## *Drawing Engine Command Set*

---

## Section 6: DRAWING ENGINE COMMAND SET

### Special Programming Note:

*Registers CP0-4 and XY0-4 are shadowed registers. Writing into XY0 would also write into CP0 and vice versa. Similarly, writing into XY1 would shadow into CP1, writing into XY2 would shadow into CP2, etc...*

*Special care must be taken when switching between 2D and 3D commands, i.e. writing into CP1 would trigger a 2D command! Also, XY or CP registers may have been written over between 2D and 3D commands.*

#### *Additional Shadowed Registers:*

- 1) XY3 = CP3 = CP25
- 2) XY4 = CP5
- 3) CP11 = CP27
- 4) CP19 = CP29
- 5) CMD(0x0048) = CMD(0x0168)
- 6) \*Register address F8 is shadowed to the register whose address is 1F8.
- 7) \*Register address FC is shadowed to the register whose address is 1FC.

### 6.1 Noop

**Command Name:** No operation

**Command Mnemonic:** NOOP

#### **Command Description:**

The **NOOP** command performs a null operation. The CHIP returns to its idle states.

#### **Command Capabilities:**

- None

0x0	OPCODE

## 6.2 BitBlT

**Command Name:** Bit Block Transfer

**Command Mnemonic:** BITBLT

### Command Description:

The BITBLT command manipulates rectangular areas in the local buffers. The source or destination can be in the Display or Virtual buffer. The BITBLT command requires the host to calculate the scanning direction and provide the correct corner of both the source and destination rectangles. The scanning direction will always be from left to right, top to bottom regardless of the DIR field for any bitblt with zoom or any packed mode bitblt.

Command capabilities:

- Transparent BLT.
- Raster operations as defined by the ROP field of the command register.
- Fast area fills with selectable pixel values.
- 32x32 and 8x8 area patterning.
- Color expansion.
- Screen door transparency in stipple mode or using Masking.
- Bit plane masking.
- Variable pitch for virtual and Mask buffers.
- OpenGL Alpha Blending

		0x9 - 0xF	9X to 65535X Zoom

## 6.3 LINE

**Command Name:** Line

**Command Mnemonic:** LINE

**Command Description:**

The LINE command draws straight lines in to memory using a modified Bresenham's Algorithm to ensure that a line drawn from point A to point B will exactly match a line drawn from point B to point A. This command accepts directly in X-Y format the start and end point for a line.

Command capabilities:

- 16 raster operations as defined by the ROP field of the command register.
- Gouraud shading.
- 32 bit scaled patterning.
- Color expansion.
- Screen door transparency.
- Bit plane masking.
- Open GL Alpha Blending

0x2 OPCODE

## 6.4 PLINE

**Command Name:** Poly Line

**Command Mnemonic:** PLINE

### Command Description:

The PLINE command draws straight lines beginning at the destination of the last command. It uses modified Bresenham's Algorithm to ensure that a line drawn from point A to point B will exactly match a line drawn from point B to point A. This command accepts end point for a line in XY format.

Command capabilities:

- 16 raster operations as defined by the ROP field of the command register.
- Gouraud shading.
- 32 bit scaled patterning.
- Color expansion.
- Screen door transparency.
- Bit plane masking.
- Open GL Blending

## 6.5 Line with Initial Error

**Command Name:** Draw line with initial error

**Command Mnemonic:** ELINE

**Command Description:**

The ELINE is a variant of the LINE command which allows the setting of the initial and incremental values of the Bresenham error term. All the characteristics of the LINE command also apply to the ELINE command. The ELINE may be used when sub-pixel accuracy is required. By pre-loading the error terms, a line segment can be drawn and the pixels will match exactly as if the entire line had been drawn. In addition, the ELINE command allows triangle boundaries to be drawn to match precisely the pixels drawn by the triangle command.

Command capabilities:

- 16 raster operations as defined by the ROP field of the command register.
- 32 bit scaled patterning.
- Color expansion.
- Screen door transparency.
- Bit plane masking.
- OpenGL Alpha Blending

0x3	OPCODE

## 6.6 3D Lines with Setup

**Command Name:** Draw line with full setup.

**Command Mnemonic:** LINE\_3D

**Command Description:** LINE\_3D draws 3D Gouraud shaded, fogged, lit lines and points.

Command capabilities:

- 16 raster operations as defined by the ROP field of the command register.
- Specular High Lighting.
- Fog.
- Gouraud Shading.
- Alpha blending and compare.
- 16 or 32 bit Z buffering.
- bit scaled patterning.
- Color expansion.
- Screen door transparency in stipple mode.
- Bit plane masking.

## 6.7 3D Triangle with Full Setup and Vertex Sorting

**Command Name:** 3D Triangle

**Command Mnemonic:** TRIAN\_3D

**Command Description:**

The TRIAN command draws a Textured, Gouraud shaded, Specular lighted or flat shaded triangle. This command requires only vertex level parameters.

**Command Capabilities:**

- 16 raster operations as defined by the ROP field of the command register.
- Perspective corrected texture mapping.
- Bilinear filtering.
- Palettized texture maps.
- Linear MIP mapping.
- Specular Lighting.
- Fog.
- Gouraud Shading.
- Alpha blending and compare.
- 16, 24, fixed point Z buffering.
- 32 bit floating point Z buffering.
- 32x32 and 8x8 area patterning.
- Color expansion.
- Screen door transparency in stipple mode.
- Bit plane masking.
- 3D Color Keying
- Optional Float color values.
- Optional Backface culling w/ CW/CCW selection

## 6.8 Texture Invalidate

**Command Name:** Texture Invalidate

**Command Mnemonic:** INV\_TEX

**Command Description:**

The texture invalidate command is set before switching to a new texture. It instructs the silverhammer chip that the next triangle coming through has a different texture than previously used.

## 6.9 Load Texture Palette

**Command Name:** Load Texture Palette

**Command Mnemonic:** LD\_TPAL

**Command Description:**

The load texture palette command loads a palette from the system or frame buffer memory into the Imagine internal texture cache palette. This command must be used to load a palette before using a 1, 2, or 4 bit palettized texture for the first time, or whenever a new texture is required.

- 8 bit palettized, 32 bit exact
- 8 bit palettized, 16 bit filtered
- 16 bit or 32 bit color palettes at 1,2,4 bit per texel
- automatic conversion of 32 bit to either 4444 or 0565 for 8 bit palette filtering
