Information in this document is provided in connection with Intel products. No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted by this document. Except as provided in Intel's Terms and Conditions of Sale for such products, Intel assumes no liability whatsoever, and Intel disclaims any express or implied warranty, relating to sale and/or use of Intel products including liability or warranties relating to fitness for a particular purpose, merchantability, or infringement of any patent, copyright or other intellectual property right. Intel products are not intended for use in medical, life saving, or life sustaining applications.

Intel may make changes to specifications and product descriptions at any time, without notice.

Designers must not rely on the absence or characteristics of any features or instructions marked "reserved" or "undefined." Intel reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them.

Intel's Intel Architecture processors (e.g., Pentium® processor, Pentium processor with MMX™ technology, Pentium Pro processor, Pentium II processor, Pentium II Xeon™ processor and Intel® Celeron™ processor) may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Contact your local Intel sales office or your distributor to obtain the latest specifications and before placing your product order.

Copies of documents which have an ordering number and are referenced in this document, or other Intel literature, may be obtained by calling 1-800-548-4725 or by visiting Intel's website at <http://www.intel.com>

REVISION HISTORY

Revision	Revision History	Date
-001	Original Issue.	05/93
-002	Modified Table 2, Intel486™ and Pentium® Processor Signatures.	10/93
003	Updated to accommodate new processor versions. Program examples modified for ease of use, section added discussing BIOS recognition for OverDrive® processors, and feature flag information updated	09/94
-004	Updated with Pentium Pro® and OverDrive® processors information Modified Tables 1, 3 and 5. Inserted Tables 6, 7 and 8. Inserted Section 3.4. and 3.5.	12/95
-005	Added Figures 1 and 3. Added Footnotes 1 and 2. Modified Figure 2 Added Assembly code example in Section 4. Modified Tables 3, 5 and 7 Added two bullets in Section 5.0. Modified cpuid3b.ASM and cpuid3b.C programs to determine if processor features MMX™ technology. Modified Figure 6.0.	11/96
-006	Modified Table 3. Added reserved for future member of P6 family c processors entry. Modified table header to reflect Pentium® II processor family. Modified Table 5. Added SEP bit definition. Added Section 3.5. Added Section 3.7 and Table 9. Corrected references of P6 family to reflect correct usage. Modified cpuid3a.asm, cpuid3b.asm and cpuid3.c example code sections to check for SEP feature bit and to check for, and identify, the Pentium® II processor. Added additional disclaimer related to designers and errata	3/97
- 007	Modified Table 2. Added Pentium® II processor, model 5 entry. Modified existing Pentium II processor entry to read "Pentium II processor, model 3". Modified Table 5. Added additional feature bits, PAT and FXSR. Modified Table 7. Added entries 44h and 45h Removed the note "Do not assume a value of 1 in a feature flag indicates that a given feature is present. For future feature flags, a value of 1 may indicate that the specific feature is not present" in section 4.0. Modified cpuid3b.asm and cpuid3.c example code section to check for and identify, the Pentium® II processor, model 5. Modified existing Pentium II processor code to print Pentium II processor, model 3	1/98
- 008	Added note to identify Intel Celeron™ processor in section 3.2. Modified Table 2. Added Intel Celeron processor & Pentium® OverDrive® processor with MMX™ technology entry. Modified Table 5. Added additional feature bit, PSE-36 Modified cpuid3b.asm and cpuid3.c example code to check for, and identify, the Intel Celeron processor.	4/98
-009	Added note to identify Pentium® II Xeon™ processor in section 3.2 Modified Table 2. Added Pentium II Xeon processor entry Modified cpuid3b.asm and cpuid3.c example code to check for, and identify, the Pentium II Xeon processor	6/98

1.0. INTRODUCTION

As the Intel Architecture evolves with the addition of new generations and models of processors (8086, 8088, Intel286, Intel386™, Intel486™, Pentium® processors, Pentium OverDrive® processors, Pentium processors with MMX™ technology, Pentium OverDrive® processors with MMX technology, Pentium Pro processors, Pentium II processors, Pentium II Xeon™ processors and Intel Celeron™ processors), it is essential that Intel provide an increasingly sophisticated means with which software can identify the features available on each processor. This identification mechanism has evolved in conjunction with the Intel Architecture as follows:

1. Originally, Intel published code sequences that could detect minor implementation or architectural differences to identify processor generations.
2. Later, with the advent of the Intel386 processor, Intel implemented processor signature identification which provided the processor family, model, and stepping numbers to software, but only upon reset.
3. As the Intel Architecture evolved, Intel extended the processor signature identification into the CPUID instruction. The CPUID instruction not only provides the processor signature, but also provides information about the features supported by and implemented on the Intel processor.

The evolution of processor identification was necessary because, as the Intel Architecture proliferates, the computing market must be able to tune processor functionality across processor generations and models that have differing sets of features. Anticipating that this trend will continue with future processor generations, the Intel Architecture implementation of the CPUID instruction is extensible.

This application note explains how to use the CPUID instruction in software applications, BIOS implementations, and various processor tools. By taking advantage of the CPUID instruction, software developers can create software applications and tools that can execute compatibly across the widest range of Intel processor generations and models, past, present, and future.

1.1. Update Support

You can obtain new Intel processor signature and feature bits information from the developer's manual, programmer's reference manual or appropriate

documentation for a processor. In addition, you can receive updated versions of the programming examples included in this application note; contact your Intel representative for more information.

2.0. DETECTING THE CPUID INSTRUCTION

Starting with the Intel486 family and subsequent Intel processors, Intel provides a straightforward method for determining whether the processor's internal architecture is able to execute the CPUID instruction. This method uses the ID flag in bit 21 of the EFLAGS register. If software can change the value of this flag, the CPUID instruction is executable.¹ See Figure 1.

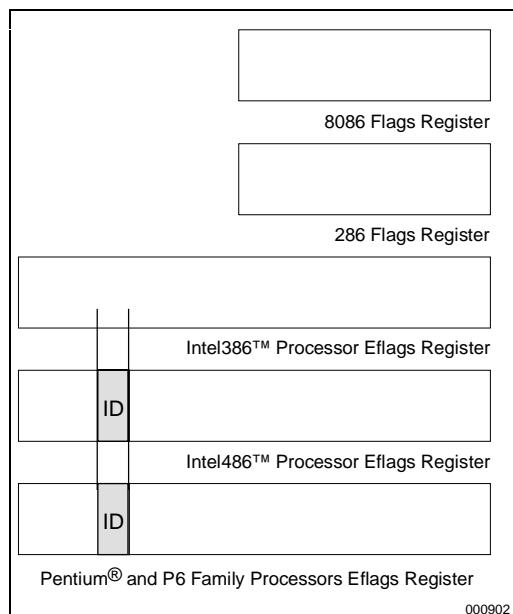

Figure 1. Flag Register Evolution

Footnotes

¹ Only in some Intel486™ and succeeding processors. Bit 21 in the Intel386™ processor's Eflag register cannot be changed by software, and the Intel386 processor cannot execute the CPUID instruction. Execution of CPUID on a processor that does not support this instruction will result in an invalid opcode exception.

The POPF, POPFD, PUSHF, and PUSHFD instructions are used to access the Flags, Eflags register. The program examples at the end of this application note show how you use the PUSHFD instruction to read and the POPFD instruction to change the value of the ID flag.

3.0. OUTPUT OF THE CPUID INSTRUCTION

Figure 2 summarizes the outputs of the CPUID instruction. The function of the CPUID instruction is

fully dependent upon the contents of the EAX register. This means, by placing different values in the EAX register and then executing CPUID, the CPUID instruction will perform a specific function dependent upon whatever value is resident in the EAX register (see Table 1). In order to determine the highest acceptable value for the EAX register input and CPUID operation, the program should set the EAX register parameter value to "0" and then execute the CPUID instruction as follows:

MOV EAX, 00H
CPUID

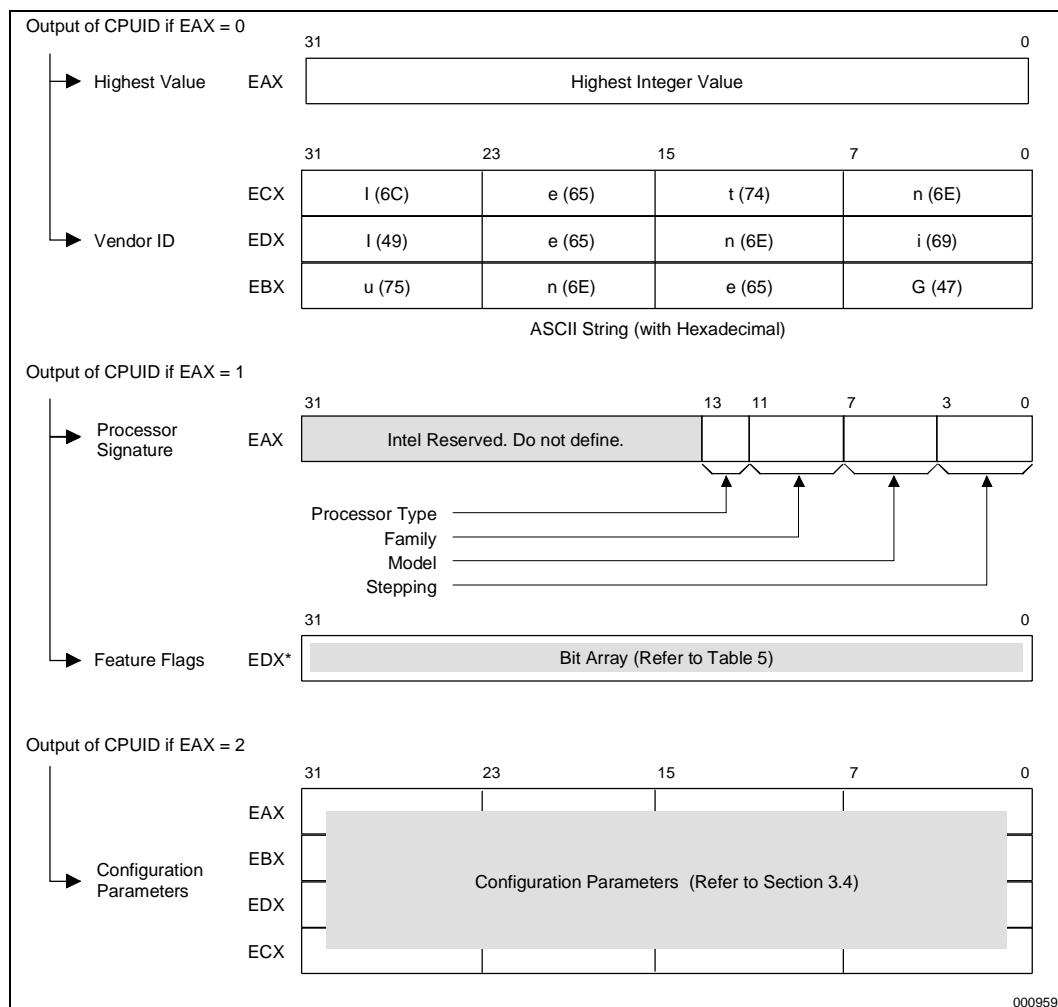

Figure 2. CPUID Instruction Outputs

Table 1. Effects of EAX Contents on CPUID Instruction Output

Parameter	Outputs of CPUID
EAX = 0	EAX \leftarrow Highest value recognized by CPUID instruction
	EBX:EDX:ECX \leftarrow Vendor identification string
EAX = 1	EAX \leftarrow Processor signature
	EDX \leftarrow Feature flags
	EBX:ECX \leftarrow Intel reserved (Do not use.)
EAX = 2	EAX:EBX:ECX:EDX \leftarrow Processor configuration parameters
$3 \leq EAX \leq$ highest value	Intel reserved
EAX > highest value	EAX:EBX:ECX:EDX \leftarrow Undefined (Do not use.)

After the execution of the CPUID instruction, a return value will be present in the EAX register. Always use an EAX parameter value that is equal to or greater than zero and less than or equal to this highest EAX "returned" value. On current and future IA-32 processors, bit 31 in the EAX register will be clear when CPUID is called with an input parameter greater than highest value. All other bit values returned by the processor in response to a CPUID instruction with EAX set to a value higher than appropriate for that processor are model specific and should not be relied upon.

3.1. Vendor ID String

In addition to returning the highest value in the EAX register, the Intel Vendor-ID string can be simultaneously verified as well. If the EAX register contains an input value of 0, the CPUID instruction also returns the vendor identification string in the EBX, EDX, and ECX registers (see Figure 2). These registers contain the ASCII string:

GenuineIntel

While any imitator of the Intel Architecture can provide the CPUID instruction, no imitator can legitimately claim that its part is a genuine Intel part. So the presence of the GenuineIntel string is an assurance that the CPUID instruction and the processor signature are implemented as described in this document. If the "GenuineIntel" string is not returned after execution of the CPUID instruction, do not rely upon the information described in

this document to interpret the information returned by the CPUID instruction.

3.2. Processor Signature

Beginning with the Intel486 processor family, the processor will return a processor identification signature value after reset in the EDX register (see Figure 3).

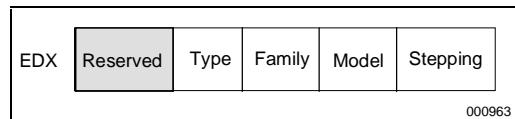

Figure 3. EDX Register Value after RESET

Processors that implement the CPUID instruction also return the processor identification signature after reset; however, the CPUID instruction gives you the flexibility of checking the processor signature at any time. Figure 3 shows the format of the signature for the Intel®486™, Pentium®, Pentium Pro, Pentium II processors, Pentium II Xeon™ processors and Intel® Celeron™ processors. Note that the EDX processor signature value after reset is equivalent to the processor signature output value in the EAX register in Figure 2. Table 2 shows the values returned in the EAX register currently defined for these processors. (The high-order 18 bits are undefined and reserved.)

The processor type, specified in bit positions 12 and 13 of Table 3, indicates whether the processor is an original OEM processor, an OverDrive® processor, or a dual processor (capable of being used in a dual processor system). Table 3 shows the processor type values returned in bits 12 and 13 of the EAX register.

The family values, specified in bit positions 8 through 11, indicates whether the processor belongs to the Intel386™, Intel486, Pentium or P6 family of processors.

The model number, specified in bits 4 though 7, indicates the processor's family model number, while the stepping number in bits 0 through 3 indicates the revision number of that model.

The Pentium II processor, model 5, the Pentium II Xeon processor and the Intel Celeron processor share the same family and model number. To differentiate between the processors, software should check the cache descriptor values through executing CPUID instruction with EAX = 2. If no L2 cache is returned, the processor is identified as an Intel Celeron processor.

Table 2. Intel®486™, Pentium® Processor Family, OverDrive®, Pentium Pro Processor, Pentium II Processor, Pentium II Xeon™ Processor and Intel Celeron™ Processor Signatures

Type	Family	Model	Stepping	Description
00	0100	0000 and 0001	xxxx (1)	Intel®486™ DX processors
00	0100	0010	xxxx (1)	Intel®486 SX processors
00	0100	0011	xxxx (1)	Intel®487™ processors
00	0100	0011	xxxx (1)	Intel®DX2™ processors
00	0100	0011	xxxx (1)	Intel®DX2™ OverDrive® processors
00	0100	0100	xxxx (3)	Intel®486 SL processor
00	0100	0101	xxxx (1)	Intel®SX2™ processors
00	0100	0111	xxxx (3)	Write-Back Enhanced IntelDX2 processors
00	0100	1000	xxxx (3)	Intel®DX4™ processors
00, 01	0100	1000	xxxx (3)	Intel®DX4™ OverDrive® processors
00	0101	0001	xxxx (2)	Pentium® processors (60, 66)
00	0101	0010	xxxx (2)	Pentium® processors (75, 90, 100, 120, 133, 150, 166 200)
01 (4)	0101	0001	xxxx (2)	Pentium® OverDrive® processor for Pentium processor (60, 66)
01 (4)	0101	0010	xxxx (2)	Pentium® OverDrive® processor for Pentium processor (75, 90, 100, 120, 133)
01	0101	0011	xxxx (2)	Pentium® OverDrive® processors for Intel®486 processor-based systems
00	0101	0100	xxxx (2)	Pentium® processor with MMX™ technology (166, 200)
01	0101	0100	xxxx (2)	Pentium® OverDrive® processor with MMX™ technology for Pentium processor (75, 90, 100, 120, 133)
00	0110	0001	xxxx (2)	Pentium® Pro processor
00	0110	0011	xxxx (2)	Pentium® II processor, model 3
00	0110	0101(5)	xxxx (2)	Pentium® II processor, model 5, Pentium II Xeon™ processor and Intel® Celeron™ processor
01	0110	0011	xxxx (2)	Reserved for a future OverDrive® processor for Pentium® Pro processor

NOTES:

1. This processor does not implement the CPUID instruction.
2. Refer to the Intel®486™ documentation, the *Pentium® Processor Specification Update* (Order Number 242480), the *Pentium® Pro Processor Specification Update* (Order Number 242689), the *Pentium® II Processor Specification Update* (Order Number 243337), the *Pentium® II Xeon™ Processor Specification Update* (Order Number 243776) or the *Intel® Celeron™ Processor Specification Update* (Order Number 243748) for the latest list of stepping numbers.
3. Stepping 3 implements the CPUID instruction.
4. The definition of the type field for the OverDrive® processor is 01h. An errata on the Pentium® OverDrive processor will always return 00h as the type.
5. To differentiate between the Pentium® II processor, model 5, Pentium II Xeon™ processor and the Intel® Celeron™ processor, software should check the cache descriptor values through executing CPUID instruction with EAX = 2. If no L2 cache is returned, the processor is identified as an Intel Celeron processor. If 1M or 2M L2 cache size is reported, the processor is the Pentium II Xeon processor otherwise it is a Pentium II processor, model 5 or a Pentium II Xeon processor with 512K L2 cache size.

**Table 3. Processor Type
(Bit Positions 13 and 12)**

Value	Description
00	Original OEM processor
01	OverDrive® processor
10	Dual processor
11	Intel reserved (Do not use.)

If 1M or 2M L2 cache size is reported, the processor is the Pentium II Xeon processor otherwise it is a Pentium II processor, model 5 or a Pentium II Xeon processor with 512K L2 cache.

Older versions of Intel486 SX, Intel486 DX and IntelDX2 processors do not support the CPUID instruction,² so they can only return the processor signature at reset. Refer to Table 2 to determine which processors support the CPUID instruction.

Figure 4 shows the format of the processor signature for Intel386 processors, which are different from other processors. Table 4 shows the values currently defined for these Intel386 processors.

Footnotes

² All Intel486 SL-enhanced and Write-Back enhanced processors are capable of executing the CPUID instruction. See Table 2.

3.3. Feature Flags

When the EAX register contains a value of 1, the CPUID instruction (in addition to loading the processor signature in the EAX register) loads the EDX register with the feature flags. The current feature flags (when Flag = 1) indicate what features the processor supports. Table 5 lists the currently defined feature flag values.

For future processors, refer to the programmer's reference manual, user's manual, or the appropriate documentation for the latest feature flag values.

Use the feature flags in your applications to determine which processor features are supported. By using the CPUID feature flags to predetermine processor features, your software can detect and avoid incompatibilities.

3.4. Cache Size and Format Information

When the EAX register contains a value of 2, the CPUID instruction loads the EAX, EBX, ECX and EDX registers with descriptors that indicate the processor's cache characteristics. The lower 8 bits of the EAX register (AL) contain a value that identifies the number of times the CPUID has to be executed to obtain a complete image of the processor's caching systems. For example, the Pentium Pro processor returns a value of 1 in the lower 8 bits of the EAX register to indicate that the CPUID instruction need only be executed once (with EAX = 2) to obtain a complete image of the processor configuration.

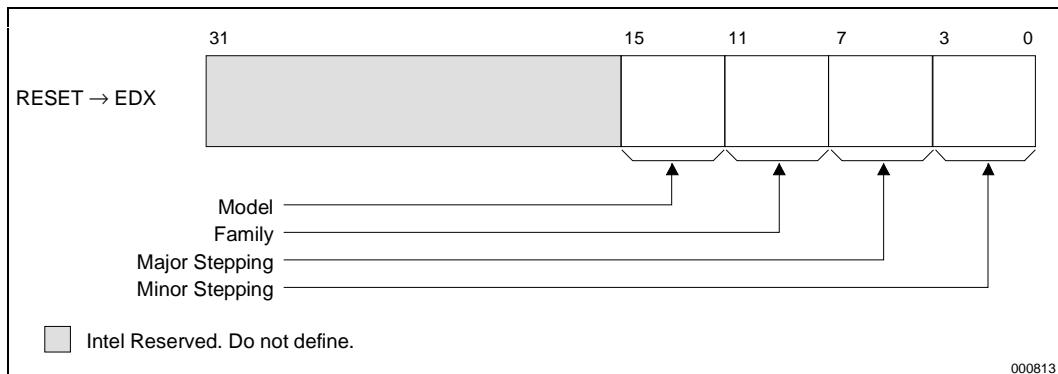

Figure 4. Processor Signature Format on Intel®V386™ Processors

Table 4. Intel®386™ Processor Signatures

Type	Family	Major Stepping	Minor Stepping	Description
0000	0011	0000	xxxx	Intel®386™ DX processor
0010	0011	0000	xxxx	Intel®386 SX processor
0010	0011	0000	xxxx	Intel®386 CX processor
0010	0011	0000	xxxx	Intel®386 EX processor
0100	0011	0000 and 0001	xxxx	Intel®386 SL processor
0000	0011	0100	xxxx	RapidCAD® coprocessor

Table 5. Feature Flag Values

Bit	Name	Description when Flag = 1	Comments
0	FPU	Floating-point unit on-chip	The processor contains an FPU that supports the Intel387 floating-point instruction set.
1	VME	Virtual Mode Extension	The processor supports extensions to virtual-8086 mode.
2	DE	Debugging Extension	The processor supports I/O breakpoints, including the CR4.DE bit for enabling debug extensions and optional trapping of access to the DR4 and DR5 registers.
3	PSE	Page Size Extension	The processor supports 4-Mbyte pages.
4	TSC	Time Stamp Counter	The RDTSC instruction is supported including the CR4.TSD bit for access/privilege control.
5	MSR	Model Specific Registers	Model Specific Registers are implemented with the RDMSR, WRMSR instructions
6	PAE	Physical Address Extension	Physical addresses greater than 32 bits are supported.
7	MCE	Machine Check Exception	Machine Check Exception, Exception 18, and the CR4.MCE enable bit are supported
8	CX8	CMPXCHG8 Instruction Supported	The compare and exchange 8 bytes instruction is supported.
9	APIC	On-chip APIC Hardware Supported (1)	The processor contains a local APIC.
10		Reserved	Do not count on their value.

Table 5. Feature Flag Values

Bit	Name	Description when Flag = 1	Comments
11	SEP	Fast System Call	Indicates whether the processor supports the Fast System Call instructions, SYSENTER and SYSEXIT. NOTE: Refer to Section 3.5 for further information regarding SYSENTER/SYSEXIT feature and SEP feature bit.
12	MTRR	Memory Type Range Registers	The Processor supports the Memory Type Range Registers specifically the MTRR_CAP register.
13	PGE	Page Global Enable	The global bit in the PDEs and PTEs and the CR4.PGE enable bit are supported.
14	MCA	Machine Check Architecture	The Machine Check Architecture is supported, specifically the MCG_CAP register.
15	CMOV	Conditional Move Instruction Supported	The processor supports CMOVcc, and if the FPU feature flag (bit 0) is also set, supports the FCMOVCC and FCOMI instructions.
16	PAT	Page Attribute Table	Indicates whether the processor supports the Page Attribute Table. This feature augments the Memory Type Range Registers (MTRRs), allowing an operating system to specify attributes of memory on a 4K granularity through a linear address.
17	PSE-36	36-bit Page Size Extension	Indicates whether the processor supports 4-Mbyte pages that are capable of addressing physical memory beyond 4GB. This feature indicates that the upper four bits of the physical address of the 4-Mbyte page is encoded by bits 13-16 of the page directory entry.
18 – 22		Reserved	Do not count on their value.
23	MMX™ Technology	Intel Architecture MMX™ technology supported	The processor supports the MMX™ technology instruction set extensions to Intel Architecture.
24	FXSR	Fast floating-point save and restore	Indicates whether the processor supports the FXSAVE and FXRSTOR instructions for fast save and restore of the floating point context. Presence of this bit also indicates that CR4.OSFXSR is available for an operating system to indicate that it uses the fast save/restore instructions.
25 – 31		Reserved	Do not count on their value.

NOTE:

1. The processor contains a software-accessible Local APIC.

The remainder of the EAX register, and the EBX, ECX, and EDX registers, contain valid 8 bit descriptors. Table 6 shows that a most significant bit of zero indicates a valid 8-bit descriptor. To decode descriptors, move sequentially from the most significant byte of the register down through the least significant byte of the register. Table 7 lists the current descriptor values and their respective cache characteristics. This list will be extended in the future as necessary.

Table 6. Descriptor Formats

Register MSB	Descriptor Type	Description
1	Reserved	Reserved for future use.
0	8 bit descriptors	Descriptors point to a parameter table to identify cache characteristics. The descriptor is null if it has a 0 value.

Table 7. Descriptor Decode Values

Descriptor Value	Cache Description
00h	Null
01h	Instruction TLB, 4K pages, 4-way set associative, 32 entries
02h	Instruction TLB, 4M pages, fully associative, 2 entries
03h	Data TLB, 4K pages, 4-way set associative, 64 entries
04h	Data TLB, 4M pages, 4-way set associative, 8 entries
06h	Instruction cache, 8K, 4-way set associative, 32 byte line size
08h	16KB instruction cache, 4-way set associative, 32 byte line size
0Ah	Data cache, 8K, 2-way set associative, 32 byte line size
0Ch	16KB data cache, 4-way set associative, 32 byte line size
40h	No L2 cache
41h	Unified cache, 32 byte cache line, 4-way set associative, 128K
42h	Unified cache, 32 byte cache line, 4-way set associative, 256K
43h	Unified cache, 32 byte cache line, 4-way set associative, 512K
44h	Unified cache, 32 byte cache line, 4-way set associative, 1M
45h	Unified cache, 32 byte cache line, 4-way set associative, 2M

Table 8. Pentium® Pro Processor, with 256K L2 Cache, CPUID (EAX=2) Example Return Values

	31	23	15	7	0
EAX	03h	02h	01h	01h	0
EBX	0	0	0	0	0
ECX	0	0	0	0	0
EDX	06h	04h	0Ah	42h	0

3.5. SYSENTER/SYSEXIT – SEP Features Bit

The presence of this facility is indicated by the SYSENTER Present (SEP) bit 11 of CPUID. An operating system that detects the presence of the SEP bit must also qualify the processor family and model to ensure that the SYSENTER/SYSEXIT instructions are actually present:

```
If (CPUID SEP bit is set) {
If (Family == 6) AND (Model < 3) AND
    (Stepping < 3) {
        THEN
        Fast System Call is NOT supported
    }
    ELSE Fast System Call is
        supported
}
```

The Pentium Pro processor (Model = 1) returns a set SEP CPUID feature bit, but should not be used by software.

3.6. Pentium® Pro Processor Output Example

The Pentium Pro processor returns the values shown in Table 8. As the value of AL = 1, it is valid to interpret the remainder of the registers according to Table 7. Table 8 also shows that the MSB of the EAX register is 0. This indicates that the upper 8 bits constitute an 8 bit descriptor. The remaining register values in Table 8 show that the Pentium Pro processor has the following cache characteristics:

- A data TLB that maps 4K pages, is 4 way set associative, and has 64 entries.
- An instruction TLB that maps 4M pages, is fully associative, and has 2 entries.

- An instruction TLB that maps 4K pages, is 4 way set associative, and has 32 entries.
- An instruction cache that is 8K, is 4 way set associative, and has a 32 byte line size.
- A data TLB that maps 4M pages, is 4 way set associative, and has 8 entries.
- A data cache that is 8K, is 2 way set associative, and has a 32 byte line size.
- A unified cache that is 256K, is 4 way set associative, and has a 32 byte line size.

3.7. Pentium® II Processor, model 3 Output Example

The Pentium II processor, model 3 returns the values shown in Table 9. If the value of AL=1, it is valid to interpret the remainder of the registers according to Table 7. Table 9 also shows the MSB of EAX register is 0. As with the Pentium Pro processor this indicates the upper 8 bits constitute an 8 bit descriptor. The remaining register values in Table 9 shows the Pentium II processor has the following cache characteristics:

- A data TLB that maps 4K pages, is 4 way set associative, and has 64 entries.
- An instruction TLB that maps 4M pages, is fully associative, and has 2 entries.
- An instruction TLB that maps 4K pages, is 4 way set associative, and has 32 entries.
- A data cache that is 16K, is 4 way set associative, and has a 32 byte line size.
- A data TLB that maps 4M pages, is 4 way set associative, and has 8 entries.
- An instruction cache that is 16K, is 4 way set associative, and has a 32 byte line size.
- A unified cache that is 512K, is 4 way set associative, and has a 32 byte line size.

Table 9. Pentium® II Processor, model 3 with 512K L2 Cache, CPUID (EAX=2) Example Return Values

	31	23	15	7	0
EAX	03h	02h	01h	01h	
EBX	0	0	0	0	
ECX	0	0	0	0	
EDX	0Ch	04h	08h	43h	

4.0. USAGE GUIDELINES

This document presents Intel-recommended feature-detection methods. Software should not try to identify features by exploiting programming tricks, undocumented features, or otherwise deviating from the guidelines presented in this application note.

The following guidelines are intended to help programmers maintain the widest range of compatibility for their software.

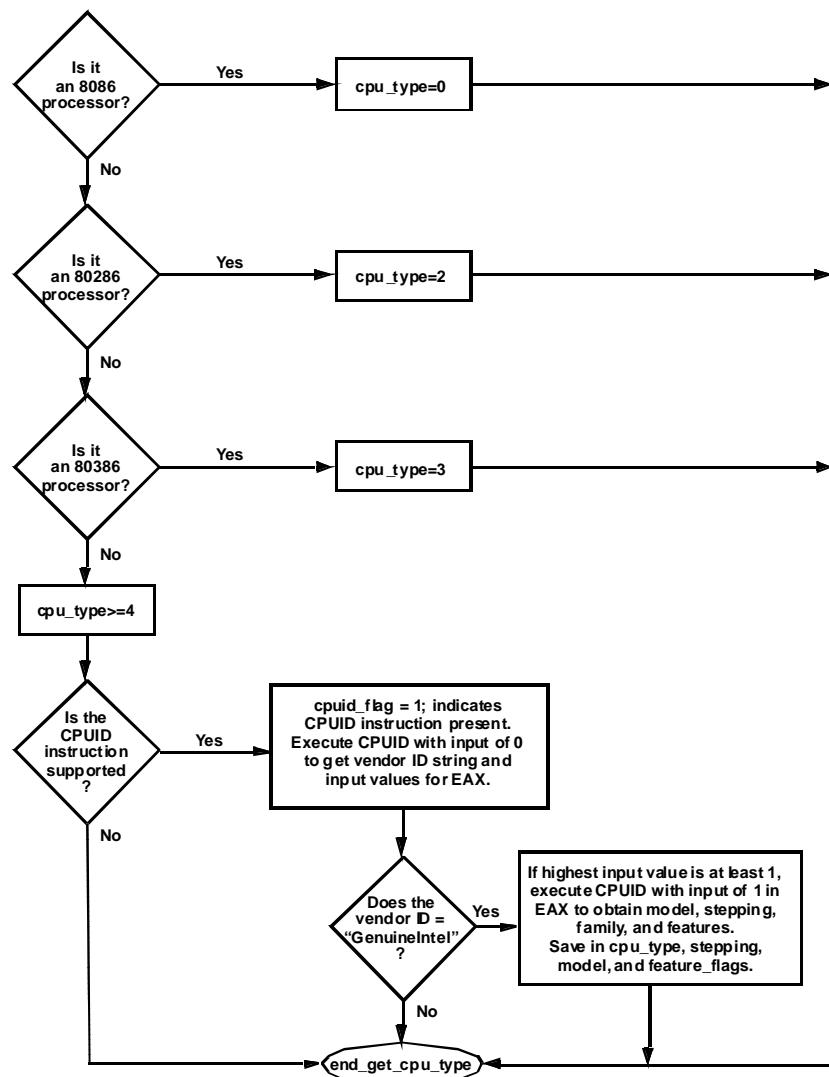

- Do not depend on the absence of an invalid opcode trap on the CPUID opcode to detect the CPUID instruction. Do not depend on the absence of an invalid opcode trap on the PUSHFD opcode to detect a 32-bit processor. Test the ID flag, as described in Section 2.0, and shown in Section 5.0.
- Do not assume that a given family or model has any specific feature. For example, do not assume the family value 5 (Pentium® processor) means there is a floating-point unit on-chip. Use the feature flags for this determination.
- Do not assume processors with higher family or model numbers have all the features of a processor with a lower family or model number. For example, a processor with a family value of 6 (P6 family processor) may not necessarily have all the features of a processor with a family value of 5.
- Do not assume that the features in the OverDrive® processors are the same as those in the OEM version of the processor. Internal caches and instruction execution might vary.
- Do not use undocumented features of a processor to identify steppings or features. For example, the Intel®386™ processor A-step had bit instructions that were withdrawn with the B-step. Some software attempted to execute these instructions and depended on the invalid-opcode exception as a signal that it was not running on the A-step part. The software failed to work correctly when the Intel®486™ processor used the same opcodes for different instructions. The software should have used the stepping information in the processor signature.
- Test feature flags individually and do not make assumptions about undefined bits. For example, it would be a mistake to test the FPU bit by comparing the feature register to a binary 1 with a compare instruction.
- Do not assume the clock of a given family or model runs at a specific frequency, and do not write processor speed-dependent code, such as timing loops. For instance, an OverDrive® Processor could operate at a higher internal frequency and still report the same family and/or model. Instead, use a combination of the system's timers to measure elapsed time and the TSC (Time Stamp Counter) to measure processor core clocks to allow direct calibration of the processor core.
- Processor model-specific registers may differ among processors, including in various models of the Pentium® processor. Do not use these registers unless identified for the installed processor. This is particularly important for systems upgradeable with an OverDrive® processor. Only use Model Specific registers that are defined in the BIOS writers guide for that processor.
- Do not rely on the result of the CPUID algorithm when executed in virtual 8086 mode.
- Do not assume any ordering of model and/or stepping numbers. They are assigned arbitrarily.

5.0. PROPER IDENTIFICATION SEQUENCE

The cpuid3a.asm program example demonstrates the correct use of the CPUID instruction. (See Example 1.) It also shows how to identify earlier processor generations that do not implement the processor signature or CPUID instruction. (See Figure 5.) This program example contains the following two procedures:

- `get_cpu_type` identifies the processor type. Figure 5 illustrates the flow of this procedure.
- `get_fpu_type` determines the type of floating-point unit (FPU) or math coprocessor (MCP).

This procedure has been tested with 8086, 80286, Intel®386™, Intel486™, Pentium® processor, Pentium processor with MMX™ technology, OverDrive® processor with MMX technology, Pentium Pro processors, Pentium II processors, Pentium II Xeon™ processors and Intel Celeron™ processors. This program example is written in assembly language and is suitable for inclusion in a run-time library, or as system calls in operating systems.

000806

Figure 5. Flow of Processor_get_cpu_type Procedure

6.0. USAGE PROGRAM EXAMPLES

The cpuid3b.asm or cpuid3.c program examples demonstrate applications that call `get_cpu_type` and `get_fpu_type` procedures and interpret the returned information. This code is shown in Example 2 and Example 3. The results, which are displayed on the monitor, identify the installed processor and features.

The `cpuid3b.asm` example is written in assembly language and demonstrates an application that displays the returned information in the DOS environment. The `cpuid3.c` example is written in the C language (see Example 2 and Example 3). Figure 6 presents an overview of the relationship between the three program examples.

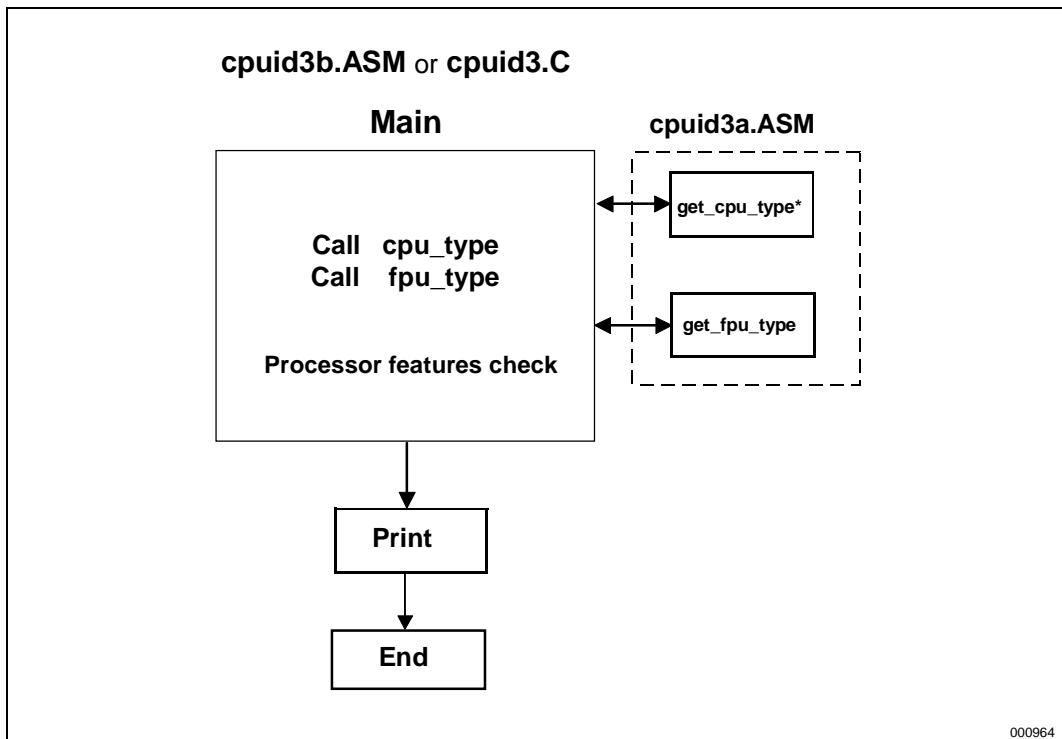

Figure 6. Flow of Processor Identification Extraction Procedure

Example 1. Processor Identification Extraction Procedure

Filename: cpuid3a.asm
Copyright 1993, 1994, 1995, 1996, 1997, 1998 by Intel Corp.

This program has been developed by Intel Corporation. Intel has various intellectual property rights which it may assert under certain circumstances, such as if another manufacturer's processor mis-identifies itself as being "GenuineIntel" when the CPUID instruction is executed.

Intel specifically disclaims all warranties, express or implied, and all liability, including consequential and other indirect damages, for the use of this program, including liability for infringement of any proprietary rights, and including the warranties of merchantability and fitness for a particular purpose. Intel does not assume any responsibility for any errors which may appear in this program nor any responsibility to update it.

This code contains two procedures:

_get_cpu_type: Identifies processor type in _cpu_type:
0=8086/8088 processor
2=Intel 286 processor
3=Intel386(TM) family processor
4=Intel486(TM) family processor
5=Pentium(R) family processor
6=P6 family of processors

_get_fpu_type: Identifies FPU type in _fpu_type:
0=FPU not present
1=FPU present
2=287 present (only if _cpu_type=3)
3=387 present (only if _cpu_type=3)

This program has been tested with the Microsoft Developer Studio.
This code correctly detects the current Intel 8086/8088,
80286, 80386, 80486, Pentium(R) processor, Pentium(R) Pro
processor, Pentium(R) II processor, Pentium II Xeon(TM) processor and
Intel Celeron processor in the real-address mode only.

NOTE: When using this code with C program cpuid3.c, 32-bit
segments are recommended.

To assemble this code with TASM, add the JUMPS directive.
