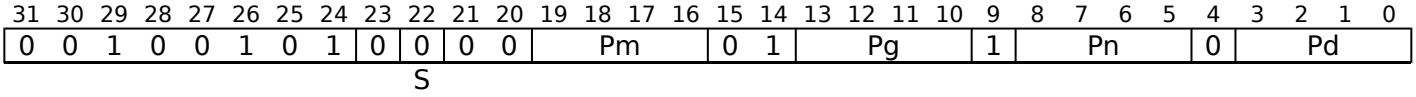
NOT (predicate)

Bitwise invert predicate

Bitwise invert each active element of the source predicate, and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Does not set the condition flags.

This is an alias of EOR (predicates). This means:

- The encodings in this description are named to match the encodings of EOR (predicates).
- The description of EOR (predicates) gives the operational pseudocode for this instruction.



NOT <Pd>.B, <Pg>/Z, <Pn>.B

is equivalent to

EOR <Pd>.B, <Pg>/Z, <Pn>.B, <Pg>.B

and is the preferred disassembly when `Pm == Pg`.

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the first source scalable predicate register, encoded in the "Pn" field.

Operation

The description of EOR (predicates) gives the operational pseudocode for this instruction.

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

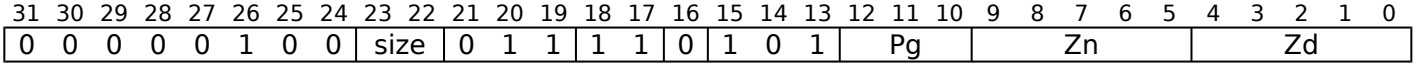
NOT (vector)

Bitwise invert vector (predicated)

Bitwise invert each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.



NOT <Zd>.<T>, <Pg>/M, <Zn>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);
bits(VL) result = Z[d, VL];

for e = 0 to elements-1
    if ElemP[mask, e, esize] == '1' then
        bits(esize) element = Elem[operand, e, esize];
        Elem[result, e, esize] = NOT element;

Z[d, VL] = result;
```

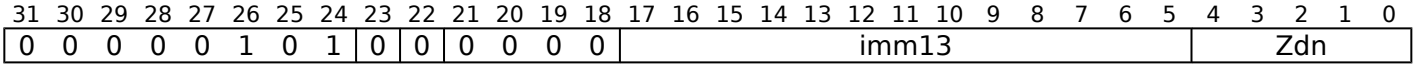
ORN (immediate)

Bitwise inclusive OR with inverted immediate (unpredicated)

Bitwise inclusive OR an inverted immediate with each 64-bit element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits. This instruction is unpredicated.

This is a pseudo-instruction of ORR (immediate). This means:

- The encodings in this description are named to match the encodings of ORR (immediate).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of ORR (immediate) gives the operational pseudocode for this instruction.



ORN <Zdn>.<T>, <Zdn>.<T>, #<const>

is equivalent to

ORR <Zdn>.<T>, <Zdn>.<T>, #(-<const> - 1)

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “imm13<12>:imm13<5:0>”:

imm13<12>	imm13<5:0>	<T>
0	0xxxxx	S
0	10xxxx	H
0	110xxx	B
0	1110xx	B
0	11110x	B
0	111110	RESERVED
0	111111	RESERVED
1	xxxxxx	D

<const> Is a 64, 32, 16 or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32 or 64 bit fields, each field containing a rotated run of non-zero bits, encoded in the "imm13" field.

Operation

The description of ORR (immediate) gives the operational pseudocode for this instruction.

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.

```

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the NZCV condition flags written by this instruction might be significantly delayed.

Internal version only: isa v33.23junrel, AdvSIMD v29.1, pseudocode v2022-06_rel, sve v2022-06_rel ; Build timestamp: 2022-07-06T09:51

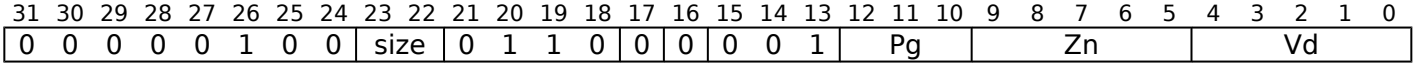
ORV

Bitwise inclusive OR reduction to scalar

Bitwise inclusive OR horizontally across all lanes of a vector, and place the result in the SIMD&FP scalar destination register. Inactive elements in the source vector are treated as zero.



ORV <V><d>, <Pg>, <Zn>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Vd);
```

Assembler Symbols

<V> Is a width specifier, encoded in “size”:

size	<V>
00	B
01	H
10	S
11	D

<d> Is the number [0-31] of the destination SIMD&FP register, encoded in the "Vd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);
bits(esize) result = Zeros(esize);

for e = 0 to elements-1
    if ElemP[mask, e, esize] == '1' then
        result = result OR Elem[operand, e, esize];

V[d, esize] = result;
```

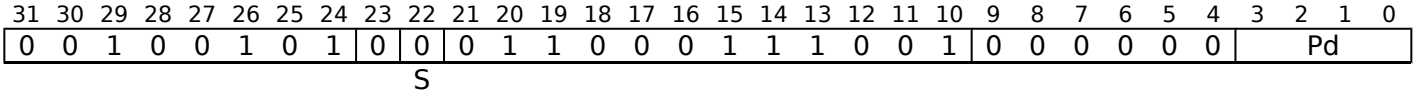
PFALSE

Set all predicate elements to false

Set all elements in the destination predicate to false.



PFALSE <Pd>.B

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
integer d = UInt(Pd);
```

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
P[d, PL] = Zeros(PL);
```

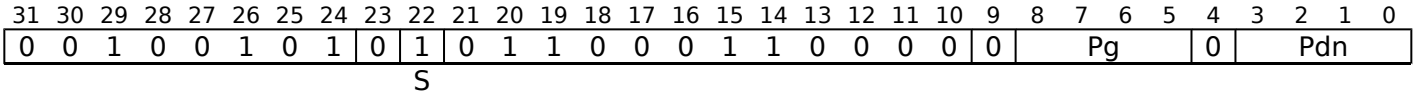
PFIRST

Set the first active predicate element to true

Sets the first active element in the destination predicate to true, otherwise elements from the source predicate are passed through unchanged. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.



PFIRST <Pdn>.B, <Pg>, <Pdn>.B

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8;
integer g = UInt(Pg);
integer dn = UInt(Pdn);
```

Assembler Symbols

<Pdn>	Is the name of the source and destination scalable predicate register, encoded in the "Pdn" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(PL) result = P[dn, PL];
integer first = -1;

for e = 0 to elements-1
    if ElemP[mask, e, esize] == '1' && first == -1 then
        first = e;

if first >= 0 then
    ElemP[result, first, esize] = '1';

PSTATE.<N,Z,C,V> = PredTest(mask, result, esize);
P[dn, PL] = result;
```

Operational information

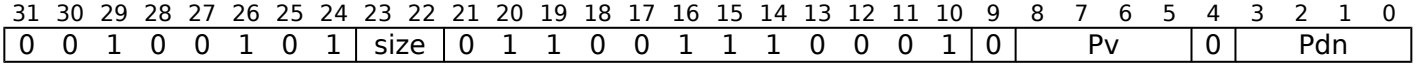
PNEXT

Find next active predicate

An instruction used to construct a loop which iterates over all true elements in the vector select predicate register. If all elements in the first source predicate register are false it determines the first true element in the vector select predicate register, otherwise it determines the next true element in the vector select predicate register that follows the last true element in the first source predicate register. All elements of the destination predicate register are set to false, except the element corresponding to the determined vector select element, if any, which is set to true. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.



PNEXT <Pdn>.<T>, <Pv>, <Pdn>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer v = UInt(Pv);
integer dn = UInt(Pdn);
```

Assembler Symbols

<Pdn> Is the name of the first source and destination scalable predicate register, encoded in the "Pdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pv> Is the name of the vector select predicate register, encoded in the "Pv" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[v, PL];
bits(PL) operand = P[dn, PL];
bits(PL) result;

integer next = LastActiveElement(operand, esize) + 1;

while next < elements && (ElemP[mask, next, esize] == '0') do
    next = next + 1;

result = Zeros(PL);
if next < elements then
    ElemP[result, next, esize] = '1';

PSTATE.<N,Z,C,V> = PredTest(mask, result, esize);
P[dn, PL] = result;
```

Operational information

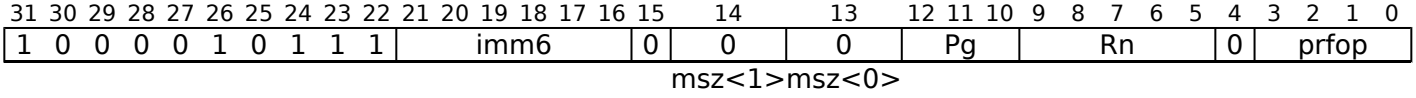
PRFB (scalar plus immediate)

Contiguous prefetch bytes (immediate index)

Contiguous prefetch of byte elements from the memory address generated by a 64-bit scalar base and immediate index in the range -32 to 31 which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.
The predicate may be used to suppress prefetches from unwanted addresses.



PRFB <prfop>, <Pg>, [<Xn|SP>{, #<imm>, MUL VL}]

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8;
integer g = UInt(Pg);
integer n = UInt(Rn);
integer level = UInt(prfop<2:1>);
boolean stream = (prfop<0> == '1');
pref_hint = if prfop<3> == '0' then Prefetch_READ else Prefetch_WRITE;
integer scale = 0;
integer offset = SInt(imm6);
```

Assembler Symbols

<prfop> Is the prefetch operation specifier, encoded in “prfop”:

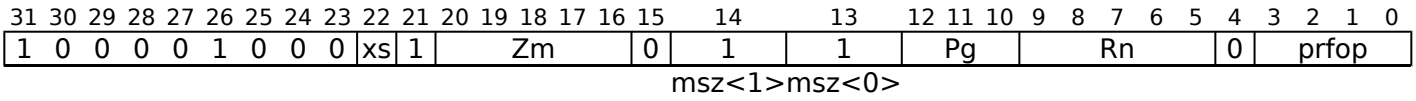
PRFD (scalar plus vector)

Gather prefetch doublewords (scalar plus vector)

Gather prefetch of doublewords from the active memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then multiplied by 8. Inactive addresses are not prefetched from memory.
The <prfop> symbol specifies the prefetch hint as a combination of three options: access type PLD for load or PST for store; target cache level L1, L2 or L3; temporality (KEEP for temporal or STRM for non-temporal).
This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled at the current Exception level.
It has encodings from 3 classes: 32-bit scaled offset , 32-bit unpacked scaled offset and 64-bit scaled offset

32-bit scaled offset



PRFD <prfop>, <Pg>, [<Xn|SP>, <Zm>.S, <mod> #3]

```
if !HaveSVE() then UNDEFINED;
constant integer esize = 32;

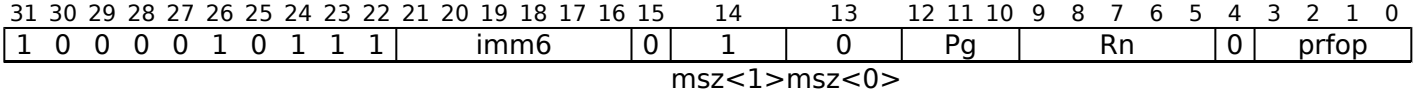
PRFW (scalar plus immediate)

Contiguous prefetch words (immediate index)

Contiguous prefetch of word elements from the memory address generated by a 64-bit scalar base and immediate index in the range -32 to 31 which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.
The predicate may be used to suppress prefetches from unwanted addresses.



PRFW <prfop>, <Pg>, [<Xn|SP>{, #<imm>, MUL VL}]

```
if !HaveSVE() && !HaveSME() then UNDEFINED;

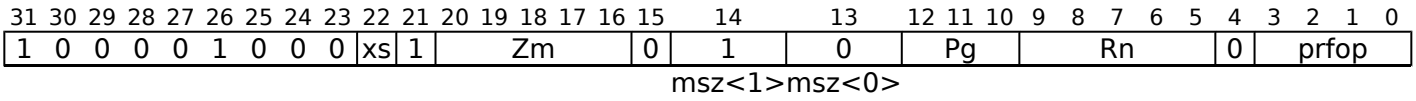
PRFW (scalar plus vector)

Gather prefetch words (scalar plus vector)

Gather prefetch of words from the active memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then multiplied by 4. Inactive addresses are not prefetched from memory.
The <prfop> symbol specifies the prefetch hint as a combination of three options: access type PLD for load or PST for store; target cache level L1, L2 or L3; temporality (KEEP for temporal or STRM for non-temporal).
This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled at the current Exception level.
It has encodings from 3 classes: 32-bit scaled offset , 32-bit unpacked scaled offset and 64-bit scaled offset

32-bit scaled offset



PRFW <prfop>, <Pg>, [<Xn|SP>, <Zm>.S, <mod> #2]

```
if !HaveSVE() then UNDEFINED;
constant integer esize = 32;

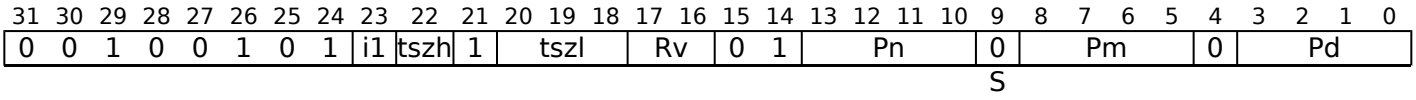
PSEL

Predicate select between predicate register or all-false

If the indexed element of the second source predicate is true, place the contents of the first source predicate register into the destination predicate register, otherwise set the destination predicate to all-false. The indexed element is determined by the sum of a general-purpose index register and an immediate, modulo the number of elements. Does not set the condition flags.

SVE2
(FEAT_SME)



PSEL <Pd>, <Pn>, <Pm>.<T>[<Wv>, <imm>]

```
if !HaveSME() then UNDEFINED;
bits(5) imm5 = i1:tszh:tszl;
integer esize;
integer imm;
case tszh:tszl of
    when '0000' UNDEFINED;
    when '1000' esize = 64;  imm = UInt(imm5<4>);
    when 'x100' esize = 32;  imm = UInt(imm5<4:3>);

    when 'xxx1' esize = 8;   imm = UInt(imm5<4:1>);
integer n = UInt(Pn);
integer m = UInt(Pm);
integer d = UInt(Pd);
integer v = UInt('011':Rv);
```

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.

<Pn> Is the name of the first source scalable predicate register, encoded in the "Pn" field.

<Pm> Is the name of the second source scalable predicate register, encoded in the "Pm" field.

<T> Is the size specifier, encoded in “tszh:tszl”:

tszh	tszl	<T>
0	000	RESERVED
x	xx1	B
x	x10	H
x	100	S
1	000	D

<Wv> Is the 32-bit name of the vector select register W12-W15, encoded in the "Rv" field.

<imm> Is the element index, in the range 0 to one less than the number of vector elements in a 128-bit vector register, encoded in "i1:tszh:tszl".

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) operand1 = P[n, PL];
bits(PL) operand2 = P[m, PL];
bits(32) idx = X[v, 32];
integer element = (UInt(idx) + imm) MOD elements;
bits(PL) result;

if ElemP[operand2, element, esize] == '1' then
    result = operand1;
else
    result = Zeros(PL);

P[d, PL] = result;
```

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

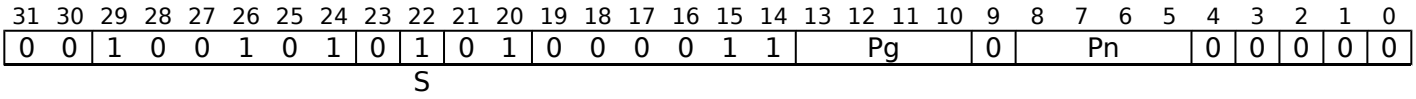
- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

Internal version only: isa v33.23junrel, AdvSIMD v29.1, pseudocode v2022-06_rel, sve v2022-06_rel ; Build timestamp: 2022-07-06T09:51

PTEST

Set condition flags for predicate

Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate source register, and the V flag to zero.



PTEST <Pg>, <Pn>.B

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8;
integer g = UInt(Pg);
integer n = UInt(Pn);
```

Assembler Symbols

<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the source scalable predicate register, encoded in the "Pn" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
bits(PL) mask = P[g, PL];
bits(PL) result = P[n, PL];

PSTATE.<N,Z,C,V> = PredTest(mask, result, esize);
```

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the predicate register written by this instruction might be significantly delayed.

Internal version only: isa v33.23junrel, AdvSIMD v29.1, pseudocode v2022-06_rel, sve v2022-06_rel ; Build timestamp: 2022-07-06T09:51

PTRUE

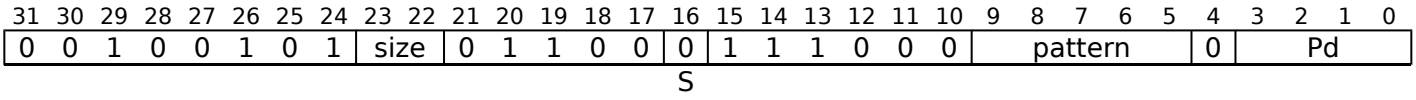
Initialise predicate from named constraint

Set elements of the destination predicate to true if the element number satisfies the named predicate constraint, or to false otherwise. If the constraint specifies more elements than are available at the current vector length then all elements of the destination predicate are set to false.

The named predicate constraint limits the number of active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception. Does not set the condition flags.



PTRUE <Pd>.<T>{, <pattern>}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer d = UInt(Pd);
boolean setflags = FALSE;
bits(5) pat = pattern;
```

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B

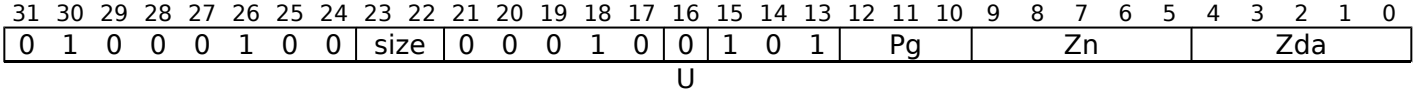
SADALP

Signed add and accumulate long pairwise

Add pairs of adjacent signed integer values and accumulate the results into the overlapping double-width elements of the destination vector.



SADALP <Zda>.<T>, <Pg>/M, <Zn>.<Tb>

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer da = UInt(Zda);
```

Assembler Symbols

<Zda> Is the name of the second source and destination scalable vector register, encoded in the "Zda" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	B
10	H
11	S

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand_acc = Z[da, VL];
bits(VL) operand_src = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);
bits(VL) result;

for e = 0 to elements-1
    if ElemP[mask, e, esize] == '0' then
        Elem[result, e, esize] = Elem[operand_acc, e, esize];
    else
        integer element1 = SInt(Elem[operand_src, 2*e + 0, esize DIV 2]);
        integer element2 = SInt(Elem[operand_src, 2*e + 1, esize DIV 2]);
        bits(esize) sum = (element1 + element2)<esize-1:0>;
        Elem[result, e, esize] = Elem[operand_acc, e, esize] + sum;

Z[da, VL] = result;
```

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

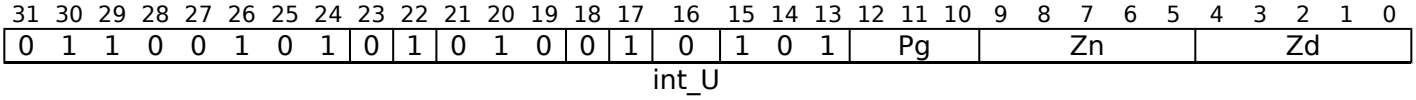
SCVTF

Signed integer convert to floating-point (predicated)

Convert to floating-point from the signed integer in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.
If the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are zero-extended to fill each destination element.
It has encodings from 7 classes: 16-bit to half-precision , 32-bit to half-precision , 32-bit to single-precision , 32-bit to double-precision , 64-bit to half-precision , 64-bit to single-precision and 64-bit to double-precision

16-bit to half-precision



SCVTF <Zd>.H, <Pg>/M, <Zn>.H

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 16;
integer g = UInt(Pg);

SDOT (indexed)

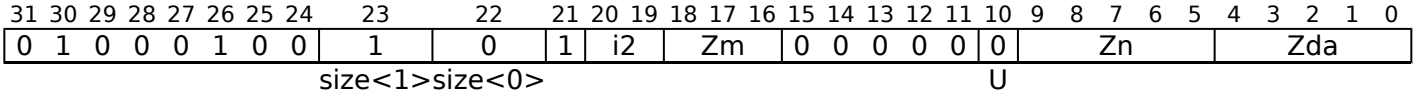
Signed integer indexed dot product

The signed integer indexed dot product instruction computes the dot product of a group of four signed 8-bit or 16-bit integer values held in each 32-bit or 64-bit element of the first source vector multiplied by a group of four signed 8-bit or 16-bit integer values in an indexed 32-bit or 64-bit element of the second source vector, and then destructively adds the widened dot product to the corresponding 32-bit or 64-bit element of the destination vector.

The groups within the second source vector are specified using an immediate index which selects the same group position within each 128-bit vector segment. The index range is from 0 to one less than the number of groups per 128-bit segment, encoded in 1 to 2 bits depending on the size of the group. This instruction is unpredicated.

It has encodings from 2 classes: 32-bit and 64-bit

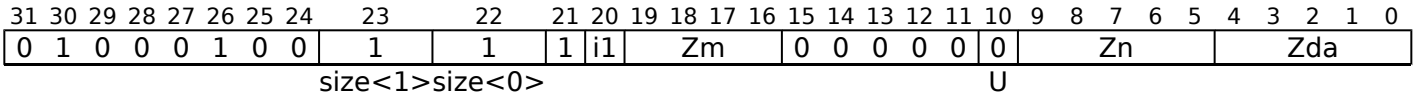
32-bit



SDOT <Zda>.S, <Zn>.B, <Zm>.B[<imm>]

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 32;
integer index = UInt(i2);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
```

64-bit



SDOT <Zda>.D, <Zn>.H, <Zm>.H[<imm>]

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 64;
integer index = UInt(i1);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the 32-bit variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the 64-bit variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the 32-bit variant: is the immediate index of a 32-bit group of four 8-bit values within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field. For the 64-bit variant: is the immediate index of a 64-bit group of four 16-bit values within each 128-bit vector segment, in the range 0 to 1, encoded in the "i1" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
constant integer eltspersegment = 128 DIV esize;
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) operand3 = Z[da, VL];
bits(VL) result;

for e = 0 to elements-1
    integer segmentbase = e - (e MOD eltspersegment);
    integer s = segmentbase + index;
    bits(esize) res = Elem[operand3, e, esize];
    for i = 0 to 3
        integer element1 = SInt(Elem[operand1, 4 * e + i, esize DIV 4]);
        integer element2 = SInt(Elem[operand2, 4 * s + i, esize DIV 4]);
        res = res + element1 * element2;
    Elem[result, e, esize] = res;

Z[da, VL] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.

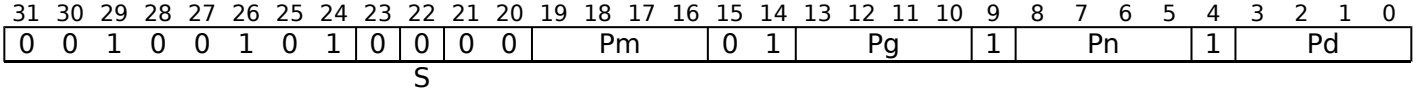
SEL (predicates)

Conditionally select elements from two predicates

Read active elements from the first source predicate and inactive elements from the second source predicate and place in the corresponding elements of the destination predicate. Does not set the condition flags.
This instruction is used by the alias MOV (predicate, predicated, merging).



SEL <Pd>.B, <Pg>, <Pn>.B, <Pm>.B

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8;
integer g = UInt(Pg);
integer n = UInt(Pn);
integer m = UInt(Pm);
integer d = UInt(Pd);
```

Assembler Symbols

<Pd>	Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg>	Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn>	Is the name of the first source scalable predicate register, encoded in the "Pn" field.
<Pm>	Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Alias Conditions

Alias	Is preferred when
MOV (predicate, predicated, merging)	`Pd == Pm`

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(PL) operand1 = P[n, PL];
bits(PL) operand2 = P[m, PL];
bits(PL) result;

for e = 0 to elements-1
    bit element1 = ElemP[operand1, e, esize];
    bit element2 = ElemP[operand2, e, esize];
    if ElemP[mask, e, esize] == '1' then
        ElemP[result, e, esize] = element1;
    else
        ElemP[result, e, esize] = element2;

P[d, PL] = result;
```

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

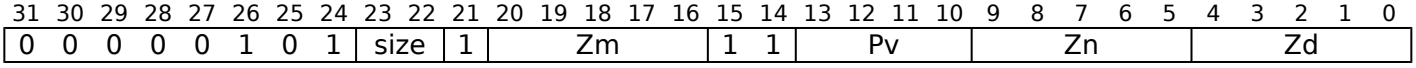
- The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
    - The values of the NZCV flags.

Internal version only: isa v33.23junrel, AdvSIMD v29.1, pseudocode v2022-06_rel, sve v2022-06_rel ; Build timestamp: 2022-07-06T09:51

SEL (vectors)

Conditionally select elements from two vectors

Select elements from the first source vector where the corresponding vector select predicate element is true, and from the second source vector where the predicate element is false, placing them in the corresponding elements of the destination vector.
This instruction is used by the alias MOV (vector, predicated).



SEL <Zd>.<T>, <Pv>, <Zn>.<T>, <Zm>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;

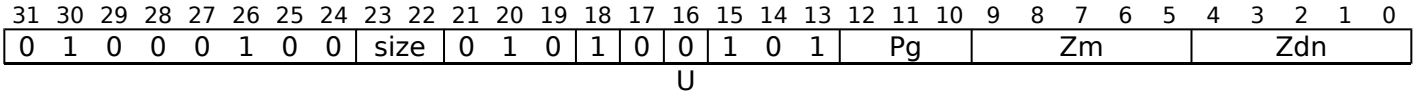
SMAXP

Signed maximum pairwise

Compute the maximum value of each pair of adjacent signed integer elements within each source vector, and interleave the results from corresponding lanes. The interleaved result values are destructively placed in the first source vector.



SMAXP <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer m = UInt(Zm);
integer dn = UInt(Zdn);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand1 = Z[dn, VL];
bits(VL) operand2 = if AnyActiveElement(mask, esize) then Z[m, VL] else Zeros(VL);
bits(VL) result;
integer element1;
integer element2;

for e = 0 to elements-1
    if ElemP[mask, e, esize] == '0' then
        Elem[result, e, esize] = Elem[operand1, e, esize];
    else
        if IsEven(e) then
            element1 = SInt(Elem[operand1, e + 0, esize]);

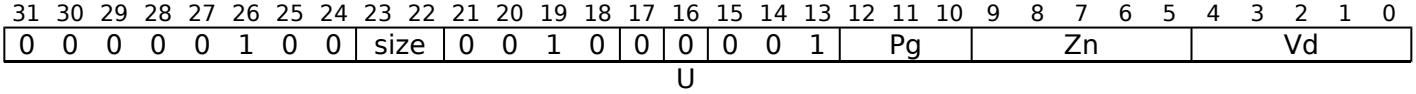
SMAXV

Signed maximum reduction to scalar

Signed maximum horizontally across all lanes of a vector, and place the result in the SIMD&FP scalar destination register. Inactive elements in the source vector are treated as the minimum signed integer for the element size.



SMAXV <V><d>, <Pg>, <Zn>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Vd);
boolean unsigned = FALSE;
```

Assembler Symbols

<V> Is a width specifier, encoded in “size”:

size	<V>
00	B
01	H
10	S
11	D

<d> Is the number [0-31] of the destination SIMD&FP register, encoded in the "Vd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);
integer maximum = if unsigned then 0 else -(2^(esize-1));

for e = 0 to elements-1
    if ElemP[mask, e, esize] == '1' then
        integer element = Int(Elem[operand, e, esize], unsigned);
        maximum = Max(maximum, element);

V[d, esize] = maximum<esize-1:0>;
```

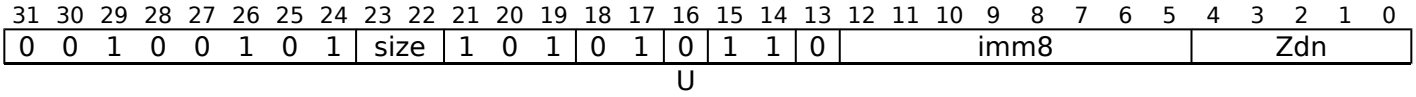
SMIN (immediate)

Signed minimum with immediate (unpredicated)

Determine the signed minimum of an immediate and each element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a signed 8-bit value in the range -128 to +127, inclusive. This instruction is unpredicated.



```
SMIN <Zdn>.<T>, <Zdn>.<T>, #<imm>
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer dn = UInt(Zdn);
boolean unsigned = FALSE;
integer imm = Int(imm8, unsigned);
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is the signed immediate operand, in the range -128 to 127, encoded in the "imm8" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn, VL];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    Elem[result, e, esize] = Min(element1, imm)<esize-1:0>;

Z[dn, VL] = result;
```

Operational information

SMMLA

Signed integer matrix multiply-accumulate

The signed integer matrix multiply-accumulate instruction multiplies the 2×8 matrix of signed 8-bit integer values held in each 128-bit segment of the first source vector by the 8×2 matrix of signed 8-bit integer values in the corresponding segment of the second source vector. The resulting 2×2 widened 32-bit integer matrix product is then destructively added to the 32-bit integer matrix accumulator held in the corresponding segment of the addend and destination vector. This is equivalent to performing an 8-way dot product per destination element.

This instruction is unpredicated.

ID_AA64ZFR0_EL1.I8MM indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled at the current Exception level.

SVE

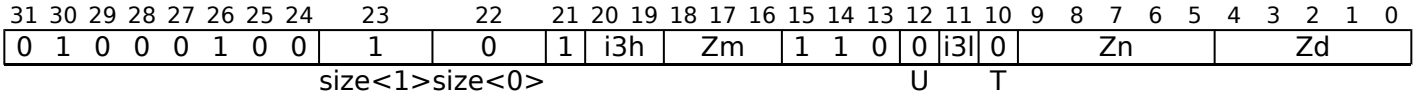
SMULLB (indexed)

Signed multiply long (bottom, indexed)

Multiply the even-numbered signed elements within each 128-bit segment of the first source vector by the specified signed element in the corresponding second source vector segment, and place the results in the overlapping double-width elements of the destination vector register.
The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 2 or 3 bits depending on the size of the element.
It has encodings from 2 classes: 32-bit and 64-bit

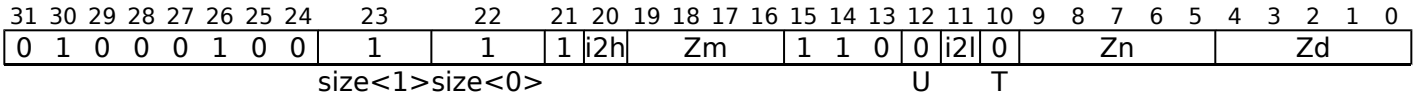
32-bit



SMULLB <Zd>.S, <Zn>.H, <Zm>.H[<imm>]

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 16;
integer index = UInt(i3h:i3l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
integer sel = 0;
```

64-bit



SMULLB <Zd>.D, <Zn>.S, <Zm>.S[<imm>]

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 32;
integer index = UInt(i2h:i2l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
integer sel = 0;
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the 32-bit variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the 64-bit variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the 32-bit variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the 64-bit variant: is the element index, in the range 0 to 3, encoded in the "i2h:i2l" fields.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV (2 * esize);
constant integer eltspersegment = 128 DIV (2 * esize);
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) result;

for e = 0 to elements-1
    integer s = e - (e MOD eltspersegment);
    integer element1 = SInt(Elem[operand1, 2 * e + sel,   esize]);
    integer element2 = SInt(Elem[operand2, 2 * s + index, esize]);
    integer res = element1 * element2;
    Elem[result, e, 2*esize] = res<2*esize-1:0>;

Z[d, VL] = result;
```

Operational information

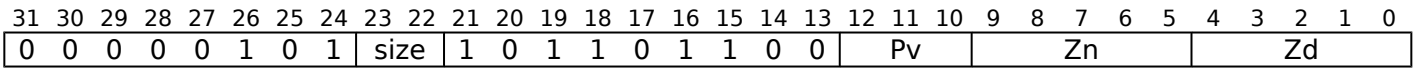
SPLICE

Splice two vectors under predicate control

Select a region from the first source vector and copy it to the lowest-numbered elements of the result. Then set any remaining elements of the result to a copy of the lowest-numbered elements from the second source vector. The region is selected using the first and last true elements in the vector select predicate register. The result is placed destructively in the destination and first source vector, or constructively in the destination vector.
The Destructive encoding of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE: The MOVPRFX instruction must be unpredicated. The MOVPRFX instruction must specify the same destination register as this instruction. The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
It has encodings from 2 classes: Constructive and Destructive

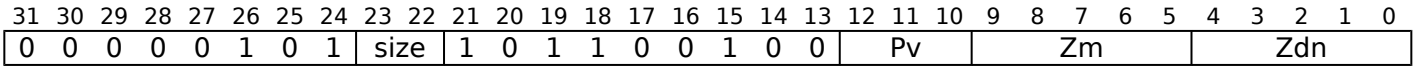
Constructive



SPLICE <Zd>.<T>, <Pv>, { <Zn1>.<T>, <Zn2>.<T> }

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer v = UInt(Pv);
integer dst = UInt(Zd);
integer s1 = UInt(Zn);
integer s2 = (s1 + 1) MOD 32;
```

Destructive



SPLICE <Zdn>.<T>, <Pv>, <Zdn>.<T>, <Zm>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer v = UInt(Pv);
integer dst = UInt(Zdn);
integer s1 = dst;
integer s2 = UInt(Zm);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pv> Is the name of the vector select predicate register P0-P7, encoded in the "Pv" field.

<Zn1> Is the name of the first scalable vector register of a multi-vector sequence, encoded in the "Zn" field.

<Zn2> Is the name of the second scalable vector register of a multi-vector sequence, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[v, PL];
bits(VL) operand1 = if AnyActiveElement(mask, esize) then Z[s1, VL] else Zeros(VL);
bits(VL) operand2 = Z[s2, VL];
bits(VL) result;
integer x = 0;
boolean active = FALSE;
constant integer lastnum = LastActiveElement(mask, esize);

if lastnum >= 0 then
    for e = 0 to lastnum
        active = active || ElemP[mask, e, esize] == '1';
        if active then
            Elem[result, x, esize] = Elem[operand1, e, esize];
            x = x + 1;

constant integer nelements = (elements - x) - 1;
for e = 0 to nelements
    Elem[result, x, esize] = Elem[operand2, e, esize];
    x = x + 1;

Z[dst, VL] = result;
```

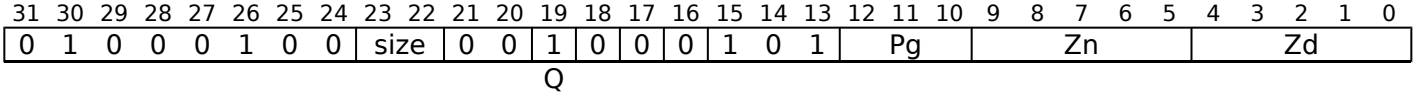
SQABS

Signed saturating absolute value

Compute the absolute value of the signed integer in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. Inactive elements in the destination vector register remain unmodified.



SQABS <Zd>.<T>, <Pg>/M, <Zn>.<T>

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);
bits(VL) result = Z[d, VL];

for e = 0 to elements-1
    if ElemP[mask, e, esize] == '1' then
        integer element = SInt(Elem[operand, e, esize]);
        element = Abs(element);
        Elem[result, e, esize] = SignedSat(element, esize);

Z[d, VL] = result;
```

Operational information

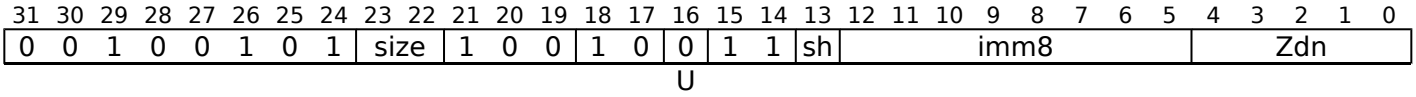
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

SQADD (immediate)

Signed saturating add immediate (unpredicated)

Signed saturating add of an unsigned immediate to each element of the source vector, and destructively place the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. This instruction is unpredicated.
The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.
The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<uimm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".



SQADD <Zdn>.<T>, <Zdn>.<T>, #<imm>{, <shift>}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size:sh == '001' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer dn = UInt(Zdn);
integer imm = UInt(imm8);
if sh == '1' then imm = imm << 8;
boolean unsigned = FALSE;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

sh	<shift>
0	LSL #0
1	LSL #8

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn, VL];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element1 + imm, esize, unsigned);

Z[dn, VL] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

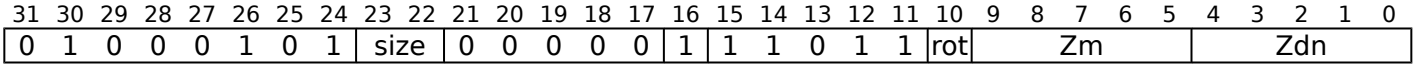
SQCADD

Saturating complex integer add with rotate

Add the real and imaginary components of the integral complex numbers from the first source vector to the complex numbers from the second source vector which have first been rotated by 90 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, equivalent to multiplying the complex numbers in the second source vector by ±J beforehand. Destructively place the results in the corresponding elements of the first source vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. This instruction is unpredicated.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.



SQCADD <Zdn>.<T>, <Zdn>.<T>, <Zm>.<T>, <const>

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer m = UInt(Zm);
integer dn = UInt(Zdn);
boolean sub_i = (rot == '0');
boolean sub_r = (rot == '1');
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B

    Elem[result, 2 * p + 1, esize] = SignedSat(acc_i, esize);

Z[dn, VL] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

Internal version only: isa v33.23junrel, AdvSIMD v29.1, pseudocode v2022-06_rel, sve v2022-06_rel ; Build timestamp: 2022-07-06T09:51

SQDECB

Signed saturating decrement scalar by multiple of 8-bit predicate constraint element count

Determines the number of active 8-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination. The result is saturated to the source general-purpose register's signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

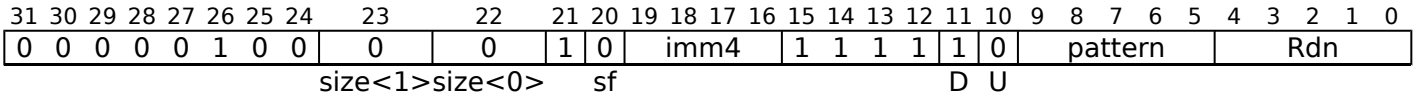
The named predicate constraint limits the number of active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit



SQDECB <Xdn>, <Wdn>{, <pattern>{, MUL #<imm>}}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8;
integer dn = UInt(Rdn);

- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

SQDECW <Zdn>.S{, <pattern>{, MUL #<imm>}}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 32;
integer dn = UInt(Zdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
boolean unsigned = FALSE;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<pattern> Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>
00000	POW2
00001	VL1
00010	VL2
00011	VL3
00100	VL4
00101	VL5
00110	VL6
00111	VL7
01000	VL8
01001	VL16
01010	VL32
01011	VL64
01100	VL128
01101	VL256
0111x	#uimm5
101x1	#uimm5
10110	#uimm5
1x0x1	#uimm5
1x010	#uimm5
1xx00	#uimm5
11101	MUL4
11110	MUL3
11111	ALL

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
bits(VL) operand1 = Z[dn, VL];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element1 - (count * imm), esize, unsigned);

Z[dn, VL] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

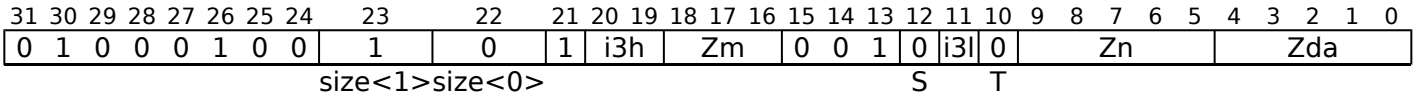
SQDMLALB (indexed)

Signed saturating doubling multiply-add long to accumulator (bottom, indexed)

Multiply then double the even-numbered signed elements within each 128-bit segment of the first source vector and specified signed element in the corresponding second source vector segment. Each intermediate value is saturated to the double-width N-bit value's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. Then destructively add to the overlapping double-width elements of the addend and destination vector. Each destination element is saturated to the double-width N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$.
The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 2 or 3 bits depending on the size of the element.
It has encodings from 2 classes: 32-bit and 64-bit

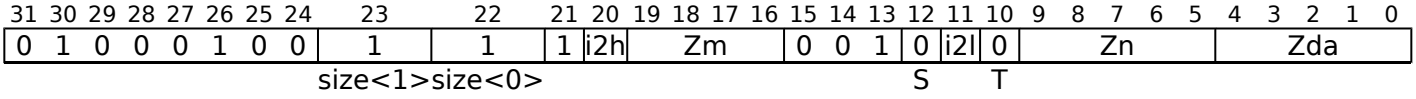
32-bit



SQDMLALB <Zda>.S, <Zn>.H, <Zm>.H[<imm>]

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 16;
integer index = UInt(i3h:i3l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
integer sel = 0;
```

64-bit



SQDMLALB <Zda>.D, <Zn>.S, <Zm>.S[<imm>]

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 32;
integer index = UInt(i2h:i2l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
integer sel = 0;
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the 32-bit variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the 64-bit variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the 32-bit variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the 64-bit variant: is the element index, in the range 0 to 3, encoded in the "i2h:i2l" fields.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;

    Elem[result, e, esize] = SignedSat(element3 - product, esize);

Z[da, VL] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

SQDMLSLT (indexed)

Signed saturating doubling multiply-subtract long from accumulator (top, indexed)

Multiply then double the odd-numbered signed elements within each 128-bit segment of the first source vector and the specified signed element in the corresponding second source vector segment. Each intermediate value is saturated to the double-width N-bit value's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. Then destructively subtract from the overlapping double-width elements of the addend and destination vector. Each destination element is saturated to the double-width N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$.
The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 2 or 3 bits depending on the size of the element.
It has encodings from 2 classes: 32-bit and 64-bit

32-bit

SQINCB

Signed saturating increment scalar by multiple of 8-bit predicate constraint element count

Determines the number of active 8-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination. The result is saturated to the source general-purpose register's signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

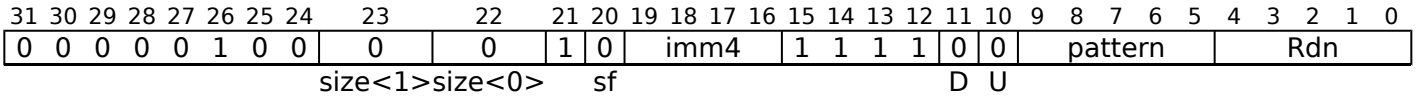
The named predicate constraint limits the number of active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit



SQINCB <Xdn>, <Wdn>{, <pattern>{, MUL #<imm>}}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;

SQINCD (scalar)

Signed saturating increment scalar by multiple of 64-bit predicate constraint element count

Determines the number of active 64-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination. The result is saturated to the source general-purpose register's signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

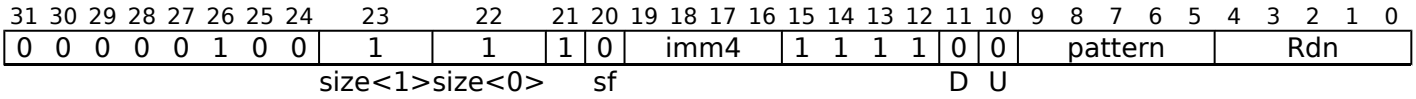
The named predicate constraint limits the number of active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

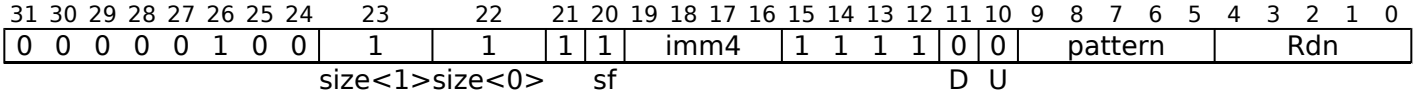
32-bit



SQINCD <Xdn>, <Wdn>{, <pattern>{, MUL #<imm>}}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 64;
integer dn = UInt(Rdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
boolean unsigned = FALSE;
integer ssize = 32;
```

64-bit



SQINCD <Xdn>{, <pattern>{, MUL #<imm>}}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 64;
integer dn = UInt(Rdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
boolean unsigned = FALSE;
integer ssize = 64;
```

Assembler Symbols

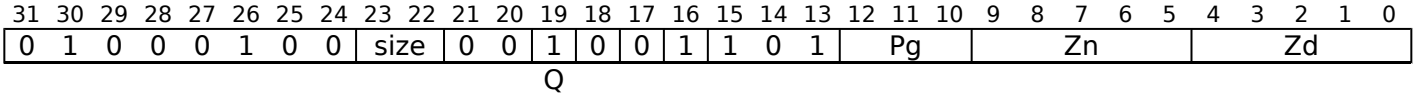
SQNEG

Signed saturating negate

Negate the signed integer value in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. Inactive elements in the destination vector register remain unmodified.



SQNEG <Zd>.<T>, <Pg>/M, <Zn>.<T>

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);
bits(VL) result = Z[d, VL];

for e = 0 to elements-1
    if ElemP[mask, e, esize] == '1' then
        integer element = SInt(Elem[operand, e, esize]);
        element = -element;
        Elem[result, e, esize] = SignedSat(element, esize);

Z[d, VL] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

SQRDCMLAH (indexed)

Saturating rounding doubling complex integer multiply-add high with rotate (indexed)

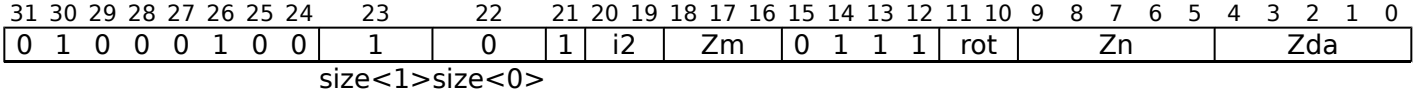
Multiply without saturation the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of the integral numbers in each 128-bit segment of the first source vector by the specified complex number in the corresponding the second source vector segment rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation. Then double and add the products to the corresponding components of the complex numbers in the addend vector. Destructively place the most significant rounded half of the results in the corresponding elements of the addend vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. This instruction is unpredicated.

These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees apart.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

It has encodings from 2 classes: 16-bit and 32-bit

16-bit



SQRDCMLAH <Zda>.H, <Zn>.H, <Zm>.H[<imm>], <const>

SQRDMLAH (indexed)

Signed saturating rounding doubling multiply-add high to accumulator (indexed)

Multiply then double all signed elements within each 128-bit segment of the first source vector and the specified signed element of the corresponding second source vector segment, and destructively add the rounded high half of each result to the corresponding elements of the addend and destination vector. Each destination element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$.
The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element.
It has encodings from 3 classes: 16-bit , 32-bit and 64-bit

16-bit

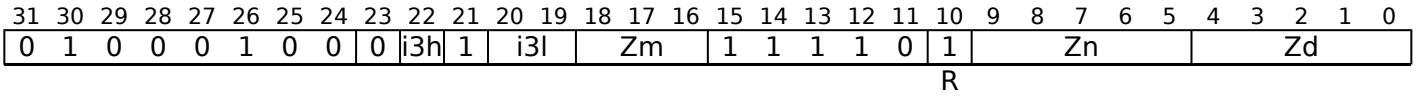
SQRDMULH (indexed)

Signed saturating rounding doubling multiply high (indexed)

Multiply all signed elements within each 128-bit segment of the first source vector by the specified signed element in the corresponding second source vector segment, double and place the most significant rounded half of the result in the corresponding elements of the destination vector register. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$.
The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element.
It has encodings from 3 classes: 16-bit , 32-bit and 64-bit

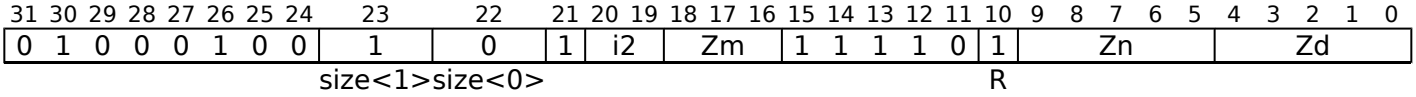
16-bit



SQRDMULH <Zd>.H, <Zn>.H, <Zm>.H[<imm>]

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 16;
integer index = UInt(i3h:i3l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
```

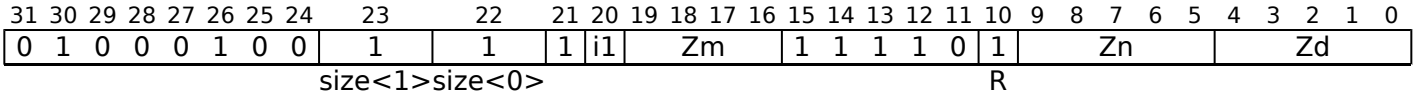
32-bit



SQRDMULH <Zd>.S, <Zn>.S, <Zm>.S[<imm>]

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 32;
integer index = UInt(i2);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
```

64-bit



SQRDMULH <Zd>.D, <Zn>.D, <Zm>.D[<imm>]

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 64;
integer index = UInt(i1);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the 16-bit and 32-bit variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the 64-bit variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the 16-bit variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the 32-bit variant: is the element index, in the range 0 to 3, encoded in the "i2" field. For the 64-bit variant: is the element index, in the range 0 to 1, encoded in the "i1" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
constant integer eltspersegment = 128 DIV esize;
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) result;
constant integer round_const = 1 << (esize - 1);

for e = 0 to elements-1
    integer segmentbase = e - (e MOD eltspersegment);
    integer s = segmentbase + index;
    integer element1 = SInt(Elem[operand1, e, esize]);
    integer element2 = SInt(Elem[operand2, s, esize]);
    integer res = 2 * element1 * element2;
    Elem[result, e, esize] = SignedSat((res + round_const) >> esize, esize);

Z[d, VL] = result;
```

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

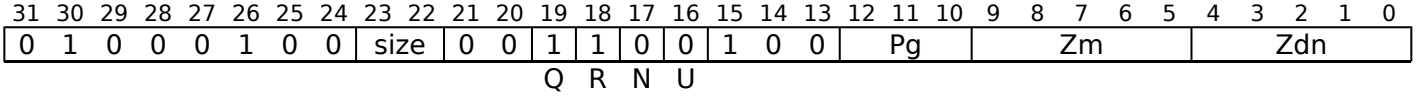
SQSHLR

Signed saturating shift left reversed vectors (predicated)

Shift active signed elements of the second source vector by corresponding elements of the first source vector and destructively place the results in the corresponding elements of the first source vector. A positive shift amount performs a left shift, otherwise a right shift by the negated shift amount is performed. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. Inactive elements in the destination vector register remain unmodified.



SQSHLR <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>

```

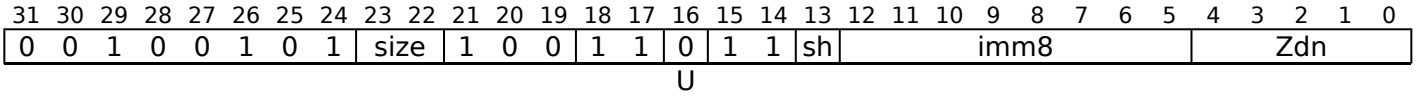
SQSUB (immediate)

Signed saturating subtract immediate (unpredicated)

Signed saturating subtract of an unsigned immediate from each element of the source vector, and destructively place the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. This instruction is unpredicated.
The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.
The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<uimm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".



SQSUB <Zdn>.<T>, <Zdn>.<T>, #<imm>{, <shift>}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size:sh == '001' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer dn = UInt(Zdn);
integer imm = UInt(imm8);
if sh == '1' then imm = imm << 8;
boolean unsigned = FALSE;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

sh	<shift>
0	LSL #0
1	LSL #8

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn, VL];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element1 - imm, esize, unsigned);

Z[dn, VL] = result;
```

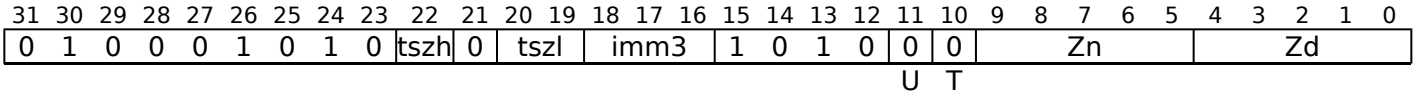
SSHLLB

Signed shift left long by immediate (bottom)

Shift left by immediate each even-numbered signed element of the source vector, and place the results in the overlapping double-width elements of the destination vector. The immediate shift amount is an unsigned value in the range 0 to number of bits per element minus 1. This instruction is unpredicated.



SSHLLB <Zd>.<T>, <Zn>.<Tb>, #<const>

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
bits(3) tsize = tszh:tszl;
integer esize;
case tsize of
    when '000' UNDEFINED;
    when '001' esize = 8;
    when '01x' esize = 16;
    when '1xx' esize = 32;
integer n = UInt(Zn);
integer d = UInt(Zd);
integer shift = UInt(tsize:imm3) - esize;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “tszh:tszl”:

tszh	tszl	<T>
0	00	RESERVED
0	01	H
0	1x	S
1	xx	D

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “tszh:tszl”:

tszh	tszl	<Tb>
0	00	RESERVED
0	01	B
0	1x	H
1	xx	S

<const> Is the immediate shift amount, in the range 0 to number of bits per element minus 1, encoded in "tsz:imm3".

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV (2 * esize);
bits(VL) operand = Z[n, VL];
bits(VL) result;

for e = 0 to elements-1
    bits(esize) element = Elem[operand, 2*e + 0, esize];
    integer shifted_value = SInt(element) << shift;
    Elem[result, e, 2*esize] = shifted_value<2*esize-1:0>;

Z[d, VL] = result;
```

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

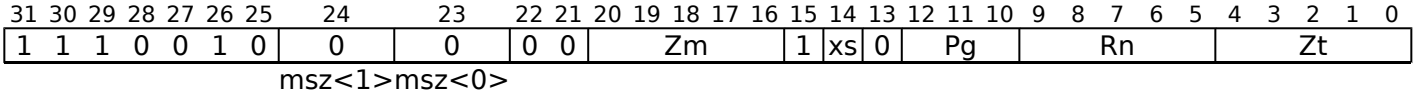
ST1B (scalar plus vector)

Scatter store bytes from a vector (vector index)

Scatter store of bytes from the active elements of a vector register to the memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally sign or zero-extended from 32 to 64 bits. Inactive elements are not written to memory.
This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled at the current Exception level.
It has encodings from 3 classes: 32-bit unpacked unscaled offset , 32-bit unscaled offset and 64-bit unscaled offset

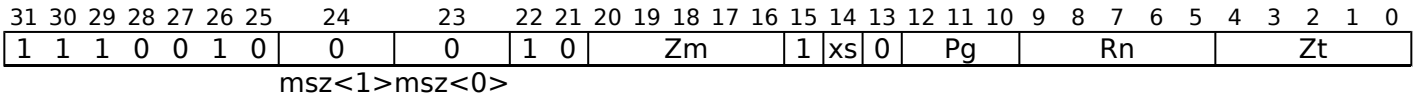
32-bit unpacked unscaled offset



ST1B { <Zt>.D }, <Pg>, [<Xn|SP>, <Zm>.D, <mod>]

```
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer m = UInt(Zm);
integer g = UInt(Pg);
constant integer esize = 64;
constant integer msize = 8;
integer offs_size = 32;
boolean offs_unsigned = xs == '0';
integer scale = 0;
```

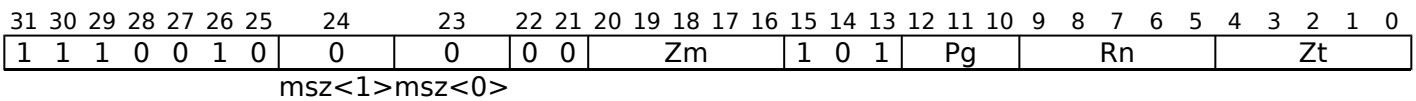
32-bit unscaled offset



ST1B { <Zt>.S }, <Pg>, [<Xn|SP>, <Zm>.S, <mod>]

```
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer m = UInt(Zm);
integer g = UInt(Pg);
constant integer esize = 32;
constant integer msize = 8;
integer offs_size = 32;
boolean offs_unsigned = xs == '0';
integer scale = 0;
```

64-bit unscaled offset



ST1B { <Zt>.D }, <Pg>, [<Xn|SP>, <Zm>.D]

```
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer m = UInt(Zm);
integer g = UInt(Pg);
constant integer esize = 64;
constant integer msize = 8;
integer offs_size = 64;
boolean offs_unsigned = TRUE;
integer scale = 0;
```

Assembler Symbols

<Zt> Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.

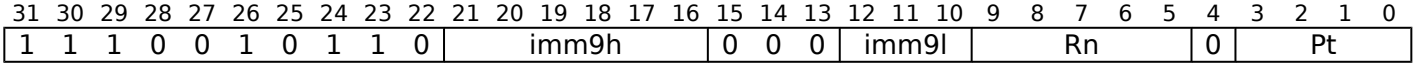
STR (predicate)

Store predicate register

Store a predicate register to a memory address generated by a 64-bit scalar base, plus an immediate offset in the range -256 to 255 which is multiplied by the current predicate register size in bytes. This instruction is unpredicated.

The store is performed as contiguous byte accesses, each containing 8 consecutive predicate bits in ascending element order, with no endian conversion and no guarantee of single-copy atomicity larger than a byte. However, if alignment is checked, then a general-purpose base register must be aligned to 2 bytes.



STR <Pt>, [<Xn|SP>{, #<imm>, MUL VL}]

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
integer t = UInt(Pt);
integer n = UInt(Rn);
integer imm = SInt(imm9h:imm9l);
```

Assembler Symbols

<Pt>	Is the name of the scalable predicate transfer register, encoded in the "Pt" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional signed immediate vector offset, in the range -256 to 255, defaulting to 0, encoded in the "imm9h:imm9l" fields.

Operation

```
CheckSVEEnabled();
constant integer PL = CurrentVL DIV 8;
constant integer elements = PL DIV 8;
bits(PL) src;
bits(64) base;
integer offset = imm * elements;

if n == 31 then
    CheckSPAlignment();
    if HaveMTEExt() then SetTagCheckedInstruction(FALSE);
    base = SP[];
else
    if HaveMTEExt() then SetTagCheckedInstruction(TRUE);
    base = X[n, 64];

src = P[t, PL];
boolean aligned = AArch64.CheckAlignment(base + offset, 2, AccType_SVE, TRUE);
for e = 0 to elements-1
    AArch64.MemSingle[base + offset, 1, AccType_SVE, aligned] = Elem[src, e, 8];
    offset = offset + 1;
```

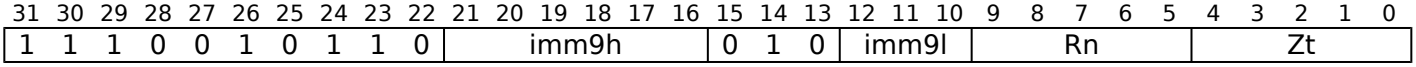
Internal version only: isa v33.23junrel, AdvSIMD v29.1, pseudocode v2022-06_rel, sve v2022-06_rel ; Build timestamp: 2022-07-06T09:51

STR (vector)

Store vector register

Store a vector register to a memory address generated by a 64-bit scalar base, plus an immediate offset in the range -256 to 255 which is multiplied by the current vector register size in bytes. This instruction is unpredicated.

The store is performed as contiguous byte accesses, with no endian conversion and no guarantee of single-copy atomicity larger than a byte. However, if alignment is checked, then the base register must be aligned to 16 bytes.



STR <Zt>, [<Xn|SP>{, #<imm>, MUL VL}]

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer imm = SInt(imm9h:imm9l);
```

Assembler Symbols

<Zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm>	Is the optional signed immediate vector offset, in the range -256 to 255, defaulting to 0, encoded in the "imm9h:imm9l" fields.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV 8;
bits(VL) src;
bits(64) base;
integer offset = imm * elements;

if n == 31 then
    CheckSPAlignment();
    if HaveMTEExt() then SetTagCheckedInstruction(FALSE);
    base = SP[];
else
    if HaveMTEExt() then SetTagCheckedInstruction(TRUE);
    base = X[n, 64];

src = Z[t, VL];
boolean aligned = AArch64.CheckAlignment(base + offset, 16, AccType_SVE, TRUE);
for e = 0 to elements-1
    AArch64.MemSingle[base + offset, 1, AccType_SVE, aligned] = Elem[src, e, 8];
    offset = offset + 1;
```

Internal version only: isa v33.23junrel, AdvSIMD v29.1, pseudocode v2022-06_rel, sve v2022-06_rel ; Build timestamp: 2022-07-06T09:51

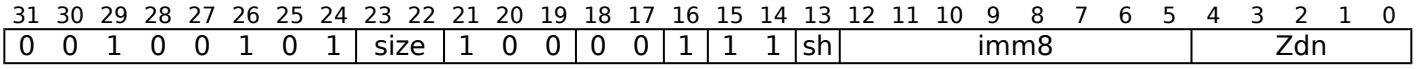
SUB (immediate)

Subtract immediate (unpredicated)

Subtract an unsigned immediate from each element of the source vector, and destructively place the results in the corresponding elements of the source vector. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<uimm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".



SUB <Zdn>.<T>, <Zdn>.<T>, #<imm>{, <shift>}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size:sh == '001' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer dn = UInt(Zdn);
integer imm = UInt(imm8);
if sh == '1' then imm = imm << 8;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

sh	<shift>
0	LSL #0
1	LSL #8

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn, VL];
bits(VL) result;

for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
    Elem[result, e, esize] = element1 - imm;

Z[dn, VL] = result;
```

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.

    - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a `MOVPRFX` instruction. The `MOVPRFX` instruction must conform to all of the following requirements, otherwise the behavior of the `MOVPRFX` and this instruction is UNPREDICTABLE:

- The `MOVPRFX` instruction must be unpredicated.
- The `MOVPRFX` instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

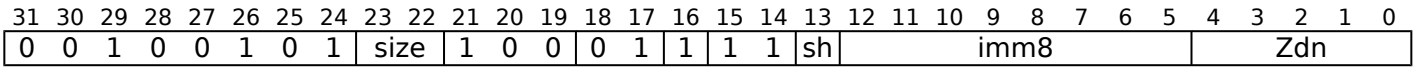
SUBR (immediate)

Reversed subtract from immediate (unpredicated)

Reversed subtract from an unsigned immediate each element of the source vector, and destructively place the results in the corresponding elements of the source vector. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<uimm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".



SUBR <Zdn>.<T>, <Zdn>.<T>, #<imm>{, <shift>}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size:sh == '001' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer dn = UInt(Zdn);
integer imm = UInt(imm8);
if sh == '1' then imm = imm << 8;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

sh	<shift>
0	LSL #0
1	LSL #8

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn, VL];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = UInt(Elem[operand1, e, esize]);

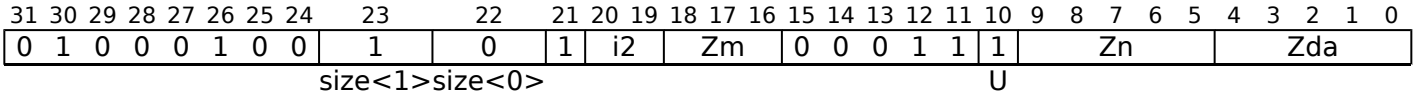
SUDOT

Signed by unsigned integer indexed dot product

The signed by unsigned integer indexed dot product instruction computes the dot product of a group of four signed 8-bit integer values held in each 32-bit element of the first source vector multiplied by a group of four unsigned 8-bit integer values in an indexed 32-bit element of the second source vector, and then destructively adds the widened dot product to the corresponding 32-bit element of the destination vector.
The groups within the second source vector are specified using an immediate index which selects the same group position within each 128-bit vector segment. The index range is from 0 to 3. This instruction is unpredicated.
ID_AA64ZFR0_EL1.I8MM indicates whether this instruction is implemented.

SVE
(FEAT_I8MM)



SUDOT <Zda>.S, <Zn>.B, <Zm>.B[<imm>]

```
if (!HaveSVE() && !HaveSME()) || !HaveInt8MatMulExt() then UNDEFINED;

        Elem[result, e, esize] = Extend(element<s_esize-1:0>, esize, unsigned);

Z[d, VL] = result;
```

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

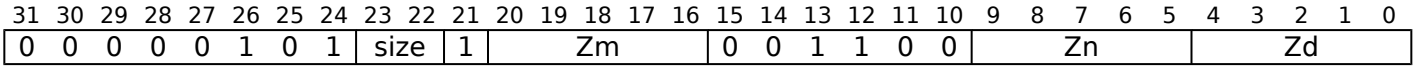
TBL

Programmable table lookup in one or two vector table (zeroing)

Reads each element of the second source (index) vector and uses its value to select an indexed element from a table of elements consisting of one or two consecutive vector registers, where the first or only vector holds the lower numbered elements, and places the indexed table element in the destination vector element corresponding to the index vector element. If an index value is greater than or equal to the number of vector elements then it places zero in the corresponding destination vector element.
Since the index values can select any element in a vector this operation is not naturally vector length agnostic.
It has encodings from 2 classes: SVE and SVE2

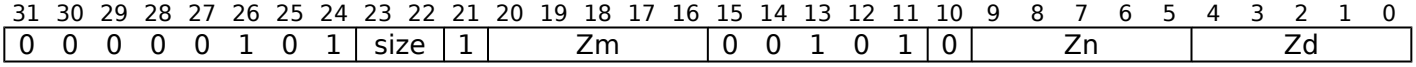
SVE



TBL <Zd>.<T>, { <Zn>.<T> }, <Zm>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
boolean double_table = FALSE;
```

SVE2



TBL <Zd>.<T>, { <Zn1>.<T>, <Zn2>.<T> }, <Zm>.<T>

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
boolean double_table = TRUE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zn1> Is the name of the first scalable vector register of a multi-vector sequence, encoded in the "Zn" field.

<Zn2> Is the name of the second scalable vector register of a multi-vector sequence, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(VL) indexes = Z[m, VL];
bits(VL) result;
constant integer table_size = if double_table then VL*2 else VL;
constant integer table_elems = table_size DIV esize;

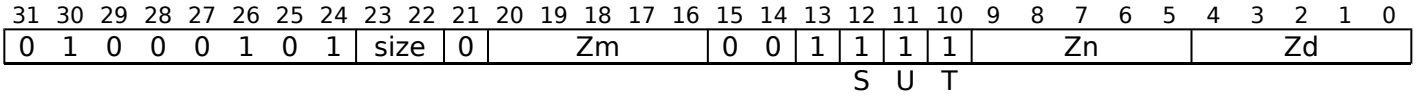
UABDLT

Unsigned absolute difference long (top)

Compute the absolute difference between the odd-numbered unsigned integer values in elements of the second source vector and corresponding elements of the first source vector, and place the results in the overlapping double-width elements of the destination vector. This instruction is unpredicated.



UABDLT <Zd>.<T>, <Zn>.<Tb>, <Zm>.<Tb>

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S

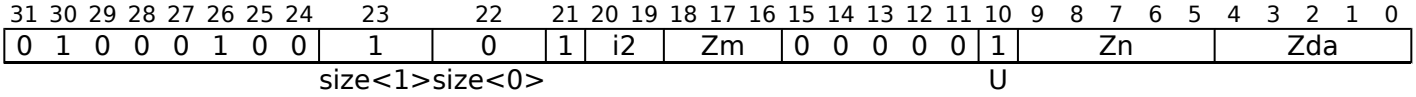
UDOT (indexed)

Unsigned integer indexed dot product

The unsigned integer indexed dot product instruction computes the dot product of a group of four unsigned 8-bit or 16-bit integer values held in each 32-bit or 64-bit element of the first source vector multiplied by a group of four unsigned 8-bit or 16-bit integer values in an indexed 32-bit or 64-bit element of the second source vector, and then destructively adds the widened dot product to the corresponding 32-bit or 64-bit element of the destination vector. The groups within the second source vector are specified using an immediate index which selects the same group position within each 128-bit vector segment. The index range is from 0 to one less than the number of groups per 128-bit segment, encoded in 1 to 2 bits depending on the size of the group. This instruction is unpredicated.
It has encodings from 2 classes: 32-bit and 64-bit

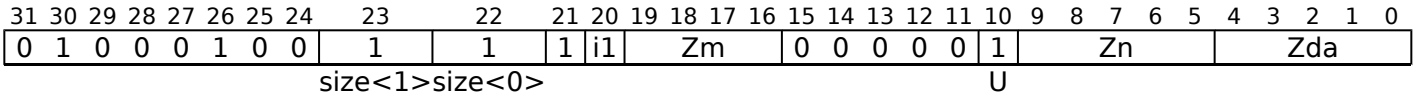
32-bit



UDOT <Zda>.S, <Zn>.B, <Zm>.B[<imm>]

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 32;
integer index = UInt(i2);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
```

64-bit



UDOT <Zda>.D, <Zn>.H, <Zm>.H[<imm>]

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 64;
integer index = UInt(i1);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
```

Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the 32-bit variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the 64-bit variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the 32-bit variant: is the immediate index of a 32-bit group of four 8-bit values within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field. For the 64-bit variant: is the immediate index of a 64-bit group of four 16-bit values within each 128-bit vector segment, in the range 0 to 1, encoded in the "i1" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
constant integer eltspersegment = 128 DIV esize;
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) operand3 = Z[da, VL];
bits(VL) result;

for e = 0 to elements-1
    integer segmentbase = e - (e MOD eltspersegment);
    integer s = segmentbase + index;
    bits(esize) res = Elem[operand3, e, esize];
    for i = 0 to 3
        integer element1 = UInt(Elem[operand1, 4 * e + i, esize DIV 4]);
        integer element2 = UInt(Elem[operand2, 4 * s + i, esize DIV 4]);
        res = res + element1 * element2;
    Elem[result, e, esize] = res;

Z[da, VL] = result;
```

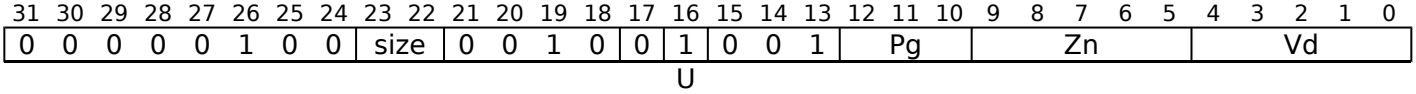
UMAXV

Unsigned maximum reduction to scalar

Unsigned maximum horizontally across all lanes of a vector, and place the result in the SIMD&FP scalar destination register. Inactive elements in the source vector are treated as zero.



UMAXV <V><d>, <Pg>, <Zn>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Vd);
boolean unsigned = TRUE;
```

Assembler Symbols

<V> Is a width specifier, encoded in “size”:

size	<V>
00	B
01	H
10	S
11	D

<d> Is the number [0-31] of the destination SIMD&FP register, encoded in the "Vd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);
integer maximum = if unsigned then 0 else -(2^(esize-1));

for e = 0 to elements-1
    if ElemP[mask, e, esize] == '1' then
        integer element = Int(Elem[operand, e, esize], unsigned);
        maximum = Max(maximum, element);

V[d, esize] = maximum<esize-1:0>;
```

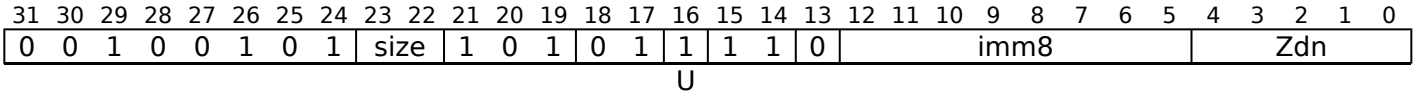
UMIN (immediate)

Unsigned minimum with immediate (unpredicated)

Determine the unsigned minimum of an immediate and each element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is an unsigned 8-bit value in the range 0 to 255, inclusive. This instruction is unpredicated.



```
UMIN <Zdn>.<T>, <Zdn>.<T>, #<imm>
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer dn = UInt(Zdn);
boolean unsigned = TRUE;
integer imm = Int(imm8, unsigned);
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is the unsigned immediate operand, in the range 0 to 255, encoded in the "imm8" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn, VL];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    Elem[result, e, esize] = Min(element1, imm)<esize-1:0>;

Z[dn, VL] = result;
```

UMMLA

Unsigned integer matrix multiply-accumulate

The unsigned integer matrix multiply-accumulate instruction multiplies the 2×8 matrix of unsigned 8-bit integer values held in each 128-bit segment of the first source vector by the 8×2 matrix of unsigned 8-bit integer values in the corresponding segment of the second source vector. The resulting 2×2 widened 32-bit integer matrix product is then destructively added to the 32-bit integer matrix accumulator held in the corresponding segment of the addend and destination vector. This is equivalent to performing an 8-way dot product per destination element.

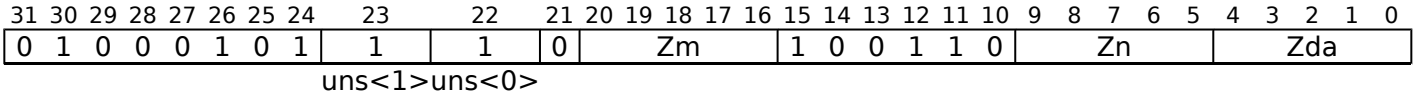
This instruction is unpredicated.

ID_AA64ZFR0_EL1.I8MM indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled at the current Exception level.

SVE

(FEAT_I8MM)



UMMLA <Zda>.S, <Zn>.B, <Zm>.B

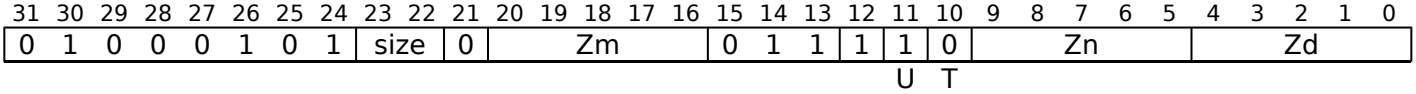
UMULLB (vectors)

Unsigned multiply long (bottom)

Multiply the corresponding even-numbered unsigned elements of the first and second source vectors, and place the results in the overlapping double-width elements of the destination vector. This instruction is unpredicated.



UMULLB <Zd>.<T>, <Zn>.<Tb>, <Zm>.<Tb>

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	B
10	H
11	S

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = UInt(Elem[operand1, 2*e + 0, esize DIV 2]);
    integer element2 = UInt(Elem[operand2, 2*e + 0, esize DIV 2]);
    integer res = element1 * element2;
    Elem[result, e, esize] = res<esize-1:0>;

Z[d, VL] = result;
```

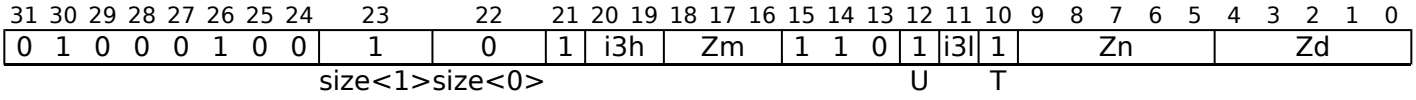
UMULLT (indexed)

Unsigned multiply long (top, indexed)

Multiply the odd-numbered unsigned elements within each 128-bit segment of the first source vector by the specified unsigned element in the corresponding second source vector segment, and place the results in the overlapping double-width elements of the destination vector register.
The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 2 or 3 bits depending on the size of the element.
It has encodings from 2 classes: 32-bit and 64-bit

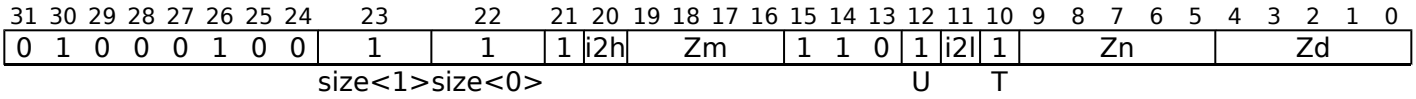
32-bit



UMULLT <Zd>.S, <Zn>.H, <Zm>.H[<imm>]

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 16;
integer index = UInt(i3h:i3l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
integer sel = 1;
```

64-bit



UMULLT <Zd>.D, <Zn>.S, <Zm>.S[<imm>]

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 32;
integer index = UInt(i2h:i2l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
integer sel = 1;
```

Assembler Symbols

<Zd>	Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the 32-bit variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the 64-bit variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the 32-bit variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the 64-bit variant: is the element index, in the range 0 to 3, encoded in the "i2h:i2l" fields.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV (2 * esize);
constant integer eltspersegment = 128 DIV (2 * esize);
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) result;

for e = 0 to elements-1
    integer s = e - (e MOD eltspersegment);
    integer element1 = UInt(Elem[operand1, 2 * e + sel,   esize]);
    integer element2 = UInt(Elem[operand2, 2 * s + index, esize]);
    integer res = element1 * element2;
    Elem[result, e, 2*esize] = res<2*esize-1:0>;

Z[d, VL] = result;
```

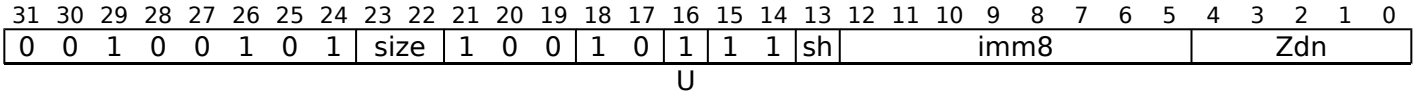
UQADD (immediate)

Unsigned saturating add immediate (unpredicated)

Unsigned saturating add of an unsigned immediate to each element of the source vector, and destructively place the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element's unsigned integer range 0 to (2^N)-1. This instruction is unpredicated.
The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.
The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<uimm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".



UQADD <Zdn>.<T>, <Zdn>.<T>, #<imm>{, <shift>}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size:sh == '001' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer dn = UInt(Zdn);
integer imm = UInt(imm8);
if sh == '1' then imm = imm << 8;
boolean unsigned = TRUE;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<imm> Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

sh	<shift>
0	LSL #0
1	LSL #8

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn, VL];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element1 + imm, esize, unsigned);

Z[dn, VL] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

UQDECB

Unsigned saturating decrement scalar by multiple of 8-bit predicate constraint element count

Determines the number of active 8-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.

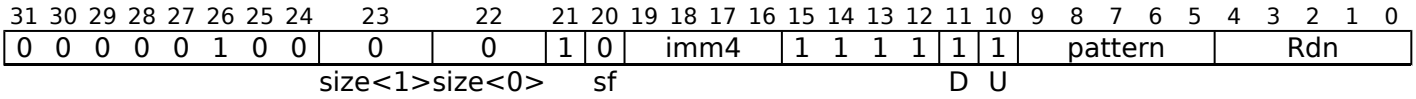
The named predicate constraint limits the number of active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

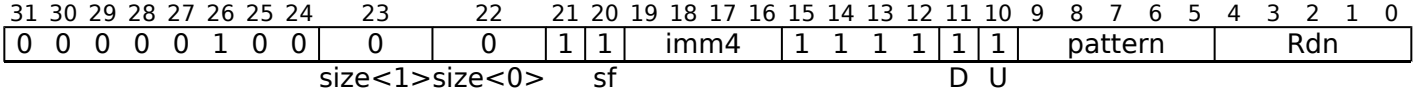
32-bit



UQDECB <Wdn>{, <pattern>{, MUL #<imm>}}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8;
integer dn = UInt(Rdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
boolean unsigned = TRUE;
integer ssize = 32;
```

64-bit



UQDECB <Xdn>{, <pattern>{, MUL #<imm>}}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8;
integer dn = UInt(Rdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
boolean unsigned = TRUE;
integer ssize = 64;
```

Assembler Symbols

<Wdn>	Is the 32-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
<Xdn>	Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
<pattern>	Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>
00000	POW2

UQDECH (scalar)

Unsigned saturating decrement scalar by multiple of 16-bit predicate constraint element count

Determines the number of active 16-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.

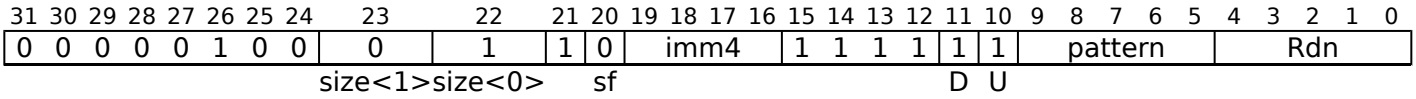
The named predicate constraint limits the number of active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

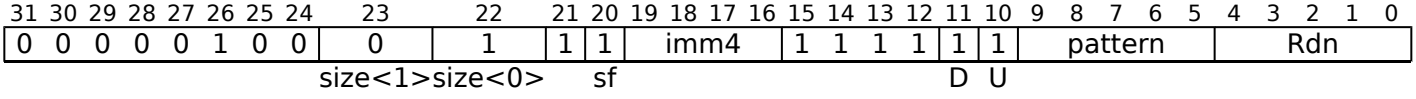
32-bit



UQDECH <Wdn>{, <pattern>{, MUL #<imm>}}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 16;
integer dn = UInt(Rdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
boolean unsigned = TRUE;
integer ssize = 32;
```

64-bit



UQDECH <Xdn>{, <pattern>{, MUL #<imm>}}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 16;
integer dn = UInt(Rdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
boolean unsigned = TRUE;
integer ssize = 64;
```

Assembler Symbols

<Wdn>	Is the 32-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
<Xdn>	Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
<pattern>	Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>
00000	POW2
00001	VL1
00010	VL2
00011	VL3
00100	VL4
00101	VL5
00110	VL6
00111	VL7
01000	VL8
01001	VL16
01010	VL32
01011	VL64
01100	VL128
01101	VL256
0111x	#uimm5
101x1	#uimm5

11101	MUL4
11110	MUL3
11111	ALL

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
bits(VL) operand1 = Z[dn, VL];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element1 - (count * imm), esize, unsigned);

Z[dn, VL] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

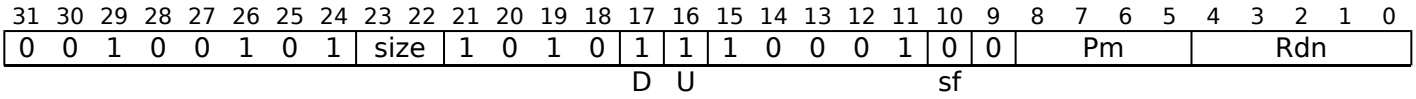
Internal version only: isa v33.23junrel, AdvSIMD v29.1, pseudocode v2022-06_rel, sve v2022-06_rel ; Build timestamp: 2022-07-06T09:51

UQDECP (scalar)

Unsigned saturating decrement scalar by count of true predicate elements

Counts the number of true elements in the source predicate and then uses the result to decrement the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.
It has encodings from 2 classes: 32-bit and 64-bit

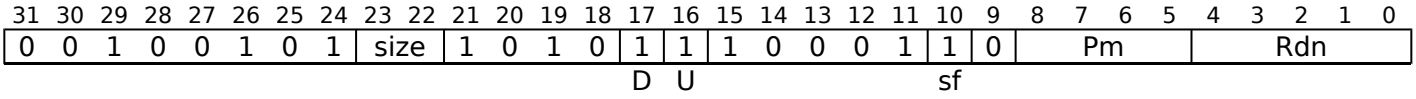
32-bit



UQDECP <Wdn>, <Pm>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer m = UInt(Pm);
integer dn = UInt(Rdn);
boolean unsigned = TRUE;
integer ssize = 32;
```

64-bit



UQDECP <Xdn>, <Pm>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer m = UInt(Pm);
integer dn = UInt(Rdn);
boolean unsigned = TRUE;
integer ssize = 64;
```

Assembler Symbols

<Wdn> Is the 32-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

<Xdn> Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(ssize) operand1 = X[dn, ssize];
bits(PL) operand2 = P[m, PL];
bits(ssize) result;
integer count = 0;

for e = 0 to elements-1
    if ElemP[operand2, e, esize] == '1' then
        count = count + 1;

integer element = Int(operand1, unsigned);
(result, -) = SatQ(element - count, ssize, unsigned);
X[dn, 64] = Extend(result, 64, unsigned);
```

Operational information

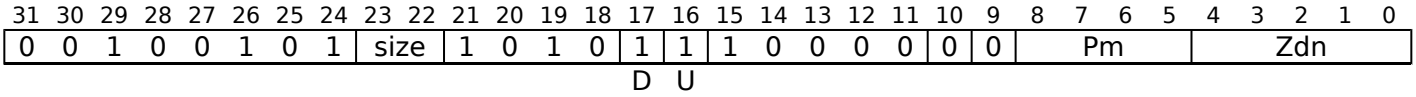
If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the general-purpose register written by this instruction might be significantly delayed.

Internal version only: isa v33.23junrel, AdvSIMD v29.1, pseudocode v2022-06_rel, sve v2022-06_rel ; Build timestamp: 2022-07-06T09:51

UQDECP (vector)

Unsigned saturating decrement vector by count of true predicate elements

Counts the number of true elements in the source predicate and then uses the result to decrement all destination vector elements. The results are saturated to the element unsigned integer range.
The predicate size specifier may be omitted in assembler source code, but this is deprecated and will be prohibited in a future release of the architecture.



UQDECP <Zdn>.<T>, <Pm>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer m = UInt(Pm);
integer dn = UInt(Zdn);
boolean unsigned = TRUE;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn, VL];
bits(PL) operand2 = P[m, PL];
bits(VL) result;
integer count = 0;

for e = 0 to elements-1
    if ElemP[operand2, e, esize] == '1' then
        count = count + 1;

for e = 0 to elements-1
    integer element = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element - count, esize, unsigned);

Z[dn, VL] = result;
```

Operational information

11101	MUL4
11110	MUL3
11111	ALL

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
bits(VL) operand1 = Z[dn, VL];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element1 + (count * imm), esize, unsigned);

Z[dn, VL] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

Internal version only: isa v33.23junrel, AdvSIMD v29.1, pseudocode v2022-06_rel, sve v2022-06_rel ; Build timestamp: 2022-07-06T09:51

UQINCH (scalar)

Unsigned saturating increment scalar by multiple of 16-bit predicate constraint element count

Determines the number of active 16-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.

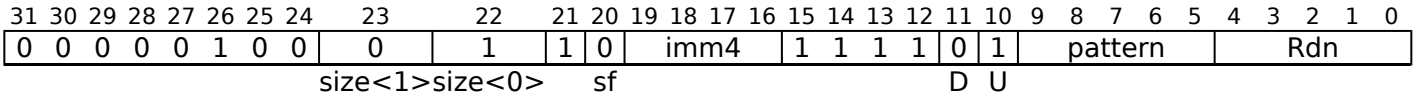
The named predicate constraint limits the number of active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

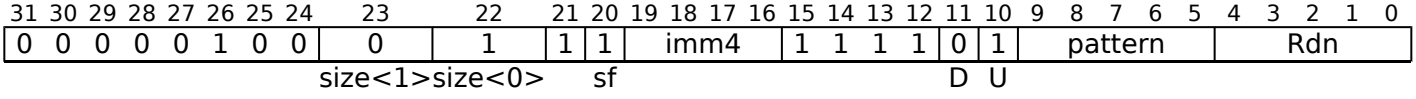
32-bit



UQINCH <Wdn>{, <pattern>{, MUL #<imm>}}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 16;
integer dn = UInt(Rdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
boolean unsigned = TRUE;
integer ssize = 32;
```

64-bit



UQINCH <Xdn>{, <pattern>{, MUL #<imm>}}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 16;
integer dn = UInt(Rdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
boolean unsigned = TRUE;
integer ssize = 64;
```

Assembler Symbols

<Wdn>	Is the 32-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
<Xdn>	Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
<pattern>	Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>

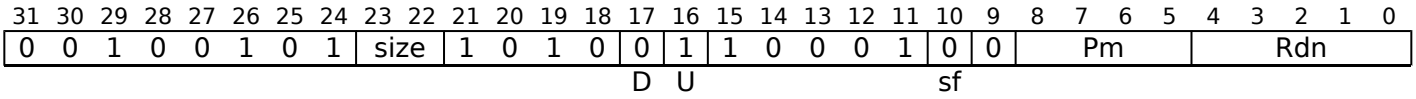
UQINCP (scalar)

Unsigned saturating increment scalar by count of true predicate elements

Counts the number of true elements in the source predicate and then uses the result to increment the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.
It has encodings from 2 classes: 32-bit and 64-bit

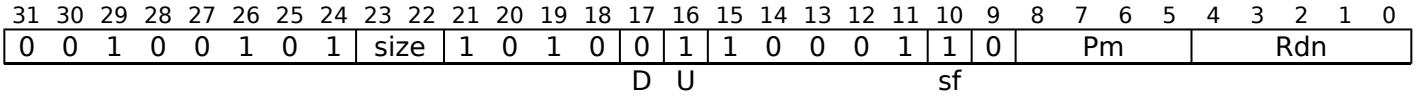
32-bit



UQINCP <Wdn>, <Pm>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer m = UInt(Pm);
integer dn = UInt(Rdn);
boolean unsigned = TRUE;
integer ssize = 32;
```

64-bit



UQINCP <Xdn>, <Pm>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer m = UInt(Pm);
integer dn = UInt(Rdn);
boolean unsigned = TRUE;
integer ssize = 64;
```

Assembler Symbols

<Wdn> Is the 32-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

<Xdn> Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(ssize) operand1 = X[dn, ssize];
bits(PL) operand2 = P[m, PL];
bits(ssize) result;
integer count = 0;

for e = 0 to elements-1
    if ElemP[operand2, e, esize] == '1' then
        count = count + 1;

integer element = Int(operand1, unsigned);
(result, -) = SatQ(element + count, ssize, unsigned);
X[dn, 64] = Extend(result, 64, unsigned);
```

Operational information

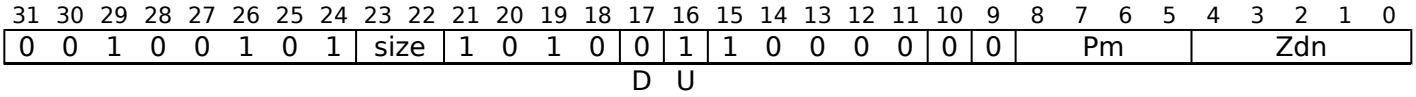
If FEAT_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the general-purpose register written by this instruction might be significantly delayed.

Internal version only: isa v33.23junrel, AdvSIMD v29.1, pseudocode v2022-06_rel, sve v2022-06_rel ; Build timestamp: 2022-07-06T09:51

UQINCP (vector)

Unsigned saturating increment vector by count of true predicate elements

Counts the number of true elements in the source predicate and then uses the result to increment all destination vector elements. The results are saturated to the element unsigned integer range.
The predicate size specifier may be omitted in assembler source code, but this is deprecated and will be prohibited in a future release of the architecture.



UQINCP <Zdn>.<T>, <Pm>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer m = UInt(Pm);
integer dn = UInt(Zdn);
boolean unsigned = TRUE;
```

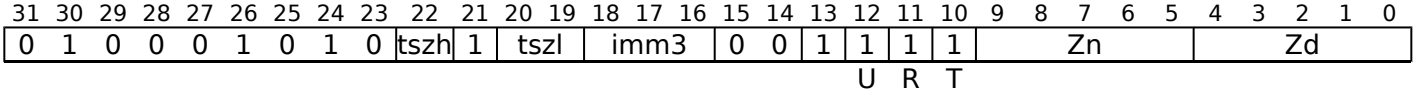
UQRSHRNT

Unsigned saturating rounding shift right narrow by immediate (top)

Shift each unsigned integer value in the source vector elements by an immediate value, and place the rounded results in the odd-numbered half-width destination elements, leaving the even-numbered elements unchanged. Each result element is saturated to the half-width N-bit element's unsigned integer range 0 to (2^N)-1. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.



UQRSHRNT <Zd>.<T>, <Zn>.<Tb>, #<const>

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
bits(3) tsize = tszh:tszl;
integer esize;
case tsize of
    when '000' UNDEFINED;
    when '001' esize = 8;
    when '01x' esize = 16;
    when '1xx' esize = 32;
integer n = UInt(Zn);
integer d = UInt(Zd);
integer shift = (2 * esize) - UInt(tsize:imm3);
```

Assembler Symbols

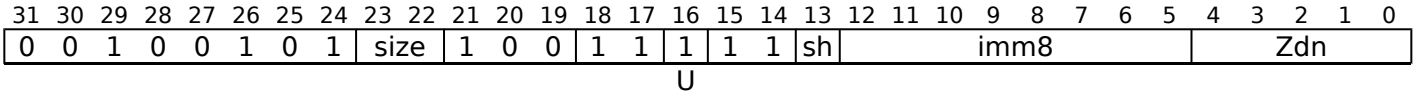
UQSUB (immediate)

Unsigned saturating subtract immediate (unpredicated)

Unsigned saturating subtract an unsigned immediate from each element of the source vector, and destructively place the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element's unsigned integer range 0 to (2^N)-1. This instruction is unpredicated.
The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.
The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<uimm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".



UQSUB <Zdn>.<T>, <Zdn>.<T>, #<imm>{, <shift>}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;

USMMLA

Unsigned by signed integer matrix multiply-accumulate

The unsigned by signed integer matrix multiply-accumulate instruction multiplies the 2×8 matrix of unsigned 8-bit integer values held in each 128-bit segment of the first source vector by the 8×2 matrix of signed 8-bit integer values in the corresponding segment of the second source vector. The resulting 2×2 widened 32-bit integer matrix product is then destructively added to the 32-bit integer matrix accumulator held in the corresponding segment of the addend and destination vector. This is equivalent to performing an 8-way dot product per destination element.

This instruction is unpredicated.

ID_AA64ZFR0_EL1.I8MM indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled at the current Exception level.

SVE

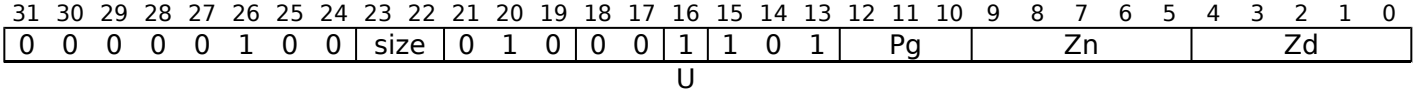
UXTB, UXTH, UXTW

Unsigned byte / halfword / word extend (predicated)

Zero-extend the least-significant sub-element of each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.
It has encodings from 3 classes: Byte , Halfword and Word

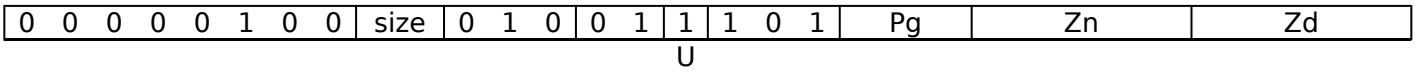
Byte



UXTB <Zd>.<T>, <Pg>/M, <Zn>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
constant integer s_esize = 8;
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
boolean unsigned = TRUE;
```

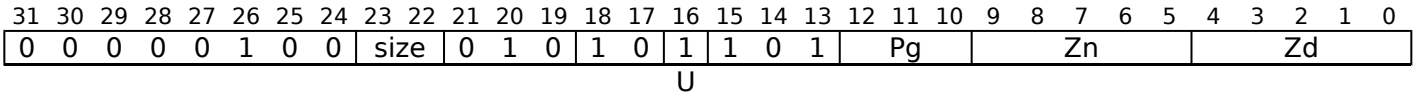
Halfword



UXTH <Zd>.<T>, <Pg>/M, <Zn>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size IN {'0x'} then UNDEFINED;
constant integer esize = 8 << UInt(size);
constant integer s_esize = 16;
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
boolean unsigned = TRUE;
```

Word



UXTW <Zd>.D, <Pg>/M, <Zn>.D

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size != '11' then UNDEFINED;
constant integer esize = 8 << UInt(size);
constant integer s_esize = 32;
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
boolean unsigned = TRUE;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> For the byte variant: is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

For the halfword variant: is the size specifier, encoded in “size<0>”:

size<0>	<T>
0	S
1	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);
bits(VL) result = Z[d, VL];

for e = 0 to elements-1
    if ElemP[mask, e, esize] == '1' then
        bits(esize) element = Elem[operand, e, esize];
        Elem[result, e, esize] = Extend(element<s_esize-1:0>, esize, unsigned);

Z[d, VL] = result;
```

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

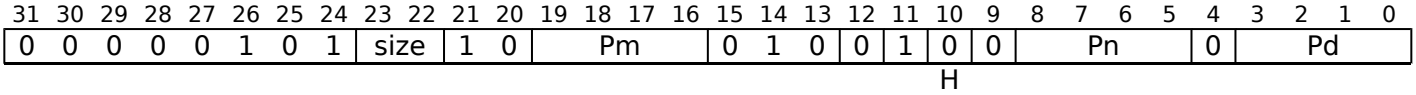
UZP1, UZP2 (predicates)

Concatenate even or odd elements from two predicates

Concatenate adjacent even or odd-numbered elements from the first and second source predicates and place in elements of the destination predicate. This instruction is unpredicated.
It has encodings from 2 classes: Even and Odd

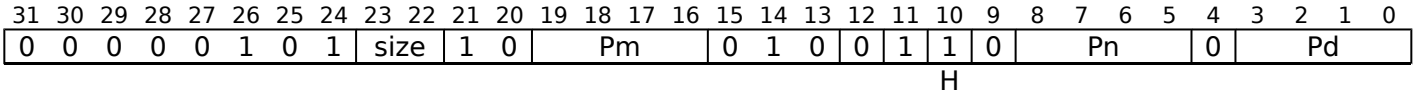
Even



UZP1 <Pd>.<T>, <Pn>.<T>, <Pm>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer n = UInt(Pn);
integer m = UInt(Pm);
integer d = UInt(Pd);
integer part = 0;
```

Odd



UZP2 <Pd>.<T>, <Pn>.<T>, <Pm>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer n = UInt(Pn);
integer m = UInt(Pm);
integer d = UInt(Pd);
integer part = 1;
```

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Pn> Is the name of the first source scalable predicate register, encoded in the "Pn" field.

<Pm> Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer pairs = VL DIV (esize * 2);
bits(PL) operand1 = P[n, PL];
bits(PL) operand2 = P[m, PL];
bits(PL) result;

for p = 0 to pairs - 1
    Elem[result, p, esize DIV 8] = Elem[operand1, 2*p+part, esize DIV 8];

for p = 0 to pairs - 1
    Elem[result, pairs+p, esize DIV 8] = Elem[operand2, 2*p+part, esize DIV 8];

P[d, PL] = result;
```

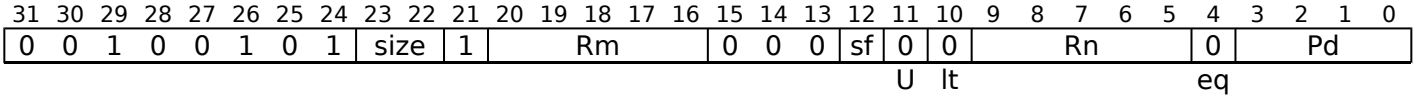
WHILEGE

While decrementing signed scalar greater than or equal to scalar

Generate a predicate that starting from the highest numbered element is true while the decrementing value of the first, signed scalar operand is greater than or equal to the second scalar operand and false thereafter down to the lowest numbered element.
If the second scalar operand is equal to the minimum signed integer value then a condition which includes an equality test can never fail and the result will be an all-true predicate.
The full width of the scalar operands is significant for the purposes of comparison, and the full width first operand is decremented by one for each destination predicate element, irrespective of the predicate result element size. The first general-purpose source register is not itself updated.
The predicate result is placed in the predicate destination register. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.



WHILEGE <Pd>.<T>, <R><n>, <R><m>

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);

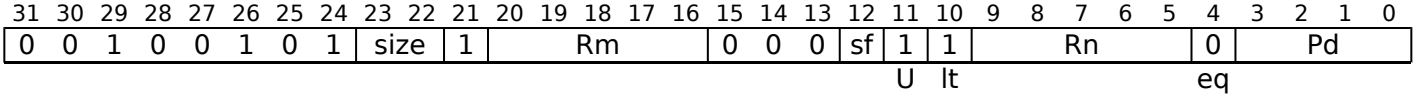
WHILELO

While incrementing unsigned scalar lower than scalar

Generate a predicate that starting from the lowest numbered element is true while the incrementing value of the first, unsigned scalar operand is lower than the second scalar operand and false thereafter up to the highest numbered element.
The full width of the scalar operands is significant for the purposes of comparison, and the full width first operand is incremented by one for each destination predicate element, irrespective of the predicate result element size. The first general-purpose source register is not itself updated.
The predicate result is placed in the predicate destination register. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.



WHILELO <Pd>.<T>, <R><n>, <R><m>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
constant integer rsize = 32 << UInt(sf);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer d = UInt(Pd);
boolean unsigned = TRUE;
SVECmp op = Cmp_LT;
```

Assembler Symbols

WRFFR

Write the first-fault register

Read the source predicate register and place in the first-fault register (FFR). This instruction is intended to restore a saved FFR and is not recommended for general use by applications.

This instruction requires that the source predicate contains a MONOTONIC predicate value, in which starting from bit 0 there are zero or more 1 bits, followed only by 0 bits in any remaining bit positions. If the source is not a monotonic predicate value, then the resulting value in the FFR will be UNPREDICTABLE. It is not possible to generate a non-monotonic value in FFR when using SETFFR followed by first-fault or non-fault loads.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled at the current Exception level.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	1	0	0	1	0	1	0	0	1	0	1	0	0	0	1	0	0	1	0	0	0	Pn				0	0	0	0	0

WRFFR <Pn>.B

```
if !HaveSVE() then UNDEFINED;
integer n = UInt(Pn);
```

Assembler Symbols

<Pn> Is the name of the source scalable predicate register, encoded in the "Pn" field.

Operation

```
CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
bits(PL) operand = P[n, PL];

constant integer hsb = HighestSetBit(operand);
if hsb < 0 || IsOnes(operand<hsb:0>) then
    FFR[PL] = operand;
else // not a monotonic predicate
    FFR[PL] = bits(PL) UNKNOWN;
```

Operational information

ADDSPL: Add multiple of Streaming SVE predicate register size to scalar register.

ADDSVL: Add multiple of Streaming SVE vector register size to scalar register.

ADDVA: Add vertically vector elements to ZA tile.

BFMOPA: BFloat16 sum of outer products and accumulate.

BFMOPS: BFloat16 sum of outer products and subtract.

FMOPA (non-widening): Floating-point outer product and accumulate.

FMOPA (widening): Half-precision floating-point sum of outer products and accumulate.

FMOPS (non-widening): Floating-point outer product and subtract.

FMOPS (widening): Half-precision floating-point sum of outer products and subtract.

LD1B: Contiguous load of bytes to 8-bit element ZA tile slice.

LD1D: Contiguous load of doublewords to 64-bit element ZA tile slice.

LD1H: Contiguous load of halfwords to 16-bit element ZA tile slice.

LD1Q: Contiguous load of quadwords to 128-bit element ZA tile slice.

LD1W: Contiguous load of words to 32-bit element ZA tile slice.

LDR: Load vector to ZA array.

MOV (tile to vector): Move ZA tile slice to vector register: an alias of MOVA (tile to vector).

MOV (vector to tile): Move vector register to ZA tile slice: an alias of MOVA (vector to tile).

MOVA (tile to vector): Move ZA tile slice to vector register.

MOVA (vector to tile): Move vector register to ZA tile slice.

RDSVL: Read multiple of Streaming SVE vector register size to scalar register.

SMOPA: Signed integer sum of outer products and accumulate.

SMOPS: Signed integer sum of outer products and subtract.

ST1B: Contiguous store of bytes from 8-bit element ZA tile slice.

ST1D: Contiguous store of doublewords from 64-bit element ZA tile slice.

ST1H: Contiguous store of halfwords from 16-bit element ZA tile slice.

ST1Q: Contiguous store of quadwords from 128-bit element ZA tile slice.

ST1W: Contiguous store of words from 32-bit element ZA tile slice.

STR: Store vector from ZA array.

SUMOPA: Signed by unsigned integer sum of outer products and accumulate.

SUMOPS: Signed by unsigned integer sum of outer products and subtract.

UMOPA: Unsigned integer sum of outer products and accumulate.

UMOPS: Unsigned integer sum of outer products and subtract.

USMOPA: Unsigned by signed integer sum of outer products and accumulate.

USMOPS: Unsigned by signed integer sum of outer products and subtract.

ZERO: Zero a list of 64-bit element ZA tiles.

ADDHA

Add horizontally vector elements to ZA tile

Add each element of the source vector to the corresponding active element of each horizontal slice of a ZA tile. The tile elements are predicated by a pair of governing predicates. An element of a horizontal slice is considered active if its corresponding element in the second governing predicate is TRUE and the element corresponding to its horizontal slice number in the first governing predicate is TRUE. Inactive elements in the destination tile remain unmodified.
ID_AA64SMFR0_EL1.I16I64 indicates whether the 64-bit integer variant is implemented.
It has encodings from 2 classes: 32-bit and 64-bit

32-bit

BFMOPA

BFloat16 sum of outer products and accumulate

The BFloat16 floating-point sum of outer products and accumulate instruction works with a 32-bit element ZA tile.
This instruction multiplies the $SVL_S \times 2$ sub-matrix of BFloat16 values held in the first source vector by the $2 \times SVL_S$ sub-matrix of BFloat16 values in the second source vector.
Each source vector is independently predicated by a corresponding governing predicate. When a 16-bit source element is Inactive it is treated as having the value +0.0, but if both pairs of source vector elements that correspond to a 32-bit destination element contain Inactive elements, then the destination element remains unmodified.
The resulting $SVL_S \times SVL_S$ single-precision floating-point sum of outer products is then destructively added to the single-precision floating-point destination tile. This is equivalent to performing a 2-way dot product and accumulate to each of the destination tile elements.
Each 32-bit container of the first source vector holds 2 consecutive column elements of each row of a $SVL_S \times 2$ sub-matrix. Similarly, each 32-bit container of the second source vector holds 2 consecutive row elements of each column of a $2 \times SVL_S$ sub-matrix.
This instruction follows SME BFloat16 numerical behaviors.

FMOPA (non-widening)

Floating-point outer product and accumulate

The single-precision variant works with a 32-bit element ZA tile.
The double-precision variant works with a 64-bit element ZA tile.
These instructions generate an outer product of the first source vector and the second source vector. In case of the single-precision variant, the first source is $SVL_S \times 1$ vector and the second source is $1 \times SVL_S$ vector. In case of the double-precision variant, the first source is $SVL_D \times 1$ vector and the second source is $1 \times SVL_D$ vector.
Each source vector is independently predicated by a corresponding governing predicate. When either source vector element is Inactive the corresponding destination tile element remains unmodified.
The resulting outer product, $SVL_S \times SVL_S$ in case of single-precision variant or $SVL_D \times SVL_D$ in case of double-precision variant, is then destructively added to the destination tile. This is equivalent to performing a single multiply-accumulate to each of the destination tile elements.
This instruction follows SME ZA-targeting floating-point behaviors.
ID_AA64SMFR0_EL1.F64F64 indicates whether the double-precision variant is implemented.
It has encodings from 2 classes: Single-precision and Double-precision

FMOPA (widening)

Half-precision floating-point sum of outer products and accumulate

The half-precision floating-point sum of outer products and accumulate instruction works with a 32-bit element ZA tile.
This instruction widens the $SVL_S \times 2$ sub-matrix of half-precision floating-point values held in the first source vector to single-precision floating-point values and multiplies it by the widened $2 \times SVL_S$ sub-matrix of half-precision floating-point values in the second source vector to single-precision floating-point values.
Each source vector is independently predicated by a corresponding governing predicate. When a 16-bit source element is Inactive it is treated as having the value +0.0, but if both pairs of source vector elements that correspond to a 32-bit destination element contain Inactive elements, then the destination element remains unmodified.
The resulting $SVL_S \times SVL_S$ single-precision floating-point sum of outer products is then destructively added to the single-precision floating-point destination tile. This is equivalent to performing a 2-way dot product and accumulate to each of the destination tile elements.
Each 32-bit container of the first source vector holds 2 consecutive column elements of each row of a $SVL_S \times 2$ sub-matrix. Similarly, each 32-bit container of the second source vector holds 2 consecutive row elements of each column of a $2 \times SVL_S$ sub-matrix.
This instruction follows SME ZA-targeting floating-point behaviors.

FMOPS (non-widening)

Floating-point outer product and subtract

The single-precision variant works with a 32-bit element ZA tile.
The double-precision variant works with a 64-bit element ZA tile.
These instructions generate an outer product of the first source vector and the second source vector. In case of the single-precision variant, the first source is $SVL_S \times 1$ vector and the second source is $1 \times SVL_S$ vector. In case of the double-precision variant, the first source is $SVL_D \times 1$ vector and the second source is $1 \times SVL_D$ vector.
Each source vector is independently predicated by a corresponding governing predicate. When either source vector element is Inactive the corresponding destination tile element remains unmodified.
The resulting outer product, $SVL_S \times SVL_S$ in case of single-precision variant or $SVL_D \times SVL_D$ in case of double-precision variant, is then destructively subtracted from the destination tile. This is equivalent to performing a single multiply-subtract from each of the destination tile elements.
This instruction follows SME ZA-targeting floating-point behaviors.
ID_AA64SMFR0_EL1.F64F64 indicates whether the double-precision variant is implemented.
It has encodings from 2 classes: Single-precision and Double-precision

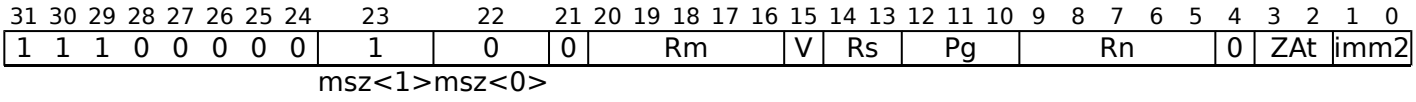
LD1W

Contiguous load of words to 32-bit element ZA tile slice

The slice number within the tile is selected by the sum of the slice index register and an immediate, modulo the number of 32-bit elements in a vector. The immediate is in the range 0 to 3. The memory address is generated by scalar base and optional scalar offset which is multiplied by 4 and added to the base address. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

SME
(FEAT_SME)



LD1W { <ZAt><HV>.S[<Ws>, <imm>] }, <Pg>/Z, [<Xn|SP>{, <Xm>, LSL #2}]

```
if !HaveSME() then UNDEFINED;
integer n = UInt(Rn);
integer m = UInt(Rm);
integer g = UInt('0':Pg);
integer s = UInt('011':Rs);
integer t = UInt(ZAt);
integer imm = UInt(imm2);
constant integer esize = 32;
boolean vertical = V == '1';
```

Assembler Symbols

<ZAt> Is the name of the ZA tile ZA0-ZA3 to be accessed, encoded in the "ZAt" field.

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded in the "Rs" field.

<imm> Is the slice index offset, in the range 0 to 3, encoded in the "imm2" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<Xm> Is the optional 64-bit name of the general-purpose offset register, defaulting to XZR, encoded in the "Rm" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer dim = VL DIV esize;
bits(64) base;
bits(64) addr;
bits(64) offset;
bits(PL) mask = P[g, PL];
bits(VL) result;
bits(32) index = X[s, 32];
integer  slice = (UInt(index) + imm) MOD dim;
constant integer mbytes = esize DIV 8;

if HaveMTEExt() then SetTagCheckedInstruction(TRUE);

if n == 31 then
    if AnyActiveElement(mask, esize) ||
          ConstrainUnpredictableBool(Unpredictable_CHECKSPNONEACTIVE) then
        CheckSPAlignment();
    base = SP[];
else
    base = X[n, 64];
offset = X[m, 64];

for e = 0 to dim - 1
    addr = base + UInt(offset) * mbytes;
    if ElemP[mask, e, esize] == '1' then
        Elem[result, e, esize] = Mem[addr, mbytes, AccType_SME];
    else
        Elem[result, e, esize] = Zeros(esize);
    offset = offset + 1;

ZAslice[t, esize, vertical, slice, VL] = result;
```

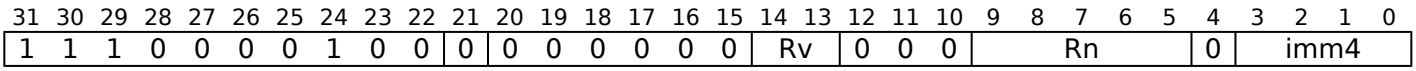
LDR

Load vector to ZA array

The ZA array vector is selected by the sum of the vector select register and an immediate, modulo the number of bytes in a Streaming SVE vector. The immediate is in the range 0 to 15. The memory address is generated by scalar base, plus the same optional immediate offset multiplied by the current vector length in bytes. This instruction is unpredicated.
The load is performed as contiguous byte accesses, with no endian conversion and no guarantee of single-copy atomicity larger than a byte. However, if alignment is checked, then the base register must be aligned to 16 bytes.
This instruction does not require the PE to be in Streaming SVE mode, and it is expected that this instruction will not experience a significant slowdown due to contention with other PEs that are executing in Streaming SVE mode.

SME
(FEAT_SME)



LDR ZA[<Wv>, <imm>], [<Xn|SP>{, #<imm>, MUL VL}]

```
if !HaveSME() then UNDEFINED;
integer n = UInt(Rn);
integer v = UInt('011':Rv);
integer imm = UInt(imm4);
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W12-W15, encoded in the "Rv" field.
<imm>	Is the vector select offset and optional memory offset, in the range 0 to 15, defaulting to 0, encoded in the "imm4" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
CheckSMEAndZAEnabled();
constant integer svl = SVL;
constant integer dim = svl DIV 8;
bits(64)  base;
integer   offset = imm * dim;
bits(svl) result;
bits(32)  idx = X[v, 32];
integer   vec = (UInt(idx) + imm) MOD dim;

if HaveTME() && TSTATE.depth > 0 then
    FailTransaction(TMFailure_ERR, FALSE);

if n == 31 then
    if HaveMTEExt() then SetTagCheckedInstruction(FALSE);
    CheckSPAlignment();
    base = SP[];
else
    if HaveMTEExt() then SetTagCheckedInstruction(TRUE);
    base = X[n, 64];

boolean aligned = AArch64.CheckAlignment(base + offset, 16, AccType_SME, FALSE);
for e = 0 to dim-1
    Elem[result, e, 8] = AArch64.MemSingle[base + offset, 1, AccType_SME, aligned];
    offset = offset + 1;

ZAvector[vec, svl] = result;
```

MOV (tile to vector)

Move ZA tile slice to vector register

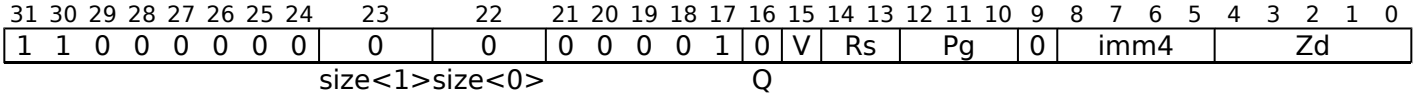
The instruction operates on individual horizontal or vertical slices within a named ZA tile of the specified element size. The slice number within the tile is selected by the sum of the slice index register and an immediate, modulo the number of such elements in a vector. The immediate is in the range 0 to the number of elements in a 128-bit vector segment minus 1.
Inactive elements in the destination vector remain unmodified.

This is an alias of MOVA (tile to vector). This means:

- The encodings in this description are named to match the encodings of MOVA (tile to vector).
- The description of MOVA (tile to vector) gives the operational pseudocode for this instruction.

It has encodings from 5 classes: 8-bit , 16-bit , 32-bit , 64-bit and 128-bit

8-bit



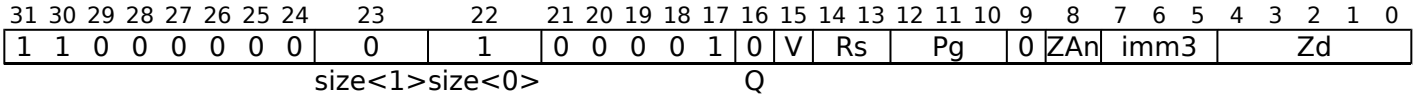
MOV <Zd>.B, <Pg>/M, ZA0<HV>.B[<Ws>, <imm>]

is equivalent to

MOVA <Zd>.B, <Pg>/M, ZA0<HV>.B[<Ws>, <imm>]

and is always the preferred disassembly.

16-bit



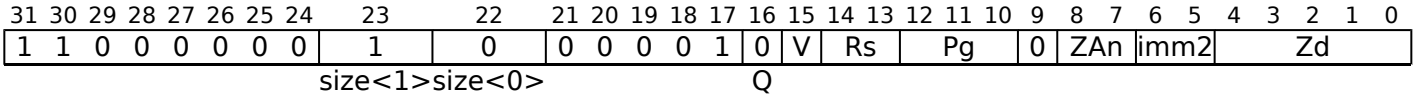
MOV <Zd>.H, <Pg>/M, <ZAn><HV>.H[<Ws>, <imm>]

is equivalent to

MOVA <Zd>.H, <Pg>/M, <ZAn><HV>.H[<Ws>, <imm>]

and is always the preferred disassembly.

32-bit



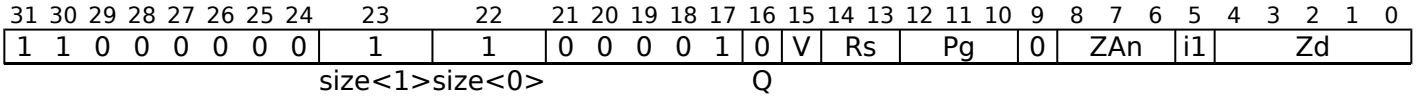
MOV <Zd>.S, <Pg>/M, <ZAn><HV>.S[<Ws>, <imm>]

is equivalent to

MOVA <Zd>.S, <Pg>/M, <ZAn><HV>.S[<Ws>, <imm>]

and is always the preferred disassembly.

64-bit



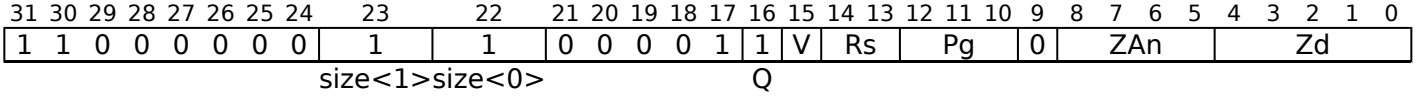
MOV <Zd>.D, <Pg>/M, <ZAn><HV>.D[<Ws>, <imm>]

is equivalent to

MOVA <Zd>.D, <Pg>/M, <ZAn><HV>.D[<Ws>, <imm>]

and is always the preferred disassembly.

128-bit



MOV <Zd>.Q, <Pg>/M, <ZAn><HV>.Q[<Ws>, <imm>]

is equivalent to

MOVA <Zd>.Q, <Pg>/M, <ZAn><HV>.Q[<Ws>, <imm>]

and is always the preferred disassembly.

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<ZAn> For the 16-bit variant: is the name of the ZA tile ZA0-ZA1 to be accessed, encoded in the "ZAn" field.
For the 32-bit variant: is the name of the ZA tile ZA0-ZA3 to be accessed, encoded in the "ZAn" field.
For the 64-bit variant: is the name of the ZA tile ZA0-ZA7 to be accessed, encoded in the "ZAn" field.
For the 128-bit variant: is the name of the ZA tile ZA0-ZA15 to be accessed, encoded in the "ZAn" field.

<HV> Is the horizontal or vertical slice indicator, encoded in “V”:

V	<HV>
0	H
1	V

<Ws> Is the 32-bit name of the slice index register W12-W15, encoded in the "Rs" field.

<imm> For the 8-bit variant: is the slice index offset, in the range 0 to 15, encoded in the "imm4" field.
For the 16-bit variant: is the slice index offset, in the range 0 to 7, encoded in the "imm3" field.
For the 32-bit variant: is the slice index offset, in the range 0 to 3, encoded in the "imm2" field.
For the 64-bit variant: is the slice index offset, in the range 0 to 1, encoded in the "i1" field.
For the 128-bit variant: is the slice index offset 0.

Operation

The description of MOVA (tile to vector) gives the operational pseudocode for this instruction.

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

SMOPA

Signed integer sum of outer products and accumulate

The 8-bit integer variant works with a 32-bit element ZA tile.
The 16-bit integer variant works with a 64-bit element ZA tile.
The signed integer sum of outer products and accumulate instructions multiply the sub-matrix in the first source vector by the sub-matrix in the second source vector. In case of the 8-bit integer variant, the first source holds $SVL_S \times 4$ sub-matrix of signed 8-bit integer values, and the second source holds $4 \times SVL_S$ sub-matrix of signed 8-bit integer values. In case of the 16-bit integer variant, the first source holds $SVL_D \times 4$ sub-matrix of signed 16-bit integer values, and the second source holds $4 \times SVL_D$ sub-matrix of signed 16-bit integer values.
Each source vector is independently predicated by a corresponding governing predicate. When an 8-bit source element in case of 8-bit integer variant or a 16-bit source element in case of 16-bit integer variant is Inactive, it is treated as having the value 0.
The resulting $SVL_S \times SVL_S$ widened 32-bit integer or $SVL_D \times SVL_D$ widened 64-bit integer sum of outer products is then destructively added to the 32-bit integer or 64-bit integer destination tile, respectively for 8-bit integer and 16-bit integer instruction variants. This is equivalent to performing a 4-way dot product and accumulate to each of the destination tile elements.
In case of the 8-bit integer variant, each 32-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_S \times 4$ sub-matrix, and each 32-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_S$ sub-matrix. In case of the 16-bit integer variant, each 64-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_D \times 4$ sub-matrix, and each 64-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_D$ sub-matrix.
ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.
It has encodings from 2 classes: 32-bit and 64-bit

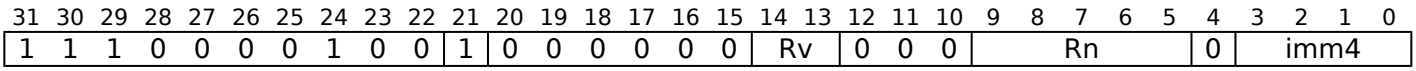
STR

Store vector from ZA array

The ZA array vector is selected by the sum of the vector select register and an immediate, modulo the number of bytes in a Streaming SVE vector. The immediate is in the range 0 to 15. The memory address is generated by scalar base, plus the same optional immediate offset multiplied by the current vector length in bytes. This instruction is unpredicated.
The store is performed as contiguous byte accesses, with no endian conversion and no guarantee of single-copy atomicity larger than a byte. However, if alignment is checked, then the base register must be aligned to 16 bytes.
This instruction does not require the PE to be in Streaming SVE mode, and it is expected that this instruction will not experience a significant slowdown due to contention with other PEs that are executing in Streaming SVE mode.

SME
(FEAT_SME)



STR ZA[<Wv>, <imm>], [<Xn|SP>{, #<imm>, MUL VL}]

```
if !HaveSME() then UNDEFINED;
integer n = UInt(Rn);
integer v = UInt('011':Rv);
integer imm = UInt(imm4);
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W12-W15, encoded in the "Rv" field.
<imm>	Is the vector select offset and optional memory offset, in the range 0 to 15, defaulting to 0, encoded in the "imm4" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
CheckSMEAndZAEnabled();
constant integer svl = SVL;
constant integer dim = svl DIV 8;
bits(32)  idx = X[v, 32];
integer   vec = (UInt(idx) + imm) MOD dim;
bits(svl) src;
bits(64)  base;
integer   offset = imm * dim;

if HaveTME() && TSTATE.depth > 0 then
    FailTransaction(TMFailure_ERR, FALSE);

if n == 31 then
    if HaveMTEExt() then SetTagCheckedInstruction(FALSE);
    CheckSPAlignment();
    base = SP[];
else
    if HaveMTEExt() then SetTagCheckedInstruction(TRUE);
    base = X[n, 64];

src = ZAvector[vec, svl];
boolean aligned = AArch64.CheckAlignment(base + offset, 16, AccType_SME, TRUE);
for e = 0 to dim-1
    AArch64.MemSingle[base + offset, 1, AccType_SME, aligned] = Elem[src, e, 8];
    offset = offset + 1;
```

SUMOPA

Signed by unsigned integer sum of outer products and accumulate

The 8-bit integer variant works with a 32-bit element ZA tile.

The 16-bit integer variant works with a 64-bit element ZA tile.

The signed by unsigned integer sum of outer products and accumulate instructions multiply the sub-matrix in the first source vector by the sub-matrix in the second source vector. In case of the 8-bit integer variant, the first source holds $SVL_S \times 4$ sub-matrix of signed 8-bit integer values, and the second source holds $4 \times SVL_S$ sub-matrix of unsigned 8-bit integer values. In case of the 16-bit integer variant, the first source holds $SVL_D \times 4$ sub-matrix of signed 16-bit integer values, and the second source holds $4 \times SVL_D$ sub-matrix of unsigned 16-bit integer values.

Each source vector is independently predicated by a corresponding governing predicate. When an 8-bit source element in case of 8-bit integer variant or a 16-bit source element in case of 16-bit integer variant is Inactive, it is treated as having the value 0.

The resulting $SVL_S \times SVL_S$ widened 32-bit integer or $SVL_D \times SVL_D$ widened 64-bit integer sum of outer products is then destructively added to the 32-bit integer or 64-bit integer destination tile, respectively for 8-bit integer and 16-bit integer instruction variants. This is equivalent to performing a 4-way dot product and accumulate to each of the destination tile elements.

In case of the 8-bit integer variant, each 32-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_S \times 4$ sub-matrix, and each 32-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_S$ sub-matrix. In case of the 16-bit integer variant, each 64-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_D \times 4$ sub-matrix, and each 64-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_D$ sub-matrix.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.

It has encodings from 2 classes: 32-bit and 64-bit

USMOPA

Unsigned by signed integer sum of outer products and accumulate

The 8-bit integer variant works with a 32-bit element ZA tile.

The 16-bit integer variant works with a 64-bit element ZA tile.

The unsigned by signed integer sum of outer products and accumulate instructions multiply the sub-matrix in the first source vector by the sub-matrix in the second source vector. In case of the 8-bit integer variant, the first source holds $SVL_S \times 4$ sub-matrix of unsigned 8-bit integer values, and the second source holds $4 \times SVL_S$ sub-matrix of signed 8-bit integer values. In case of the 16-bit integer variant, the first source holds $SVL_D \times 4$ sub-matrix of unsigned 16-bit integer values, and the second source holds $4 \times SVL_D$ sub-matrix of signed 16-bit integer values.

Each source vector is independently predicated by a corresponding governing predicate. When an 8-bit source element in case of 8-bit integer variant or a 16-bit source element in case of 16-bit integer variant is Inactive, it is treated as having the value 0.

The resulting $SVL_S \times SVL_S$ widened 32-bit integer or $SVL_D \times SVL_D$ widened 64-bit integer sum of outer products is then destructively added to the 32-bit integer or 64-bit integer destination tile, respectively for 8-bit integer and 16-bit integer instruction variants. This is equivalent to performing a 4-way dot product and accumulate to each of the destination tile elements.

In case of the 8-bit integer variant, each 32-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_S \times 4$ sub-matrix, and each 32-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_S$ sub-matrix. In case of the 16-bit integer variant, each 64-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_D \times 4$ sub-matrix, and each 64-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_D$ sub-matrix.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

boolean op2_unsigned = FALSE;
```

Assembler Symbols

<ZAda>	For the 32-bit variant: is the name of the ZA tile ZA0-ZA3, encoded in the "ZAda" field. For the 64-bit variant: is the name of the ZA tile ZA0-ZA7, encoded in the "ZAda" field.
<Pn>	Is the name of the first governing scalable predicate register P0-P7, encoded in the "Pn" field.
<Pm>	Is the name of the second governing scalable predicate register P0-P7, encoded in the "Pm" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer dim = VL DIV esize;
bits(PL) mask1 = P[a, PL];
bits(PL) mask2 = P[b, PL];
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
bits(dim*dim*esize) operand3 = ZAtile[da, esize, dim*dim*esize];
bits(dim*dim*esize) result;
integer  prod;

for row = 0 to dim-1
    for col = 0 to dim-1
        bits(esize) sum = Elem[operand3, row*dim+col, esize];
        for k = 0 to 3
            if ElemP[mask1, 4*row + k, esize DIV 4] == '1' &&
                    ElemP[mask2, 4*col + k, esize DIV 4] == '1' then
                prod = (Int(Elem[operand1, 4*row + k, esize DIV 4], op1_unsigned) *
                        Int(Elem[operand2, 4*col + k, esize DIV 4], op2_unsigned));
                if sub_op then prod = -prod;
                sum = sum + prod;

        Elem[result, row*dim+col, esize] = sum;

ZAtile[da, esize, dim*dim*esize] = result;
```

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then when PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate registers contain the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate registers contain the same value for each execution.
  - The values of the NZCV flags.

USMOPS

Unsigned by signed integer sum of outer products and subtract

The 8-bit integer variant works with a 32-bit element ZA tile.

The 16-bit integer variant works with a 64-bit element ZA tile.

The unsigned by signed integer sum of outer products and subtract instructions multiply the sub-matrix in the first source vector by the sub-matrix in the second source vector. In case of the 8-bit integer variant, the first source holds $SVL_S \times 4$ sub-matrix of unsigned 8-bit integer values, and the second source holds $4 \times SVL_S$ sub-matrix of signed 8-bit integer values. In case of the 16-bit integer variant, the first source holds $SVL_D \times 4$ sub-matrix of unsigned 16-bit integer values, and the second source holds $4 \times SVL_D$ sub-matrix of signed 16-bit integer values.

Each source vector is independently predicated by a corresponding governing predicate. When an 8-bit source element in case of 8-bit integer variant or a 16-bit source element in case of 16-bit integer variant is Inactive, it is treated as having the value 0.

The resulting $SVL_S \times SVL_S$ widened 32-bit integer or $SVL_D \times SVL_D$ widened 64-bit integer sum of outer products is then destructively subtracted from the 32-bit integer or 64-bit integer destination tile, respectively for 8-bit integer and 16-bit integer instruction variants. This is equivalent to performing a 4-way dot product and subtract from each of the destination tile elements.

In case of the 8-bit integer variant, each 32-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_S \times 4$ sub-matrix, and each 32-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_S$ sub-matrix. In case of the 16-bit integer variant, each 64-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_D \times 4$ sub-matrix, and each 64-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_D$ sub-matrix.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.

It has encodings from 2 classes: 32-bit and 64-bit

ZERO

Zero a list of 64-bit element ZA tiles

Zeroes all bytes within each of the up to eight listed 64-bit element tiles named ZA0.D to ZA7.D, leaving the other 64-bit element tiles unmodified.

This instruction does not require the PE to be in Streaming SVE mode, and it is expected that this instruction will not experience a significant slowdown due to contention with other PEs that are executing in Streaming SVE mode.

For programmer convenience an assembler must also accept the names of 32-bit, 16-bit, and 8-bit element tiles which are converted into the corresponding set of 64-bit element tiles.

In accordance with the architecturally defined mapping between different element size tiles:

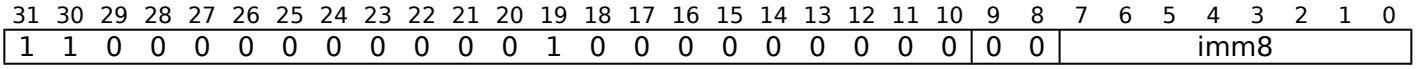
- Zeroing the 8-bit element tile name ZA0.B, or the entire array name ZA, is equivalent to zeroing all eight 64-bit element tiles named ZA0.D to ZA7.D.
- Zeroing the 16-bit element tile name ZA0.H is equivalent to zeroing 64-bit element tiles named ZA0.D, ZA2.D, ZA4.D, and ZA6.D.
- Zeroing the 16-bit element tile name ZA1.H is equivalent to zeroing 64-bit element tiles named ZA1.D, ZA3.D, ZA5.D, and ZA7.D.
- Zeroing the 32-bit element tile name ZA0.S is equivalent to zeroing 64-bit element tiles named ZA0.D and ZA4.D.
- Zeroing the 32-bit element tile name ZA1.S is equivalent to zeroing 64-bit element tiles named ZA1.D and ZA5.D.
- Zeroing the 32-bit element tile name ZA2.S is equivalent to zeroing 64-bit element tiles named ZA2.D and ZA6.D.
- Zeroing the 32-bit element tile name ZA3.S is equivalent to zeroing 64-bit element tiles named ZA3.D and ZA7.D.

The preferred disassembly of this instruction uses the shortest list of tile names that represent the encoded immediate mask.

For example:

- An immediate which encodes 64-bit element tiles ZA0.D, ZA1.D, ZA4.D, and ZA5.D is disassembled as {ZA0.S, ZA1.S}.
- An immediate which encodes 64-bit element tiles ZA0.D, ZA2.D, ZA4.D, and ZA6.D is disassembled as {ZA0.H}.
- An all-ones immediate is disassembled as {ZA}.
- An all-zeros immediate is disassembled as an empty list { }.

SME
(FEAT_SME)



ZERO { <mask> }

```
if !HaveSME() then UNDEFINED;
bits(8) mask = imm8;
constant integer esize = 64;
```

Assembler Symbols

<mask> Is a list of up to eight 64-bit element tile names separated by commas, encoded in the "imm8" field.

Operation

```
CheckSMEAndZAEnabled();
constant integer svl = SVL;
constant integer dim = svl DIV esize;
bits(dim*dim*esize) result = Zeros(dim*dim*esize);

if HaveTME() && TSTATE.depth > 0 then
    FailTransaction(TMFailure_ERR, FALSE);

for i = 0 to 7
    if mask<i> == '1' then ZAtile[i, esize, dim*dim*esize] = result;
```

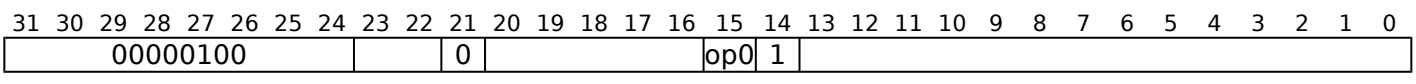
SVE Integer Multiply-Add - Predicated

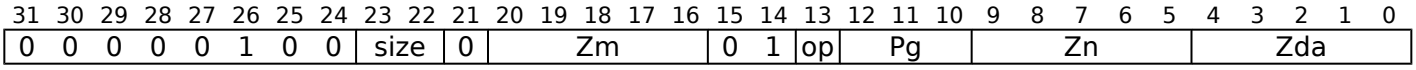
These instructions are under SVE encodings.



Decode fields op0	Instruction details
0	SVE integer multiply-accumulate writing addend (predicated)
1	SVE integer multiply-add writing multiplicand (predicated)

SVE integer multiply-accumulate writing addend (predicated)

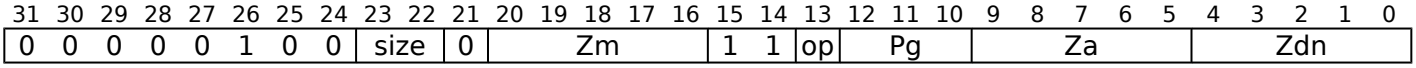
These instructions are under SVE Integer Multiply-Add - Predicated.



Decode fields op	Instruction Details
0	MLA (vectors)
1	MLS (vectors)

SVE integer multiply-add writing multiplicand (predicated)

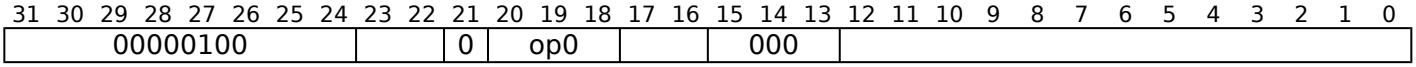
These instructions are under SVE Integer Multiply-Add - Predicated.



Decode fields op	Instruction Details
0	MAD
1	MSB

SVE Integer Binary Arithmetic - Predicated

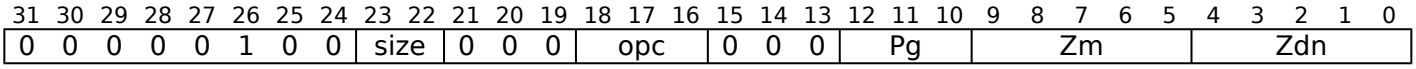
These instructions are under SVE encodings.



Decode fields op0	Instruction details
00x	SVE integer add/subtract vectors (predicated)
01x	SVE integer min/max/difference (predicated)
100	SVE integer multiply vectors (predicated)
101	SVE integer divide vectors (predicated)
11x	SVE bitwise logical operations (predicated)

SVE integer add/subtract vectors (predicated)

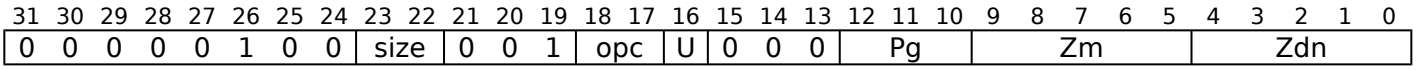
These instructions are under SVE Integer Binary Arithmetic - Predicated.



Decode fields opc	Instruction Details
000	ADD (vectors, predicated)
001	SUB (vectors, predicated)
010	UNALLOCATED
011	SUBR (vectors)
1xx	UNALLOCATED

SVE integer min/max/difference (predicated)

These instructions are under SVE Integer Binary Arithmetic - Predicated.



Decode fields opc	U	Instruction Details
00	0	SMAX (vectors)
00	1	UMAX (vectors)
01	0	SMIN (vectors)
01	1	UMIN (vectors)
10	0	SABD
10	1	UABD
11		UNALLOCATED

SVE integer multiply vectors (predicated)

These instructions are under SVE Integer Binary Arithmetic - Predicated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Decode fields H	U	Instruction Details
0	0	MUL (vectors, predicated)
0	1	UNALLOCATED
1	0	SMULH (predicated)
1	1	UMULH (predicated)

SVE integer divide vectors (predicated)

These instructions are under SVE Integer Binary Arithmetic - Predicated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	0	0	size		0	1	0	1	R	U	0	0	0	Pg			Zm					Zdn				

Decode fields R	U	Instruction Details
0	0	SDIV
0	1	UDIV
1	0	SDIVR
1	1	UDIVR

SVE bitwise logical operations (predicated)

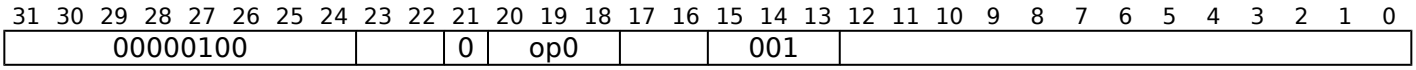
These instructions are under SVE Integer Binary Arithmetic - Predicated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	0	0	size		0	1	1	opc			0	0	0	Pg			Zm					Zdn				

Decode fields opc	Instruction Details
000	ORR (vectors, predicated)
001	EOR (vectors, predicated)
010	AND (vectors, predicated)
011	BIC (vectors, predicated)
1xx	UNALLOCATED

SVE Integer Reduction

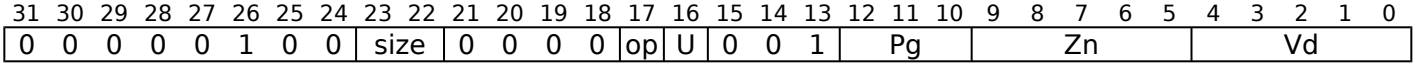
These instructions are under SVE encodings.



Decode fields op0	Instruction details
000	SVE integer add reduction (predicated)
010	SVE integer min/max reduction (predicated)
0x1	UNALLOCATED
10x	SVE constructive prefix (predicated)
110	SVE bitwise logical reduction (predicated)
111	UNALLOCATED

SVE integer add reduction (predicated)

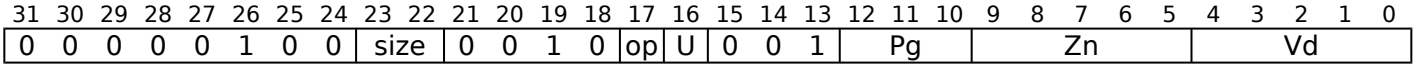
These instructions are under SVE Integer Reduction.



Decode fields op	U	Instruction Details
0	0	SADDV
0	1	UADDV
1		UNALLOCATED

SVE integer min/max reduction (predicated)

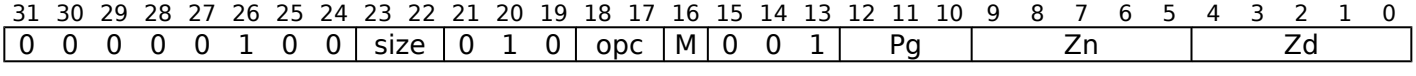
These instructions are under SVE Integer Reduction.



Decode fields op	U	Instruction Details
0	0	SMAXV
0	1	UMAXV
1	0	SMINV
1	1	UMINV

SVE constructive prefix (predicated)

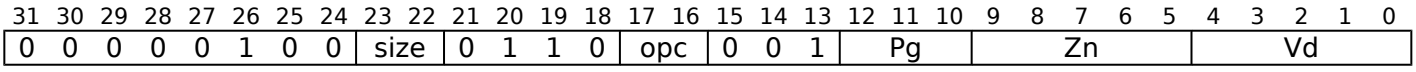
These instructions are under SVE Integer Reduction.



Decode fields opc	Instruction Details
00	MOVPRFX (predicated)
01	UNALLOCATED
1x	UNALLOCATED

SVE bitwise logical reduction (predicated)

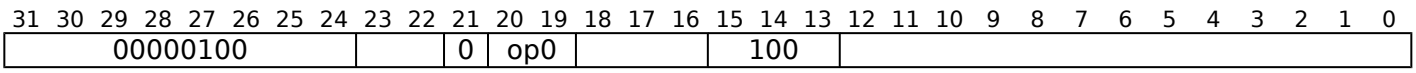
These instructions are under SVE Integer Reduction.



Decode fields opc	Instruction Details
00	ORV
01	EORV
10	ANDV
11	UNALLOCATED

SVE Bitwise Shift - Predicated

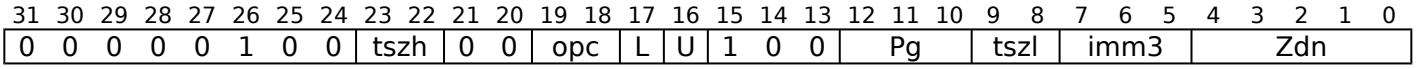
These instructions are under SVE encodings.



Decode fields op0	Instruction details
0x	SVE bitwise shift by immediate (predicated)
10	SVE bitwise shift by vector (predicated)
11	SVE bitwise shift by wide elements (predicated)

SVE bitwise shift by immediate (predicated)

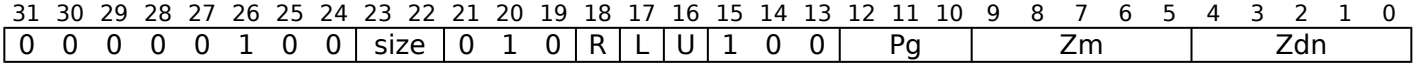
These instructions are under SVE Bitwise Shift - Predicated.



Decode fields opc	L	U	Instruction Details
00	0	0	ASR (immediate, predicated)
00	0	1	LSR (immediate, predicated)
00	1	0	UNALLOCATED
00	1	1	LSL (immediate, predicated)
01	0	0	ASRD
01	0	1	UNALLOCATED
01	1	0	SQSHL (immediate)
01	1	1	UQSHL (immediate)
10			UNALLOCATED
11	0	0	SRSHR
11	0	1	URSHR
11	1	0	UNALLOCATED
11	1	1	SQSHLU

SVE bitwise shift by vector (predicated)

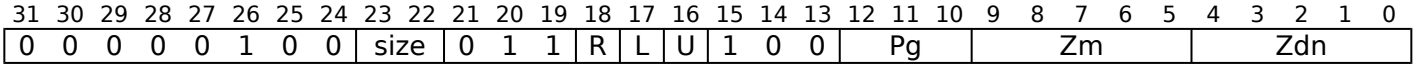
These instructions are under SVE Bitwise Shift - Predicated.



Decode fields R	L	U	Instruction Details
	1	0	UNALLOCATED
0	0	0	ASR (vectors)
0	0	1	LSR (vectors)
0	1	1	LSL (vectors)
1	0	0	ASRR
1	0	1	LSRR
1	1	1	LSLR

SVE bitwise shift by wide elements (predicated)

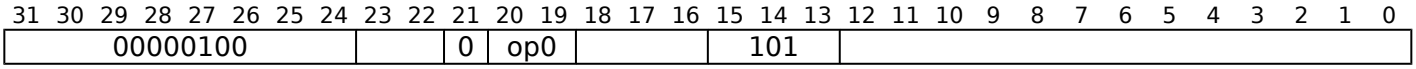
These instructions are under SVE Bitwise Shift - Predicated.



Decode fields R	L	U	Instruction Details
0	0	0	ASR (wide elements, predicated)
0	0	1	LSR (wide elements, predicated)
0	1	0	UNALLOCATED
0	1	1	LSL (wide elements, predicated)
1			UNALLOCATED

SVE Integer Unary Arithmetic - Predicated

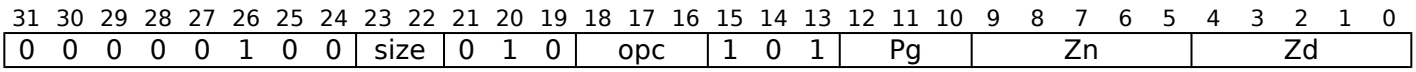
These instructions are under SVE encodings.



Decode fields op0	Instruction details
0x	UNALLOCATED
10	SVE integer unary operations (predicated)
11	SVE bitwise unary operations (predicated)

SVE integer unary operations (predicated)

These instructions are under SVE Integer Unary Arithmetic - Predicated.

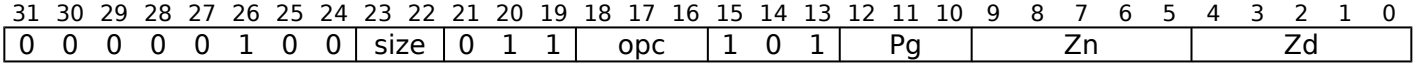


Decode fields opc	Instruction Details
000	SXTB, SXTH, SXTW — SXTB
001	UXTB, UXTH, UXTW — UXTB
010	SXTB, SXTH, SXTW — SXTH
011	UXTB, UXTH, UXTW — UXTH
100	SXTB, SXTH, SXTW — SXTW
101	UXTB, UXTH, UXTW — UXTW
110	ABS

Decode fields opc	Instruction Details
111	NEG

SVE bitwise unary operations (predicated)

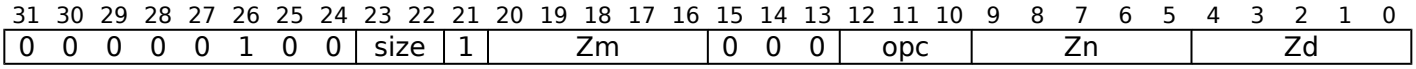
These instructions are under SVE Integer Unary Arithmetic - Predicated.



Decode fields opc	Instruction Details
000	CLS
001	CLZ
010	CNT
011	CNOT
100	FABS
101	FNEG
110	NOT (vector)
111	UNALLOCATED

SVE integer add/subtract vectors (unpredicated)

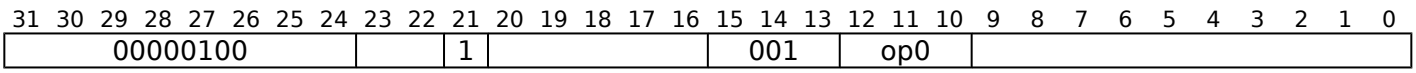
These instructions are under SVE encodings.



Decode fields opc	Instruction Details
000	ADD (vectors, unpredicated)
001	SUB (vectors, unpredicated)
01x	UNALLOCATED
100	SQADD (vectors, unpredicated)
101	UQADD (vectors, unpredicated)
110	SQSUB (vectors, unpredicated)
111	UQSUB (vectors, unpredicated)

SVE Bitwise Logical - Unpredicated

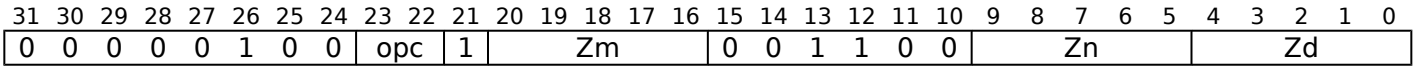
These instructions are under SVE encodings.



Decode fields op0	Instruction details
0xx	UNALLOCATED
100	SVE bitwise logical operations (unpredicated)
101	XAR
11x	SVE2 bitwise ternary operations

SVE bitwise logical operations (unpredicated)

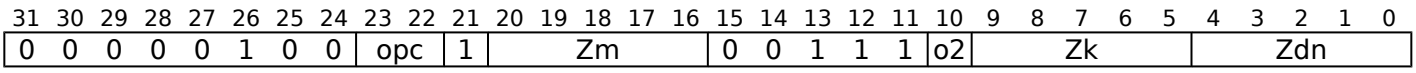
These instructions are under SVE Bitwise Logical - Unpredicated.



Decode fields opc	Instruction Details
00	AND (vectors, unpredicated)
01	ORR (vectors, unpredicated)
10	EOR (vectors, unpredicated)
11	BIC (vectors, unpredicated)

SVE2 bitwise ternary operations

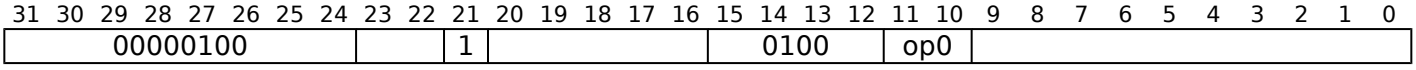
These instructions are under SVE Bitwise Logical - Unpredicated.



Decode fields opc	o2	Instruction Details
00	0	EOR3
00	1	BSL
01	0	BCAX
01	1	BSL1N
1x	0	UNALLOCATED
10	1	BSL2N
11	1	NBSL

SVE Index Generation

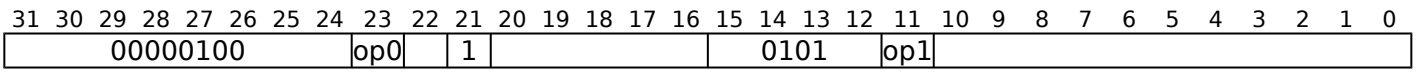
These instructions are under SVE encodings.



Decode fields op0	Instruction details
00	INDEX (immediates)
01	INDEX (scalar, immediate)
10	INDEX (immediate, scalar)
11	INDEX (scalars)

SVE Stack Allocation

These instructions are under SVE encodings.

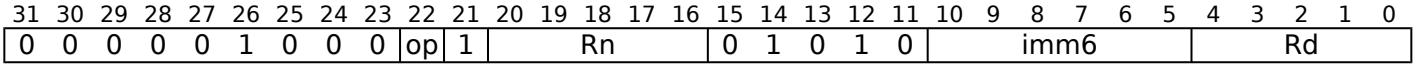


Decode fields op0	op1	Instruction details
0	0	SVE stack frame adjustment
0	1	Streaming SVE stack frame adjustment

1	0	SVE stack frame size
1	1	Streaming SVE stack frame size

SVE stack frame adjustment

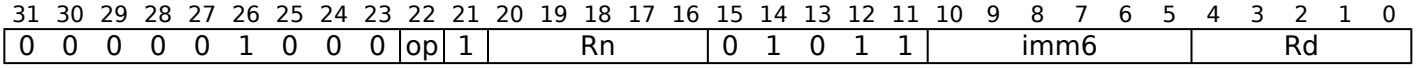
These instructions are under SVE Stack Allocation.



Decode fields op	Instruction Details
0	ADDVL
1	ADDPL

Streaming SVE stack frame adjustment

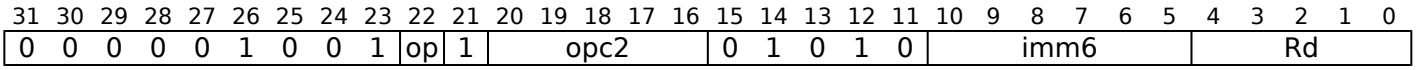
These instructions are under SVE Stack Allocation.



Decode fields op	Instruction Details	Feature
0	ADDSVL	FEAT_SME
1	ADDSPL	FEAT_SME

SVE stack frame size

These instructions are under SVE Stack Allocation.



Decode fields op	opc2	Instruction Details
0	0xxxx	UNALLOCATED
0	10xxx	UNALLOCATED
0	110xx	UNALLOCATED
0	1110x	UNALLOCATED
0	11110	UNALLOCATED
0	11111	RDVL
1		UNALLOCATED

Streaming SVE stack frame size

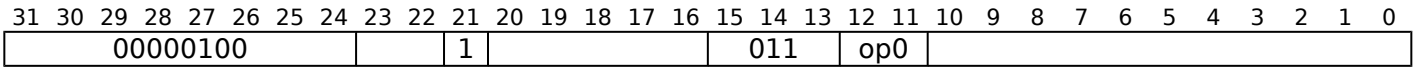
These instructions are under SVE Stack Allocation.

Decode fields op	opc2	Instruction Details	Feature
0	0xxxx	UNALLOCATED	-
0	10xxx	UNALLOCATED	-

Decode fields op	opc2	Instruction Details	Feature
0	110xx	UNALLOCATED	-
0	1110x	UNALLOCATED	-
0	11110	UNALLOCATED	-
0	11111	RDSVL	FEAT_SME
1		UNALLOCATED	-

SVE2 Integer Multiply - Unpredicated

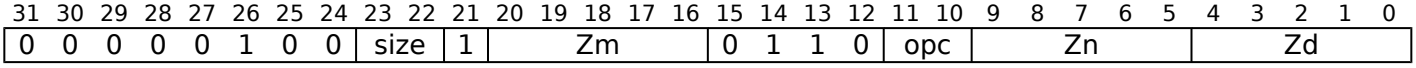
These instructions are under SVE encodings.



Decode fields op0	Instruction details
0x	SVE2 integer multiply vectors (unpredicated)
10	SVE2 signed saturating doubling multiply high (unpredicated)
11	UNALLOCATED

SVE2 integer multiply vectors (unpredicated)

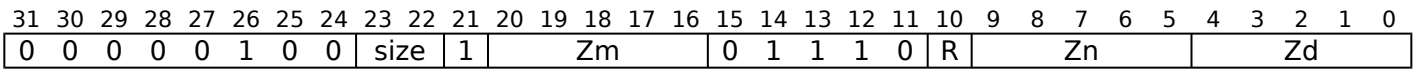
These instructions are under SVE2 Integer Multiply - Unpredicated.



Decode fields size	opc	Instruction Details
	00	MUL (vectors, unpredicated)
	10	SMULH (unpredicated)
	11	UMULH (unpredicated)
00	01	PMUL
01	01	UNALLOCATED
1x	01	UNALLOCATED

SVE2 signed saturating doubling multiply high (unpredicated)

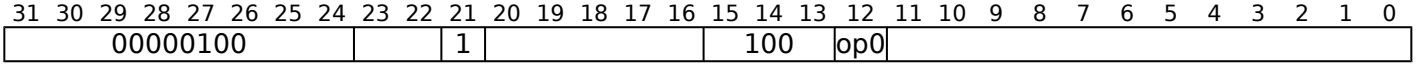
These instructions are under SVE2 Integer Multiply - Unpredicated.



Decode fields R	Instruction Details
0	SQDMULH (vectors)
1	SQRDMULH (vectors)

SVE Bitwise Shift - Unpredicated

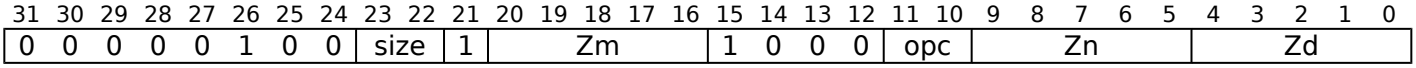
These instructions are under SVE encodings.



Decode fields op0	Instruction details
0	SVE bitwise shift by wide elements (unpredicated)
1	SVE bitwise shift by immediate (unpredicated)

SVE bitwise shift by wide elements (unpredicated)

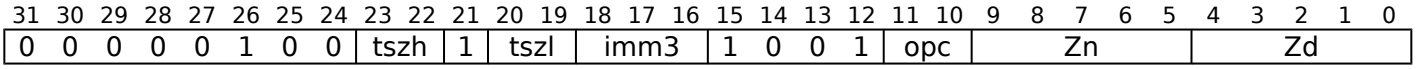
These instructions are under SVE Bitwise Shift - Unpredicated.



Decode fields opc	Instruction Details
00	ASR (wide elements, unpredicated)
01	LSR (wide elements, unpredicated)
10	UNALLOCATED
11	LSL (wide elements, unpredicated)

SVE bitwise shift by immediate (unpredicated)

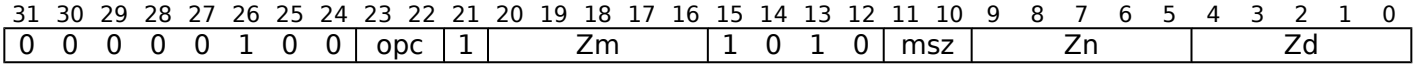
These instructions are under SVE Bitwise Shift - Unpredicated.



Decode fields opc	Instruction Details
00	ASR (immediate, unpredicated)
01	LSR (immediate, unpredicated)
10	UNALLOCATED
11	LSL (immediate, unpredicated)

SVE address generation

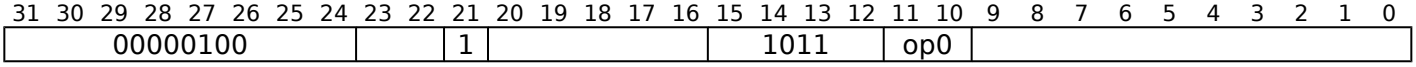
These instructions are under SVE encodings.



Decode fields opc	Instruction Details
00	ADR — Unpacked 32-bit signed offsets
01	ADR — Unpacked 32-bit unsigned offsets
1x	ADR — Packed offsets

SVE Integer Misc - Unpredicated

These instructions are under SVE encodings.

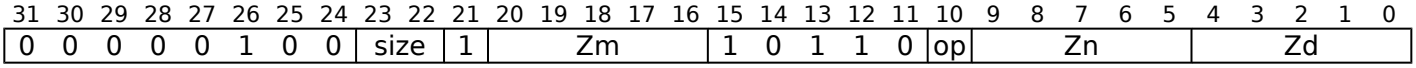


Decode fields op0	Instruction details

0x	SVE floating-point trig select coefficient
10	SVE floating-point exponential accelerator
11	SVE constructive prefix (unpredicated)

SVE floating-point trig select coefficient

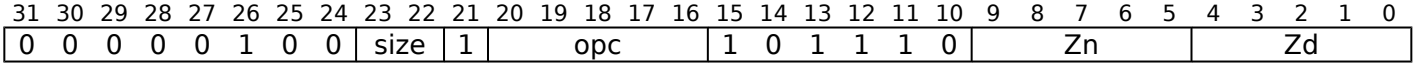
These instructions are under SVE Integer Misc - Unpredicated.



Decode fields op	Instruction Details
0	FTSSEL
1	UNALLOCATED

SVE floating-point exponential accelerator

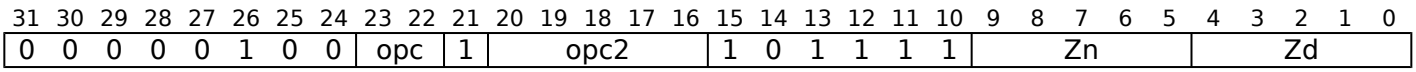
These instructions are under SVE Integer Misc - Unpredicated.



Decode fields opc	Instruction Details
00000	FEXPA
00001	UNALLOCATED
0001x	UNALLOCATED
001xx	UNALLOCATED
01xxx	UNALLOCATED
1xxxx	UNALLOCATED

SVE constructive prefix (unpredicated)

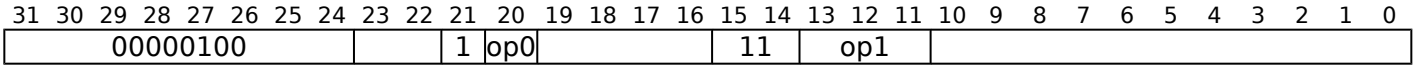
These instructions are under SVE Integer Misc - Unpredicated.



Decode fields opc	opc2	Instruction Details
00	00000	MOVPRFX (unpredicated)
00	00001	UNALLOCATED
00	0001x	UNALLOCATED
00	001xx	UNALLOCATED
00	01xxx	UNALLOCATED
00	1xxxx	UNALLOCATED
01		UNALLOCATED
1x		UNALLOCATED

SVE Element Count

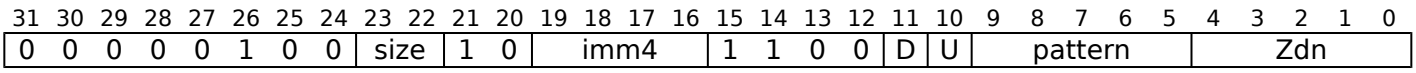
These instructions are under SVE encodings.



Decode fields op0	op1	Instruction details
0	00x	SVE saturating inc/dec vector by element count
0	100	SVE element count
0	101	UNALLOCATED
1	000	SVE inc/dec vector by element count
1	100	SVE inc/dec register by element count
1	x01	UNALLOCATED
	01x	UNALLOCATED
	11x	SVE saturating inc/dec register by element count

SVE saturating inc/dec vector by element count

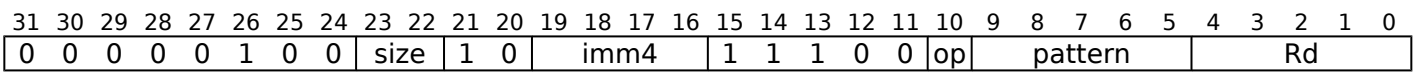
These instructions are under SVE Element Count.



Decode fields size	D	U	Instruction Details
00			UNALLOCATED
01	0	0	SQINCH (vector)
01	0	1	UQINCH (vector)
01	1	0	SQDECH (vector)
01	1	1	UQDECH (vector)
10	0	0	SQINCW (vector)
10	0	1	UQINCW (vector)
10	1	0	SQDECW (vector)
10	1	1	UQDECW (vector)
11	0	0	SQINCD (vector)
11	0	1	UQINCD (vector)
11	1	0	SQDECD (vector)
11	1	1	UQDECD (vector)

SVE element count

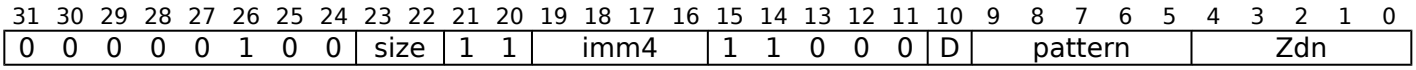
These instructions are under SVE Element Count.



Decode fields size	op	Instruction Details
	1	UNALLOCATED
00	0	CNTB, CNTD, CNTH, CNTW — CNTB
01	0	CNTB, CNTD, CNTH, CNTW — CNTH
10	0	CNTB, CNTD, CNTH, CNTW — CNTW
11	0	CNTB, CNTD, CNTH, CNTW — CNTD

SVE inc/dec vector by element count

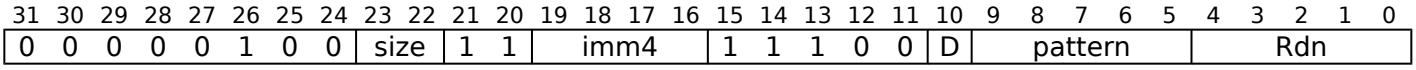
These instructions are under SVE Element Count.



Decode fields size	D	Instruction Details
00		UNALLOCATED
01	0	INCD, INCH, INCW (vector) — INCH
01	1	DECD, DECH, DECW (vector) — DECH
10	0	INCD, INCH, INCW (vector) — INCW
10	1	DECD, DECH, DECW (vector) — DECW
11	0	INCD, INCH, INCW (vector) — INCD
11	1	DECD, DECH, DECW (vector) — DECD

SVE inc/dec register by element count

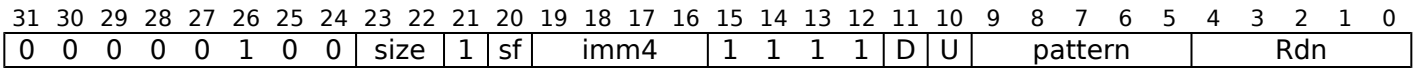
These instructions are under SVE Element Count.



Decode fields size	D	Instruction Details
00	0	INCB, INCD, INCH, INCW (scalar) — INCB
00	1	DECB, DECD, DECH, DECW (scalar) — DECB
01	0	INCB, INCD, INCH, INCW (scalar) — INCH
01	1	DECB, DECD, DECH, DECW (scalar) — DECH
10	0	INCB, INCD, INCH, INCW (scalar) — INCW
10	1	DECB, DECD, DECH, DECW (scalar) — DECW
11	0	INCB, INCD, INCH, INCW (scalar) — INCD
11	1	DECB, DECD, DECH, DECW (scalar) — DECD

SVE saturating inc/dec register by element count

These instructions are under SVE Element Count.



Decode fields size	sf	D	U	Instruction Details
00	0	0	0	SQINCB — 32-bit
00	0	0	1	UQINCB — 32-bit
00	0	1	0	SQDECB — 32-bit
00	0	1	1	UQDECB — 32-bit
00	1	0	0	SQINCB — 64-bit
00	1	0	1	UQINCB — 64-bit
00	1	1	0	SQDECB — 64-bit
00	1	1	1	UQDECB — 64-bit
01	0	0	0	SQINCH (scalar) — 32-bit
01	0	0	1	UQINCH (scalar) — 32-bit
01	0	1	0	SQDECH (scalar) — 32-bit

Decode fields size	sf	D	U	Instruction Details
01	0	1	1	UQDECH (scalar) — 32-bit
01	1	0	0	SQINCH (scalar) — 64-bit
01	1	0	1	UQINCH (scalar) — 64-bit
01	1	1	0	SQDECH (scalar) — 64-bit
01	1	1	1	UQDECH (scalar) — 64-bit
10	0	0	0	SQINCW (scalar) — 32-bit
10	0	0	1	UQINCW (scalar) — 32-bit
10	0	1	0	SQDECW (scalar) — 32-bit
10	0	1	1	UQDECW (scalar) — 32-bit

11	1	0	0	SQINCD (scalar) — 64-bit
11	1	0	1	UQINCD (scalar) — 64-bit
11	1	1	0	SQDECD (scalar) — 64-bit
11	1	1	1	UQDECD (scalar) — 64-bit

SVE Bitwise Immediate

These instructions are under SVE encodings.

31 … 25	24 … 23	22 … 21	20 … 19	18 … 0
00000101	op0	00	op1	

Decode fields op0	op1	Instruction details
11	00	DUPM
!= 11	00	SVE bitwise logical with immediate (unpredicated)
	!= 00	UNALLOCATED

SVE bitwise logical with immediate (unpredicated)

These instructions are under SVE Bitwise Immediate.

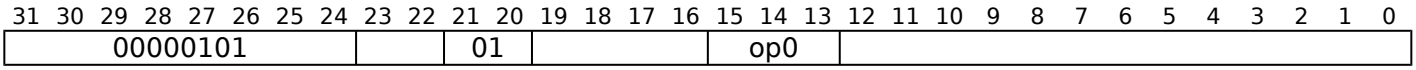
31 … 25	24 … 23	22 … 19	18 … 5	4 … 0
0 0 0 0 0 1 0 1	!= 11	0 0 0 0	imm13	Zdn
	opc			

The following constraints also apply to this encoding: opc != 11 && opc != 11

Decode fields opc	Instruction Details
00	ORR (immediate)
01	EOR (immediate)
10	AND (immediate)

SVE Integer Wide Immediate - Predicated

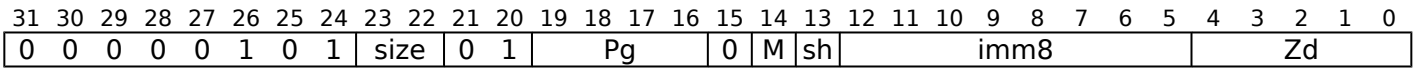
These instructions are under SVE encodings.



Decode fields op0	Instruction details
0xx	SVE copy integer immediate (predicated)
10x	UNALLOCATED
110	FCPY
111	UNALLOCATED

SVE copy integer immediate (predicated)

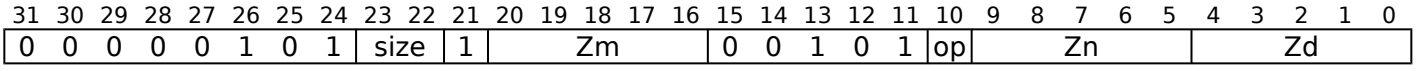
These instructions are under SVE Integer Wide Immediate - Predicated.



Decode fields M	Instruction Details
0	CPY (immediate, zeroing)
1	CPY (immediate, merging)

SVE table lookup (three sources)

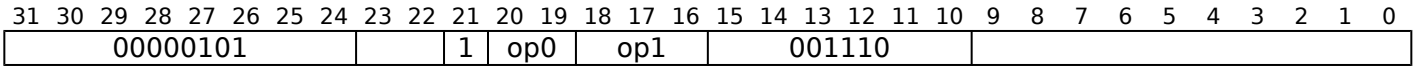
These instructions are under SVE encodings.



Decode fields op	Instruction Details
0	TBL
1	TBX

SVE Permute Vector - Unpredicated

These instructions are under SVE encodings.

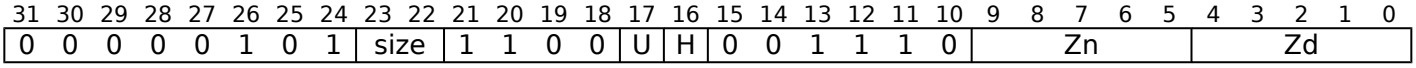


Decode fields op0	op1	Instruction details
00	000	DUP (scalar)
00	100	INSR (scalar)
00	x10	UNALLOCATED
00	xx1	UNALLOCATED
01		UNALLOCATED
10	0xx	SVE unpack vector elements
10	100	INSR (SIMD&FP scalar)
10	110	UNALLOCATED
10	1x1	UNALLOCATED

11	000	REV (vector)
11	!= 000	UNALLOCATED

SVE unpack vector elements

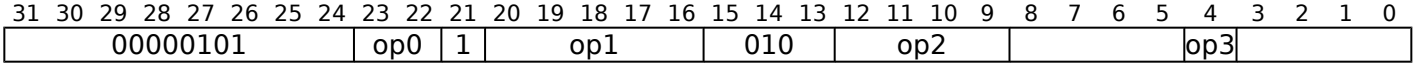
These instructions are under SVE Permute Vector - Unpredicated.



Decode fields U	H	Instruction Details
0	0	SUNPKHI, SUNPKLO — SUNPKLO
0	1	SUNPKHI, SUNPKLO — SUNPKHI
1	0	UUNPKHI, UUNPKLO — UUNPKLO
1	1	UUNPKHI, UUNPKLO — UUNPKHI

SVE Permute Predicate

These instructions are under SVE encodings.



op0	Decode fields op1	op2	op3	Instruction details

1110x	SVE2 saturating multiply-add high
11110	SVE mixed sign dot product
11111	UNALLOCATED

SVE integer dot product (unpredicated)

These instructions are under SVE Integer Multiply-Add - Unpredicated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	0	0	0	1	0	0	size		0	Zm					0	0	0	0	0	U	Zn					Zda				

Decode fields U	Instruction Details
0	SDOT (vectors)
1	UDOT (vectors)

SVE2 saturating multiply-add interleaved long

These instructions are under SVE Integer Multiply-Add - Unpredicated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	0	0	0	1	0	0	size		0	Zm					0	0	0	0	1	S	Zn					Zda				

Decode fields S	Instruction Details
0	SQDMLALBT
1	SQDMLSLBT

SVE2 complex integer multiply-add

These instructions are under SVE Integer Multiply-Add - Unpredicated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	0	0	0	1	0	0	size		0	Zm					0	0	1	op	rot		Zn					Zda				

Decode fields op	Instruction Details
0	CMLA (vectors)
1	SQRDCMLAH (vectors)

SVE2 integer multiply-add long

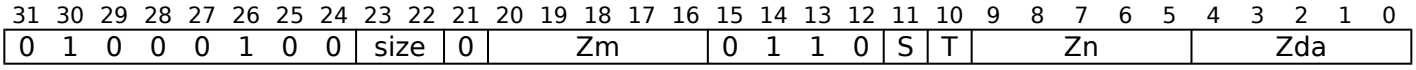
These instructions are under SVE Integer Multiply-Add - Unpredicated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	0	0	0	1	0	0	size		0	Zm					0	1	0	S	U	T	Zn					Zda				

Decode fields S	U	T	Instruction Details
0	0	0	SMLALB (vectors)
0	0	1	SMLALT (vectors)
0	1	0	UMLALB (vectors)
0	1	1	UMLALT (vectors)
1	0	0	SMLSLB (vectors)
1	0	1	SMLSLT (vectors)
1	1	0	UMLSLB (vectors)
1	1	1	UMLSLT (vectors)

SVE2 saturating multiply-add long

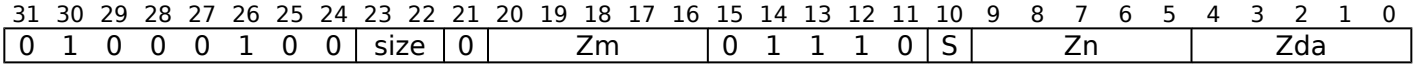
These instructions are under SVE Integer Multiply-Add - Unpredicated.



Decode fields S	T	Instruction Details
0	0	SQDMLALB (vectors)
0	1	SQDMLALT (vectors)
1	0	SQDMLSLB (vectors)
1	1	SQDMLSLT (vectors)

SVE2 saturating multiply-add high

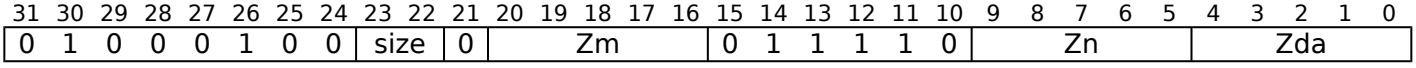
These instructions are under SVE Integer Multiply-Add - Unpredicated.



Decode fields S	Instruction Details
0	SQRDMLAH (vectors)
1	SQRDMLSH (vectors)

SVE mixed sign dot product

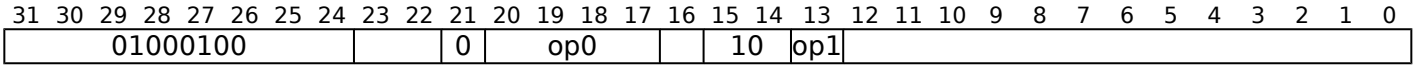
These instructions are under SVE Integer Multiply-Add - Unpredicated.



Decode fields size	Instruction Details	Feature
0x	UNALLOCATED	-
10	USDOT (vectors)	FEAT_I8MM
11	UNALLOCATED	-

SVE2 Integer - Predicated

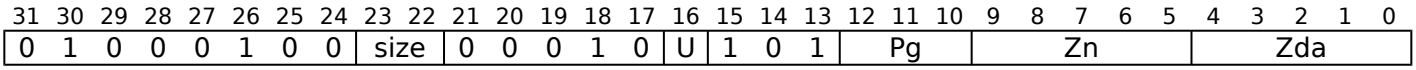
These instructions are under SVE encodings.



Decode fields op0	op1	Instruction details
0010	1	SVE2 integer pairwise add and accumulate long
0011	1	UNALLOCATED
011x	1	UNALLOCATED
0x0x	1	SVE2 integer unary operations (predicated)
0xxx	0	SVE2 saturating/rounding bitwise shift left (predicated)
10xx	0	SVE2 integer halving add/subtract (predicated)
10xx	1	SVE2 integer pairwise arithmetic
11xx	0	SVE2 saturating add/subtract
11xx	1	UNALLOCATED

SVE2 integer pairwise add and accumulate long

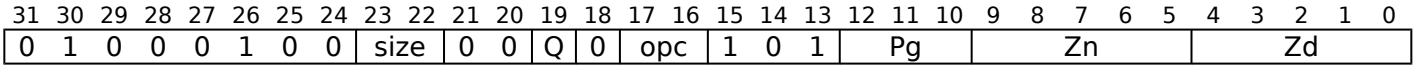
These instructions are under SVE2 Integer - Predicated.



Decode fields U	Instruction Details
0	SADALP
1	UADALP

SVE2 integer unary operations (predicated)

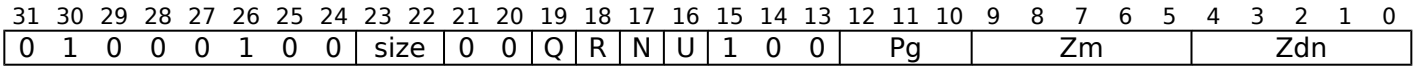
These instructions are under SVE2 Integer - Predicated.



Decode fields Q	opc	Instruction Details
	1x	UNALLOCATED
0	00	URECPE
0	01	URSQRTE
1	00	SQABS
1	01	SQNEG

SVE2 saturating/rounding bitwise shift left (predicated)

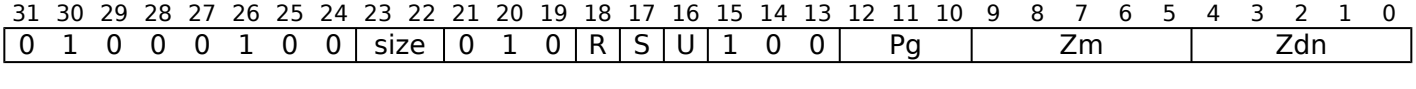
These instructions are under SVE2 Integer - Predicated.



Decode fields Q	R	N	U	Instruction Details
0		0		UNALLOCATED
0	0	1	0	SRSHL
0	0	1	1	URSHL
0	1	1	0	SRSHLR
0	1	1	1	URSHLR
1	0	0	0	SQSHL (vectors)
1	0	0	1	UQSHL (vectors)
1	0	1	0	SQRSHL
1	0	1	1	UQRSHL
1	1	0	0	SQSHLR
1	1	0	1	UQSHLR
1	1	1	0	SQRSHLR
1	1	1	1	UQRSHLR

SVE2 integer halving add/subtract (predicated)

These instructions are under SVE2 Integer - Predicated.



Decode fields R	S	U	Instruction Details
0	0	0	SHADD
0	0	1	UHADD
0	1	0	SHSUB
0	1	1	UHSUB
1	0	0	SRHADD
1	0	1	URHADD
1	1	0	SHSUBR
1	1	1	UHSUBR

SVE2 integer pairwise arithmetic

These instructions are under SVE2 Integer - Predicated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	0	0	0	1	0	0	size		0	1	0	opc		U	1	0	1	Pg			Zm					Zdn				

Decode fields opc	U	Instruction Details
00	0	UNALLOCATED
00	1	ADDP
01		UNALLOCATED
10	0	SMAXP
10	1	UMAXP
11	0	SMINP
11	1	UMINP

SVE2 saturating add/subtract

These instructions are under SVE2 Integer - Predicated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	0	0	0	1	0	0	size		0	1	1	op	S	U	1	0	0	Pg			Zm					Zdn				

Decode fields op	S	U	Instruction Details
0	0	0	SQADD (vectors, predicated)
0	0	1	UQADD (vectors, predicated)
0	1	0	SQSUB (vectors, predicated)
0	1	1	UQSUB (vectors, predicated)
1	0	0	SUQADD
1	0	1	USQADD
1	1	0	SQSUBR
1	1	1	UQSUBR

SVE integer clamp

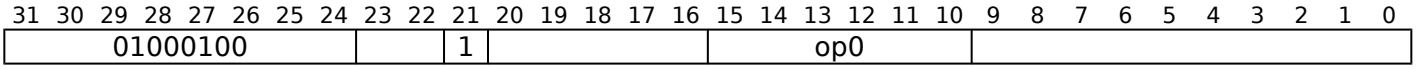
These instructions are under SVE encodings.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	0	0	0	1	0	0	size		0	Zm					1	1	0	0	0	U	Zn					Zd				

Decode fields U	Instruction Details	Feature
0	SCLAMP	FEAT_SME
1	UCLAMP	FEAT_SME

SVE Multiply - Indexed

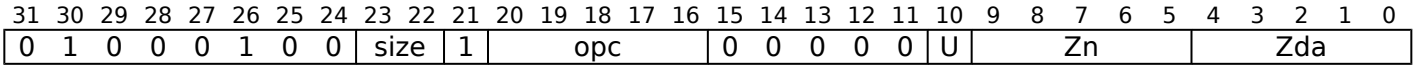
These instructions are under SVE encodings.



Decode fields op0	Instruction details
00000x	SVE integer dot product (indexed)
00001x	SVE2 integer multiply-add (indexed)
00010x	SVE2 saturating multiply-add high (indexed)
00011x	SVE mixed sign dot product (indexed)
001xxx	SVE2 saturating multiply-add (indexed)
0100xx	SVE2 complex integer dot product (indexed)
0101xx	UNALLOCATED
0110xx	SVE2 complex integer multiply-add (indexed)
0111xx	SVE2 complex saturating multiply-add (indexed)
10xxxx	SVE2 integer multiply-add long (indexed)
110xxx	SVE2 integer multiply long (indexed)
1110xx	SVE2 saturating multiply (indexed)
11110x	SVE2 saturating multiply high (indexed)
111110	SVE2 integer multiply (indexed)
111111	UNALLOCATED

SVE integer dot product (indexed)

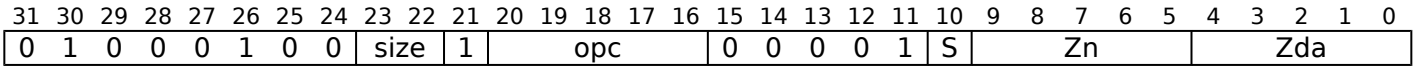
These instructions are under SVE Multiply - Indexed.



Decode fields size	Decode fields U	Instruction Details
0x		UNALLOCATED
10	0	SDOT (indexed) — 32-bit
10	1	UDOT (indexed) — 32-bit
11	0	SDOT (indexed) — 64-bit
11	1	UDOT (indexed) — 64-bit

SVE2 integer multiply-add (indexed)

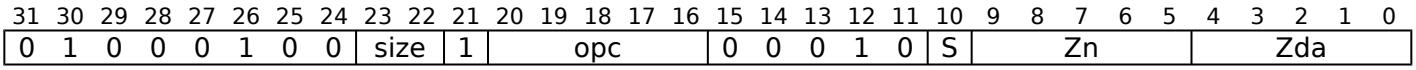
These instructions are under SVE Multiply - Indexed.



Decode fields size	S	Instruction Details
0x	0	MLA (indexed) — 16-bit
0x	1	MLS (indexed) — 16-bit
10	0	MLA (indexed) — 32-bit
10	1	MLS (indexed) — 32-bit
11	0	MLA (indexed) — 64-bit
11	1	MLS (indexed) — 64-bit

SVE2 saturating multiply-add high (indexed)

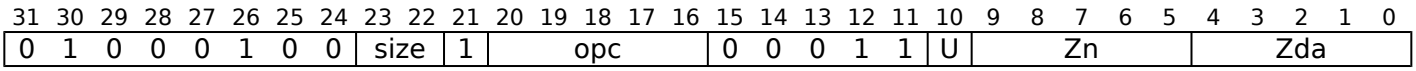
These instructions are under SVE Multiply - Indexed.



Decode fields size	S	Instruction Details
0x	0	SQRDMLAH (indexed) — 16-bit
0x	1	SQRDMLSH (indexed) — 16-bit
10	0	SQRDMLAH (indexed) — 32-bit
10	1	SQRDMLSH (indexed) — 32-bit
11	0	SQRDMLAH (indexed) — 64-bit
11	1	SQRDMLSH (indexed) — 64-bit

SVE mixed sign dot product (indexed)

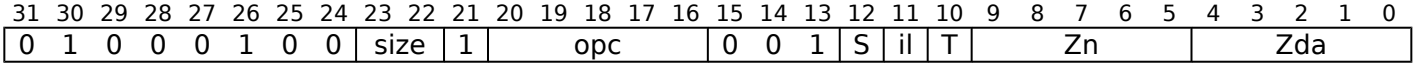
These instructions are under SVE Multiply - Indexed.



Decode fields size	U	Instruction Details	Feature
0x		UNALLOCATED	-
10	0	USDOT (indexed)	FEAT_I8MM
10	1	SUDOT	FEAT_I8MM
11		UNALLOCATED	-

SVE2 saturating multiply-add (indexed)

These instructions are under SVE Multiply - Indexed.



Decode fields size	S	T	Instruction Details
0x			UNALLOCATED
10	0	0	SQDMLALB (indexed) — 32-bit
10	0	1	SQDMLALT (indexed) — 32-bit
10	1	0	SQDMLSLB (indexed) — 32-bit
10	1	1	SQDMLSLT (indexed) — 32-bit
11	0	0	SQDMLALB (indexed) — 64-bit

Decode fields size	S	T	Instruction Details
11	0	1	SQDMLALT (indexed) — 64-bit
11	1	0	SQDMLSLB (indexed) — 64-bit
11	1	1	SQDMLSLT (indexed) — 64-bit

SVE2 complex integer dot product (indexed)

These instructions are under SVE Multiply - Indexed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

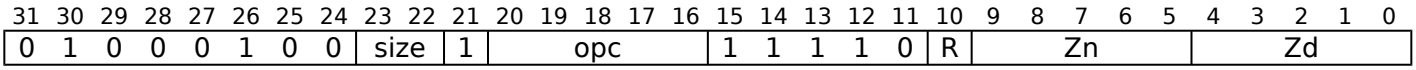
Decode fields size	T	Instruction Details
0x		UNALLOCATED
10	0	SQDMULLB (indexed) — 32-bit
10	1	SQDMULLT (indexed) — 32-bit
11	0	SQDMULLB (indexed) — 64-bit
11	1	SQDMULLT (indexed) — 64-bit

SVE2 saturating multiply high (indexed)

These instructions are under SVE Multiply - Indexed.



Decode fields size	R	Instruction Details
0x	0	SQDMULH (indexed) — 16-bit
0x	1	SQRDMULH (indexed) — 16-bit
10	0	SQDMULH (indexed) — 32-bit
10	1	SQRDMULH (indexed) — 32-bit
11	0	SQDMULH (indexed) — 64-bit
11	1	SQRDMULH (indexed) — 64-bit

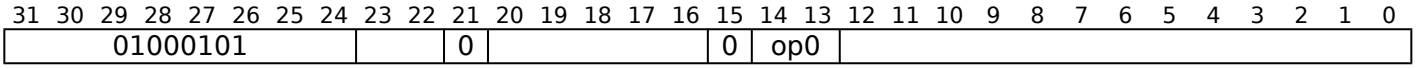
SVE2 integer multiply (indexed)

These instructions are under SVE Multiply - Indexed.

Decode fields size	Instruction Details
0x	MUL (indexed) — 16-bit
10	MUL (indexed) — 32-bit
11	MUL (indexed) — 64-bit

SVE2 Widening Integer Arithmetic

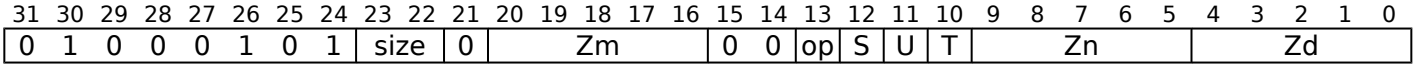
These instructions are under SVE encodings.



Decode fields op0	Instruction details
0x	SVE2 integer add/subtract long
10	SVE2 integer add/subtract wide
11	SVE2 integer multiply long

SVE2 integer add/subtract long

These instructions are under SVE2 Widening Integer Arithmetic.

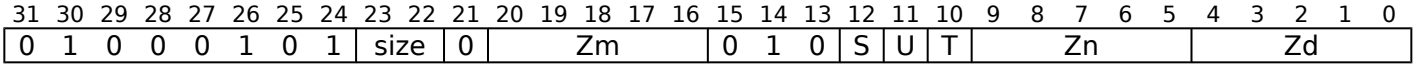


Decode fields op	S	U	T	Instruction Details
0	0	0	0	SADDLB
0	0	0	1	SADDLT
0	0	1	0	UADDLB
0	0	1	1	UADDLT
0	1	0	0	SSUBLB

Decode fields op	S	U	T	Instruction Details
0	1	0	1	SSUBLT
0	1	1	0	USUBLB
0	1	1	1	USUBLT
1	0			UNALLOCATED
1	1	0	0	SABDLB
1	1	0	1	SABDLT
1	1	1	0	UABDLB
1	1	1	1	UABDLT

SVE2 integer add/subtract wide

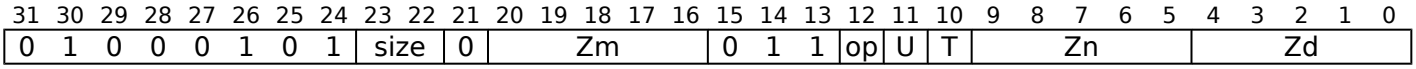
These instructions are under SVE2 Widening Integer Arithmetic.



Decode fields S	U	T	Instruction Details
0	0	0	SADDWB
0	0	1	SADDWT
0	1	0	UADDWB
0	1	1	UADDWT
1	0	0	SSUBWB
1	0	1	SSUBWT
1	1	0	USUBWB
1	1	1	USUBWT

SVE2 integer multiply long

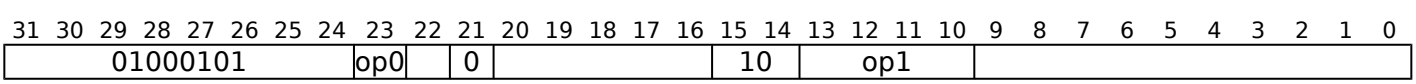
These instructions are under SVE2 Widening Integer Arithmetic.



Decode fields op	U	T	Instruction Details
0	0	0	SQDMULLB (vectors)
0	0	1	SQDMULLT (vectors)
0	1	0	PMULLB
0	1	1	PMULLT
1	0	0	SMULLB (vectors)
1	0	1	SMULLT (vectors)
1	1	0	UMULLB (vectors)
1	1	1	UMULLT (vectors)

SVE Misc

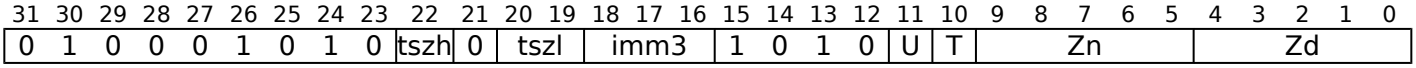
These instructions are under SVE encodings.



Decode fields op0	op1	Instruction details
0	10xx	SVE2 bitwise shift left long
1	10xx	UNALLOCATED
	00xx	SVE2 integer add/subtract interleaved long
	010x	SVE2 bitwise exclusive-or interleaved
	0110	SVE integer matrix multiply accumulate
	0111	UNALLOCATED
	11xx	SVE2 bitwise permute

SVE2 bitwise shift left long

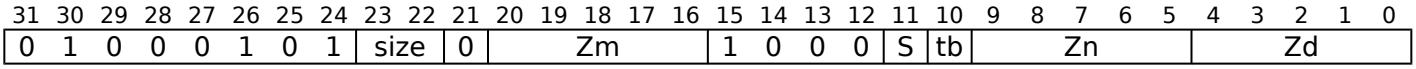
These instructions are under SVE Misc.



Decode fields U	T	Instruction Details
0	0	SSHLLB
0	1	SSHLLT
1	0	USHLLB
1	1	USHLLT

SVE2 integer add/subtract interleaved long

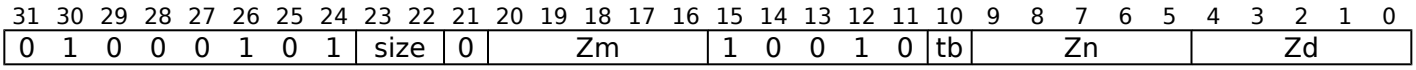
These instructions are under SVE Misc.



Decode fields S	tb	Instruction Details
0	0	SADDLBT
0	1	UNALLOCATED
1	0	SSUBLBT
1	1	SSUBLTB

SVE2 bitwise exclusive-or interleaved

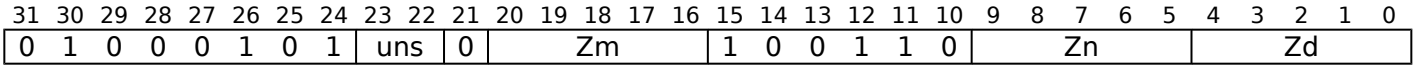
These instructions are under SVE Misc.



Decode fields tb	Instruction Details
0	EORBT
1	EORTB

SVE integer matrix multiply accumulate

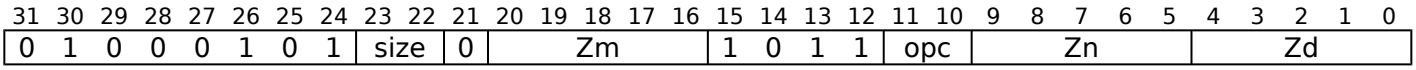
These instructions are under SVE Misc.



Decode fields uns	Instruction Details	Feature
00	SMMLA	FEAT_I8MM
01	UNALLOCATED	-
10	USMMLA	FEAT_I8MM
11	UMMLA	FEAT_I8MM

SVE2 bitwise permute

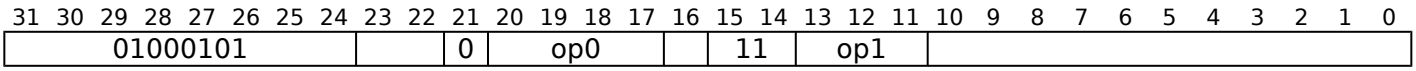
These instructions are under SVE Misc.



Decode fields opc	Instruction Details	Feature
00	BEXT	FEAT_SVE_BitPerm
01	BDEP	FEAT_SVE_BitPerm
10	BGRP	FEAT_SVE_BitPerm
11	UNALLOCATED	-

SVE2 Accumulate

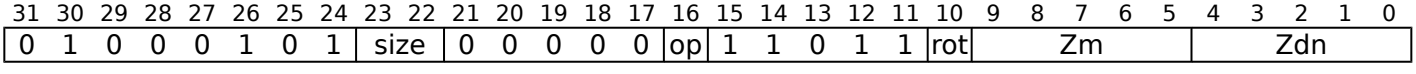
These instructions are under SVE encodings.



Decode fields op0	op1	Instruction details
0000	011	SVE2 complex integer add
!= 0000	011	UNALLOCATED
	00x	SVE2 integer absolute difference and accumulate long
	010	SVE2 integer add/subtract long with carry
	10x	SVE2 bitwise shift right and accumulate
	110	SVE2 bitwise shift and insert
	111	SVE2 integer absolute difference and accumulate

SVE2 complex integer add

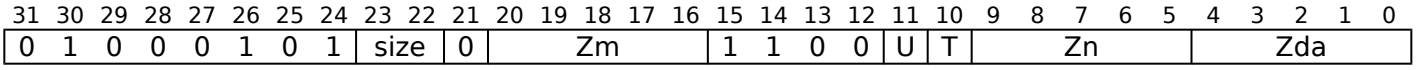
These instructions are under SVE2 Accumulate.



Decode fields op	Instruction Details
0	CADD
1	SQCADD

SVE2 integer absolute difference and accumulate long

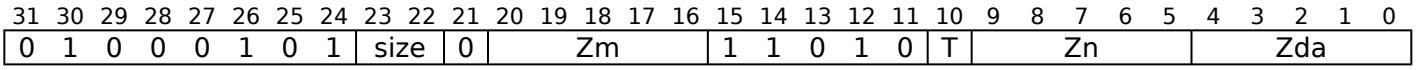
These instructions are under SVE2 Accumulate.



Decode fields U	T	Instruction Details
0	0	SABALB
0	1	SABALT
1	0	UABALB
1	1	UABALT

SVE2 integer add/subtract long with carry

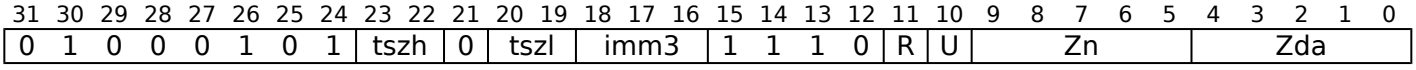
These instructions are under SVE2 Accumulate.



Decode fields size	T	Instruction Details
0x	0	ADCLB
0x	1	ADCLT
1x	0	SBCLB
1x	1	SBCLT

SVE2 bitwise shift right and accumulate

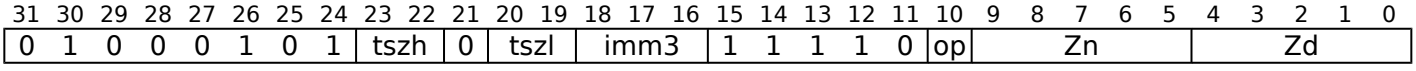
These instructions are under SVE2 Accumulate.



Decode fields R	U	Instruction Details
0	0	SSRA
0	1	USRA
1	0	SRSRA
1	1	URSRA

SVE2 bitwise shift and insert

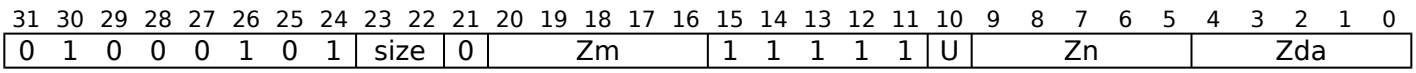
These instructions are under SVE2 Accumulate.



Decode fields op	Instruction Details
0	SRI
1	SLI

SVE2 integer absolute difference and accumulate

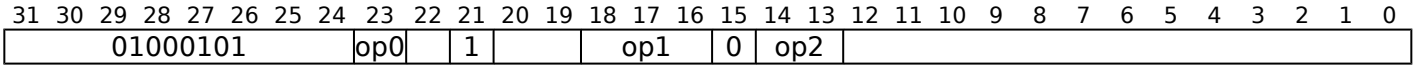
These instructions are under SVE2 Accumulate.



Decode fields U	Instruction Details
0	SABA
1	UABA

SVE2 Narrowing

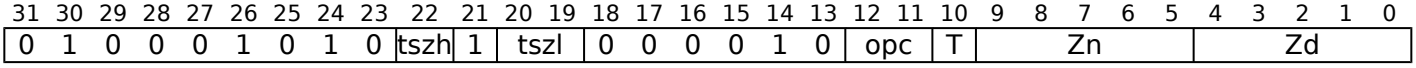
These instructions are under SVE encodings.



Decode fields op0	op1	op2	Instruction details
0	000	10	SVE2 saturating extract narrow
0	!= 000	10	UNALLOCATED
0		0x	SVE2 bitwise shift right narrow
1		0x	UNALLOCATED
1		10	UNALLOCATED
		11	SVE2 integer add/subtract narrow high part

SVE2 saturating extract narrow

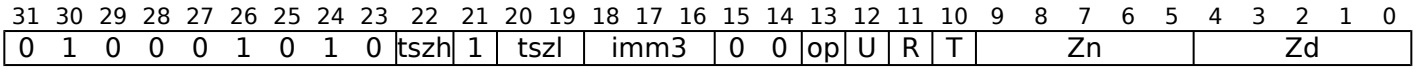
These instructions are under SVE2 Narrowing.



Decode fields opc	T	Instruction Details
00	0	SQXTNB
00	1	SQXTNT
01	0	UQXTNB
01	1	UQXTNT
10	0	SQXTUNB
10	1	SQXTUNT
11		UNALLOCATED

SVE2 bitwise shift right narrow

These instructions are under SVE2 Narrowing.

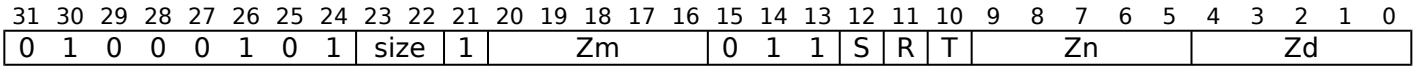


Decode fields op	U	R	T	Instruction Details
0	0	0	0	SQSHRUNB
0	0	0	1	SQSHRUNT
0	0	1	0	SQRSHRUNB
0	0	1	1	SQRSHRUNT
0	1	0	0	SHRNB
0	1	0	1	SHRNT
0	1	1	0	RSHRNB

Decode fields op	U	R	T	Instruction Details
0	1	1	1	RSHRNT
1	0	0	0	SQSHRNB
1	0	0	1	SQSHRNT
1	0	1	0	SQRSHRNB
1	0	1	1	SQRSHRNT
1	1	0	0	UQSHRNB
1	1	0	1	UQSHRNT
1	1	1	0	UQRSHRNB
1	1	1	1	UQRSHRNT

SVE2 integer add/subtract narrow high part

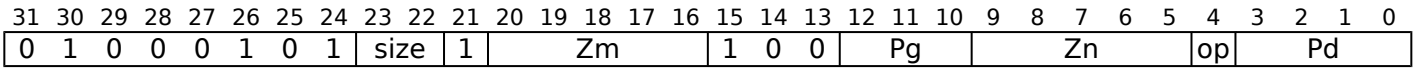
These instructions are under SVE2 Narrowing.



Decode fields S	R	T	Instruction Details
0	0	0	ADDHNB
0	0	1	ADDHNT
0	1	0	RADDHNB
0	1	1	RADDHNT
1	0	0	SUBHNB
1	0	1	SUBHNT
1	1	0	RSUBHNB
1	1	1	RSUBHNT

SVE2 character match

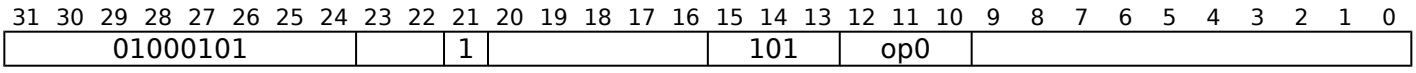
These instructions are under SVE encodings.



Decode fields op	Instruction Details
0	MATCH
1	NMATCH

SVE2 Histogram Computation - Segment

These instructions are under SVE encodings.



Decode fields op0	Instruction details
000	HISTSEG
!= 000	UNALLOCATED

SVE2 Crypto Extensions

These instructions are under SVE encodings.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
01000101										1	op0			op1		111			op2			op3									

Decode fields op0	op1	op2	op3	Instruction details
000	00	00	00000	SVE2 crypto unary operations
000	00	00	!= 00000	UNALLOCATED

// FPUnpackBase()
// ==============
//
// Unpack a floating-point number into its type, sign bit and the real number
// that it represents. The real number result has the correct sign for numbers
// and infinities, is very large in magnitude for infinities, and is 0.0 for
// NaNs. (These values are chosen to simplify the description of comparisons
// and conversions.)
//
// The 'fpcr_in' argument supplies FPCR control bits, 'fpexc' controls the
// generation of floating-point exceptions and 'isbfloat16' determines whether
// N=16 signifies BFloat16 or half-precision type. Status information is updated
// directly in the FPSR where appropriate.
