	BD	BT	RSVD					RE	

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RV	**Reserved**. Software must write a "0" to these bits.
15	0b RW1CS	**Header Log Overflow Error (HLOE)**
14	0b RW1CS	**Correctable Internal Error (CIE)**
13	0b RW1CS	**Advisory Non-Fatal Error Status (ANFES):**
12	0b RW1CS	**Replay Timer Timeout Status (RTT):** Indicates the replay timer timed out.
11:9	0h RV	**Reserved.** Software must write '0' to these bits.
8	0b RW1CS	**Replay Number Rollover Status (RNR):** Indicates the replay number roll over from 11 to 00.
7	0b RW1CS	**Bad DLLP Status (BD):** Indicates a bad DLLP was received.
6	0b RW1CS	**Bad TLP Status (BT):** Indicates a bad TLP was received.
5:1	0h RV	**Reserved**. Software must write '0' to these bits.
0	0b RW1CS	**Receiver Error Status (RE):** Indicates that the physical layer detected a receiver error.

22.8.33 Correctable Error Mask (CEM)—Offset 114h

When set, the corresponding error in the CES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 0000E000h

31			28				24				20				16				12				8			4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0
RSVD																HLOEM	CIEM	ANFEM	RTT	RSVD			RNR	BD	BT	RSVD				RE

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RV	Reserved.
15	1b RWS	**Header Log Overflow Error Mask (HLOEM)**
14	1b RWS	**Correctable Internal Error Mask (CIEM)**
13	1b RWS	**Advisory Non-Fatal Error Mask (ANFEM):** When set, masks Advisory Non-Fatal errors from (a) signaling ERR_COR to the device control register and (b) updating the Uncorrectable Error Status register. This register is set by default to enable compatibility with software that does not comprehend Role-Based Error Reporting.
12	0b RWS	**Replay Timer Timeout Mask (RTTEM):**
11:9	0h RO	**Reserved**.
8	0b RWS	**Replay Number Rollover Mask (RNREM):**
7	0b RWS	**Bad DLLP Mask (BDLLPEM):.**
6	0b RWS	**Bad TLP Mask (BTLPEM):**
5:1	0h RO	**Reserved**.
0	0h RW/P	**Receiver Error Mask (REM):**

22.8.34 Advanced Error Capabilities and Control (AECC)—Offset 118h

This register gives the status and control for ECRC checks, and also the pointer to the first uncorrectable error that happened. This register is only reset by a loss of core power.

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD																			CTPHLC	TLPPLP	MHRE	MHRC	ECE	ECC	EGE	EGC	FEP					

Bit Range	Default and Access	Field Name (ID): Description
31:13	0h RV	Reserved.
12	0b RO	**Completion Timeout Prefix/Header Log Capable (CTPHLC):** If Set, this bit indicates that the Function records the prefix/header of Request TLPs that experience a Completion Timeout error.
11	0b ROSV	**TLP Prefix Log Present (TLPPLP):** If Set and the First Error Pointer is valid, indicates that the TLP Prefix Log register contains valid information. If Clear or if First Error Pointer is invalid, the TLP Prefix Log register is undefined.
10	0b RO	**Multiple Header Recording Enable (MHRE):** Multiple Header recording is not supported
9	0b RO	**Multiple Header Recording Capable (MHRC):** Multiple header recording is not supported.
8	0b RWS	**ECRC Check Enable (ECE):**
7	0b RWL	**ECRC Check Capable (ECC):**
6	0b RWS	**ECRC Generation Enable (EGE):**
5	0b RWL	**ECRC Generation Capable (EGC):**.
4:0	0h ROSV	**First Error Pointer (FEP):** This field identifies the bit position of the first error reported in the UncorrectableError Status Register (xref). This register re-arms itself (which does not change its current value) as soon as the error status bit indicated by the pointer is cleared by the software by writing a 1 to that status bit.

22.8.35 Header Log Register (AERHDRLOG[1-4])—Offset 11C - 128h by 4h

This register logs the 4 Dwords of the transaction header for PCI Express Errors.

Type: CFG Register
(Size: 32 bits)

Device:
Function: 0

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
AERHDRLOG																															

Bit Range	Default and Access	Field Name (ID): Description
31:0	00000000h ROSV	**TLP Header Log (TLPHDRLOG)**: As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log, thus rearming the logging of errors

22.8.36 Uncorrectable Error Detect Mask Register (ERRUNCDETMSK)—Offset 140h

A value of 1 masks the field and prevents detection as well as logging of errors.

Access Method

Type: CFG Register

14	0b RW1CS	**Lane 14 Error (L14ERR)**: A value of 1b indicates that a lane based error was detected on this PCIe Express lane.
13	0b RW1CS	**Lane 13Error (L13ERR)**: A value of 1b indicates that a lane based error was detected on this PCIe Express lane.
12	0b RW1CS	**Lane 12 Error (L12ERR)**: A value of 1b indicates that a lane based error was detected on this PCIe Express lane.
11	0b RW1CS	**Lane 11 Error (L11ERR)**: A value of 1b indicates that a lane based error was detected on this PCIe Express lane.

Bit Range	Default and Access	Field Name (ID): Description
10	0b RW1CS	**Lane 10 Error (L10ERR)**: A value of 1b indicates that a lane based error was detected on this PCIe Express lane.
9	0b RW1CS	**Lane 9 Error (L9ERR)**: A value of 1b indicates that a lane based error was detected on this PCIe Express lane.
8	0b RW1CS	**Lane 8Error (L8ERR)**: A value of 1b indicates that a lane based error was detected on this PCIe Express lane.
7	0b RW1CS	**Lane 7Error (L7ERR)**: A value of 1b indicates that a lane based error was detected on this PCIe Express lane.
6	0b RW1CS	**Lane 6Error (L6ERR)**: A value of 1b indicates that a lane based error was detected on this PCIe Express lane.
5	0b RW1CS	**Lane 5Error (L5ERR)**: A value of 1b indicates that a lane based error was detected on this PCIe Express lane.
4	0b RW1CS	**Lane 4 Error (L4ERR)**: A value of 1b indicates that a lane based error was detected on this PCIe Express lane.
3	0b RW1CS	**Lane 3Error (L3ERR)**: A value of 1b indicates that a lane based error was detected on this PCIe Express lane.
2	0b RW1CS	**Lane 2Error (L2ERR)**: A value of 1b indicates that a lane based error was detected on this PCIe Express lane.
1	0b RW1CS	**Lane 1Error (L1ERR)**: A value of 1b indicates that a lane based error was detected on this PCIe Express lane.
0	0b RW1CS	**Lane 0 Error (L0ERR)**: A value of 1b indicates that a lane based error was detected on this PCIe Express lane.

22.8.41 Lane Equalization Control Register (LANEEQCTL[0-15])—Offset 20C - 22Ah by 2h (for up to 16 Upstream Lanes)

Each entry contains the values for the Lane with the corresponding default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during Link training.

Type: CFG Register
(Size: 16bits)

Device:
Function: 0

Default: 7F00

15	14	13	12	11	10	9	8	7	6	5	3	2	2	1	0
0	1	1	1	1	1	1	1	0	0	0	0	0	0	0	0
RSVD	UPRPH			UPTP				RSVD							

Bit Range	Default and Access	Field Name (ID): Description
15	0h RV	**Reserved**.
14:12	7h ROV	**Upstream Port Lane 1 Receiver Preset Hint (UPRPH):** Upstream Port Lane 1 Receiver Preset Hint (UPL1RPH): Field contains the Receiver Preset Hint value sent or received during Link Equalization. The settings are: 000b: -6 dB 001b: -7 dB 010b: -8 dB 011b: -9 dB 100b: -10 dB 101b: -11 dB 110b: -12 dB 111b: Reserved
11:8	Fh ROV	**Upstream Port Lane 1 Transmitter Preset (UPTP):** Upstream Port Lane 1 Transmitter Preset (UPL1TP): Field contains the Transmit Preset value sent or received during Link Equalization. The settings are: 0000b: -6 dB for de-emphasis, 0 dB for preshoot 0001b: -3.5 dB for de-emphasis, 0 dB for preshoot 0010b: -4.5 dB for de-emphasis, 0 dB for preshoot 0011b: -2.5 dB for de-emphasis, 0 dB for preshoot 0100b: 0 dB for de-emphasis, 0 dB for preshoot 0101b: 0 dB for de-emphasis, 2 dB for preshoot 0110b: 0 dB for de-emphasis, 2.5 dB for preshoot 0111b: -6 dB for de-emphasis, 3.5 dB for preshoot 1000b: -3.5 dB for de-emphasis, 3.5 dB for preshoot 1001b: 0 dB for de-emphasis, 3.5 dB for preshoot 1010b: The Transmitter Preset encoding of 1010b corresponds to the maximum Vtx-boost that the Transmitter advertises with FS and LF in both full swing and reduced swing modes with C_{-1} = 0 and C_{+1} = FS – (2*LF). All other encodings are reserved.
7:0	00h RV	Reserved.

22.8.42 Implementation Specific Registers

The following register lies in PCIe configuration space. It is not part of any PCIe specification register definition and is unique to the implementation on the Intel® C620 Series Chipset. With the normal register discovery mechanism this can not be found, and is only discovered by being listed here.

22.8.43 Personality Lock Key Control Register (PLKCTL) —Offset EAh

Type: CFG Register
(Size: 32 bits)

Device:
Function: 0

Default: 00000000

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h Rv	Reserved.
0	0b RW-L	**Capability Lock (CL):** Lock key bit for all RWS-L bits (capabilities, next capability pointer, SSID/SVID, etc.) 1b = lock 0b = unlocked ***Note:*** This bit is self-locking. Once this bit is set to 1b, this key bit can not be unlocked. Writing a 0b has no effect on this bit.

22.9 PCI Express NP8 Uplink Port Configuration Registers Register Summary

The NP16 Uplink is a single endpoint PCIe controller. This controller is configurable into being x8, x4 or x1. However, it is not capable of being configured into two endpoints (2x4 for example). This port is muxed with the output of the SATA and PCIe Root Port controllers and is configured by a combination of fuses and soft straps. This muxing is static, meaning at start up the I/O is configured to be routed to one these 3 ports and does not dynamically change during run time.

Table 22-10. Summary of PCI Express Port Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Identifiers (ID)—Offset 0h	37418086h
4h	7h	Device Command; Primary Status (CMD_PSTS)—Offset 4h	00100000h

Bit Range	Default and Access	Field Name (ID): Description
31:16	37C1 RO/V	**Device Identification (DID):** Identifies this particular function as the x8 PCIe Upstream port in the Intel® C620 Series Chipset.
15:0	8086h RO	**Vendor Identification (VID):** Indicates Intel.

22.9.2 Device Command; Primary Status (CMD_PSTS)—Offset 4h

Type: CFG Register
(Size: 32 bits)

Device: 00
Function: 0

Default: 00100000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DPE	SSE	RMA	RTA	STA	PDTS		DPD	PFBC	RSVD	PC66	CLIST	IS	RSVD								ID	FBE	SEE	WCC	PERE	VGA_PSE	MWIE	SCE	BME	MSE	IOSE

Bit Range	Default and Access	Field Name (ID): Description
31	0b RW1C/V	**DPE - Detected Parity Error (DPE):** Set when the port receives a poisoned tlp from the PCIe interface of the internal backboner. This is set even if CMD.PERE is not set.
30	0b RW1C/V	**Signaled System Error (SSE):** This bit is set when ERR_FATAL or ERR_NONFATAL messages are sent to the root complex and the SERR enable bit in the PCICMD Register is set
29	0b RW1C/V	**Received Master Abort (RMA):** Set when the requester receives a completion with unsupported request status.
28	0b R/1C/V	**Received Target Abort (RTA):** Set when the root port receives a completion with completer abort.
27	0b RW1C/V	**Signaled Target Abort (STA):** This bit is Set when the port completes a Posted or Non-Posted Request as a Completer Abort error. This applies to a Function with a Type 1 Configuration header when the Completer Abort was generated by its Primary Side.
26:25	0h RO	**Primary DEVSEL# Timing Status (PDTS):** Reserved per *PCI Express Specification*.
24	0b RW1C/V	**Master Data Parity Error Detected (DPD):** This bit is set by a requester (primary side for type1 configuration headerfunctions) if the parity error response enable bit (PERE) in the Command Register is set and either of the following two conditions occur: • Requester receives a completion marked poisoned. • Requester sends a poisoned request (includes writes and messages) If the parity error bit is 0b, this bit is never set.
23	0b RO	**Primary Fast Back to Back Capable (PFBC):** Reserved per *PCI Express Specification*.
22	0b RV	**Reserved.**
21	0b RO	**Primary 66 MHz Capable (PC66):** Reserved per *PCI Express Specification*.
20	1b RO	**Capabilities List (CLIST):** Indicates the presence of a capabilities list.
19	0b RO/V	**Interrupt Status (IS):** When set indicates that an INTx emulation interrupt is pending internally for this function.
18:11	0h RV	**Reserved.**

Bit Range	Default and Access	Field Name (ID): Description
10	0b RW/V	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts on enabled hot plug and power management events. This bit has no effect on MSI operation. When set, internal INTx# messages will not be generated. When cleared, internal INTx# messages are generated if there is an interrupt for hot plug or power management and MSI is not enabled. This bit does not affect interrupt forwarding from devices connected to the root port. Assert_INTx and Deassert_INTx messages will still be forwarded to the internal interrupt controllers if this bit is set. For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register is RO and returns a value of 0 when read, else it is RW with the functionality described above.
9	0b RO	**Fast Back to Back Enable (FBE):** Reserved per *PCI Express Specification*.
8	0b RW	**SERR# Enable (SEE):** When set, enables the root port to generate an SERR# message when PSTS.SSE is set.
7	0b RO	**Wait Cycle Control (WCC):** Reserved per *PCI Express Specification*.
6	0b RW	**Parity Error Response Enable (PERE):** Indicates that the device is capable of reporting parity errors as a master on the backbone.
5	0b RO	**VGA Palette Snoop (VGA_PSE):** Reserved per *PCI Express Specification*.
4	0b RO	**Memory Write and Invalidate Enable (MWIE):** Reserved per *PCI Express Specification*.
3	0b RO	**Special Cycle Enable (SCE):** Reserved per *PCI Express Specification* and *PCI Bridge Specification*.
2	0b RW	**Bus Master Enable (BME):.**This bit controls the ability of the Function to issue Memory and I/O read or write requests, and the ability of Root or Switch port to forward memory and I/O read or write requests in the upstream direction. When this bit is 0b, memory and I/O requests received at the root port or downstream side of a switch port (secondary side) must be handled as an Unsupported Request (UR). For Non-posted requests, a completion with UR completion status must be returned. For an endpoint, when this bit is Set, the PCI Express Function is allowed to issue Memory or I/O Requests. When this bit is Clear, the PCI Express Function is not allowed to issue any Memory or I/O Requests.
1	0b RW	**Memory Space Enable (MSE):** When set, memory cycles within the range specified by the memory base and limit registers can be forwarded to the PCI-Express device. When cleared, these memory cycles are responded to on the primary interface with an unsupported request completion.
0	0b RW	**I/O Space Enable (IOSE):** When set, I/O cycles within the range specified by the I/O base and limit registers can be forwarded to the PCI-Express device. When cleared, these cycles are responded to on the primary interface with an unsupported request completion.

22.9.3 Revision ID;Class Code (RID_CC)—Offset 8h

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 06040000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	1	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0
BCC								SCC								PI								RID								

Bit Range	Default and Access	Field Name (ID): Description
31:24	06h RO	**Base Class Code (BCC):** Indicates the device is a bridge device.
23:16	04h RO/V	**Sub-Class Code (SCC):** The default indicates the device is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:8	00h RO/V	**Programming Interface (PI):** This bit indicates that this device is standard (non-subtractive) PCI-to-PCI Bridge.
7:0	00h RO/V	**Revision ID (RID):** Indicates the revision of the function.

22.9.4 Cache Line Size; Primary Latency Timer; Header Type (CLS_PLT_HTYPE)—Offset Ch

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00010000h

31			28				24				20				16				12				8				4				0

0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0
RSVD																								PTR							

Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RV	**Reserved**.
7:0	40h RO	**Capabilities Pointer (PTR):** Indicates that the pointer for the first entry in the capabilities list. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list.

22.9.13 Expansion ROM Base Address Register (EXPROM))—Offset 38h

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
BADDR												RSVD																			EXPROMEN

Bit Range	Default and Access	Field Name (ID): Description
31:20	0h RW	**Base Address (BADDR)**: This marks the base address for the 1 MB expansion ROM for the endpoint device. Firmware should initialize this region prior to PCIe enumeration.
19:1	0h RV	Reserved
0	0b RW	**Expansion ROM Enable (EXPROMEN):** This field enables the expansion ROM base address to be used by the device. 0: Disables access to Expansion ROM 1: Enables Access to Expansion ROM.

22.9.14 Interrupt Information; Bridge Control (INTR_BCTRL)—Offset 3Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00000100h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
RSVD				DTSE	DTS	SDT	PDT	FBE	SBR	MAM	V16	VE	IE	SE	PERE	IPIN								ILINE								

Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RV	**Reserved.**
27	0h RO	**Discard Timer SERR# Enable (DTSE):** Reserved per *PCI Express Specification*.
26	0h RO	**Discard Timer Status (DTS):** Reserved per *PCI Express Specification*.
25	0h RO	**Secondary Discard Timer (SDT):** Reserved per *PCI Express Specification*.
24	0h RO	**Primary Discard Timer (PDT):** Reserved per *PCI Express Specification*.
23	0h RO	**Fast Back to Back Enable (FBE):** Reserved per *PCI Express Specification*.
22	0h RW	**Secondary Bus Reset (SBR):** Triggers a Hot Reset on the PCI-Express port.
21	0h RO	**Master Abort Mode (MAM):** Reserved per *PCI Express Specification*.
20	0h RW	**VGA 16-Bit Decode (V16):** When set, indicates that the I/O aliases of the VGA range (see BCTRL:VE definition below), are not enabled. 0: Execute 10-bit address decode on VGA I/O accesses. 1: Execute 16-bit address decode on VGA I/O accesses.
19	0h RW	**VGA Enable (VE):** When set to 1b, the following ranges will be forwarded from the primary to the secondary side of the bridge regardless of the value of the I/O base and limit registers. Memory ranges A0000h-BFFFFh I/O ranges 3B0h 3BBh and 3C0h 3DFh, and all aliases of bits [15:10] in any combination of 1's
18	0h RW	**ISA Enable (IE):** This bit only applies to I/O addresses that are enabled by the I/O Base and I/O Limit registers and are in the first 64KB of PCI I/O space. If this bit is set, the PCIe bridge will block any forwarding from the primary to the secondary sided I/O transactions addressing the last 768 bytes in each 1KB block (offsets 100h to 3FFh). In the opposite direction (secondary to primary) I/O transactions will be forwarded if they address the last 768B in each 1KB block. 1: Forward upstream ISA I/O addresses in the address range defined by the I/O Base and I/O Limit registers that are in the firsts 64KB of PCI I/O address space (Top 768B of each 1K block). 0: Forward downstream all I/O addresses in the address range defined by the I/O Base and I/O Limit registers.
17	0h RW	**SERR# Enable (SE):** This bit controls the forwarding of ERR_COR, ERR_NONFATAL AND ERR_FATAL messages to the primary side of the PCIe port. 1: Enables forwarding of ERR_COR, ERR_NONFATA, ERR_FATAL messages. 0: Disables forwarding of ERR_COR, ERR_NONFATA, ERR_FATAL messages.
16	0h RW	**Parity Error Response Enable (PERE):** This bit controls the response to poisoned TLPs in the PCI Express port. 1: Enables reporting of poisoned TLP errors. 0: Disables reporting of poisoned TLP errors.
15:8	01h RW-L	**Interrupt Pin (IPIN):** This register tells which interrupt pin the function uses. 01h: Generate INTA 02h: Generate INTB 03h: Generate INTC 04h: Generate INTD Others: Reserved BIOS has the ability to write this register during boot to setup the correct interrupt for the function. After it is locked this register can not be updated until another PLTRST#
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register.

22.9.15 Capabilities List; PCI Express Capabilities (CLIST_XCAP)—Offset 40h

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00528010h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	1	0	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0	1	0	0	0	0
RSVD			IMN				SI	DT				CV				NEXT								CID								

Bit Range	Default and Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:25	0h RO	**Interrupt Message Number (IMN):** This field indicates the interrupt message number that is generated from the PCI Express port. When there is more than one MSI interrupt number, this register is required to contain the offset between the base Message Data and the MSI Message that is generated when the status bits in the slot status register or root port status registers are set. The chipset is required to update this field if the number of MSI messages change
24	0h RO	**Slot Implemented (SI):** Hardwired to 0b
23:20	5h RO	**Device / Port Type (DT):** Indicates this the upstream port of a PCIe switch
19:16	2h RO	**Capability Version (CV):** Version 2.0 indicates devices compliant to the PCI Express 2.0 specification which incorporates the Register Expansion ECN.
15:8	80h RO	**Next Capability (NEXT):** Indicates the location of the next capability.
7:0	10h RO	**Capability ID (CID):** Indicates this is a PCI Express capability

22.9.16 Device Capabilities (DCAP)—Offset 44h

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00008002h

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RW-L	**Port Number (PN):** Indicates the port number assigned to the uplink
23	0b RO	Reserved.
22	1b RW/O	**ASPM Optionality Compliance (ASPMOC):** ASPM Optionality Compliance(ASPMOC): This bit must be set to 1b for PCIe 3.0 compliant port. Components implemented against certain earlier versions of this specification will have this bit set to 0b. Software is permitted to use the value of this bit to help determine whether to enable ASPM or whether to run ASPM compliance tests.
21	0b RO	**Link Bandwidth Notification Capability (LBNC):** reserved, not supported
20	0b RO	**Link Active Reporting Capable (LARC):** reserved, not supported
19	0b RO	**Surprise Down Error Reporting Capable (SDERC):** Set to '0' to indicate the uplink does not support Surprise Down Error Reporting
18	0b RO	**Clock Power Management (CPM):** '0' Indicates that the upstream port does not support the CLKREQ# mechanism.
17:15	5h RW-L	**L1 Exit Latency (EL1):** Indicates an exit latency of 2 us to 4 us. 000b Less than 1 us 001b 1 us to less than 2 us 010b 2 us to less than 4 us 011b 4 us to less than 8 us 100b 8 us to less than 16 us 101b 16 us to less than 32 us 110b 32 us to 64 us 111b More than 64 us

Bit Range	Default and Access	Field Name (ID): Description
14:12	4h RW-L	**L0s Exit Latency (EL0):** This field indicates the L0s exit latency for the given PCI-Express Link. It indicates the length of time this port requires to complete transition from L0s to L0. 000b: Less than 64 ns 001b: 64 ns to less than 128 ns 010b: 128 ns to less than 256 ns 011b: 256 ns to less than 512 ns 100b 512 ns to less than 1 µs 101b: 1 us to less than 2 us 110b: 2 us to less than 4 us 111b: More than 4 us
11:10	2h RW-L	**Active State Link PM Support (APMS):** Indicates the level of active state power management on this link Bits Definition 00 No ASPM Supported 01 L0s Supported 10 L1 Supported 11 L0s and L1 supported ***Note:*** L0s should not be advertised when operating with SRIS.
9:4	08h RO/V	**Maximum Link Width (MLW):** This field indicates the maximum link width implemented by the given PCI Express Link. 00h: Reserved 01h: x1 02h: x2 04h: x4 08h: x8 10h: x16 20h: x32 (Unsupported) Others Reserved ***Note:*** Default value is determined by HW after port training is initiated for ports that bifurcate. Hence effective MLW can be smaller than indicated by default.
3:0	3h RO/V	**Max Link Speeds (MLS):** Indicates the supported link speeds of the Uplink Port. This field indicates the supported link speed(s) of the associated port. 0001b: 2.5 Gb/s link speed is supported 0010b: 5.0 Gb/s and 2.5 Gb/s link speed supported 0011b: 8.0 Gb/s and 5.0 and 2.5 Gb/s link speed supported Others: Reserved. ***Note:*** The encoding is the binary value of the bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the maximum Link speed.

22.9.19 Link Control; Link Status (LCTL_LSTS)—Offset 50h

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

LABS	LBMS	LA	SCC	LT	RSVD	NLW						CLS				RSVD				LABIE	LBMIE	HAWD	ECPM	ES	CCC	RL	LD	RCBC	RSVD	ASPM	

Bit Range	Default and Access	Field Name (ID): Description
31	0b RO	**Link Autonomous Bandwidth Status (LABS):** This bit is not applicable and hardwired to 0b
30	0b RO	**Link Bandwidth Management Status (LBMS):** This bit is not applicable and hardwired to 0b
29	0h RO/V	**Link Active (LA):** Set to 1b when the Data Link Control and Management State Machine is in the DL_Active state, 0b otherwise.
28	1b RW-L	**Slot Clock Configuration (SCC):** When to 1b, this bit indicates that the component uses the same physical reference clock that he platform provides on the connector. If the device uses an independent clock irrespective of the presence of a reference on the connector, this bit must be clear. 1: Indicates same reference clock. 0: Indicates independent reference clock
27	0b RO	**Link Training (LT):** This bit is not applicable for an upstream port and is hardwired to 0
26	0h RO	Reserved.
25:20	0h RO/V	**Negotiated Link Width (NLW):** This field indicates the negotiated width of the PCI Express link. 00 0001b: x1 00 0010b: X2 00 0100b: x4 00 1000b: X8 00 1100b: X12—not supported 01 0000b: X16 10 0000b: X32—not supported All other values are reserved. ***Note:*** The value in this field is undefined when the link is not up.
19:16	1b RO/V	**Current Link Speed (CLS):** This field indicates the negotiated link speed of the given PCI Express link. 0001b: 2.5 Gb/s PCI Express Link 0010b: 5.0 Gb/s PCI Express Link 0011b: 8.0 Gb/s PCI Express Link Others: Reserved ***Note:*** The encoding is the binary value of the bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. ***Note:*** The value in this field is undefined when the link is not up.
15:12	0h RO	**Reserved.**
11	0b RO	**Link Autonomous Bandwidth Interrupt Enable (LABIE):** this is not applicable so hardwired to 0b
10	0b RO	**Link Bandwidth Management Interrupt Enable (LBMIE):** The uplink does not implement the Link Bandwidth Notification Capability so this is hardwired to 0.
9	0h RW	**Hardware Autonomous Width Disable (HAWD):** When Set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width.
8	0b RO	**Enable Clock Power Management (ECPM):** Reserved. Not supported by the upstream port.
7	0b RW	**Extended Synch (ES):** When set, forces extended transmission of FTS ordered sets in FTS and extra TS2 at exit from L1 prior to entering L0.
6	0b RW	**Common Clock Configuration (CCC):** When set, indicates that the root port and device are operating with a distributed common reference clock. A value of 0b indicates that this component and the component at the opposite end of this link are operating with asynchronous reference clock. After changing the value in this bit in both components on a link, software must trigger the link to retrain by writing a 1b to the Retrain Link bit of the downstream port.

Bit Range	Default and Access	Field Name (ID): Description
5	0b RO	**Retrain Link (RL):** Read only of 0b for an upstream port.
4	0b RO	**Link Disable (LD):** Read only of 0b for an upstream port.
3	0b RO	**Read Completion Boundary Control (RCBC):** Indicates the read completion boundary is 64 bytes.
2	0b RO	**Reserved**.
1:0	00b RW	**Active State Link PM Control (ASPM):** Indicates whether the upstream port should enter L0s or L1 or both. Bits Definition 00 Disabled 01 L0s Entry Enabled 10 L1 Entry Enabled 11 L0s and L1 Entry Enabled

RSVD										LER	EQP3S	EQP2S	EQP1S	EqC	CDL	CD				CSOS	EMC	TM			SD	HASD	EC	TLS				

Bit Range	Default and Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21	0b RW1CS	**Link Equalization Request (LER):** This bit is set by hardware to request the Link equalization process to be performed on the Link.
20	0b ROS-V	**Equalization Phase 3 Successful (EQP3S):** When set to 1, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed.
19	0b ROS-V	**Equalization Phase 2 Successful (EQP2S):** When set to 1, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed.
18	0b ROS-V	**Equalization Phase 1 Successful (EQP1S):** When set to 1, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed.
17	0b ROS-V	**Equalization Complete (EqC):** When set to 1, this bit indicates that the Transmitter Equalization procedure has completed
16	0b RO V	**Current De-emphasis Level (CDL):** When the Link is operating at 5.0 GT/s speed, this bit reflects the level of de-emphasis. Encodings: 1b -3.5 dB 0b -6 dB The value in this bit is undefined when the Link is not operating at 5.0 GT/s speed.

Bit Range	Default and Access	Field Name (ID): Description
15:12	0h RWS	**Compliance Preset/De-emphasis (CD):** For 8 GT/s and 5 GT/s: This bit sets the transmitter preset level forPolling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. The Encoding are defined as follows: 8 GT/s Rate: 0000b: -6 dB for de-emphasis, 0 dB for preshoot 0001b: -3.5 dB for de-emphasis, 0 dB for preshoot 0010b: -4.5 dB for de-emphasis, 0 dB for preshoot 0011b: -2.5 dB for de-emphasis, 0 dB for preshoot 0100b: 0 dB for de-emphasis, 0 dB for preshoot 0101b: 0 dB for de-emphasis, 2 dB for preshoot 0110b: 0 dB for de-emphasis, 2.5 dB for preshoot 0111b: -6 dB for de-emphasis, 3.5 dB for preshoot 1000b: -3.5 dB for de-emphasis, 3.5 dB for preshoot 1001b: 0 dB for de-emphasis, 3.5 dB for preshoot 1010b: The Transmitter Preset encoding of 1010b corresponds to the maximum Vtx-boost that the Transmitter advertises with FS and LF in both full swing and reduced swing modes with C_{-1} = 0 and C_{+1} = FS – (2*LF). All other encodings are reserved. 5 GT/s Rate: 001b: -3.5dB 000b: -6 dB All other are reserved. When the link is operating at 2.5 Gb/s, the setting of this bit has no effect.
11	0h RWS	**Compliance SOS (CSOS):** When set to 1b, the LTSSM is required to send SKP Ordered Sets periodically in between the (modified) compliance patterns. The default value of this bit is 0b.
10	0b RWS	**Enter Modified Compliance (EMC):** When this bit is set to 1b, the device transmits Modified Compliance Pattern if the LTSSM enters Polling.Compliance substate. Default value of this bit is 0b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
9:7	0h RWS-V	**Transmit Margin (TM):** This field controls the value of the non-de-emphasized voltage level at the transmitter pins. This field is reset to 000b on entry to the LTSSM Polling.Configuration substate. 000b: Normal operating range 001b: 800-1200mV for full swing and 400-700mV for half-swing Others: Reserved This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
6	0b RO	**Selectable De-emphasis (SD):** Not supported.

Bit Range	Default and Access	Field Name (ID): Description
5	0b RWS	**Hardware Autonomous Speed Disable (HASD):** When set, this bit disables hardware from changing the link speed for device specific reasons other than attempting to correct unreliable link operation by reducing link speed for device-specific reasons other than attempting to correct unreliable link operations by reducing link speed. Initial transition to the highest supported common link speed is not blocked by this bit.
4	0b RWS-V	**Enter Compliance (EC):** Software is permitted to force a Link to enter Compliance mode at the speed indicated in the Target Link Speed field by setting this bit to 1b in both components on a Link and then initiating a hot reset on the Link. Default value of this bit following Fundamental Reset is 0b. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value.
3:0	3h RWS-V	**Target Link Speed (TLS):** For downstream ports and root ports, this field sets an upper limit on link operational speed by restricting the values advertised by the Downstream Port in its training sequences. 0001b: 2.5 Gb/s Target Link Speed 0010b: 5.0 Gb/s Target Link Speed 0011b: 8.0 Gb/s Target Link Speed Others: Reserved ***Note:*** The encoding is the binary value of the bit in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the desired target Link speed. All other encodings are reserved If a value is written to this field that does not correspond to a speed included in the Supported Link Speeds field, the result is undefined. ***Note:*** The default value of this field is the highest Link speed supported by the component (as reported in the Max Link Speed field of the Link Capabilities register) unless the corresponding platform/form factor requires a different default value. For both Upstream and Downstream Ports, this field is used to set the target compliance mode speed when software is using the Enter Compliance bit to force a Link into compliance mode.

22.9.24 Power Management Capability; PCI Power Management Capabilities (PMCAP_PMC)—Offset 80h

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: C8038801h

31			28				24				20				16				12				8				4				0
1	1	0	0	1	0	0	0	0	0	0	0	0	0	0	1	1	1	0	0	0	1	0	0	0	0	0	0	0	0	0	1
PMES					D2S	D1S	AC			DSI	RSVD	PMEC	VS				NEXT								CID							

Bit Range	Default and Access	Field Name (ID): Description
31:27	19h RO	**PME Support (PMES):** Indicates PME# is supported for states D0, $D3_{HOT}$ and $D3_{COLD}$. There is no PME support for $D3_{COLD}$ as the part does not have the capability, but for PCIe compliance purposes, bit 15is set.
26	0b RO	**D2_Support (D2S):** The D2 state is not supported.
25	0b RO	**D1_Support (D1S):** The D1 state is not supported.
24:22	0h RO	**Aux_Current (AC):** Reports 0 mA (self-powered).
21	0b RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
20	0h RO	**Reserved.**
19	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
18:16	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the *PCI Power Management Specification*.
15:8	88h RO	**Next Capability (NEXT):** Contains the offset of the next item in the Capabilities List.
7:0	1h RO	**Capability Identifier (CID):** Value of 01h indicates this is a PCI power management capability.

22.9.25 PCI Power Management Control and Status (PMCS)—Offset 84h

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00000008h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
RSVD								BPCE	B23S	RSVD						PMES	DSC	DSEL				PMEE	RSVD				NSR	RSVD	PS		

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0b RO	**Bus Power / Clock Control Enable (BPCE):** Reserved per *PCI Express Specification*.
22	0b RO	**B2/B3 Support (B23S):** Reserved per *PCI Express Specification*.
21:16	0h RO	**Reserved.**
15	0b RW1CS	**PME Status (PMES):** Indicates a PME was received.

Bit Range	Default and Access	Field Name (ID): Description
14:13	0h RO	**Data Scale (DSC):** Reserved
12:9	0h RO	**Data Select (DSEL):** Reserved
8	0b RWS	**PME Enable (PMEE):** Gates assertion of the PME message.
7:4	0h RO	**Reserved.**
3	1b RW/O	**No Soft Reset (NSR):** When set to 1 this bit indicates that devices transitioning from $D3_{HOT}$ to D0 because of Power State commands do not perform an internal reset. Configuration context is preserved. Upon transition from $D3_{HOT}$ to D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the Power State bits. When clear, devices do perform an internal reset upon transitioning from $D3_{HOT}$ to D0 via software control of the Power State bits. Configuration Context is lost when performing the soft reset. Upon transition from $D3_{HOT}$ to D0 state, full reinitialization sequence is needed to return the device to D0 Initialized.
2	0b RO	**Reserved.**
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the upstream port and to set a new power state. The values are: 00 D0 state 11 $D3_{HOT}$ state If software attempts to write a '10' or '01' to these bits, the write will be ignored.

22.9.26 Subsystem Capability List Register (SVCAP)—Offset 88h

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 0000000Dh

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1
RSVD																NEXT												CID			

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:8	0h RO	**Next Capability (NEXT):** For upstream ports there is no MSI structure so the capability is terminated
7:0	Dh RO	**Capability Identifier (CID):** Value of 0Dh indicates the function as subsystem identification capable.

22.9.27 Subsystem Vendor IDs (SVID)—Offset 8Ch

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00008086h

31			28				24				20				16				12				8				4				0

SID																SVID															

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW-L	**Subsystem Identifier (SID):** Indicates the subsystem as identified by the vendor. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).
15:0	8086h RW-L	**Subsystem Vendor Identifier (SVID):** Indicates the manufacturer of the subsystem. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).

22.9.28 Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h

Size:32 bits
The AER capability can optionally be included or excluded from the capabilities list. The full AER is supported.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 20010001h

31			28				24				20				16				12				8				4				0
0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
NCO															CV	CID															

Bit Range	Default and Access	Field Name (ID): Description
31:20	200h RW-L	**Next Capability Offset (NCO):** Contains the offset of the next structure in the extended capabilities list.
19:16	1h RO	**Capability Version (CV):** Indicates the version of the capability structure present.
15:0	0001h RO	**Capability ID (CID):** Identifies the function as Advanced Error Reporting capable.

22.9.29 Uncorrectable Error Status (UES)—Offset 104h

This register must maintain its state through a platform reset. It loses its state upon loss of core power.

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD					PTLLPEBS	TPBES	AEBE	MCE	UIE	AVS	URE	EE	MT	RO	UC	CA	CT	FCPE	PT	RSVD					SDE	DLPE	RSVD			TE		

Bit Range	Default and Access	Field Name (ID): Description
31:27	000h RV	**Reserved**.
26	0b RO	**Poisoned TLP Egress Blocked Status (PLTLPEBS)**
25	0b RO	**TLP Prefix Blocked Error Status (TPBES)**
24	0b RW1CS	**Atomic Egress Blocked Status (AEBE):** This bit will never be set.
23	0b RW1CS	**MC Blocked TLP Status (MCE):** This bit is set whenever a Multicast TLP is blocked
22	0b RW1CS	**Uncorrectable Internal Error Status (UIE):** This bit is set whenever an uncorrectable internal error is detected.
21	0b RO	**ACS Violation Status (AVS):** Reserved, not supported
20	0b RW1CS	**Unsupported Request Error Status (URE):** Indicates an unsupported request was received.
19	0b RW1CS	**ECRC Error Status (EE):** Set to 1b when an ECRC is detected.
18	0b RW1CS	**Malformed TLP Status (MT):** Indicates a malformed TLP was received.
17	0b RW1CS	**Receiver Overflow Status (RO):** Indicates a receiver overflow occurred.
16	0b RW1CS	**Unexpected Completion Status (UC):** Indicates an unexpected completion was received.
15	0b RW1CS	**Completor Abort Status (CA):** Indicates a completer abort was received
14	0b RO	**Completion Timeout Status (CT):** not applicable as the upstream port will not issue non-posted requests on it's one behalf.
13	0b RW1CS	**Flow Control Protocol Error Status (FCPE):** This bit is set when a flow control error protocol is detected.

Bit Range	Default and Access	Field Name (ID): Description
12	0b RW1CS	**Poisoned TLP Status (PT):** Indicates a poisoned TLP was received.
11:6	0h RV	**Reserved**. Software must write '0' to these bits
5	0b RO	**Surprise Down Error Status (SDE):** Surprise Down is not supported.
4	0b RW1CS	**Data Link Protocol Error Status (DLPE):** Indicates a data link protocol error occurred.
3:-	0h RV	**Reserved.**

22.9.30 Uncorrectable Error Mask (UEM)—Offset 108h

When set, the corresponding error in the UES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Access Method

15	1b RWS	**Header Log Overflow Error Mask (HLOEM)**
14	1b RWS	**Correctable Internal Error Mask (CIEM)**
13	1b RWS	**Advisory Non-Fatal Error Mask (ANFEM):** When set, masks Advisory Non-Fatal errors from (a) signaling ERR_COR to the device control register and (b) updating the Uncorrectable Error Status register. This register is set by default to enable compatibility with software that does not comprehend Role-Based Error Reporting.
12	0b RWS	**Replay Timer Timeout Mask (RTTEM):**
11:9	0h RO	Reserved.
8	0b RWS	**Replay Number Rollover Mask (RNREM):**
7	0b RWS	**Bad DLLP Mask (BDLLPEM):.**
6	0b RWS	**Bad TLP Mask (BTLPEM):**
5:1	0h RO	Reserved.
0	0h RW/P	**Receiver Error Mask (REM):**

22.9.34 Advanced Error Capabilities and Control (AECC)—Offset 118h

This register gives the status and control for ECRC checks, and also the pointer to the first uncorrectable error that happened. This register is only reset by a loss of core power.

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD																			CTPHLC	TLPPLP	MHRE	MHRC	ECE	ECC	EGE	EGC	FEP					

Bit Range	Default and Access	Field Name (ID): Description
31:13	0h RV	Reserved.
12	0b RO	**Completion Timeout Prefix/Header Log Capable (CTPHLC):** If Set, this bit indicates that the Function records the prefix/header of Request TLPs that experience a Completion Timeout error.
11	0b ROSV	**TLP Prefix Log Present (TLPPLP):** If Set and the First Error Pointer is valid, indicates that the TLP Prefix Log register contains valid information. If Clear or if First Error Pointer is invalid, the TLP Prefix Log register is undefined.
10	0b RO	**Multiple Header Recording Enable (MHRE):** Multiple Header recording is not supported
9	0b RO	**Multiple Header Recording Capable (MHRC):** Multiple header recording is not supported.
8	0b RWS	**ECRC Check Enable (ECE):**
7	0b RWL	**ECRC Check Capable (ECC):** ECRC is not supported.
6	0b RWS	**ECRC Generation Enable (EGE):**
5	0b RWL	**ECRC Generation Capable (EGC):**.
4:0	0h ROSV	**First Error Pointer (FEP):** This field identifies the bit position of the first error reported in the UncorrectableError Status Register (xref). This register re-arms itself (which does not change its current value) as soon as the error status bit indicated by the pointer is cleared by the software by writing a 1 to that status bit.

22.9.35 Header Log Register (AERHDRLOG[1-4])—Offset 11C - 128h by 4h

This register logs the 4 Dwords of the transaction header for PCI Express Errors.

Type: CFG Register
(Size: 32 bits)

Device:
Function: 0

Default: 00000000h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit Range	Default and Access	Field Name (ID): Description
31	0b RW1C	**DPE - Detected Parity Error (DPE):** Set when the port receives a poisoned tlp from the PCIe interface of the internal backboner. This is set even if CMD.PERE is not set.
30	0b RW1C	**Signaled System Error (SSE):** This bit is set when ERR_FATAL or ERR_NONFATAL messages are sent to the root complex and the SERR enable bit in the PCICMD Register is set
29	0b RW1C	**Received Master Abort (RMA):** Set when the requester receives a completion with unsupported request status.
28	0b RW1C	**Received Target Abort (RTA):** Set when the root port receives a completion with completer abort.
27	0b RW1C	**Signaled Target Abort (STA):** This bit is Set when the port completes a Posted or Non-Posted Request as a Completer Abort error. This applies to a Function with a Type 1 Configuration header when the Completer Abort was generated by its Primary Side.
26:25	0b RO	**Primary DEVSEL# Timing Status (PDTS):** Reserved per *PCI Express Specification*.
24	0b RW1C/V	**Master Data Parity Error Detected (DPD):** This bit is set by a requester (primary side for type1 configuration headerfunctions) if the parity error response enable bit (PERE) in the Command Register is set and either of the following two conditions occur: • Requester receives a completion marked poisoned. • Requester sends a poisoned request (includes writes and messages) If the parity error bit is 0b, this bit is never set.

Bit Range	Default and Access	Field Name (ID): Description
23	0b RO	**Primary Fast Back to Back Capable (PFBC):** Reserved per *PCI Express Specification*.
22	0b RV	**Reserved**.
21	0b RO	**Primary 66 MHz Capable (PC66):** Reserved per *PCI Express Specification*.
20	1b RO	**Capabilities List (CLIST):** Indicates the presence of a capabilities list.
19	0b RO/V	**Interrupt Status (IS):** When set indicates that an INTx emulation interrupt is pending internally for this function.
18:11	0h RV	**Reserved**.
10	0b RW	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts on enabled hot plug and power management events. This bit has no effect on MSI operation. When set, internal INTx# messages will not be generated. When cleared, internal INTx# messages are generated if there is an interrupt for hot plug or power management and MSI is not enabled. This bit does not affect interrupt forwarding from devices connected to the root port. Assert_INTx and Deassert_INTx messages will still be forwarded to the internal interrupt controllers if this bit is set. For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register is RO and returns a value of 0 when read, else it is RW with the functionality described above.
9	0b RO	**Fast Back to Back Enable (FBE):** Reserved per *PCI Express Specification*.
8	0b RW	**SERR# Enable (SEE):** When set, enables the root port to generate an SERR# message when PSTS.SSE is set.
7	0b RO	**Wait Cycle Control (WCC):** Reserved per *PCI Express Specification*.
6	0b RW	**Parity Error Response Enable (PERE):** Indicates that the device is capable of reporting parity errors as a master on the backbone.
5	0b RO	**VGA Palette Snoop (VGA_PSE):** Reserved per *PCI Express Specification*.
4	0b RO	**Memory Write and Invalidate Enable (MWIE):** Reserved per *PCI Express Specification*.
3	0b RO	**Special Cycle Enable (SCE):** Reserved per *PCI Express Specification* and *PCI Bridge Specification*.
2	0b RW	**Bus Master Enable (BME):.**This bit controls the ability of the Function to issue Memory and I/O read or write requests, and the ability of Root or Switch port to forward memory and I/O read or write requests in the upstream direction. When this bit is 0b, memory and I/O requests received at the root port or downstream side of a switch port (secondary side) must be handled as an Unsupported Request (UR). For Non-posted requests, a completion with UR completion status must be returned. For an endpoint, when this bit is Set, the PCI Express Function is allowed to issue Memory or I/O Requests. When this bit is Clear, the PCI Express Function is not allowed to issue any Memory or I/O Requests.
1	0b RW	**Memory Space Enable (MSE):** When set, memory cycles within the range specified by the memory base and limit registers can be forwarded to the PCI-Express device. When cleared, these memory cycles are responded to on the primary interface with an unsupported request completion.
0	0b RW	**I/O Space Enable (IOSE):** When set, I/O cycles within the range specified by the I/O base and limit registers can be forwarded to the PCI-Express device. When cleared, these cycles are responded to on the primary interface with an unsupported request completion.

22.10.3 Revision ID;Class Code (RID_CC)—Offset 8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 06040000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	1	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0
BCC								SCC								PI								RID								

Bit Range	Default and Access	Field Name (ID): Description
31:24	06h RW/L	**Base Class Code (BCC):** Indicates the device is a bridge device.
23:16	04h RW/L	**Sub-Class Code (SCC):** The default indicates the device is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:8	0h RW/L	**Programming Interface (PI):** This bit indicates that this device is standard (non-subtractive) PCI-to-PCI Bridge.
7:0	00h RO/V	**Revision ID (RID):** Indicates the revision of the function.

22.10.4 Cache Line Size; Primary Latency Timer; Header Type (CLS_PLT_HTYPE)—Offset Ch

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00010000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
BIST_TST								MFD	HTYPE							CT								LS								

Bit Range	Default and Access	Field Name (ID): Description
31:24	00h RO	**BIST tests (BIST_TST).** Not supported, hard wired to 00h
23	0b RW/L	**Multi-function Device (MFD):** This bit is '0' to indicate a single function device.

Bit Range	Default and Access	Field Name (ID): Description
22:16	01h RW/L	**Header Type (HTYPE):** The default mode identifies the header layout of the configuration space, which is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:8	00h RO	**Latency Count (CT):** Reserved per *PCI Express Specification*.
7:0	00h RW	**Line Size (LS):** This is read/write but contains no functionality, per *PCI Express Specification*.

22.10.5 Express Port Memory Base Address Register (EXPPTMBAR_VSP) —Offset 10h

Access Method

Type: CFG Register
(Size: 64 bits)

Device: 0
Function: 0

Default: 0000000000000004h

63			60				56				52				48				44				40				36				32
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
BADDR

BADDR															RSVD														PREF	TYPE		MIS

Bit Range	Default and Access	Field Name (ID): Description
63:17	00000000 0000h RW	**Base Address (BADDR):**
16:4	000h Rv	**Reserved**
3	0b RO	**Prefetchable Memory (Pref)**: Not prefetchable memory space.
2:1	10b RO	**Type (type):** The memory mapped space can be placed anywhere in the 64-bit addressable region of the device
0	0b RO	**Memory Space Indicator (MSI):** 0b = Memory space, 1b - I/O space. Indicates the bus number of the backbone.

22.10.6 Bus Numbers (BusNUM)—Offset 18h

Type: CFG Register
(Size: 24bits)

Device: 0
Function: 0

Default: 0h

23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
SBBN								SCBN								PBN							

Bit Range	Default and Access	Field Name (ID): Description
23:16	0h RW	**Subordinate Bus Number (SBBN):** Indicates the highest PCI bus number below the bridge.
15:8	0h RW	**Secondary Bus Number (SCBN):** Indicates the bus number secondary interface.
7:0	0h RW	**Primary Bus Number (PBN):** Indicates the PCI Express bus number

22.10.7 I/O Base and Limit; Secondary Status (IOBL_SSTS)—Offset 1Ch

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00000000h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

DPE	RSE	RMA	RTA	STA	SDTS		MDPD	FBC	RSVD	SC66	RSVD				IOLA				IOLC				IOBA				IOBC				

Bit Range	Default and Access	Field Name (ID): Description
31	0b RW1C/V	**Detected Parity Error (DPE):** Set when the port receives a poisoned TLP.
30	0b RW1C/V	**Received System Error (RSE):** Set when the port receives an ERR_FATAL or ERR_NONFATAL message from the device.
29	0b RW1C/V	**Received Master Abort (RMA):** Set when the port receives a completion with 'Unsupported Request' status from the device.
28	0b RW1C/V	**Received Target Abort (RTA):** Set when the port receives a completion with 'Completion Abort' status from the device.
27	0b RW1C/V	**Signaled Target Abort (STA):** Set when the port generates a completion with 'Completion Abort' status to the device.

Bit Range	Default and Access	Field Name (ID): Description
26:25	0h RO	**DEVSEL# Timing Status (DVT):** Reserved per *PCI Express Specification*.
24	0b RW1C/V	**Master Data Parity Error Detected (MDPD):** Set when the BCTRL.PERE, and either of the following two conditions occurs: Port receives completion marked poisoned. Port poisons a write request to the secondary side.
23	0h RO	**Fast Back to Back Capable (FBC):** Reserved per *PCI Express Specification*.
22	0b RV	**Reserved**.
21	0b RO	**Secondary 66 MHz Capable (SC66):** Reserved per *PCI Express Specification*.
20:16	0h RV	**Reserved.**
15:12	0h RW	**I/O Address Limit (IOLA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to FFFh.
11:8	0h RO	**I/O Limit Address Capability (IOLC):** Indicates that the bridge does not support 32-bit I/O addressing.
7:4	0h RW	**I/O Base Address (IOBA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to 000h.
3:0	0h RO	**I/O Base Address Capability (IOBC):** Indicates that the bridge does not support 32-bit I/O addressing.

22.10.8 Memory Base and Limit (MBL)—Offset 20h

Accesses that are within the ranges specified in this register will be sent to the attached device if CMD.MSE is set. Accesses from the attached device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is MB [gt]= AD[lb]31:20[rb] [lt]= ML.

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 0h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
ML												RSVD				MB												RSVD				

Bit Range	Default and Access	Field Name (ID): Description
31:20	0h RW	**Memory Limit (ML):** These bits are compared with bits [31:20] of the incoming address to determine the upper 1 MB aligned value of the range.

Bit Range	Default and Access	Field Name (ID): Description
19:16	0h RV	**Reserved**.
15:4	0h RW	**Memory Base (MB):** These bits are compared with bits [31:20] of the incoming address to determine the lower 1 MB aligned value of the range.
3:0	0h RV	**Reserved**.

22.10.9 Prefetchable Memory Base and Limit (PMBL)—Offset 24h

Accesses that are within the ranges specified in this register will be sent to the device if CMD.MSE is set. Accesses from the device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is PMBU32:PMB [gt]= AD[lb]63:32[rb]:AD[lb]31:20[rb] [lt]= PMLU32:PML.

Access Method

RSVD																								PTR							

Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	40h RW/O	**Capabilities Pointer (PTR):** Indicates that the pointer for the first entry in the capabilities list. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list.

22.10.13 Interrupt Information; Bridge Control (INTR_BCTRL)—Offset 3Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00000100h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
RSVD				DTSE	DTS	SDT	PDT	FBE	SBR	MAM	V16	VE	IE	SE	PERE	IPIN								ILINE							

Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RV	**Reserved**.
27	0b RO	**Discard Timer SERR# Enable (DTSE):** Reserved per *PCI Express Specification*.
26	0b RO	**Discard Timer Status (DTS):** Reserved per *PCI Express Specification*.
25	0b RO	**Secondary Discard Timer (SDT):** Reserved per *PCI Express Specification*.

Bit Range	Default and Access	Field Name (ID): Description
24	0b RO	**Primary Discard Timer (PDT):** Reserved per *PCI Express Specification*.
23	0b RO	**Fast Back to Back Enable (FBE):** Reserved per *PCI Express Specification*.
22	0b RW	**Secondary Bus Reset (SBR):** Triggers a Hot Reset on the PCI-Express port.
21	0b RO	**Master Abort Mode (MAM):** Reserved per *PCI Express Specification*.
20	0b RW	**VGA 16-Bit Decode (V16):** When set, indicates that the I/O aliases of the VGA range (see BCTRL:VE definition below), are not enabled. 0: Execute 10-bit address decode on VGA I/O accesses. 1: Execute 16-bit address decode on VGA I/O accesses.
19	0b RW	**VGA Enable (VE):** When set to 1b, the following ranges will be forwarded from the primary to the secondary side of the bridge regardless of the value of the I/O base and limit registers. Memory ranges A0000h-BFFFFh I/O ranges 3B0h 3BBh and 3C0h 3DFh, and all aliases of bits [15:10] in any combination of 1's
18	0b RW	**ISA Enable (IE):** This bit only applies to I/O addresses that are enabled by the I/O Base and I/O Limit registers and are in the first 64KB of PCI I/O space. If this bit is set, the PCIe bridge will block any forwarding from the primary to the secondary sided I/O transactions addressing the last 768 bytes in each 1KB block (offsets 100h to 3FFh). In the opposite direction (secondary to primary) I/O transactions will be forwarded if they address the last 768B in each 1KB block. 1: Forward upstream ISA I/O addresses in the address range defined by the I/O Base and I/O Limit registers that are in the firsts 64 KB of PCI I/O address space (Top 768B of each 1K block). 0: Forward downstream all I/O addresses in the address range defined by the I/O Base and I/O Limit registers.
17	0b RW	**SERR# Enable (SE):** This bit controls the forwarding of ERR_COR, ERR_NONFATAL AND ERR_FATAL messages to the primary side of the PCIe port. 1: Enables forwarding of ERR_COR, ERR_NONFATA, ERR_FATAL messages. 0: Disables forwarding of ERR_COR, ERR_NONFATA, ERR_FATAL messages.
16	0b RW	**Parity Error Response Enable (PERE):** This bit controls the response to poisoned TLPs in the PCI Express port. 1: Enables reporting of poisoned TLP errors. 0: Disables reporting of poisoned TLP errors.
15:8	01h RW/L	**Interrupt Pin (IPIN):** This register tells which interrupt pin the function uses. 01h: Generate INTA 02h: Generate INTB 03h: Generate INTC 04h: Generate INTD Others: Reserved BIOS has the ability to write this register during boot to setup the correct interrupt for the function. Once the bits are locked they can not be updated until another PLTRST#
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register.

22.10.14 Capabilities List; PCI Express Capabilities (CLIST_XCAP)—Offset 40h

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00628010h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	1	1	0	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
RSVD			IMN				SI	DT				CV				NEXT								CID								

Bit Range	Default and Access	Field Name (ID): Description
31:30	0h RV	**Reserved.**
29:25	0h RO	**Interrupt Message Number (IMN):** This field indicates the interrupt message number that is generated from the PCI Express port. When there is more than one MSI interrupt number, this register is required to contain the offset between the base Message Data and the MSI Message that is generated when the status bits in the slot status register or root port status registers are set. The chipset is required to update this field if the number of MSI messages change.
24	0b RO	**Slot Implemented (SI):** Hardwired to 0b.
23:20	6h RO	**Device / Port Type (DT):** Indicates this a Virtual Switch Port of a PCIe switch.
19:16	2h RO	**Capability Version (CV):** Version 2.0 indicates devices compliant to the *PCI Express 2.0 Specification* which incorporates the Register Expansion ECN.
15:8	80h RO	**Next Capability (NEXT):** Indicates the location of the next capability.
7:0	10h RO	**Capability ID (CID):** Indicates this is a PCI Express capability.

22.10.15 Device Capabilities (DCAP)—Offset 44h

31:24	08h RW-L	**Port Number (PN):** Indicates the port number assigned to this link for Virtual Switch Port.
23:22	0b RV	**Reserved**.
21	0b RO	**Link Bandwidth Notification Capability (LBNC):** Reserved, not supported
20	0b RO	**Link Active Reporting Capable (LARC):** Reserved, not supported

Bit Range	Default and Access	Field Name (ID): Description
19	0b RO	**Surprise Down Error Reporting Capable (SDERC):** Set to '0' to indicate the uplink does not support Surprise Down Error Reporting.
18	0b RO	**Clock Power Management (CPM):** '0' Indicates that the upstream port does not support the CLKREQ# mechanism.
17:15	000b RO	**L1 Exit Latency (EL1):** Indicates an exit latency of 2 us to 4 us. 000b Less than 1 us 001b 1 us to less than 2 us 010b 2 us to less than 4 us 011b 4 us to less than 8 us 100b 8 us to less than 16 us 101b 16 us to less than 32 us 110b 32 us to 64 us 111b More than 64 us
14:12	000b RO	**L0s Exit Latency (EL0):** This field indicates the L0s exit latency for the given PCI-Express Link. It indicates the length of time this port requires to complete transition from L0s to L0. 000b: Less than 64 ns 001b: 64 ns to less than 128 ns 010b: 128 ns to less than 256 ns 011b: 256 ns to less than 512 ns 100b 512 ns to less than 1 µs 101b: 1 us to less than 2 us 110b: 2 us to less than 4 us 111b: More than 4 us
11:10	11b RO	**Active State Link PM Support (APMS):** Indicates the level of active state power management on this link Bits Definition 00 No ASPM Supported 01 L0s Supported 10 L1 Supported 11 L0s and L1 supported ***Note:*** L0s should not be advertised when operating with SRIS.
9:4	1h RO	**Maximum Link Width (MLW):** This field indicates the maximum link width implemented by the given PCI Express Link. 00h: Reserved 01h: x1 02h: x2 04h: x4 08h: x8 10h: x16 20h: x32 (Unsupported) Others Reserved ***Note:*** Default value is determined by HW after port training is initiated for ports that bifurcate. Hence effective MLW can be smaller than indicated by default
3:0	1h RO	**Max Link Speeds (MLS):** This field indicates the supported link speed(s) of the associated port. 0001b: 2.5 Gb/s link speed is supported 0010b: 5.0 Gb/s and 2.5 Gb/s link speed supported 0011b: 8.0 Gb/s and 5.0 and 2.5 Gb/s link speed supported Others: Reserved. ***Note:*** The encoding is the binary value of the bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the maximum Link speed.

22.10.18 Link Control; Link Status (LCTL_LSTS)—Offset 50h

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 10110000h

31			28				24				20				16				12				8				4				0
0	0	0	1	0	0	0	0	0	0	0	1	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
LABS	LBMS	LA	SCC	LT	RSVD	NLW						CLS				RSVD				LABIE	LBMIE	HAWD	ECPM	ES	CCC	RL	LD	RCBC	RSVD	ASPM		

Bit Range	Default and Access	Field Name (ID): Description
31	0b RO	**Link Autonomous Bandwidth Status (LABS):** This bit is not applicable and hardwired to 0b.
30	0b RO	**Link Bandwidth Management Status (LBMS):** This bit is not applicable and hardwired to 0b.
29	0h RO/V	**Link Active (LA):** Set to 1b when the Data Link Control and Management State Machine is in the DL_Active state, 0b otherwise.
28	1b RW-L	**Slot Clock Configuration (SCC):** When to 1b, this bit indicates that the component uses the same physical reference clock that he platform provides on the connector. If the device uses an independent clock irrespective of the presence of a reference on the connector, this bit must be clear. 1: Indicates same reference clock. 0: Indicates independent reference clock
27	0b RO	**Link Training (LT):** This bit is not applicable for an upstream port and is hardwired to 0.
26	0b RV	**Reserved.**
25:20	1h RO/V	**Negotiated Link Width (NLW):** This field indicates the negotiated width of the PCI Express link. 00 0001b: x1 00 0010b: X2 00 0100b: x4 00 1000b: X8 00 1100b: X12—not supported 01 0000b: X16 10 0000b: X32—not supported All other values are reserved. ***Note:*** The value in this field is undefined when the link is not up.
19:16	1h RO/V	**Current Link Speed (CLS):** This field indicates the negotiated link speed of the given PCI Express link. 0001b: 2.5 Gb/s PCI Express Link 0010b: 5.0 Gb/s PCI Express Link 0011b: 8.0 Gb/s PCI Express Link Others: Reserved ***Note:*** The encoding is the binary value of the bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. ***Note:*** The value in this field is undefined when the link is not up.
15:12	0h RO	**Reserved**.

Bit Range	Default and Access	Field Name (ID): Description
11	0b RO	**Link Autonomous Bandwidth Interrupt Enable (LABIE):** Link Autonomous Bandwidth Interrupt Enable - this is not applicable so hardwired to 0b.
10	0b RO	**Link Bandwidth Management Interrupt Enable (LBMIE):** The uplink does not implement the Link Bandwidth Notification Capability so this is hardwired to 0.
9	0b RW	**Hardware Autonomous Width Disable (HAWD):** When Set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width.
8	0b RO	**Enable Clock Power Management (ECPM):** Reserved. Not supported by the upstream port.
7	0h RW	**Extended Synch (ES):** When set, forces extended transmission of FTS ordered sets in FTS and extra TS2 at exit from L1 prior to entering L0.
6	0b RW	**Common Clock Configuration (CCC):** When set, indicates that the root port and device are operating with a distributed common reference clock. A value of 0b indicates that this component and the component at the opposite end of this link are operating with asynchronous reference clock. After changing the value in this bit in both components on a link, software must trigger the link to retrain by writing a 1b to the Retrain Link bit of the downstream port.
5	0b RO	**Retrain Link (RL):** Read only of 0b for an upstream port.
4	0b RO	**Link Disable (LD):** Read only of 0b for an upstream port.
3	0b RO	**Read Completion Boundary Control (RCBC):** Indicates the read completion boundary is 64 bytes.
2	0b RV	**Reserved**.
1:0	00b RW	**Active State Link PM Control (ASPM):** Indicates whether the upstream port should enter L0s or L1 or both. Bits Definition 00 Disabled 01 L0s Entry Enabled 10 L1 Entry Enabled 11 L0s and L1 Entry Enabled

RSVD										LER	EQP3S	EQP2S	EQP1S	EqC	CDL	CD				CSOS	EMC	TM			SD	HASD	EC	TLS				

Bit Range	Default and Access	Field Name (ID): Description
31:22	0h RV	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
21	0b RO	**Link Equalization Request (LER):** This bit is set by hardware to request the Link equalization process to be performed on the Link.
20	0b RO	**Equalization Phase 3 Successful (EQP3S):** When set to 1, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed.
19	0b RO	**Equalization Phase 2 Successful (EQP2S):** When set to 1, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed.
18	0b RO	**Equalization Phase 1 Successful (EQP1S):** When set to 1, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed.
17	0b RO	**Equalization Complete (EqC):** When set to 1, this bit indicates that the Transmitter Equalization procedure has completed.
16	0b RO	**Current De-emphasis Level (CDL):** When the Link is operating at 5.0 GT/s speed, this bit reflects the level of de-emphasis. Encodings: 1b -3.5 dB 0b -6 dB The value in this bit is undefined when the Link is not operating at 5.0 GT/s speed.
15:12	0h RO	**Compliance Preset/De-emphasis (CD):** For 8 GT/s and 5 GT/s: This bit sets the transmitter preset level for Polling. Compliance state if the entry occurred due to the Enter Compliance bit being 1b. The Encoding are defined as follows: 8 GT/s Rate: 0000b: -6 dB for de-emphasis, 0 dB for preshoot 0001b: -3.5 dB for de-emphasis, 0 dB for preshoot 0010b: -4.5 dB for de-emphasis, 0 dB for preshoot 0011b: -2.5 dB for de-emphasis, 0 dB for preshoot 0100b: 0 dB for de-emphasis, 0 dB for preshoot 0101b: 0 dB for de-emphasis, 2 dB for preshoot 0110b: 0 dB for de-emphasis, 2.5 dB for preshoot 0111b: -6 dB for de-emphasis, 3.5 dB for preshoot 1000b: -3.5 dB for de-emphasis, 3.5 dB for preshoot 1001b: 0 dB for de-emphasis, 3.5 dB for preshoot 1010b: The Transmitter Preset encoding of 1010b corresponds to the maximum Vtx-boost that the Transmitter advertises with FS and LF in both full swing and reduced swing modes with C_{-1} = 0 and C_{+1} = FS – (2*LF). All other encodings are reserved. 5 GT/s Rate: 001b: -3.5dB 000b: -6 dB All other are reserved. When the link is operating at 2.5 Gb/s, the setting of this bit has no effect.
11	0h RO	**Compliance SOS (CSOS):** When set to 1b, the LTSSM is required to send SKP Ordered Sets periodically in between the (modified) compliance patterns. The default value of this bit is 0b.
10	0b RO	**Enter Modified Compliance (EMC):** When this bit is set to 1b, the device transmits Modified Compliance Pattern if the LTSSM enters Polling.Compliance substate. Default value of this bit is 0b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.

Bit Range	Default and Access	Field Name (ID): Description
9:7	0h RO	**Transmit Margin (TM):** This field controls the value of the non-de-emphasized voltage level at the transmitter pins. This field is reset to 000b on entry to the LTSSM Polling. Configuration substate. 000b: Normal operating range 001b: 800-120 0mV for full swing and 400-700 mV for half-swing Others: Reserved This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
6	0b RO	**Selectable De-emphasis (SD):** not supported.
5	0b RO	**Hardware Autonomous Speed Disable (HASD):** When set, this bit disables hardware from changing the link speed for device specific reasons other than attempting to correct unreliable link operation by reducing link speed for device-specific reasons other than attempting to correct unreliable link operations by reducing link speed. Initial transition to the highest supported common link speed is not blocked by this bit.
4	0b RO	**Enter Compliance (EC):** Software is permitted to force a Link to enter Compliance mode at the speed indicated in the Target Link Speed field by setting this bit to 1b in both components on a Link and then initiating a hot reset on the Link. Default value of this bit following Fundamental Reset is 0b. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value.
3:0	1h RO	**Target Link Speed (TLS):** For downstream ports and root ports, this field sets an upper limit on link operational speed by restricting the values advertised by the Downstream Port in its training sequences. 0001b: 2.5 Gb/s Target Link Speed 0010b: 5.0 Gb/s Target Link Speed 0011b: 8.0 Gb/s Target Link Speed Others: Reserved ***Note:*** The encoding is the binary value of the bit in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the desired target Link speed. All other encodings are reserved. If a value is written to this field that does not correspond to a speed included in the Supported Link Speeds field, the result is undefined. ***Note:*** The default value of this field is the highest Link speed supported by the component (as reported in the Max Link Speed field of the Link Capabilities register) unless the corresponding platform/form factor requires a different default value. For both Upstream and Downstream Ports, this field is used to set the target compliance mode speed when software is using the Enter Compliance bit to force a Link into compliance mode.

22.10.23 Power Management Capability; PCI Power Management Capabilities (PMCAP_PMC)—Offset 80h

Access Method

Type: CFG Register
(Size: 32 bits)

1	1	0	0	1	0	0	0	0	0	0	0	0	0	1	1	1	0	0	0	1	0	0	0	0	0	0	0	0	0	0	1
PMES					D2S	D1S	AC				DSI	RSVD	PMEC	VS					NEXT								CID					

Bit Range	Default and Access	Field Name (ID): Description
31:27	19h RO	**PME Support (PMES):** Indicates PME# is supported for states D0, $D3_{HOT}$ and $D3_{COLD}$. There is no PME support for $D3_{COLD}$ as the part does not have the capability, but for PCIe compliance purposes, bit 15 is set.
26	0b RO	**D2_Support (D2S):** The D2 state is not supported.
25	0b RO	**D1_Support (D1S):** The D1 state is not supported.
24:22	0h RO	**Aux_Current (AC):** Reports 0mA (self-powered),
21	0b RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
20	0h RO	**Reserved**.
19	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
18:16	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	88h RO	**Next Capability (NEXT):** Contains the offset of the next item in the Capabilities List.
7:0	1h RO	**Capability Identifier (CID):** Value of 01h indicates this is a PCI power management capability.

22.10.24 PCI Power Management Control and Status (PMCS)—Offset 84h

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00000008h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
RSVD								BPCE	B23S	RSVD							PMES	DSC	DSEL				PMEE	RSVD				NSR	RSVD	PS	

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RV	**Reserved**
23	0b RO	**Bus Power / Clock Control Enable (BPCE):** Reserved per *PCI Express Specification*.
22	0b RO	**B2/B3 Support (B23S):** Reserved per *PCI Express Specification*.
21:16	0h RV	**Reserved.**
15	0b RW1CS	**PME Status (PMES):** Indicates a PME was received.
14:13	0h RO	**Data Scale (DSC):** Not supported
12:9	0h RO	**Data Select (DSEL):** Not supported
8	0b RWS	**PME Enable (PMEE):** Gates assertion of the PME message.
7:4	0h RV	**Reserved**.
3	1b RWL	**No Soft Reset (NSR):** When set to 1 this bit indicates that devices transitioning from $D3_{HOT}$ to D0 because of Power State commands do not perform an internal reset. Configuration context is preserved. Upon transition from $D3_{HOT}$ to D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the Power State bits. When clear, devices do perform an internal reset upon transitioning from $D3_{HOT}$ to D0 via software control of the Power State bits. Configuration Context is lost when performing the soft reset. Upon transition from $D3_{HOT}$ to D0 state, full reinitialization sequence is needed to return the device to D0 Initialized.
2	0b RV	**Reserved**.
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the upstream port and to set a new power state. The values are: 00 D0 state 11 $D3_{HOT}$ state If software attempts to write a '10' or '01' to these bits, the write will be ignored.

22.10.25 Subsystem Capability List Register (SVCAP)—Offset 88h

Bit Range	Default and Access	Field Name (ID): Description
31:27	000h RV	Reserved.
26	0b RO	**Poisoned TLP Egress Blocked Status (PLTLPEBS)**
25	0b RO	**TLP Prefix Blocked Error Status (TPBES)**
24	0b RW1CS	**Atomic Egress Blocked Status (AEBE):** This bit will never be set
23	0b RW1CS	**MC Blocked TLP Status (MCE):** This bit is set whenever a Multicast TLP is blocked
22	0b RW1CS	**Uncorrectable Internal Error Status (UIE):** This bit is set whenever an uncorrectable internal error is detected.
21	0b RO	**ACS Violation Status (AVS):** Reserved, not supported
20	0b RW1CS	**Unsupported Request Error Status (URE):** Indicates an unsupported request was received.
19	0b RW1CS	**ECRC Error Status (EE):** Set to 1b when an ECRC is detected
18	0b RW1CS	**Malformed TLP Status (MT):** Indicates a malformed TLP was received.
17	0b RW1CS	**Receiver Overflow Status (RO):** Indicates a receiver overflow occurred.
16	0b RW1CS	**Unexpected Completion Status (UC):** Indicates an unexpected completion was received.
15	0b RW1CS	**Completor Abort Status (CA):** Indicates a completer abort was received
14	0b RO	**Completion Timeout Status (CT):** not applicable as the upstream port will not issue non-posted requests on it's one behalf.
13	0b RW1CS	**Flow Control Protocol Error Status (FCPE):** This bit is set when a flow control error protocol is detected.
12	0b RW1CS	**Poisoned TLP Status (PT):** Indicates a poisoned TLP was received.
11:6	0h RV	**Reserved.** Software must write '0' to these bits
5	0b RO	**Surprise Down Error Status (SDE):** Surprise Down is not supported.
4	0b RW1CS	**Data Link Protocol Error Status (DLPE):** Indicates a data link protocol error occurred.
3:0	0h RV	**Reserved.**

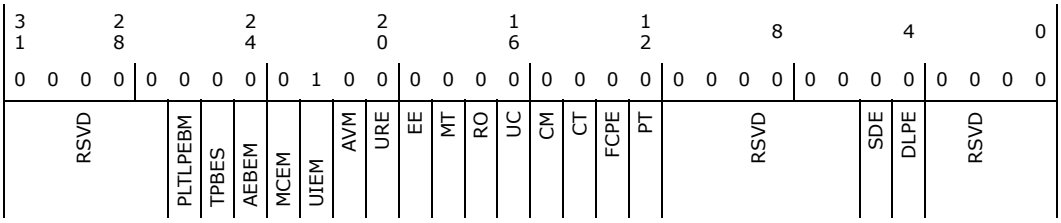
22.10.29 Uncorrectable Error Mask (UEM)—Offset 108h

When set, the corresponding error in the UES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00400000h



Bit Range	Default and Access	Field Name (ID): Description
31:27	0h RV	**Reserved.**
26	0b RO	**Poisoned TLP Egress Blocked Mask (PLTLPEBM)**: Not supported
25	0b RO	**TLP Prefix Blocked Error Mask (TPBES)**: not supported
24	0b RWS	**AtomicOP Egress Blocked Mask (AEBEM)**
23	0b RWS	**MC Blocked TLP Mask (MCEM):**
22	1b RWS	**Uncorrectable Internal Error Mask (UIEM)**
21	0b RO	**ACS Violation Mask (AVM):** Reserved. Access Control Services are not supported
20	0b RWS	**Unsupported Request Error Mask (URE):.**
19	0b RWS	**ECRC Error Mask (EE):**
18	0b RWS	**Malformed TLP Mask (MT):**
17	0b RWS	**Receiver Overflow Mask (RO):**
16	0b RWS	**Unexpected Completion Mask (UC):**
15	0b RWS	**Completor Abort Mask (CM):**
14	0b RWS	**Completion Timeout Mask (CT):** Not supported.
13	0b RWS	**Flow Control Protocol Error Mask (FCPE):**

Bit Range	Default and Access	Field Name (ID): Description
12	0b RWS	**Poisoned TLP Mask (PT):**
11:6	0h RV	**Reserved.**
5	0h RO	**Surprise Down Error Mask (SDE):** not supported.
4	0b RWS	**Data Link Protocol Error Mask (DLPE):**
3:0	0h RV	**Reserved.**

22.10.30 Uncorrectable Error Severity (UEV)—Offset 10Ch

This register gives the option to make an uncorrectable error fatal or non-fatal. An error is fatal if the bit is set. An error is non-fatal if the bit is cleared. This register is only reset by a loss of core power.

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00440010h

14	0b RWS	**Correctable Internal Error Mask (CIEM)**
13	1b RWS	**Advisory Non-Fatal Error Mask (ANFEM):** When set, masks Advisory Non-Fatal errors from (a) signaling ERR_COR to the device control register and (b) updating the Uncorrectable Error Status register. This register is set by default to enable compatibility with software that does not comprehend Role-Based Error Reporting.
12	0b RWS	**Replay Timer Timeout Mask (RTTEM):**.
11:9	0h RO	**Reserved**.
8	0b RWS	**Replay Number Rollover Mask (RNREM):**
7	0b RWS	**Bad DLLP Mask (BDLLPEM):.**
6	0b RWS	**Bad TLP Mask (BTLPEM):**
5:1	0h RO	**Reserved**.
0	0h RW/P	**Receiver Error Mask (REM):**

22.10.33 Advanced Error Capabilities and Control (AECC)—Offset 118h

This register gives the status and control for ECRC checks, and also the pointer to the first uncorrectable error that happened. This register is only reset by a loss of core power.

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD																			CTPHLC	TLPPLP	MHRE	MHRC	ECE	ECC	EGE	EGC	FEP					

Bit Range	Default and Access	Field Name (ID): Description
31:13	0h RV	Reserved.
12	0b RO	**Completion Timeout Prefix/Header Log Capable (CTPHLC):** If Set, this bit indicates that the Function records the prefix/header of Request TLPs that experience a Completion Timeout error.
11	0b ROSV	**TLP Prefix Log Present (TLPPLP):** If Set and the First Error Pointer is valid, indicates that the TLP Prefix Log register contains valid information. If Clear or if First Error Pointer is invalid, the TLP Prefix Log register is undefined.
10	0b RO	**Multiple Header Recording Enable (MHRE):** Multiple Header recording is not supported
9	0b RO	**Multiple Header Recording Capable (MHRC):** Multiple header recording is not supported.
8	0b RWS	**ECRC Check Enable (ECE):**
7	0b RWL	**ECRC Check Capable (ECC):**
6	0b RWS	**ECRC Generation Enable (EGE):**
5	0b RWL	**ECRC Generation Capable (EGC):**.
4:0	0h ROSV	**First Error Pointer (FEP):** This field identifies the bit position of the first error reported in the UncorrectableError Status Register (xref). This register re-arms itself (which does not change its current value) as soon as the error status bit indicated by the pointer is cleared by the software by writing a 1 to that status bit.

22.10.34 Header Log Register (AERHDRLOG[1-4])—Offset 11C - 128h by 4h

This register logs the 4 Dwords of the transaction header for PCI Express Errors.

Type: CFG Register
(Size: 32 bits)

Device:
Function: 0

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
AERHDRLOG																															

Bit Range	Default and Access	Field Name (ID): Description
31:0	00000000h ROSV	**TLP Header Log (TLPHDRLOG)**: As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log, thus rearming the logging of errors.

22.10.35 Access Control Services Extended Capability Header (ACSCAPHDR)—Offset 138h

Size:32 bits

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 0001000Dh

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1
NCO												CV				CID																

Bit Range	Default and Access	Field Name (ID): Description
31:20	000h RW-L	**Next Capability Offset (NCO):** Contains the offset of the next structure in the extended capabilities list.
19:16	1h RO	**Capability Version (CV):** Indicates the version of the capability structure present.
15:0	000Dh RO	**Extended Capability ID (ECID):** Identifies the function as Access Control Services capable.

22.10.36 Access Control Services Capability and Control Register (ACSCAP_ACSCTL)—Offset 13Ch

Type: CFG Register
(Size: 32 bits)

Device: 0
Function: 0

Default: 0000005Fh

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	1	1	1	1
RSVD									ACSDTP2PE	ACSP2PECE	ACSUFE	ACSP2CRE	ACSP2PRRE	ACSTBE	ACSSVE	ECVS								RSVD	ACSDTP2P	ACSP2PEC	ACSUF	ACSP2PCR	ACSP2PRR	ACSTB	ACSSV

Bit Range	Default and Access	Field Name (ID): Description
31:23	0000h RO	Reserved
22	0b RW	**ACS Direct Translated P2P Enable (T) (ACSP2PECE):** When Set, overrides the ACS P2P Request Redirect and ACS P2P Egress Control mechanisms with peer-to-peer Memory Requests whose Address Translation (AT) field indicates a Translated address ***Note:*** This bit is ignored if ACS Translation Blocking (B) is enabled.
21	0b RO	**ACS P2P Egress Control Enable (E) (ACSP2PECE):** This is hardwired to 0b as the component does not implement ACS P2P Egress Control.
20	0b RW	**ACS Upstream Forwarding Enable (U) (ACSUFE):** When set, the component forwards upstream any Request or Completion TLPs it receives that were redirected upstream by a component lower in the hierarchy. Note that the U bit only applies to upstream TLPs arriving at a Downstream Port, and whose normal routing targets the same Downstream Port.
19	0b RW	**ACS P2P Completion Redirect Enable (C) (ACSP2PCRE):** Determines when the component redirects peer-to-peer Completions upstream; applicable only to Read Completions whose Relaxed Ordering Attribute is clear.
18	0b RW	**ACS P2P Request Redirect Enable (R) (ACSP2PRRE):** This bit determines when the component redirects peer-to-peer Requests upstream.
17	0b RW	**ACS Translation Blocking Enable (B) (ACSTBE):** When set, the component blocks all upstream Memory Requests whose Address Translation (AT) field is not set to the default value.
16	0b RW	**ACS Source Validation Enable (V) (ACSSVE):** When set, the component validates the Bus Number from the Requester ID of upstream Requests against the secondary / subordinate Bus Numbers.
15:8	00h RO	**Egress Control Vector Size (ECVS):** Indicates the number of bits in the Egress Control Vector. This is set to 00h as ACS P2P Egress Control (ACSP2PEC) bit 5 in this register is 0b.
7	0b RV	Reserved
6	1b RO	**ACS Direct Translated P2P (T) (ACSDTP2P):** Indicates that the component does implement ACS Direct Translated P2P. ***Note:*** Required for Root Ports that support Address Translation Services (ATS) and also support peer-to-peer traffic with other Root Ports; required for Switch Downstream Ports
5	0b RO	**ACS P2P Egress Control (E) (ACSP2PEC):** Hardwired to 0. Indicates that the component does not implement ACS P2P Egress Control.
4	1b RO	**ACS Upstream Forwarding (U) (ACSUF):** Indicates that the component implements ACS Upstream Forwarding.
3	1b RO	**ACS P2P Completion Redirect (C) (ACSP2PCR):** Indicates that the component implements ACS P2P Completion Redirect.
2	1b RO	**ACS P2P Request Redirect (R) (ACSP2PRR):** Indicates that the component implements ACS P2P Request Redirect.
1	1b RO	**ACS Translation Blocking (B) (ACSTB):** Indicates that the component implements ACS Translation Blocking.
0	1b RO	**ACS Source Validation (V) (ACSSV):** Indicates that the component implements ACS Source Validation.

22.10.37 Uncorrectable Error Detect Mask Register (ERRUNCDETMSK)—Offset 140h

A value of 1 masks the field and prevents detection as well as logging of errors.

23.3 Overview

The PCH contains a Motorola* MC146818B-compatible real-time clock with 256 bytes of battery-backed RAM. The real-time clock performs two key functions—keeping track of the time of day and storing system data, even when the system is powered down. The RTC operates on a 32.768 kHz crystal and a 3V battery.

The RTC also supports two lockable memory ranges. By setting bits in the configuration space, two 8-byte ranges can be locked to read and write accesses. This prevents unauthorized reading of passwords or other system security information.

The RTC also supports a date alarm that allows for scheduling a wake up event up to 30 days in advance, rather than just 24 hours in advance.

23.4 Signal Description

Name	Type	Description
RTCX1	I	**Crystal Input 1:** This signal is connected to the 32.768 kHz crystal (Max 50K ESR). If using an external oscillator, the RTCX1 Vih must be within the range of 0.8V to 1.5V (1.5V max).
RTCX2	O	**Crystal Input 2:** This signal is connected to the 32.768 kHz crystal (Max 50K ESR). If using an external oscillator, RTCX2 should be left floating.
RTCRST#	I	An external RC circuit creates a time delay for the signal such that it will go high sometime after battery voltage is valid. If the battery is missing/weak, this signal can appear to be low (asserted) at boot just after the Vcc3P3 power rail is up since it will not have time to meet Vih when Vcc3P3 is high. Upon booting, BIOS should recognize that RTCRST# was asserted and clear CMOS RAM. 1. Unless CMOS is being cleared (only to be done in the G3 power state) or the battery is low, the signal input must always be high when RTC power is on. 2. In the case where the RTC battery is dead or missing on the platform, the signal should go high (de-asserted) before DSW_PWROK or RSMRST# go high (de-assert).

Name	Type	Description
SRTCRST#	I	**Secondary RTC Reset:** This signal resets the manageability register bits in the RTC well when the RTC battery is removed. An external RC circuit creates a time delay for the signal such that it will go high (de-assert) sometime after the battery voltage is valid. When asserted, this signal resets all register bits in the RTC well. ***Notes:*** 1. Unless CMOS is being cleared (only to be done in the G3 power state) the signal input must always be high when RTC power is on. 2. In the case where the RTC battery is dead or missing on the platform, the signal should go high (de-asserted) before DSW_PWROK or RSMRST# go high (de-assert).

23.5 Integrated Pull-Ups and Pull-Downs

None

23.6 I/O Signal Planes and States

Signal Name	Power Plane	During Reset	Immediately after Reset	S3/S4/S5	Deep Sx
RTCRST#	RTC	Undriven	Undriven	Undriven	Undriven
SRTCRST#	RTC	Undriven	Undriven	Undriven	Undriven

23.7 Functional Description

The Real Time Clock module provides a battery backed-up date and time keeping device with two banks of static RAM with 128 bytes each, although the first bank has 114 bytes for general purpose usage.

Three interrupt features are available: time of day alarm with once a second to once a month range, periodic rates of 122 – 500 ms, and end of update cycle notification. Seconds, minutes, hours, days, day of week, month, and year are counted. Daylight savings compensation is no longer supported.

The hour is represented in twelve or twenty-four hour format, and data can be represented in BCD or binary format. The design is functionally compatible with the Motorola MS146818B. The time keeping comes from a 32.768 kHz oscillating source, which is divided to achieve an update every second. The lower 14 bytes on the lower RAM block has very specific functions. The first ten are for time and date information. The next four (0Ah to 0Dh) are registers, which configure and report RTC functions.

The time and calendar data should match the data mode (BCD or binary) and hour mode (12 or 24 hour) as selected in register B. It is up to the programmer to make sure that data stored in these locations is within the reasonable values ranges and represents a possible date and time. The exception to these ranges is to store a value of C0–FFh in the Alarm bytes to indicate a don't care situation. All Alarm conditions must match to trigger an Alarm Flag, which could trigger an Alarm Interrupt if enabled.

The SET bit must be 1 while programming these locations to avoid clashes with an update cycle. Access to time and date information is done through the RAM locations. If a RAM read from the ten time and date bytes is attempted during an update cycle, the value read do not necessarily represent the true contents of those locations. Any RAM writes under the same conditions are ignored.

Note: The leap year determination for adding a 29th day to February does not take into account the end-of-the-century exceptions. The logic simply assumes that all years divisible by four are leap years. According to the Royal Observatory Greenwich, years that are divisible by 100 are typically not leap years. In every fourth century (years divisible by 400, like 2000), the 100-year-exception is over-ridden and a leap-year occurs.

Note: The year 2100 will be the first time in which the current RTC implementation would incorrectly calculate the leap-year.

The PCH does not implement month/year alarms.

23.7.1 Update Cycles

An update cycle occurs once a second, if the SET bit of register B is not asserted and the divide chain is properly configured. During this procedure, the stored time and date are incremented, overflow is checked, a matching alarm condition is checked, and the time and date are rewritten to the RAM locations.

The update cycle will start at least 488 µs after the UIP bit of register A is asserted, and the entire cycle does not take more than 1984 µs to complete. The time and date RAM locations (0–9) are disconnected from the external bus during this time.

To avoid update and data corruption conditions, external RAM access to these locations can safely occur at two times. When a updated-ended interrupt is detected, almost 999 ms is available to read and write the valid time and date data. If the UIP bit of Register A is detected to be low, there is at least 488 µs before the update cycle begins.

Warning: The overflow conditions for leap years adjustments are based on more than one date or time item. To ensure proper operation when adjusting the time, the new time and data values should be set at least two seconds before leap year occurs.

23.7.2 Interrupts

The real-time clock interrupt is internally routed within the PCH both to the I/O APIC and the 8259. It is mapped to interrupt vector 8. This interrupt does not leave the PCH, nor is it shared with any other interrupt. IRQ8# from the SERIRQ stream is ignored. However, the High Performance Event Timers can also be mapped to IRQ8#; in this case, the RTC interrupt is blocked.

23.7.3 Lockable RAM Ranges

The RTC battery-backed RAM supports two 8-byte ranges that can be locked using the configuration space. If the locking bits are set, the corresponding range in the RAM will not be readable or writable. A write cycle to those locations will have no effect. A read cycle to those locations will not return the location’s actual value (resultant value is undefined).

Once a range is locked, the range can be unlocked only by a hard reset, which will invoke the BIOS and allow it to relock the RAM range.

23.7.4 Century Rollover

The PCH detects a rollover when the Year byte transitions form 99 to 00. Upon detecting the rollover, the PCH sets the NEWCENTURY_STS bit.

If the system is in an S0 state, this causes an SMI#. The SMI# handler can update registers in the RTC RAM that are associated with century value.

If the system is in a sleep state (S1–S5) when the century rollover occurs, the PCH also sets the NEWCENTURY_STS bit, but no SMI# is generated. When the system resumes from the sleep state, BIOS should check the NEWCENTURY_STS bit and update the century value in the RTC RAM.

23.7.5 Clearing Battery-Backed RTC RAM

Clearing RTC well registers in a PCH-based platform can be done by using a jumper on RTCRST# or GPI. Implementations should not attempt to clear CMOS by using a jumper to pull VccRTC low. The RTC RAM contents are themselves not cleared by RTCRST#. To clear them to 0b, they must be written to.

23.7.5.1 Using RTCRST# to Clear CMOS

A jumper on RTCRST# can be used to clear CMOS values, as well as reset to default, the state of those configuration bits that reside in the RTC power well.

When the RTCRST# is strapped to ground, the RTC_PWR_STS bit will be set and those configuration bits in the RTC power well will be set to their default state. BIOS can monitor the state of this bit and manually clear the RTC CMOS array once the system is booted. The normal position would cause RTCRST# to be pulled up through a weak pull-up resistor. This RTCRST# jumper technique allows the jumper to be moved and then replaced—all while the system is powered off. Then, once booted, the RTC_PWR_STS can be detected in the set state.

23.7.5.2 Using a GPI to Clear CMOS

A jumper on a GPI can also be used to clear CMOS values. The BIOS would detect the setting of this GPI on system boot-up, and manually clear the CMOS array.

Note: The GPI strap technique to clear CMOS requires multiple steps to implement. The system is booted with the jumper in new position, then powered back down. The jumper is replaced back to the normal position, then the system is rebooted again.

Warning: Do not implement a jumper on VccRTC to clear CMOS.

23.7.6 External RTC Circuitry

The PCH implements an internal oscillator circuit that is sensitive to step voltage changes in VCCRTC. Refer to the Platform Design Guide for example external RTC circuitry guidelines.

Table 23-1. RTC Crystal Requirements

Parameter	Specification
Frequency	32.768 kHz
Typical Tolerance	20 ppm or better
ESR	≤ 50 kΩ

Table 23-2. External Crystal Oscillator Requirements

Parameter	Specification
Frequency	32.768 kHz
Typical Tolerance	20 ppm or better
RTCX1 Vin requirements	Vih min = 0.8V Vih max = 1.5V Vil min = -0.2V Vil max = 0.2V

23.8 RTC Indexed Registers Summary

The RTC contains two sets of indexed registers that are accessed using the two separate Index and Target registers (70h/71h or 72h/73h), as shown in the following table:

RTC (Standard) RAM Bank
Index Name
00h Seconds
01h Seconds Alarm
02h Minutes
03h Minutes Alarm
04h Hours
05h Hours Alarm
06h Day of Week
07h Day of Month
08h Month
09h Year
0Ah Register A
0Bh Register B
0Ch Register C
0Dh Register D
0Eh-7Fh 114 Bytes of User RAM

Table 23-3. Summary of RTC Indexed Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
1h	1h	Seconds Alarm (Sec_Alarm)—Offset 1h	0h
2h	2h	Minutes (Minutes)—Offset 2h	0h
3h	3h	Minutes Alarm (Minutes_Alarm)—Offset 3h	0h
4h	4h	Hours (Hours)—Offset 4h	0h
5h	5h	Hours Alarm (Hours_Alarm)—Offset 5h	0h
6h	6h	Day of Week (Day_of_Week)—Offset 6h	0h
7h	7h	Day of Month (Day_of_Month)—Offset 7h	0h
8h	8h	Month (Month)—Offset 8h	0h
9h	9h	Year (Year)—Offset 9h	0h
Ah	Ah	Register A (RTC_REGA)—Offset Ah	20h
Bh	Bh	Register B - General Configuration (Register_B)—Offset Bh	0h
Ch	Ch	Register C - Flag Register (Register_C)—Offset Ch	0h
Dh	Dh	Register D - Flag Register (Register_D)—Offset Dh	80h

23.8.1 Seconds Alarm (Sec_Alarm)—Offset 1h

Seconds Alarm

23.8.5 Hours Alarm (Hours_Alarm)—Offset 5h

Hours Alarm

23.8.6 Day of Week (Day_of_Week)—Offset 6h

Day of Week

23.8.7 Day of Month (Day_of_Month)—Offset 7h

Day of Month

23.8.8 Month (Month)—Offset 8h

Month

23.8.9 Year (Year)—Offset 9h

Year

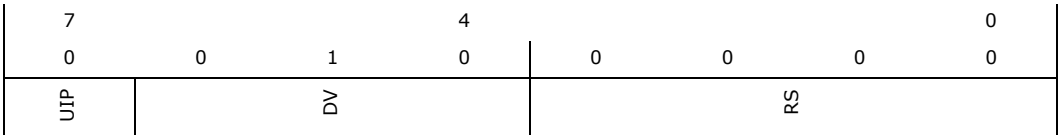
23.8.10 Register A (RTC_REGA)—Offset Ah

This register is used for general configuration of the RTC functions. None of the bits are affected by RSMRST# or any other reset signal.

Access Method

Type: Register (Size: 8 bits)	**Device:** **Function:**

Default: 20h



Bit Range	Default and Access	Field Name (ID): Description
7	0h RW	**UPDATE IN PROGRESS (UIP):** This bit may be monitored as a status flag. 0 = Update cycle will not start for at least 488 micro-seconds. The time, calendar, and alarm information in RAM is always available when the UIP bit is 0. 1 = The update is soon to occur or is in progress.
6:4	2h RW	**Division Chain Select (DV):** These three bits control the divider chain for the oscillator, and are not affected by RSMRST# or any other reset signal.DV2 corresponds to bit 6. DV2 DV1 DV0 Function 0 1 0 Normal Operation 1 1 X Divider Reset 1 0 1 Bypass 15 stages (test mode only) 1 0 0 Bypass 10 stages (test mode only) 0 1 1 Bypass 5 stages (test mode only) 0 0 1 Invalid 0 0 0 Invalid
3:0	0h RW	**Rate Select (RS):** Selects one of 13 taps of the 15 stage divider chain. The selected tap can generate a periodic interrupt if the PIE bit is set in Register B. Otherwise this tap will set the PF flag of Register C. If the periodic interrupt is not to be used, these bits should all be set to zero. RS3 corresponds to bit 3. RS3[4p] RS2 RS1 RS0 Periodic Rate 0 0 0 0 Interrupt never toggles 0 0 0 1 3.90625 ms 0 0 1 0 7.8125 ms 0 0 1 1 122.070 s 0 1 0 0 244.141 s 0 1 0 1 488.281 s 0 1 1 0 976.5625s 0 1 1 1 1.953125 ms 1 0 0 0 3.90625 ms 1 0 0 1 7.8125 ms 1 0 1 0 15.625 ms 1 0 1 1 31.25 ms 1 1 0 0 62.5 ms 1 1 0 1 125 ms 1 1 1 0 250 ms 1 1 1 1 500 ms

23.8.11 Register B - General Configuration (Register_B)—Offset Bh

Access Method

Type: Register
(Size: 8 bits)

Device:
Function:

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
SET	PIE	AIE	UIE	SQWE	DM	HOURFORM	DSE

Bit Range	Default and Access	Field Name (ID): Description
7	0h RW	**Update Cycle Inhibit (SET):** Enables/Inhibits the update cycles. 0 = Update cycle occurs normally once each second. 1 = A current update cycle will abort and subsequent update cycles will not occur until SET is returned to zero. When set is one, the BIOS may initialize time and calendar bytes safely. This bit is not affected by RSMRST# nor any other reset signal. ***Note:*** Software must ensure this bit is at least transitioned from '1' to '0' once whenever the RTC coin battery is inserted. This is to ensure that the internal RTC time updates occur properly.
6	0h RW	**Periodic Interrupt Enable (PIE):** 0 = Disabled. 1 = Enabled. Allows an interrupt to occur with a time base set with the RS bits of register A. This bit is cleared by RSMRST# assertion, but not on any other reset.
5	0h RW	**Alarm Interrupt Enable (AIE):** 0 = Disabled. 1 = Enabled. Allows an interrupt to occur when the AF is set from an alarm match from the update cycle. An alarm can occur once a second, one an hour, once a day, or once a month. This bit is cleared by RTCRST# assertion, but not on any other reset.
4	0h RW	**Update-ended Interrupt Enable: (UIE):** 0 = Disabled. 1 = Enabled. Allows an interrupt to occur when the update cycle ends. This bit is cleared by RSMRST# assertion, but not on any other reset.
3	0h RW	**Square Wave Enable (SQWE):** The Square Wave Enable bit serves no function in this device, yet is left in this register bank to provide compatibility with the Motorola 146818B. There is not SQW pin on this device. This bit is cleared by RSMRST# assertion, but not on any other reset.
2	0h RW	**Data Mode (DM):** This bit specifies either binary or BCD data representation. 0 = BCD. 1 = Binary. This bit is not affected by RSMRST# nor any other reset signal.
1	0h RW	**Hour Format (HOURFORM):** This bit indicates the hour byte format. 0 = Twelve-hour mode is selected.In twelve hour mode, the seventh bit represents AM as zero and PM as one. 1 = Twenty-four hour mode is selected. This bit is not affected by RSMRST# nor any other reset signal.
0	0h RW	**Daylight Savings Enable (DSE):** The Daylight Savings Enable bit triggers two special hour updates per year when set to one. One is on the first Sunday in April, where time increments from 1:59:59 AM to 3:00:00 AM. The other is the last Sunday in October when the time first reaches 1:59:59 AM, it is changed to 1:00:00 AM. The time must increment normally for at least two update cycles (seconds) previous to these conditions for the time change to occur properly. These special update conditions do not occur when the DSE bit is set to zero. The days for the hour adjustment are those specified in United States federal law as of 1987, which is different than previous years. If BUC.DSO bit is set, the DSE bit continues to be a R/W bit, but Daylight Saving is disabled regardless of the DSE bit. This bit is not affected by RSMRST# nor any other reset signal.

23.8.12 Register C - Flag Register (Register_C)—Offset Ch

Access Method

Type: Register
(Size: 8 bits)

Device:
Function:

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
IRQF	PF	AF	UF	RSVD			

Bit Range	Default and Access	Field Name (ID): Description
7	0h RO	**Interrupt Request Flag (IRQF):** Interrupt Request Flag = (PF * PIE) + (AF * AIE) + (UF * UFE). This also causes the RTC Interrupt to be asserted. This bit is cleared upon RSMRST# assertion or a read of Register C.
6	0h RO	**Periodic Interrupt Flag (PF):** Periodic interrupt Flag will be one when the tap as specified by the RS bits of register A is one. If no taps are specified, this flag bit will remain at zero. This bit is cleared upon RSMRST# assertion or a read of Register C.
5	0h RO	**Alarm Flag (AF):** Alarm Flag will be high after all Alarm values match the current time. This bit is cleared upon RTCRST# assertion or a read of Register C.
4	0h RO	**Update-ended Flag (UF):** Updated-ended flag will be high immediately following an update cycle for each second. The bit is cleared upon RSMRST# assertion or a read of Register C.
3:0	0h RO	Reserved.

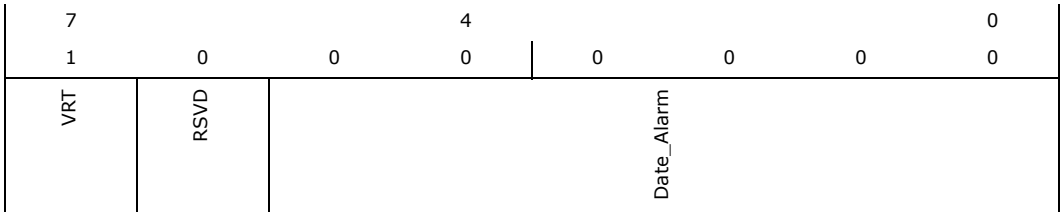
23.8.13 Register D - Flag Register (Register_D)—Offset Dh

Access Method

Type: Register
(Size: 8 bits)

Device:
Function:

Default: 80h



Bit Range	Default and Access	Field Name (ID): Description
7	1h RW	**Valid RAM and Time Bit (VRT):** This bit is hard-wired to 1 in the RTC power well. This bit should always be written as a 0 for write cycle, however it will return a 1 for read cycles.
6	0h RO	Reserved.
5:0	0h RW	**Date Alarm (Date_Alarm):** These bits store the date of month alarm value. If set to 000000, then a don't care state is assumed. The host must configure the dates alarm for these bits to do anything, yet they can be written at any time. If the date alarm is not enabled, these bits will return zeros to mimic the functionality of the Motorola 146818B. These bits are not affected by any reset assertion.

23.9 RTC Configuration Registers Summary

Table 23-4. Summary of RTC Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
3400h	3403h	RTC Configuration (RC)—Offset 3400h	0h
3414h	3417h	Backed Up Control (BUC)—Offset 3414h	0h

23.9.1 RTC Configuration (RC)—Offset 3400h

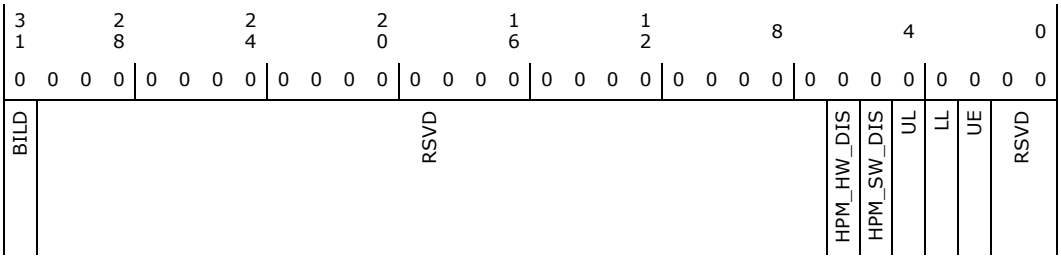
All bits in this register are in the Primary Well and cleared by PLTRST# assertion.

Access Method

Type: Register
(Size: 32 bits)

Device:
Function:

Default: 0h



Bit Range	Default and Access	Field Name (ID): Description
31	0h RWLO	**BIOS Interface Lock-Down (BILD):** When set, prevents RTC version of TS (BUC.TS) from being changed. This bit can only be written from 0 to 1 once. This BILD bit has a different function compared to LPC, SPI and eSPI version but BIOS should set all the corresponding bits after reset in order to lock down the BIOS interface correctly.
30:7	0h RO	Reserved.
6	0h RW	**RTC High Power Mode HW Disable (HPM_HW_DIS):** 0 = HW control of the RTC internal VRM is disabled. 1 = The internal VRM that generates the RTC well supply voltage in SUS mode is disabled when SLP_S0# is asserted.
5	0h RW	**RTC High Power Mode SW Disable (HPM_SW_DIS):** 0 = The internal VRM powers the RTC well when RSMRST# is '1'. (default) 1 = The internal VRM that generates the rtc well supply voltage in SUS mode is disabled.
4	0h RWLO	**Upper 128 Byte Lock (UL):** When set, bytes 38h-3Fh in the upper 128 byte bank of RTC RAM are locked and cannot be accessed. Writes will be dropped and reads will not return any guaranteed data. Bit reset on system reset.
3	0h RWLO	**Lower 128 Byte Lock (LL):** When set, bytes 38h-3Fh in the lower 128 byte bank of RTC RAM are locked and cannot be accessed. Writes will be dropped and reads will not return any guaranteed data. Bit reset on system reset.
2	0h RW	**Upper 128 Byte Enable (UE):** When set, the upper 128 byte bank of RTC RAM can be accessed.
1:0	0h RO	Reserved.

23.9.2 Backed Up Control (BUC)—Offset 3414h

All bits in this register are in the RTC well and only cleared by RTCRST# assertion.

Access Method

Type: Register
(Size: 8 bits)

Device:
Function:

Default: 0h

7			4				0
0	0	0	0	0	0	0	0
RSVD		LanDisable	DSO	RSVD			TS

Bit Range	Default and Access	Field Name (ID): Description
7:6	0h RO	Reserved.
5	0h RW/RO/F/L	**LAN Disable (LanDisable):** 0 = LAN is Enabled 1 = LAN is Disabled. This register is reset to 0 on RTCRST# assertion. If the Function Disable SUS Well Lockdown register is set, this bit can not be changed by software.
4	0h RW	**Daylight Savings Override (DSO):** 0 = The DSE bit in the RTC register B bit(0) is a RW bit that is configurable by software to enable the daylight savings. 1 = The DSE bit in the RTC Register B bit(0) is a RW bit but has no effect, daylight savings is hard-disabled internally. System BIOS shall configure this bit accordingly during the boot process before RTC time is initialized.
3	0h RW	**Reserved**
2:1	0h RO	**Reserved.**
0	0h RW	**Top Swap (TS):** 0 = PCH will not invert A16, A17 or A18. 1 = PCH will invert A16, A17 or A18 for cycles going to the BIOS space. If booting from SPI LPC (FWH), then the boot-block size is 64 KB and A16 is inverted if Top Swap is enabled. If booting from SPI, then the Top Swap Block size soft strap determines if A16, A17 or A18 should be inverted if Top Swap is enabled. If PCH is strapped for Top Swap (GPP_B14/SPKR is high at rising edge of PCH_PWROK), then this bit cannot be cleared by software. The strap jumper should be removed and the system rebooted.

§

24 Serial ATA

The PCH has two integrated Serial ATA host controllers with independent DMA operation on up to14 ports.

24.1 Acronyms

Acronyms	Description
AHCI	Advanced Host Controller Interface
DMA	Direct Memory Access
DEVSLP	Device Sleep
IDE	Integrated Drive Electronics
RAID	Redundant Array of Independent Disks
SATA and SSATA	Serial Advanced Technology Attachment
Intel® RSTe	Intel® Rapid Storage Technology Enterprise

24.2 References

Specification	Location
Serial ATA Specification, Revision 3.2	https://www.sata-io.org
Serial ATA II: Extensions to Serial ATA 1.0, Revision 1.0	https://www.sata-io.org
Serial ATA II Cables and Connectors Volume 2 Gold	https://www.sata-io.org

24.3 Overview

The PCH has two integrated SATA host controller that supports independent DMA operation for up tofourteen ports for the Intel® C620 Series Chipsetand supports data transfer rates of up to 6 Gb/s on all ports. The fourteen ports are split between eight ports on one controller and six on the other. The SATA ports on the second controller are named SSATA ports to identify that they are at a different configuration space and address as the first eight, which are compatible with the client. Other than the difference in the number of SATA ports and residing at different Device:Function numbers, the two SATA controller are identical in capabilities and programming.

The PCH SATA controller contains one mode of operation—AHCI mode using memory space, and it also supports RAID mode. The PCH SATA controller no longer supports legacy mode using I/O space. Therefore, AHCI software is required. The PCH SATA controller supports the *Serial ATA Specification*, Revision 3.2.

See Section 1.3, “PCH I/O Features and Capabilities” for details on feature availability.

24.4 Signal Description

Name	Type	Description
GPP_E4_SATA_DEVSLP0	OD	**Serial ATA Port [0] Device Sleep**: This is an open-drain pin on the PCH side. PCH will tri-state this pin to signal to the SATA device that it may enter a lower power state (pin will go high due to pull-up that is internal to the SATA device, per DEVSLP specification). PCH will drive pin low to signal an exit from DEVSLP state. Design Constraint: As per the PDG, no external pull-up or pull-down termination required when used as DEVSLP. ***Note:*** This pin can be mapped to SATA Port 0.
